by developing one section, as Figure 42, when the angle shown is that for the top cut, the side cut being the same as the top of the rafters.

It is usual to follow on with the short rafters from the main roof, keeping them the same distance between and letting the last

come where it will at the top of the valley, as in Figs. 37 and 42. The length of each, as compared with the last, will then be shown by the square, each one decreasing in length in the same degree as the one befor it.

This method is the same as when dealing with hip rafters, except that in the one case the measurement worked from is the longest corner from the edge of the plate, and in the other it is the shortest corner from the top of the ridge. Thus Figures 43 and 44 show a short rafter, marked and cut for the right-hand side of a hip, as at D (Fig. 37), and Figure 45 shows a short rafter cut for the left-hand side of a valley, as at E in Figure 37.

In Figure 37 it will be noticed that the valley rafters have feet; also that the long rafters next but one to the hips are cut on to the valleys at the extreme bottom end of the latter. This, in actual practice, can usually be avoided, as there would be more scope than can be shown in small-scale drawings. It is best to bring the rafters in Figure 46, and have a foot on the valley rafters, or as in Figure 47, when no foot will be needed.

In many cases, especially if the roof is flat, the foot end of the valleys will have to be cut as in Figure 48. If so, the corner of the plates must be cut off as in Figure 49; while if the valley has to be cut as Figure 48, and also have a foot, it will fit on to the plate as Figure 50; or if exposed to view and the job is a good one, as Figure 51.

The method of forming a valley roof, shown in the photograph (Fig. 52), is somewhat easier to do, while it is quite as strong; but if the space inside is to be used, or if exposed to view, it is not admissible. The plates are framed as Figure 53, and the main roof is carried right through, as in Figure 54. The short ridge is fixed in position up to the ridge of the main roof as shown, and instead of the valley rafters, boards, called sleepers, are nailed to the rafters of the main roof in a line with the rafters on the shore roof, as at F (Fig. 54). The short rafters are then cut to fit on to these "sleepers," thus forming the complete valley.

The sleepers have to be exactly the same length from end to end as the valley rafters proper. The angles are also the same, but the angle of the bottom end of the sleeper is the same as the top end of the valley rafter. The top end of the sleeper is square in thickness to fit against the ridge, as the valley is at the bottom to fit on to the plate, and the bottom end of the sleeper must be beveled to fit the plate, as the top end of the valley is to fit to the rafters, but on one side only. As the sleeper is only half the thickness of the valley rafter it brings the bevel the same. Thus in Figure 55 is shown the valley rafter, and in Figure 56 the sleeper, both cut to fit their position and the correct way up as when fixed.

In cutting the short rafters, the lengths and angles will be as when fitting to the valley rafters, but just the opposite way, owing to the latter being fixed vertically and the sleeper horizontally. Therefore, instead of the short rafters being cut as in Figure 45, they will be as in Figures 57 and 58, the former showing the marking out and the latter the rafter cut, ready for fixing, the position it will fit being at C (Fig. 54).

The style of roof in which the latter method of forming valleys is especially useful is that where a low roof runs into a larger one, and, of course, where it is not seen inside after the roof is covered in. In such a case the "sleeper" method is much more economical than the valley rafters proper, and, of course, the steel square is equally useful in the framing of either.

CONCRETE HOT BEDS—By IDA D. BENNETT

CONCRETE hot-beds fulfill every requirement of a permanent, substantial bed at a cost reasonably within the reach of every owner of a permanent home. Of course, the dweller in the rented house or the home which promises to be more or less temporary, will prefer the hot-bed of wooden construction, but a hot-bed of some kind should be an adjunct of every flower or vegetable garden.

The construction of a hot-bed is a very simple affair, but like all mechanical work there are certain conditions which make for success and cannot be ignored. In the first place the location must be considered as a well drained soil and southern exposure are essential. Where the drainage is poor, as in case of a clay sub-soil, without any underlying strata of gravel it will be well to lay drain tile in the immediate vicinity of the bed and carry it to a point well below the intended site, but such a process is seldom necessary as one is much more apt to encounter sandy, gravelly soil or clay soil underlaid with gravel than the former and in the last condition the depth of the hot-bed which should be between three and four feet, would carry it well below the clay into well-drained sub-soil.

The southern position is necessary as a hot-bed started, as it is at a time of the year when the ground and atmosphere are still filled with the chill of winter, require all the sunshine and protection possible and if, in addition to a southern exposure, there is also protection on the north, as a building, wall or hedge and adjacent buildings or frees to break the force of the west wind the ideal location will be assured. If no such situation is available in the rear of the house or buildings I should not hesitate to put my bed along a front wall or porch providing the conditions were all that I wanted, for there is no reason why a hot-bed should not be made as attractive and ornamental—given artistic feeling and the means to execute, as a conservatory or bay window. A hot-bed full of well-grown, thrifty plants is always an attractive sight and after its usefulness as a purveyor of plants has passed it may be made still more beautiful by filling it with ornamental bedding plants such as coleus, cannas, caladiums and the like. A spent hot-bed offers a wonderfully congenial place for this class of plants as it is full of rich food, retains moisture and keeps the plants cool in a way impossible in the open ground.

One additional point I should mention in regard to location and that is that it should be as near the house as possible as it is likely to require frequent and sudden attention in the unsettled days of late winter or early spring.

The pit of the bed should be about four feet deep and as large as desired. If the regular florist sash are used, and these are made to slide, it will be necessary to place the bed far enough from the wall to allow of this, but for the home hot-bed I much prefer the shorter sash hinged to the frame and supported at any desired height by a notched stick. It one has their sash made to order then the bed may be any desired width but should not be wider than can be conveniently reached across and may be of a length to accommodate any number of sash—three by twelve feet makes a commodious home hot-bed, equal to any reasonable demands made upon it.

If the construction is to be of cement tiles it will only be necessary to excavate the pit of the right dimensions, allowing for the thickness of the tile, which may be laid on edge, but if economy of construction is to be practiced it will be best to make the walls, at least below the surface of the ground, of grout, for which purpose it will only be necessary to dig a trench of the depth of the walls and as narrow as one can handle and fill in with concrete, care being taken not to pour in too much at a time and to thoroughly tamp each pouring down before adding more concrete.

The wall above the ground, which should be about a foot in the front and two feet in the rear, the ends sloping to this degree, may, if preferred, be of tile, which will, probably, be as cheap as to furnish lumber and construct forms, but if one has the waste lumber, very good finish may be given by going over the walls with a higher grade cement after the forms are removed.

Before bringing the wall to a finish above ground the earth may be removed from the inside of the pit but if the concrete is to be continued, the earth may remain in until all the concrete has set, when it may be removed.

A strip of two by four hardwood should be mortised into the concrete at the top for the sash to rest upon and if partitions are to be used to divide the bed into sections provisions for these should be made by placing an inch strip of wood in the trench at the several points where the sash meet. This allows the sash to rest upon the partition and makes a closer joint than would be the case were it not there. The removal of the strip of wood leaves a slot in which a light partition of wood may be slipped after the soil is in place and the bed ready for planting, for these partitions need only to rest on the top of the soil. Such partitioning of the bed is most useful as it allows of the segregation of plants, requiring similar conditions of heat and moisture, to gather and each sash section can be operated independent of the remainder of the bed.

The best sash for hot-bed, I find, is that made to order of reinforced glass, such sash, while the initial expense is much higher than ordinary sash, is practically indestructible, for while, like anything made of glass, it can be broken by rough usage, it is proof against ordinary handling and if cracked cannot come apart and its usefulness is slightly, if at all impaired. Ordinary hot-bed sash is in constant need of repair, a sudden hail storm finding the beds unprotected will riddle them, a cat jumping from a roof above onto the glass spells disaster. Of course, if one wishes a practical, working hot-bed at little expense, they may use old window sash, which may be picked up at any lumber yard at a nominal cost, with excellent results, and usually one has sash of their own resulting from improvements in the home, which may be utilized. These old window sash are usually of a very convenient size and if in good repair and well glazed answer every purpose in a bed not too exposed to accidents. They are especially to be recommended for the hot-bed of frame construction.

In hinging sash to the rear of the bed it is best to use loose pin butts so that sash may be easily removed for repairs if necessary. It is also well to give sash a coat of protective paint, inside and out.

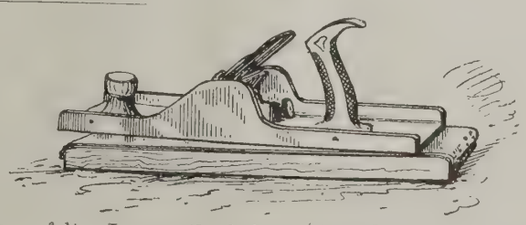
When the concrete is hard and ready to use the pit should be excavated down to the bottom of the wall; no cement bottom is needed in the bed, and the bed filled to within a foot of the top wall with fresh horse manure; this may be placed directly in the pit without preliminary piling in a heap and forking over as is done by florists who, using larger quantities, are seldom able to get sufficient at one time, so pile in a heap and allow to heat before using. Fresh manure, made over night and hauled in the morning will begin to heat at once when placed in a confined pit. Fill to within a foot of the top, tramping it down firmly and evenly in layers, taking pains to see that the corners are evenly filled. Place the sash in position and leave until fermentation is well under way. There should be a considerable quantity of straw or leaves mixed with the manure as this retains the heat much longer than manure alone would do. If the manure is very dry it will be well to give it a thorough soaking with hot water before leaving it.

Manure placed in the pit in the morning should be thoroughly heated by the following morning. The condition will be readily ascertained by the steam arising. If the manure is perfectly fresh it is usually safe to place the earth on it at once and let it heat up with the manure, but if there is any doubts about the life of the heating material it is better to defer placing the earth in position until heat is well advanced.

An inch or two of old, well-rotted manure placed over the fresh is an advantage as it furnishes food for the plants and prevents their penetrating into the hot manure and being injured thereby. Place about six inches of good, rich garden loam or a compost composed of loam, leaf mould and sharp, white sand on top of the manure making it as level and even as possible. Do not make the mistake of making the soil higher in the back than it is in front because the sash is; if this is done the water will all run towards the front of the bed when it is watered, also it will wash the seeds and plants from the ground. The surface soil should be free from stones, roots and twigs and it will pay to run the top inch or two through a mason's sieve if fine seeds are to be sown.

The soil should be in the same condition for sowing as would be desirable in a garden—neither too dry or too wet. In planting the various sorts of seeds it will be best to plant those which germinate at the same time under the same sash placing the taller-growing sorts in the rear where there is more space between the glass and ground and where they will not overshadow the lower growing sorts. Separate each little plot of seed by thin strips of wood pressed edgewise into the ground.

Label each plat with name and date of sowing and when known, with the number of days they will require to germinate. Most of the more common seeds, like asters, tomatoes and the like will germinate in from three to five days while certain others require from twelve to fifteen days and still others much longer and it is well to inform oneself on this point so that the seed plot may not be neglected or disturbed until the seeds have had ample time to germinate.



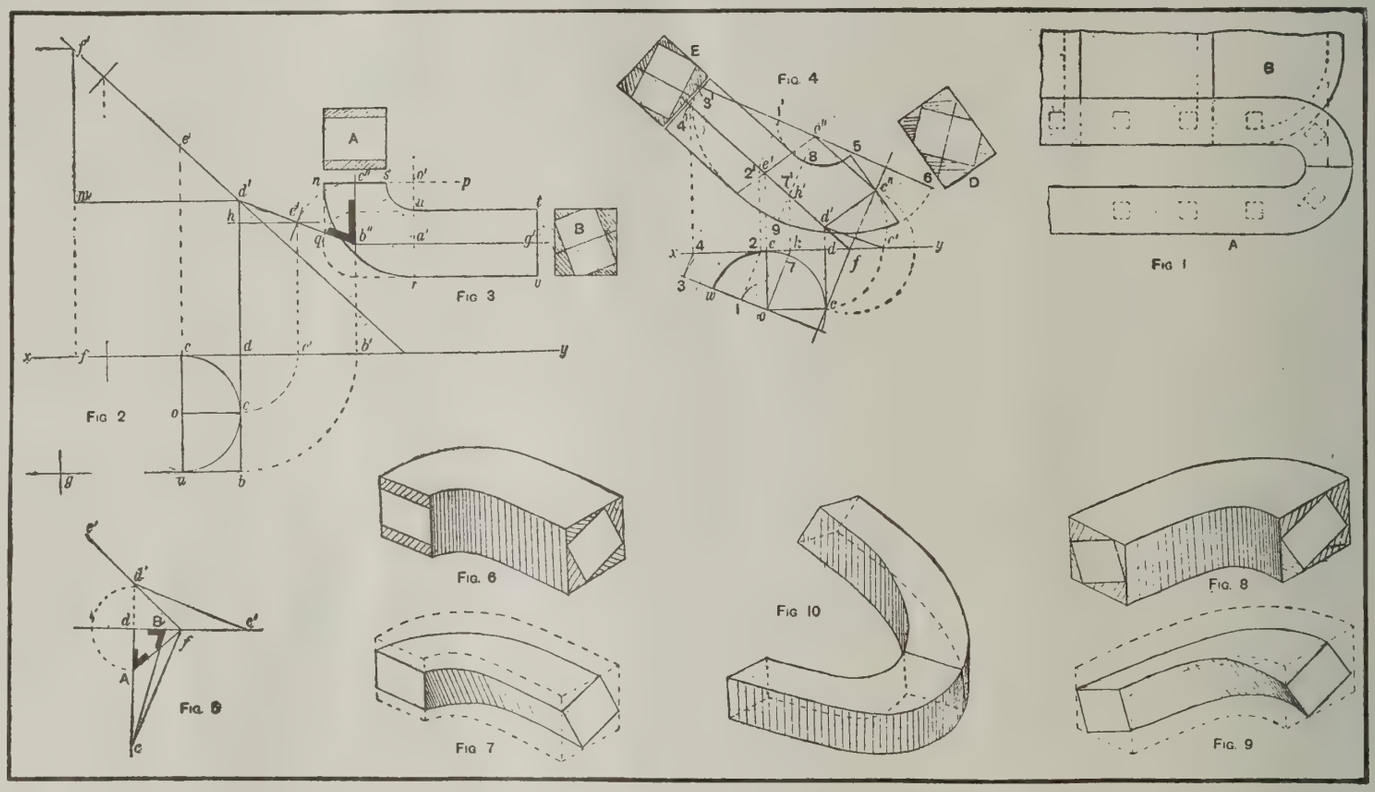
Very fine seed do not need to be covered with soil; merely pressed into it with a smooth faced board, other, somewhat coarser seed may be sown broadcast and a little fine earth or white sand, preferably the latter, sifted over them and the whole pressed down, still coarser seeds may do best sown in shallow drills from one-fourth to an inch in depth according to the size of the seeds, and the sides of the furrows drawn over them and pressed down.

When all the seeds are planted sprinkle lightly with a rubber sprinkler or very fine-rosed sprinkler, taking care not to disturb the seeds, cover with newspapers and close the sash and leave until germination takes place. Examine the bed from day to day and as soon as plants appear in a given plat remove the paper from over them, replacing it over the glass to give partial shade if the sun is very bright, but aim to give the plants all the light and air possible from the start, but protect from drafts of cold air directly across the bed by throwing a blanket across the opening of the sash on the windward side. Do not neglect to close the sash as soon as the sun gets off the sash in the early days of the plants or if the sun goes under a cloud or a cold wind springs up; the neglect to do this may mean a lot of chilled or frosted plants. If the bed has been started in late February or early March it will be necessary to protect warmly at night, but as planting approaches and the weather grows warm the sash should be left off more and more until finally the plants bear complete and continued exposure.

In planting out stuff from the hot-bed do not put out everything at once, rather set what one thinks necessary for their needs and leave a considerable stock to replace those destroyed by cutworms, for it is this reserve stock that most repays the gardener for the construction of a hot-bed, for in these days of excessive ravishings of the garden by worms the furnishing of plants for replanting is no small matter.

LUBRICATING IRON PLANES

When using an iron or iron-face plane the workman is apt to notice a disagreeable suction or repelling action which makes it necessary for him to use more force in handling the tool than when using the wooden plane. Slight lubrication will make the plane work very easily, and the following may prove a useful suggestion in this connection: Take a piece of wood about a foot long and 3 or 4 inches wide by ¾ inch thick. Tack on two thicknesses of baize or a piece of thin felt. Draw the baize taut aud secure it with tacks driven in the ends of the piece of wood so that they will be out of the way of the plane iron. Put a small quantity of oil on



the baize or felt. In use, the baize will need a little oil from time to time. Now the workman simply lays his plane on the felt pad instead of on the bench; this will lubricate it sufficiently for the next planing.—Scientific American.

HANDRAIL WREATH STARTING FROM LANDING

By C. W. D. BOXALL

IN the accompanying illustrations, Fig. 1 shows the plan; the handrail over the portion *A* is to the level landing, and the flight at *B* commences with a quarter-round step as shown, the straight line of the face of the riser being in the same plane as the crown tangent. The going is 8½ in. and the rise 8 in.; in plan the distance between the center line of the rail is 6 in., and the rail is 3¼ in. wide and 2¼ in. thick, and the arrangement of the balusters is also shown at Fig. 1. Set out the center line of the rail in plan as shown at Fig. 2 by *f e c a g*, then draw the crown tangent *d b*, produce *f d* each way to *x y*. Set up the riser *d d'* and the going *d' m*, and also the riser *f f'*; then *d' f'* is the pitch *f e'* the vertical trace of the face mould plane. With *d'* and *c'* as center, obtain the point *c''* and join to *d'* and to *f*; also through *c''* draw the joint line at right angles to *c'' d'*. Draw *o k* parallel to *f c*, project up and obtain point *k'*, then draw *k' o''* parallel to *f c''* and equal in length to *o k* in plan; then *o'' k'* is the direction of the minor axis, and then at right angles to this draw through *o''* the major axis. Next in plan draw *o* 3 and right angles to *o k*, then from where the arc meets this line in w measure off half the breadth of the rail on each side as indicated at 1 and 3, then dray 1', 2 and 3, 4 parallel to *c f*; project upwards, obtaining points 2' 4'. Then from these points project to the major axis

line of the straight rail. With *d* as center draw arcs from *c* and *b*, meeting *x y* as shown in *c' b'*, and erect perpendiculars as indicated. Now set up the desired distances from *x y* for the under side of the level rail as shown by *b'' g'*. This distance, of course, varies, depending on whether it is desired to have the rail from 2 ft. 10 in. to 3 ft. or more from the landing to its under side. Join *b'' to d'*; we now have the development of the tangents. Through *c'* draw the joint line at right angles to *b'' d'*.

The plank for the lower half of the wreath will only have one pitch, and the setting out of the face moulds is as follows: At right angles to the line *b'' g'* draw the line *b'' c''*, making it equal to *b'' c'*. Through *c''* draw *n p* parallel to *b'' g'*, which gives the joint line and the minor axis. Make *c'' o'* equal to *c o* in plan; through *o'* draw *o' r* at right angles to *n p*. This is the major axis. On each side of *c''* mark off half the breadth of the rail as shown by *n* and *s*. From *n* project down parallel to *c'' b''*, giving point *q*. With distance *b'' q* mark off from *a'* on the major axis, giving points *r* and *u*. Then draw *u t* and *r v* parallel to *a' b'*, and joining *t v* gives the shank required; the quarter ellipses *s u* and *n r* may be constructed by any of the usual methods. As before observed, there is only one pitch to this plane, and therefore only one bevel, which is shown, and at A and B are shown the ends of the wreath set out.

The method of setting out the upper portion of the wreath will now be proceeded with. Set out the square *o e d c* (Fig. 4) similar to that shown in Fig. 2; through *e d* draw *x y*. Set up *d d'* making it equal to *h d'*, (Fig. 2.). (This distance is obtained by drawing a horizontal through *c'*.) At Fig. 4 through *d'* draw the two pitch lines *d' c'* and *d' e'* corresponding to those at Fig. 2. Producing *e' d'* we obtain point *f*, and from this draw through *c*; then *f c* is the horizontal trace and 1' 3', also from *o''* set off similar distances, obtaining points 5 and 6. Then from *o''* on the minor axis obtain point 7', which is equal to the radius *o* 7 in plan; next from 7' mark off half the breadth of the rail, which gives points 8 and 9 on the major axis for the internal and external curves respectively, and these curves can now be constructed, and the face mould with its shank completed as shown.

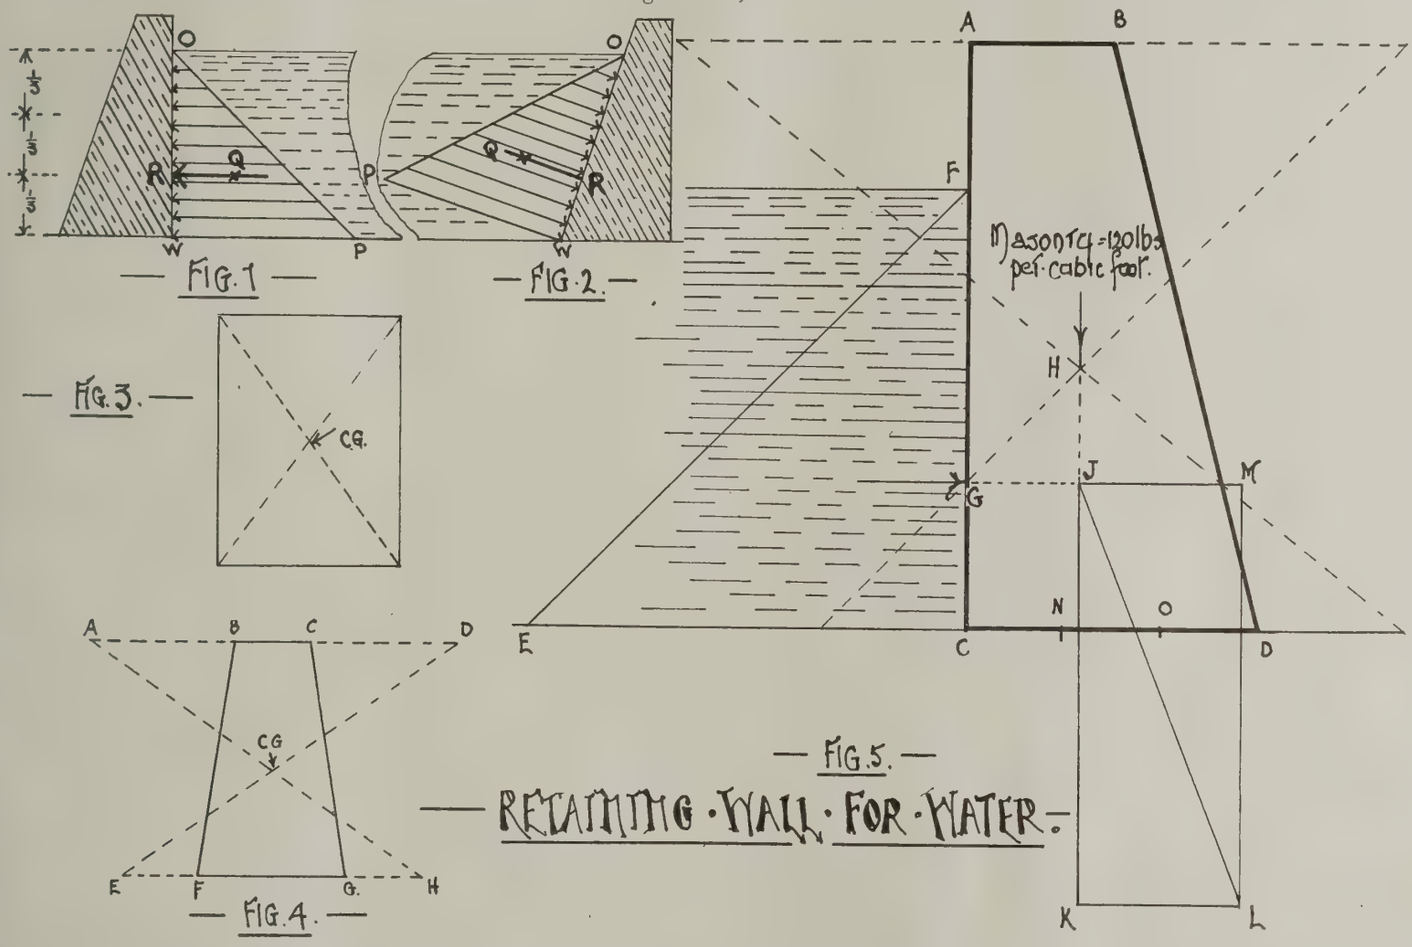
The method of obtaining the bevels is shown at Fig. 5 to a larger scale for sake of clearness; it being a portion of the setting out of Fig. 4, as will be understood by reference to the similar lettering, *d' e'* being the pitch of the straight rail, *d' c'* that of half the crown tangent, *d c* one side of the square and *f c* the horizontal trace. With *d* as center draw an arc tangent to *d' c'*, bringing it round to A, and join to *f*. Then the bevel thus obtained is for the well joint, and its application for this purpose is shown at D (Fig. 4). Again, with *d* as center draw an arc tangent to *d' f*, giving point B; join to *c*, then the bevel shown is for the shank joint, and its application for the setting out of this is shown at E in Fig. 4. At Fig. 6 is shown conventionally the lower half of the wreath cut square through from the face of the plank, the face mould having been applied and also the bevel and the ends set out. Fig. 7 shows this wreath piece squared up ready for jointing. At Fig. 8 is shown conventionally the upper portion of the wreath cut out square from the plane, and the ends set out ready for squaring up. Fig. 9 shows this piece squared up. At Fig. 10 the wreath is shown squared up and jointed ready for moulding. It will be noted that in these conventional views the wreath pieces are shown with all their arrises on, which would necessitate cutting them out a little fuller from the plank.

LEAVES FROM A STUDENT'S NOTEBOOK—No. 5

By GEO. METSON

RETAINING WALLS OR DAMS FOR WATER.

HYDROSTATICS teach us that the pressure of water is perpendicular to the surface pressed against, and that the pressure at any point is in proportion to the vertical distance of the point below the surface of the water, therefore a perpendicular drawn to the bottom of the inner surface of a retaining wall for water, equal to the vertical depth of the water above that point, will represent the magnitude of the pressure at this point. In Figs. 1 and 2, WP represents the magnitude of the water pressure at the point W, and the pressure will decrease until at the top of the water, O, it will be nil. This is shown in Figs. 1 and 2 by ordinates. From this it will be seen that the wedge-shaped volume of water WOP will represent the magnitude of the pressure on the retaining wall from the water.



In order to compare this pressure as exerted on the dam, a section of the wall and water must be taken in calculating the pressure of the water as against the force exerted by the weight of the wall. Take this section as one foot in width. The magnitude of the force exerted by the water can now be determined. It will be $\frac{OW \times WP}{2} \times 62\frac{1}{2}$ lbs. (note 1 cubic foot of water weighs $62\frac{1}{2}$ lbs.), and as the weight of a body can be considered as concentrated at its center of gravity, this center of pressure must now be found. It will be a point joining the center of each side of the triangle to its opposite angle. The direction of the force will be perpendicular to the surface pressed against. Thus in Figs. 1 and 2, Q = the center of gravity and Q. R. denotes the direction of the force exerted by the pressure of the water. It will be noticed that the point of application is always one-third up from the base.

Similarly the force exerted by the weight of the wall must be taken as being concentrated at its center of gravity, and as it must act through the same, a vertical line from the center of gravity of the wall will represent the direction of this force.

The center of gravity (C. G.) of a rectangular wall is found by lines joining the opposite angles; i. e., the intersection of the diagonals as in Fig. 3. To find the C. G. of a wall trapzium in shape as BCFG in Fig. 4, add to each side of the top BC, in prolongation of BC, a length equal to the base FG as AB and CD. Similarly prolong FG each side, making EF and GH equal to BC. Join AH and DE. Their intersection makes the center of gravity of the mass BCFG.

Let it now be required to determine the stability of the wall ABCD in Fig. 5.

From C set out EC at right angles to AC and make it equal to FC. The triangle EFC will then represent the magnitude of the force exerted by the water. This will act at its center of gravity I, the point of application being G and IGJ its direction. Its magnitude will be $\frac{FC \times EC}{2} \times 62\frac{1}{2}$ lbs. $= \frac{6 \times 6}{2} \times 62\frac{1}{2} =$ 1,125 lbs.

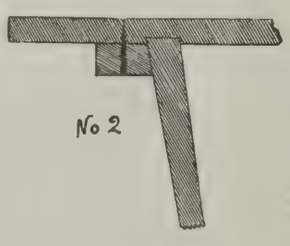
Find as above for a trapezium the center of gravity of the wall ABCD. This will be H. The force of the weight of wall will act through H in the direction H J. The magnitude of this force will be $\frac{AB + CD}{2} \times AC \times$ weight of a cubic foot of the wall.

This can be taken as 120 lbs. for masonry, it will then be for the one-foot section taken $= \frac{2 + 4}{2} \times 8 \times 120 = 2{,}280$ lbs.

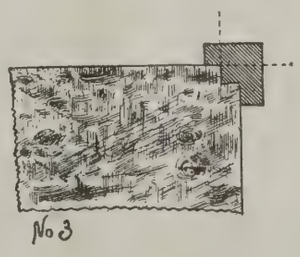
To any convenient scale set out from the point J (the meeting point of both forces) in the direction of those forces, lines equal to the magnitude of the same, viz., JM = 1,125 lbs. and JK = 2,280 lbs.

Complete the parallelogram JKLM and join the diagonal JL, which represents the resultant, the magnitude and direction of the two forces.

For the wall to be stable, it is generally considered necessary for this resultant to cut the base of the wall within its middle-third (NO = the middle-third of the base in this example). The wall is therefore considered safe against overturning.

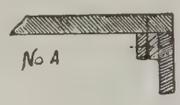


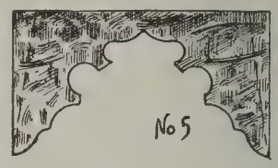
FANCY TABLES AND HOW TO MAKE THEM



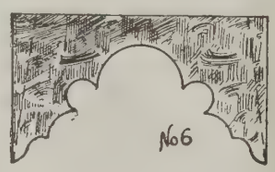
FANCY—or as they are often called, occasional—tables, although fairly simple to put together, it is wise to start on some simple form of table before the more difficult ones are attempted. Leave curves till the square has been mastered. There are many hundred designs of occasional tables obtainable by visiting people's houses, or from ordinary catalogues, if only a few tables are seen. A piece of one put in place on another table may make a great difference for the better. An improvement in the pattern of the brackets may improve what hitherto was considered an ordinary design. Many dozens of like hints might also be quoted. Take care, however, to keep all the parts in harmony with each other—to quote a flagrant case, don't put ordinary square legs on an elaborately carved top—this is for example. This description is intended to give the amateur a few hints rather than an explanation of the concrete designs sketched out. More instruction could be given in half an hour's practical demonstration than pages of writing, but as this is impracticable I must fall back on the pen.

The main thing in good cabinet making is originality in designs, get out of the common rut which is much in evidence in furniture makers' windows. Invent new designs for yourselves, and the trouble spent will be amply rewarded.

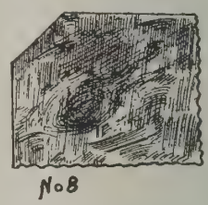




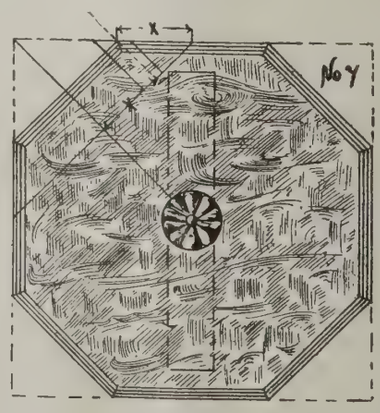
As an elementary design, and one which will present no difficulty, even to the merest beginner, is sketch No. 1. This one consists of a square top to which is fixed four simple pattern legs, an under shelf, and a few brackets and ornamental pieces. The legs could be butted against the under side of the top; but it is by far the best to let them in as depicted in sketch No. 2. Put



a small block underneath for strengthening purposes, but before fixing give the leg and table top a screw driven in slanting. Taper all the four legs together so as to get them alike. If they are square all the way down, then the table looks clumsy and ugly. For a small size table top, 18 in. square, 1½ in. square legs will be large enough, tapering to 1 in. The tops of the legs form a square about 3 in. inside the table top, and the bottoms form a square the exact size of the top. It would be useless to give any crude method of getting the correct inclination of the legs. Make a correct (no matter how rough) drawing full size, then it can easily be obtained.



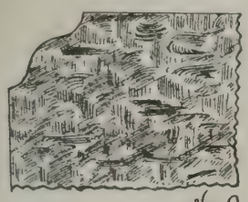
The under shelf could be cut to the inner angles of the legs, or, which is mostly done, let in the legs as shown in sketch No. 3. Small blocks could be put underneath on the legs if the former plan is adopted. From the full size drawing the size of the shelf can be obtained. Settle upon how much the shelf is to be above the ground, 10 in. will be enough, and then rule the position on the drawing.

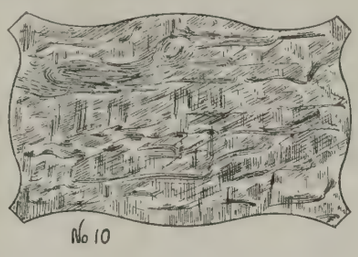


The ornamental brackets for an 18 in. square top and 1 in. thick need only be ⅝ in. thick. If all the four are to be alike, cut them all together; then you may depend on them looking alike —if each pair is alike, then cut in twos. Small fillets underneath

will hold them both, the brackets and bottom ornamental strip (see sketch No. 4.) These fillets can have a square lip or projecting tongue worked on them to rest in grooves in the brackets, etc. Again, if the brackets are let back slightly from the face of the legs, grooves could be worked on the inner sides of the legs, and the brackets let in. Settle this beforehand, however, for the mortises or grooves have to be made. Cut them exact, or material will be spoilt, or else bad jointing.

The ornamental brackets are shown separately in sketches Nos. 5 and 6. Mark them out square first, then cut together along dotted line. Measure carefully from the drawing the exact position of this dotted line, so as to get correct taper. The brackets in sketch No. 1 are different at the sides to those of the front and back. This may or may not be desired. Room is given here for fretwork designs. Instead of these long brackets, eight smaller brackets might be used without detriment to the result.

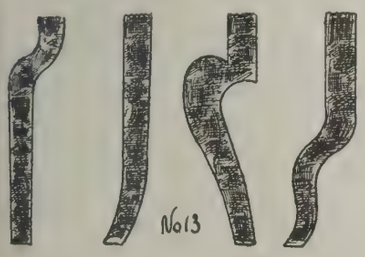




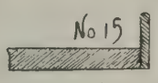
Tables of this description made in walnut or mahogany, or even ebonized, are saleable from 17 to 20 in. square top, with a total height of 2 ft. 6 in.

Many modifications can easily be made in a table of this description. Cut off the corners as in the octagonal table, sketch No. 7, which is common for larger size tables, say 2 ft. 6 in. square, to 3 ft., with vertical turned legs.

To get the correct length of side, draw a diagonal of the square, as shown, then draw a line at right angles from the center



of one side, as shown, and by trial get the lengths X equal. This can easily be done after one or two attempts. There is, of course, the true geometrical way, which some readers may know of.



A center ornament is suggested, and as the top is not small enough to be made in one piece, it must be grooved or ploughed and tongued, or else dowelled together; a batten for strengthening is indicated by dotted lines.

Sketch No. 8 shows simple cut-off, the angles often adopted, or, again, a more ornamental corner, as No. 9. An oblong table looks nice, especially if fanciful, as sketch No. 10, and, of course, the tops and bottoms of the legs must form a rectangle instead of a square, as before said.

No. 11

No. 12

A kidney-shaped table—top and shelf alike—is very popular, and if made in rosewood and neatly inlaid, suggests of Sheraton. The side of the top of both these last two would fit a rectangle of 3 ft. by 1 ft. 6 in., and about 2 ft. 6 in. high, these being average sizes.

All the foregoing tables are, of course, to be left uncovered. The designs are few in number, suitable for this class of table. Sketches Nos. 11 and 12 give the common shape, others being the circular, square or crescent shaped. The tops and shelves may be the same size, in which case the legs seem to pass right through—that is, the dowels meet in the center of the holes in the shelf. The position of the legs is marked by circles, in the first case No. 11.

The legs and their shape must claim great attention. Unturned leges, square and rectangular in section, are far more chic for many table designs. A few patterns are given in No. 13, which may be combined at will. The first represents the top of a leg, and if gradually tapered down and curved out at the bottom, after the style of the second pattern, a graceful leg is the result. The third shows the top of a leg much used; the curve or hump may be flattened, as it often is. The last is the bottom of a leg now and again seen, and if neat curves are given, it looks neat and artistic. The third pattern, modified more or less, is the writer's fancy, and is recommended.

Turned legs are sometimes fancied, especially for octagon tables. Sketch No. 14 gives a few patterns, and although the bottoms are shown straight, these can be curved outward with pleasing effect. Do not have the legs too stout; they are ugly, and suggest a kitchen table. The fourth and sixth patterns please the eye. Use casters; they look nice and are useful for shifting the table. For preventing things rolling off, a gallery is often used fixed on the edge, as in sketch No. 15. Take time in making, and the result is gratifying.—F. H.

THE OLDEST CHAIR IN EXISTENCE

THE illustration shown herein is taken from a photograph of an old Egyptian chair now in the Museum of Boular. This is a chair of the XVIIIth dynasty, B. C. 1600-1368, and was found in the tomb of King Jouiya and his queen, Fouiyau, at Thebes. Those of our readers who fondly imagine that the cabriole leg was an innovation in the time of Queen Anne will see that it was even at that remote period a few thousand years out of date. The chair is beautifully proportioned and exceedingly well carved, the flatness of the symbolic work on the back being well adapted to the position which it occupies. The top rail is ornamented with the winged scarab, the symbol of everlasting life. In a climate such as ours, where the atmosphere contains so much moisture, a chair of this description could not have survived, but in the dry heat of Egypt it has been kept in an excellent state of preservation. Many specimens of Egyptian furniture are left to us in various museums; this absence of humidity, coupled with the faith of the people in the persistence of the personality after death and the return of the spirit to the body, led to the burying of models or actual pieces of furniture, and in this way we have records of the oldest civilization, which Renan has described as "The Queen of Nations and the Boast of Time; Mother of Sciences and the House of Gods." Queen Hatshepsu's throne in the British Museum is probably the most ancient piece of furniture in the world. The Egyptian folding chairs, stools and couches had seats of leather, plaited rushes or linen cords. On most of the furniture the craftsman of Egypt stamped his stern personality, but the chair which we illustrate suggests considerable comfort. Egyptian woodwork was usually painted, but inlay was also extensively employed. A remarkable evidence of the dry climate of Egypt is afforded by the fact that a wig, some 6,000 years old, was discovered at Thebes during the past century in a good state of preservation.—Cabinetmaker.

CONCRETE CISTERNS ON TOP OF GROUND PROVIDE COUNTRY HOUSES WITH CITY CONVENIENCES

An abundance of soft water is a great aid in solving the labor problem of housekeeping. With the general use of concrete there has developed a new style of cistern which further lightens the work of the housewife. This new concrete cistern is built on top of the ground and, by direct pressure, forces the water through pipes into the house and does away with the work and exposure of pumping and carrying water. The piping of the water allows the cistern to be located to the best advantage. Since the roof water from out buildings is free from soot and other impurities, many persons prefer to build the cistern at the barn, granary or corn crib. The cistern shown in the illustration is placed on a three-foot terrace in the rear of the house. The carrying of water is thus reduced to the mere matter of turning a faucet in the kitchen.

A FARM CISTERN BUILT ON A THREE-FOOT TERRACE.

THE FORMS AND FOUNDATION.

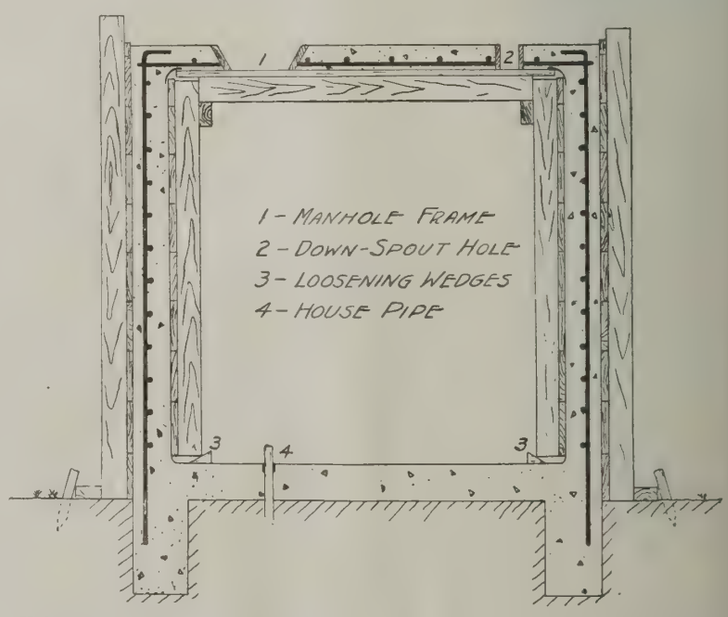
To illustrate the general method of construction, consider a cistern 8 by 8 feet square in the clear and 8 feet high with 6-inch side walls and floor and 4-inch roof. Such a cistern holds 121 barrels of water.

The first step in building a cistern is to have all materials on hand before beginning the work. Make the forms or molds of 1-inch siding on 2 by 4-inch studding spaced 2 feet. Remember that the siding always goes next to the concrete. Since the floor is 6 inches and the roof 4 inches thick, have the studs for the outside form not less than 8 feet 10 inches in length. The uprights for the inside form must be exactly 8 feet long. As the pressure of the concrete will tend to hold the siding in place, tack it lightly to the studding. Board up the outside form only to height of 3 feet, so as to make easier the handling of the concrete and the placing of the reinforcing rods. Build each side separately in order that the entire form may be quickly erected. See that the forms are joined in such a way as to make their removal an easy matter when surrounded by the solid concrete.

From the site of the cistern strip off the sod and other foreign matter. Do not disturb the solid ground. Three to four feet below ground level (depending upon the depth of freezing), lay a 2-inch house-supply pipe and have the cistern end fitted with a pipe connection, set at the concrete floor level and 1 foot from the cistern wall. Carefully imbed the pipe in concrete to the first joint beyond the cistern wall. Thoroughly tamp back the earth removed, so that there can be no settlement underneath the cistern floor. Lay out the cistern 9 by 9 feet, out to out. Within these lines dig the foundation trenches 1 foot wide and 3 feet deep.

MIXING AND PLACING THE CONCRETE.

With the forms ready and the foundation trenches dug, begin mixing the concrete. Proportion the concrete 1 part Portland cement to 2 parts sand to 4 parts crushed rock. Four parts of clean bank-run gravel may be used instead of the sand and stone. In measuring the materials do not guess or count shovelfuls. Measure exactly by means of a bottomless box, and count one bag of cement equal to 1 cubic foot. Mix the concrete mushy wet and fill the trenches to a level with the under side of the cistern floor.



To take care of the water pressure, reinforcing rods must be run in both directions through the concrete wall. For this purpose, use ⅜-inch rods 10 feet long. While the concrete in the foundation walls is yet soft, set the vertical rods in it (spaced 8 inches) to the depth of 1 foot. Carefully place these rods so as to bring them within 1 inch of the outside of the cistern walls.

Next in order is the concrete floor. Make it 6 inches thick and tamp the concrete well. See that it overlaps the inside of the foundation wall and that the top of the pipe connection is at the floor level. Finish the surface with a steel trowel.

After the floor has hardened for three or four hours, erect the inside form. To aid in taking down these forms, place removable wedges between the ends of the studs and the floor. Before setting up the outside form, fasten the first four horizontal rods to the vertical reinforcing by means of small wire. These rods are spaced 8 inches apart. The ends must be bent and spliced around the corners of the cistern. Set the ouside form and begin building the concrete side walls. Use the concrete mushy wet and work it down next to the wall form with a wooden paddle. Place it in 8-inch layers carried around the entire cistern. See that exactly 1 inch of concrete is between the steel reinforcing and the outside form. As the work progresses, add the necessary boards of the outside form and the lengthwise reinforcing rods. Do not stop placing concrete until the walls are finished.

THE CONCRETE ROOF.

While the 4-inch concrete roof is hardening, a temporary wooden platform is needed to support it. Build this platform of 1-inch boards nailed lightly to 2 by 4-inch joists. Let these joists rest on 2 by 4-inch stringers nailed to the studding of the inside form at a distance of 4 inches below their tops, so that when the stringers are loosened the platform will come down. To keep the mushy concrete from wasting, place heavy paper or thin cloth at the edges of the platform. For providing a manhole opening, take 1-inch boards 5 inches wide and build a bottomless frame, 4 inches deep, 2 feet square at the top and 18 inches

CROSS-SECTION OF CISTERN BUILT ON TOP OF GROUND SHOWING FORMS AND REINFORCING.

square at the bottom—outside measurements; or have the tinsmith make a round bottomless dish-pan of the same dimensions at the top and bottom. Grease the manhole frame and set it on the platform where the opening is desired. For the downspout from the roof, make an opening by similar use of a round wooden plug or a short section of drain tile or sewer pipe, which may be left in the roof.

Over the entire platform spread 1 inch of concrete. Quickly place the reinforcing of ⅜-inch steel rods running in both directions (criss-cross) and spaced 1 foot apart. Bend the ends to a hook shape and fasten them to the rods in the side walls. Immediately tamp in the remaining 3 inches of concrete. Increase the thickness to 3½ inches at the center so as to shed the roof water. Finish the surface with a steel trowel. If the tin manhole frame is to be used, grease it, set it in place and build the cover along with the rest of the roof. Reinforce the cover with short length of rods laid criss-cross and within 1 inch of the bottom. As lifting rings, use two halves of an old bridle bit or two hitching post rings, the ends provided with knobs of twisted wire or with nuts and large washers for holding the bolts firmly in the concrete. If the wooden manhole form is used, carefully remove it after 5 hours. After 3 days build the manhole cover the same as for the tin form, with this exception—place greased paper around the edges to prevent the new concrete from sticking to that of the platform. When the cistern roof is 3 weeks old, lift off the manhole cover and saw an opening in the wooden platform. Descend, loosen the wedges under the studs and the stringers supporting the platform, remove the forms and pass them out through the opening. To keep the settlings out of the house pipe, screw a 4-inch length of pipe into the joint coupling. Furthermore, the downspout should be provided with a cut-off, so that the first flow from the roof of the building may be kept out of the cistern. The cistern may be used for water storage after it is 1 month old.

Below is given the bill of materials and a liberal estimate of their cost. By consulting local dealers, it may be found that the cost of the cistern can be reduced.

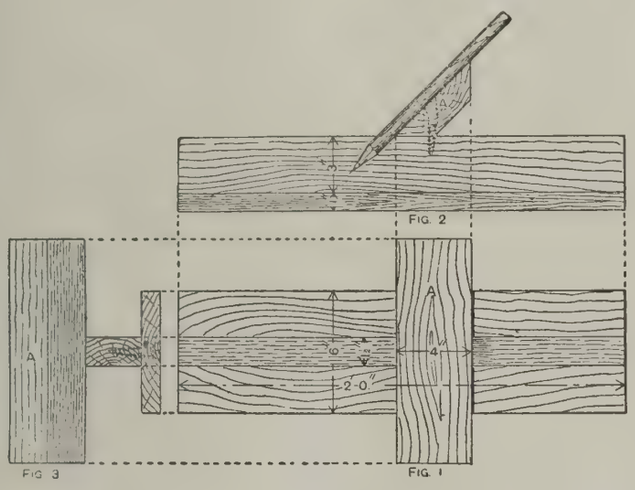
MATERIALS REQUIRED.

Crushed rock, 12 cubic yards	at $1.10.....	$13.20
Sand, 6 cubic yards	at $1.00.....	6.00
Portland cement, 21 barrels	at $2.50.....	52.50
Reinforcement (112 rods—⅜ in. by 10 ft.) 420 lbs.	at $0.02¼.....	9.45
		$81.15

If ornamental features are desired, moldings or tile decorations may be used. The point to bear in mind is, that an inexpensive cistern located on top of the ground provides the country house with the conveniences of a costly city waterworks.

APPLIANCE FOR MARKING MOULDINGS FOR MITERING AND SCRIBING

A GENERAL method of marking mouldings for scribing is to cut a miter as if for an internal angle, and afterwards to reduce this to the scribe. This entails waste and labor, and is not available for marking mouldings for the purpose of returning the ends in the solid. Figs. 1 to 3 show an appliance designed to do away with these difficulties, and properly manipulated, it will give any kind of scribe or miter that may be required.



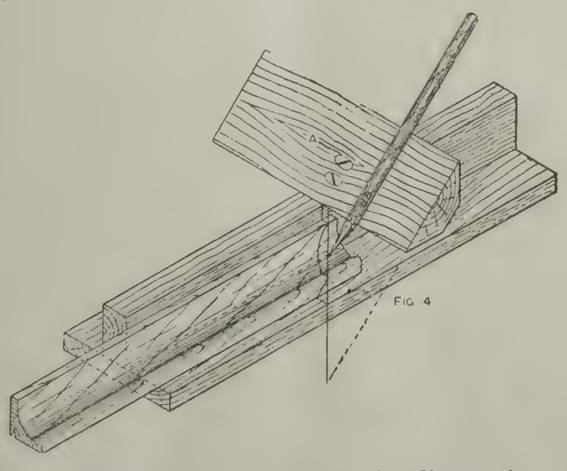


FIG. 2

The appliance can be constructed of ordinary pine or deal, A being the plane of intersection. The dimensions can be altered to meet requirements. The pencil has a flat side planed throughout its length, so as to bed fairly on the plane, and is used as indicated in Fig. 4, which shows the application of the apparatus. The moulding is held in position by the left hand, and any marks that have been made on it are adjusted to the point of the pencil, which is then worked all around the surface of the moulding, care being taken that it always lies flat on the plane. The curved lines show the path traced around the surface of the moulding by the point of the pencil. Fig. 5 shows an example of a similar device for use in brickwork or stonework. The side of the plane marked

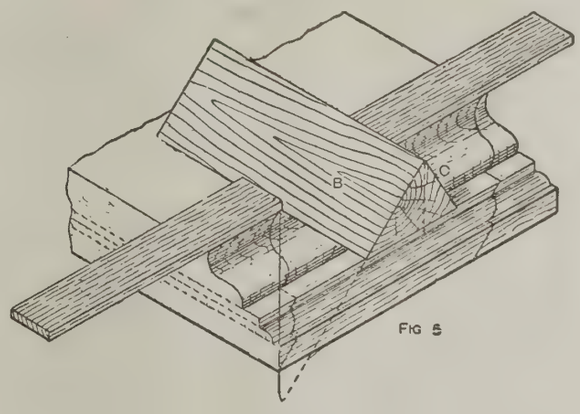

FIG 5

B is for square miters, that marked C being for octagonal miter. The curved lines on the moulding show the trace of the point of the scriber.

This method can be applied to miters or scribes of every angle by simply fixing on a fence or straightedge a plane having a pitch or inclination equal to half of the whole angle. Fig. 6

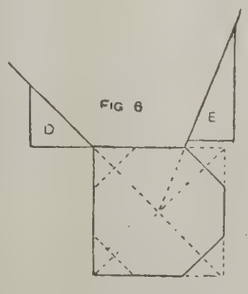

FIG 6

illustrates this adaptability, D being the plane of intersection of a right angle, E that of an octagonal angle.

The appliance, which is simple and inexpensive, might be considerably improved by hinging the plane so as to render it adjustable to any angle.

HOLLOW BRICKWORK

By H. T. F.

WALLS are often constructed in such a way that they represent a hollow space or vacuity in the interior, this not only effecting a considerable saving in bricks, but tending very much to keep the exterior face of the wall dry or dampproof, and this to a very considerable degree of completeness. This latter point will be obvious on slight consideration, inasmuch as,

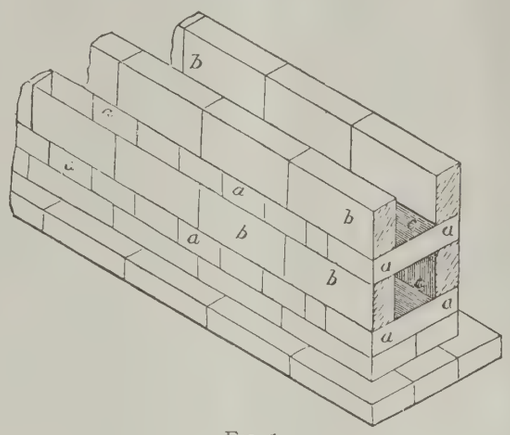

FIG. 1.

should the outer or weather surface of the wall be defectively built, either with poor bricks or through careless and improper "pointing," in heavy rains, especially if these be accompanied by high winds blowing in the direction of the walls, the wet or damp which may pass through the outer skin, so to call it, of the wall, will

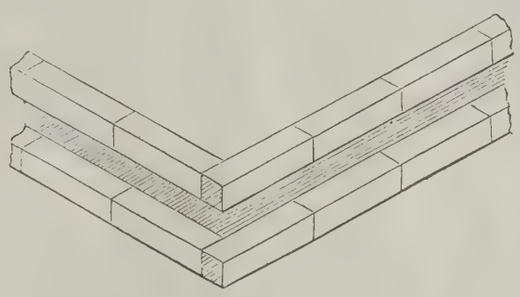

FIG. 3.

pass down the sides of the cavity or hollow, and not through the inner skin of the wall next to the room. In building "hollow walls" or "cavity walls," as they are in some districts named, the

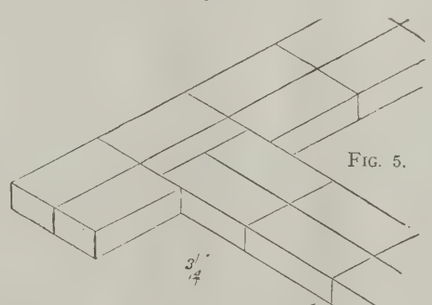

FIG. 5.

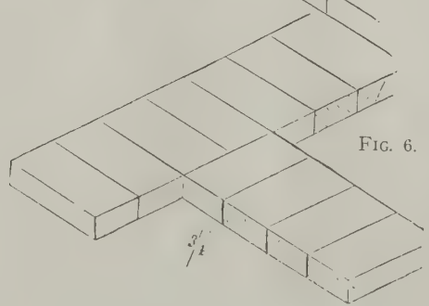

FIG. 6.

bond requires to be altered so as to meet the peculiarities of the kind or variety of wall determined upon.

In Fig. 1 we give a drawing of a hollow wall, built according to a novel bond. In this rows of headers, *a a, a a,* alternate with rows of stretchers *b b,* but the stretchers *b b* are placed on the edge; thus giving throughout the whole length of the wall a hollow space or vacuity *c c.* The appearance of this wall in elevation is also shown in the diagram; but the usual method of disposing the bricks in elevation is shown in Fig. 2, where the stretchers are

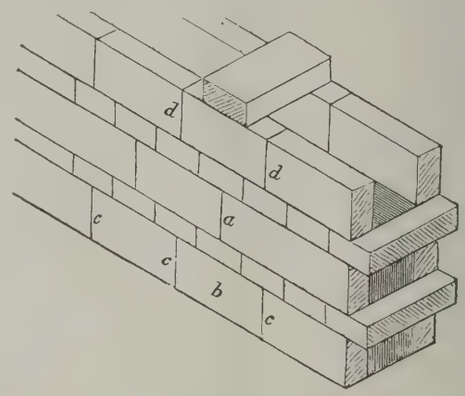

FIG. 2.

so disposed that the joints, as *c c,* of one (b) do the binding of the angle at the meeting of two walls, Fig. 3, and do not coincide with the row of stretchers next in succession, as *a,* but with the next but one, as *d d;* the joint *a* of two contiguous stretchers being

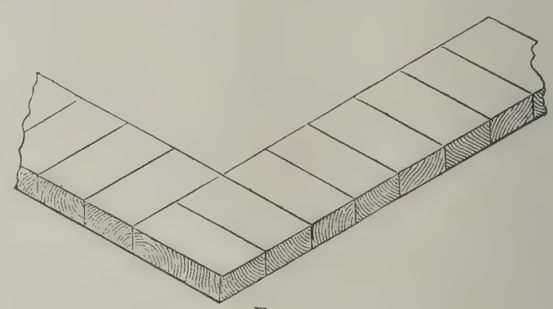

FIG. 4.

above the solid part of the stretcher *b* in the course of stretchers below. Fig. 3 shows the method being the "first course," Fig. 4 the "second course." This method of building effects a saving of

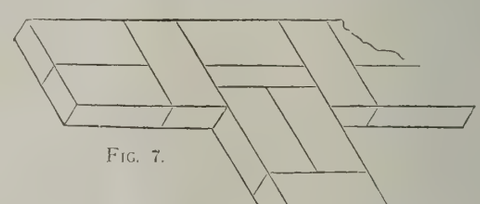

FIG. 7.

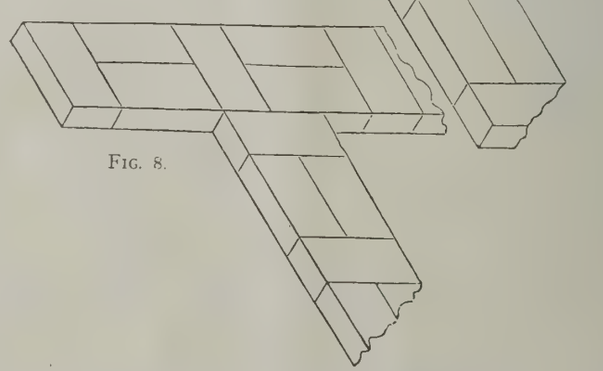

FIG. 8.

about one-third of the bricks and one-half of the mortar. Fourteen inch walls are built by having header bricks fourteen inches long.

In Fig. 5 we give an illustration of a wall equal in thickness to one brick, in English bond, this being the first course, Fig. 6 being the second. Fig. 7, the first course of a wall of same thickness, but in Flemish bond, is illustrated.

The openings in brick walls made to receive doors and windows, are in some districts technically called "voids" or the vertical sides of the opening to right and left of the "void" are called "reveals," or "jambs," according to their position. The vertical

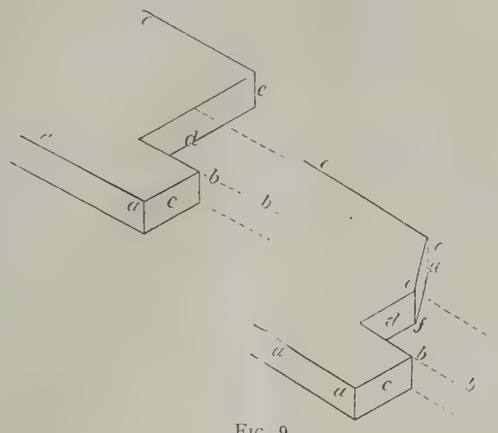

Fig. 9.

sides of the wall are called "reveals," as the part *c*, Fig. 9, formed by the "return" from the external face of wall *a a*, and the external face *b b* of the door or window frame represented by the dotted lines *b b*. The depth of the part *c* from *a* to *b* is usually half a brick, although much finer architectural effects can be obtained by having a deeper reveal. The mode sometimes still adopted, which was so prevalent in the last century, of bringing the front of the sash frame of a window formed so as to be flush, or nearly so, with the face of the wall, should be discarded. The inside return or recess formed behind the face *e e* of the inner wall, and the back of the door or window frame, is called a "jamb," as *d e*, Fig. 9. "Jambs" are of two kinds—"square" as at *a b d e*, and "splayed" as at *a b d e e*, Fig. 9. The corresponding letters indicate corresponding parts. Figs. 10 and 11 illustrate a "square reveal," or "jamb," in a two-brick wall, Fig. 10 being "first," and Fig. 11 being "second course," and in English bond. A similar reveal, but in Flemish bond, is illustrated in Fig. 12, which is the

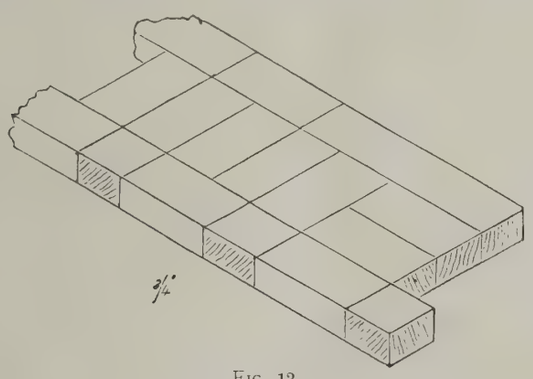

Fig. 12.

first, and in Fig. 13, which is the second course. The student will observe that in Fig. 13 the bond with the half closer, *a*, and the half brick *b*, is bad. It is usual, therefore, to throw in a brick so cut as to form both pieces (as a and b) in one. This is called a

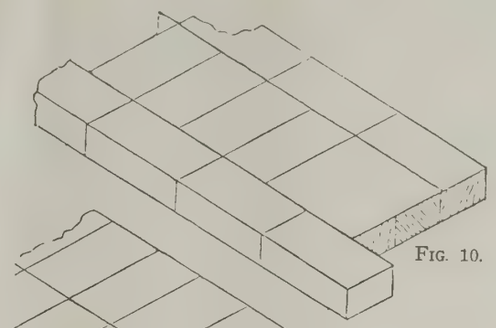

Fig. 10.

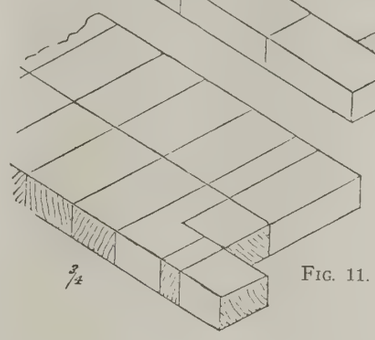

Fig. 11.

"king closer," and if it were practical, it ought to be formed, as shown by the line *c d e f g h*, with a shoulder *h g*, but as it cannot conveniently be cut in that manner, it is cut obliquely as at a Fig. 14.

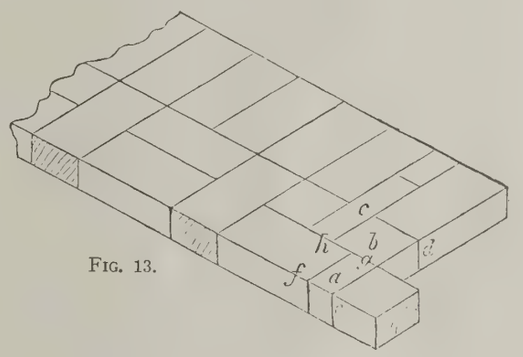

Fig. 13.

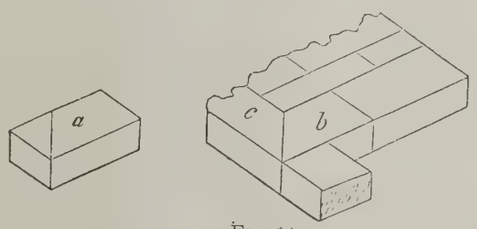

Fig. 14.

A CONTINUAL CHANGE

By WARFIELD WEBB

THE builders' occupation has undergone radical changes in the past few years. It was the vogue in times past for the builder to plan and execute every portion of the structure. The frames, sash, panels, even the doors in some instances, and the interior trim and much of the exterior detail. He had to be a skilled mechanic in all these lines. And further still, he had to know just how each portion of work was to be done and done rightly. The times have wrought wonderful changes in many of these things. Now we have houses made to order and set up at our command. We have exterior and interior docorations shipped in boxes and placed together with the aid of a few nails. Has all this changed the builders' occupation, and has he lost some of the finer art that was once his lot?

To answer this question in its strict and logical sense we must say, no. Conditions have changed; have undergone evolutions that have made over, in a way, the whole industry, and still there is today a greater demand than ever for men who can do a few things well. The day of the haphazard jobber and the careless carpenter is no more. The time when a man was expected to do any and everything has gone into oblivion. The ready-to-order structures of all kinds have robbed him of his occupation. For the man who can and who will specialize in his work and do it well, the vista widens and he is in demand. It is today a question of skill, rather than of occupations. What can he do and do exceptionally well? That is the question for him to consider at this time in a most earnest manner.

What talent has been most noted in his labor? What does he himself feel that he understands and prefers to specialize in? He has something that fits in more particularly than others. Let him cultivate this to its highest degree. Let him leave no effort idle that will make this possible. He need not complain that he has lost his occupation. No occupation is really lost to the man who is keen enough to keep abreast of the changes that are continually going on around him. If you will note it, there is generally an almost complete revolution in our methods of doing things once in twenty-five years. If we were to stand still at the sight of our industry undergoing this change, we would be left on dry land, and our bark would be unfit to continue her voyage on the seas of life.

A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.

PLATE XX. BASEMENT PLAN.

A STONE wall 1 ft. thick, set upon a concrete footing, is heavy enough to carry our walls, though a dwelling any larger should have at least an 18 in. wall. Through the center is placed a 6 by 8 in. girder, set edgewise, upon which one end of the floor joists rest. This is supported through its run by three 6 by 6 in. posts set on a concrete footing. The ends of the girder are run into the walls about 8 inches.

The brick chimney is set upon a footing and runs to the basement floor where a cleanout is formed. It curves out at the top of the foundation for about six inches so as to run just inside of the outside wall line on the first and second floors.

A 6 by 6 in. post is placed at the turn in the stairs so as to support the joists where the well is formed for the stairs. The student should have little trouble in planning the cellar stairs from what has already been said concerning them.

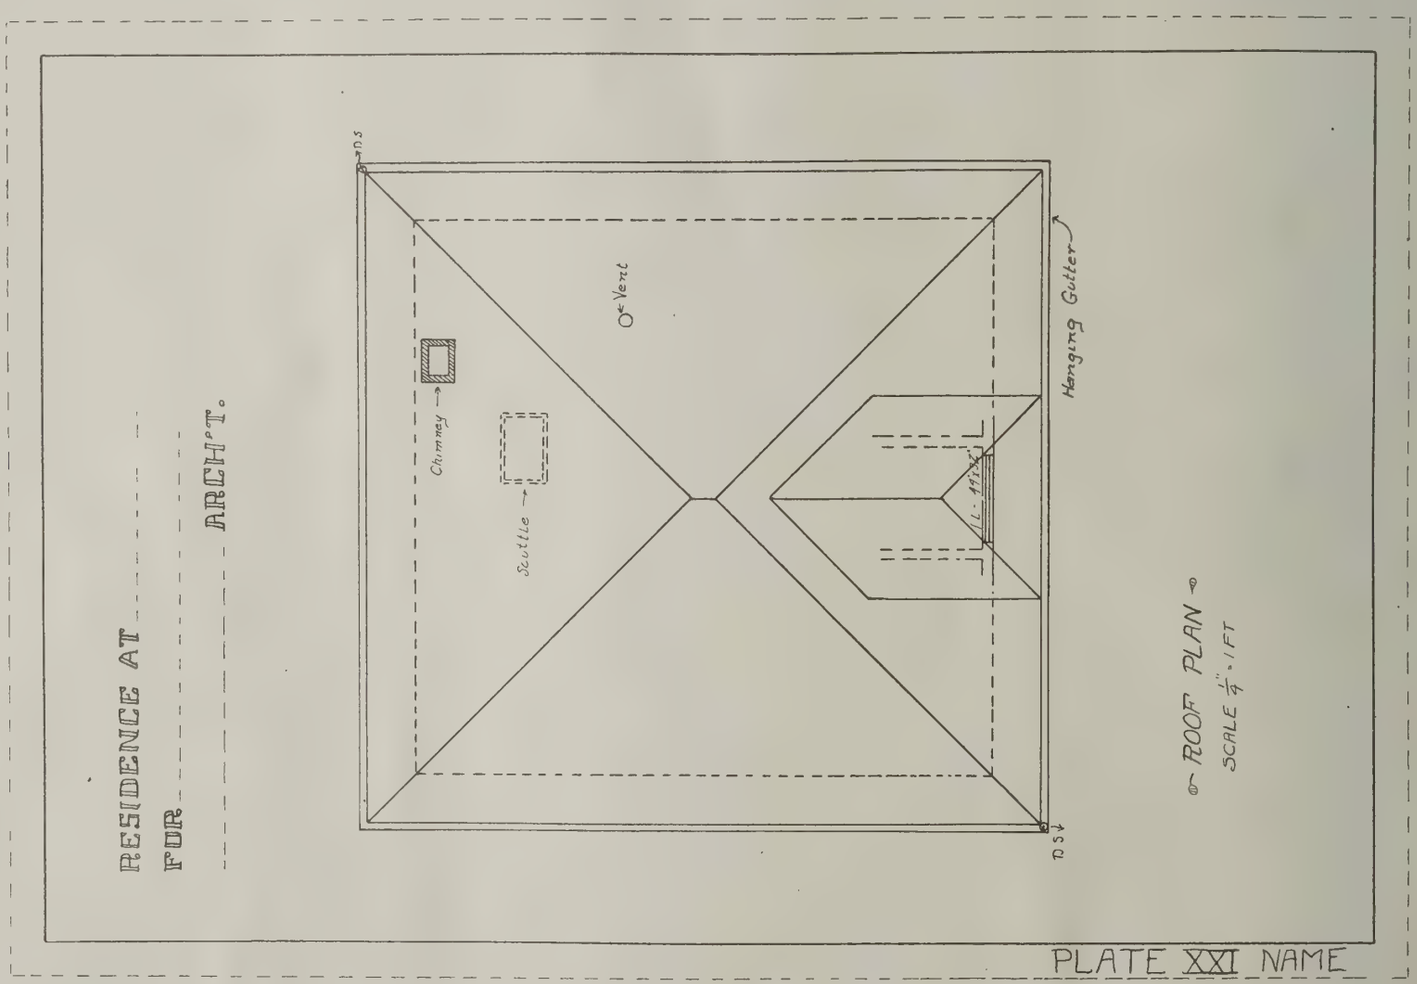
The windows and door show their frames in the wall. The windows are single sash and are hinged at the top.

The heater should always be shown and some provision made for its fresh air intake.

The fruit and coal cellars are walled in with a 7/8 in. partition, the former having a door and the latter an open space for entrance.

The sewer outlet should be shown. All branches should turn at an angle of 45 degrees (never a right angle), in the direction of the fall of the system.

The cistern and the catch basin, if there is to be one, may be located, or may not, at the discretion of the draftsman.



This plan must also show the piers for the porches. It must be fully dimensioned for from it the size of the building is determined and also the breaks in the wall which may be carried up the whole height of the building.

PLATE XXI. ROOF PLAN.

A roof plan for this building was hardly necessary, but for the sake of completeness it was included.

It shows an ordinary hip roof with a dormer on the front. The chimney, vent and scuttle are located as shown, also the hanging gutter with two down spouts. The dotted line all around shows the outside wall line of the building.

More information concerning the roof will be given when the elevations are explained.

METHODS OF REPRODUCING DRAWINGS.

The problem of reproducing drawings cheaply but satisfactorily, has been a hard one for the draftsman to solve until recent years, when a number of processes have appeared upon the market. The time was when a number of tracings were taken from the originals for use upon the field. It needs no explanation to understand the time taken to do this, hence the expense.

The best of the up-to-date processes by far is the blue print method, which we will now endeavor to explain to the inexperienced.

BLUE PRINTING. In the first place some sort of a printing frame will be needed by the student. It may be purchased or

made at home. It consists in a rather deep frame in front of which is placed a sheet of clear glass. Back of the glass is placed a pad of felt. Back of the felt is a hinged board upon which springs are fastened. The object of the springs is to force the felt evenly and tightly against the glass while the printing process is going on. It would be good practice for the young builder to test his ability as a draftsman by designing such a frame, getting out his drawings for it and constructing it himself.

To make a print we place the tracing in the frame, inked side against the glass. Back of the tracing we place a sheet of prepared blue print paper and fasten the felt and board in place by means of the springs. This is exposed to the light which acts upon the chemicals in the paper, changing their nature so that when the paper is taken from the frame and washed in clear water, we have a blue print, that is, white lines upon a blue background.

The action has been this: The paper was so prepared that when fresh and no light had struck it, the preparation could all be washed off leaving the paper white. Now when it had been exposed to the light it was so changed that when washed, instead of being washed off, it turned a deep blue color. Where the inked lines were on the tracing no light could penetrate, hence the solution washed off here leaving the white lines on a blue background.

The length of time which a print should be exposed depends upon the intensity of the light, the freshness of the paper and the chemicals used in its preparation. It should be determined by the student by successive trials. When the proper exposure is secured, the print should be washed in running water, or through a number of changes of water until no more of the solution will wash off, and then hung up to dry.

Very good paper may be purchased by the draftsman ready for use. It comes in a number of grades, weights, sizes, speeds and lengths. The best for all-round use where a large quantity is not utilized, is a ten-yard roll, 36 in. wide, medium weight and rapid printing. It will keep for some time in a closed tube and may be used summer or winter. If fresh and exposed to strong sunlight, an exposure of a minute and a half is generally about right.

If the student cares to experiment and make some paper of his own, he may do so in the following manner:

Dissolve thoroughly and filter

1.	Red prussiate of potash	1¼ ounces
	Water	½ pint
2.	Ammonia-citrate of iron	2 ounces
	Water	½ pint

Keep in separate bottles until ready for use when equal parts of 1 and 2 should be mixed and applied to the paper to be coated. This may be done at night by artificial light or during the day in a darkened room. The paper should be fastened at an angle and the solution applied from the top with a wide camel's hair brush. Allow it to dry in the dark and keep it under cover until it is used.

Another way of making blue prints which is rapidly coming into popular favor, is the positive print method, that is, prints of blue lines upon a white background. To do this a negative is needed. The negative is made from the original tracing upon paper which turns brown when washed, and it must be fixed in hyposulphite of soda. This is used in the frame with the blue print paper, the light shining through the white lines on the negative leaves these lines blue on the print after the latter is washed in water. There are ways of making positives directly on the blue print paper from the tracing, but it is not advisable for the student to use this method.

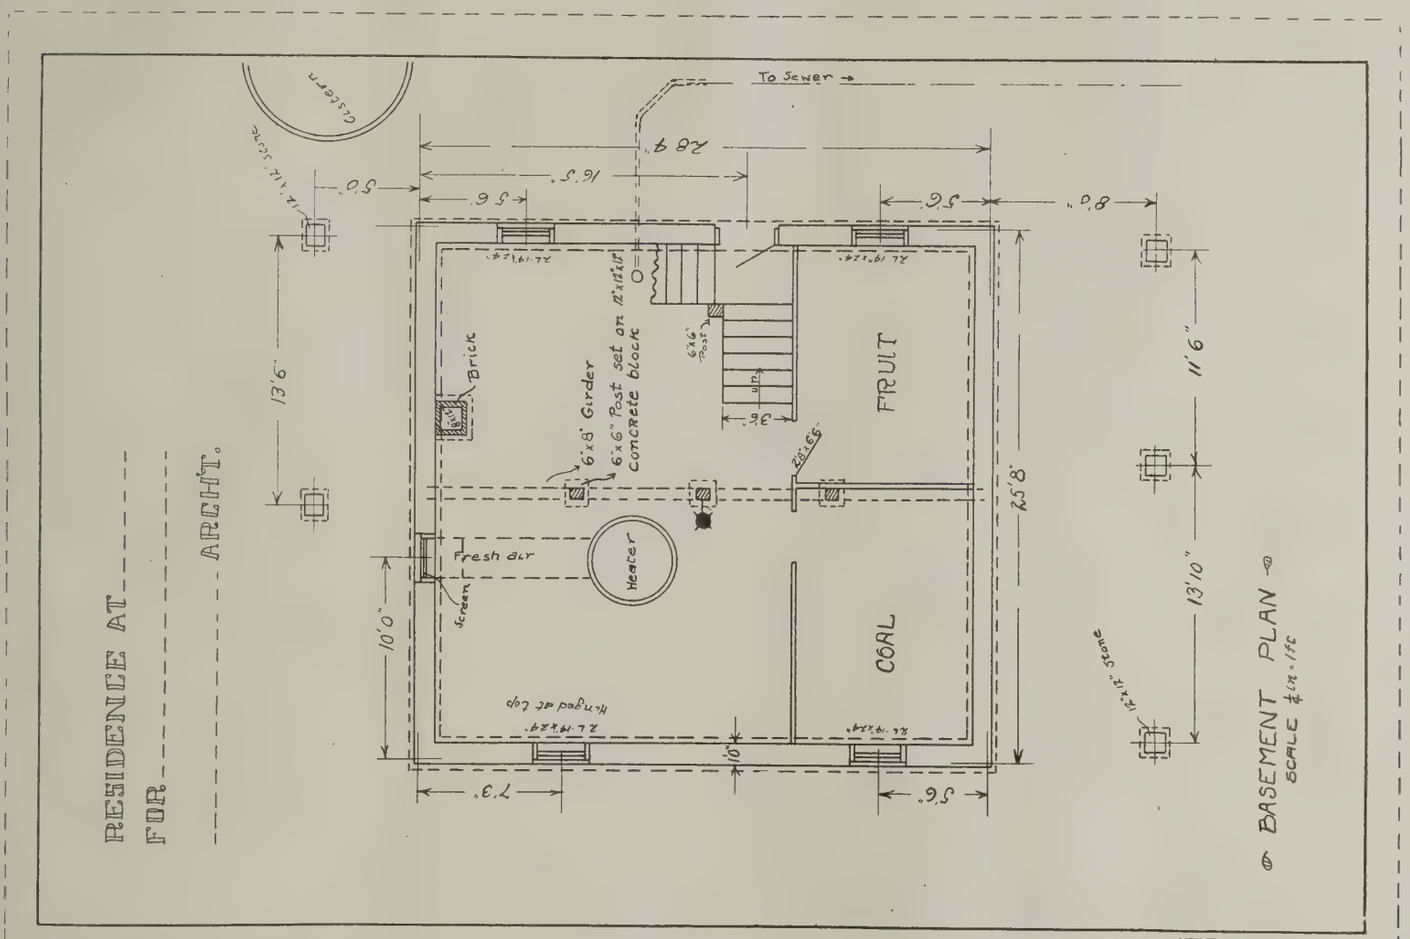


PLATE XX. NAME.

A number of other processes are on the market for reproducing drawings, but they are more expensive and do not give much better satisfaction than the blue print method.

The latest process to appear is known as Aligraphy. It is a patented process and reproduces drawings on paper or cloth with lines almost as black as the original. They closely resemble etchings. It is very expensive, but makes splendid reproductions, especially of fine work.

A process in use in some large offices and in the larger cities consists of inking the drawings with colored aniline inks. The drawing is then laid on a bed of moist clay which absorbs the greater part of the ink and a number of prints can be made by pressing blank paper against the clay. This process allows a drawing to be made in colors so that frame construction may be shown yellow, brick red, stone blue, iron green, etc. The inking can be done right over the pencil drawing, thereby saving the cost of tracing cloth. (To be continued.)

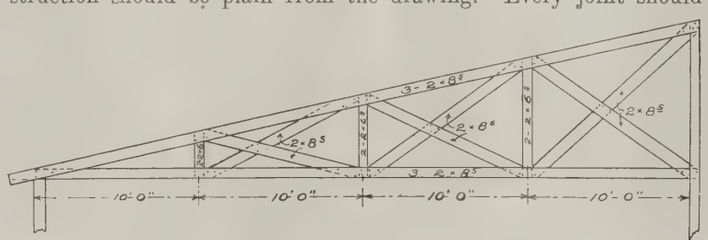
OUR READERS' PAGES

[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. These columns are open to our readers at all times without cnarge, and any questions or experiences will be given proper space.—Editor.]

ANSWERS

BURNISHING GILDING.

From A. Ashmun Kelly, Malvern, Pa.



Replying to question by G. J. R., Syracuse, N. Y., the operation of burnishing varies with the kind of work done, but the essential feature in any case is the rubbing of the gold leaf, which causes it to adhere closer to the material and removes any inequalities, thus causing the leaf to look at its best; the leaf is naturally bright, and the "burnishing" does not polish the leaf, but simply smooths it out. In glass gilding the leaf is softly rubbed over with cotton wool, after it gets dry, say after 24 hours. This removes surplus leaf, and flattens the metal to the glass, showing on the reverse side, of course. The degree of burnish obtained will depend upon the strength and character of size used.

In picture frame or any wood gilding the burnishing is done with a tool called an agate, of peculiar horn-like form, its point being intended for getting into curves or sunken parts. The gilding is rubbed with this tool until bright or burnished. Same with book gilding, etc.

ROOF DESIGN.

From B. E. N., Chicago.

Replying to Z. R. N., Narvon, Pa., a design is submitted for a simple truss, which can be built up of 2x6's and 2x8's. The construction should be plain from the drawing. Every joint should

be well nailed. The truss can best be built on the ground and raised to its position, although if a proper staging be built the truss can be built in position.

For a length of 40 ft., three trusses will be required, making the spacing 10 ft. on centers, about. No trusses are needed on the ends unless they are to be open.

Purlins can be hung between the trusses to carry the metal roof, or they can be placed on top of the trusses if preferred.

STRENGTH OF WALLS.

From E. N. B., Chicago:

Reply to J. G. C., Flint, Mich. I think there must be some mistake in your text-book if it says the New York Building Code allows an 8-inch wall for a building of this character. We quote from the code as follows:

"Walls for Dwelling Houses. Sec. 31. The expression 'walls for dwelling houses,' shall be taken to mean and include in this class, walls for the following buildings: Dwellings, asylums, apartment houses, convents, clubhouses, dormitories, hospitals, hotels, lodging houses, tenements, parish building, schools, laboratories, studios. The walls above the basement of dwelling houses not over three stories and basement in height, and not over twenty feet in width, and not over fifty-five feet in depth, shall have side and party walls not less than eight inches thick, and front and rear walls not less than twelve inches thick. All walls of dwellings exceeding twenty feet in width and not exceeding forty feet in height, shall be not less than twelve inches thick.

"Walls for Warehouses. Sec. 32. The expression 'walls for warehouses,' shall be taken to mean and include in this class walls for the following buildings: Warehouses, stores, factories, mills, printing houses, pumping stations, refrigerating houses, cooperage shops, breweries, light and power houses, sugar refineries, office buildings, stables, markets, railroad buildings, jails, police stations, court houses, observatories, foundries, machine shops, public assembly buildings, armories, churches, theaters, libraries, museums. The walls of all warehouses, twenty-five feet or less in width between wall or bearings, shall be not less than twelve inches thick, to the height of forty feet above the foundation walls.

From this you will see that 12-inch walls are required as your building would be considered a store building, and in any event, being over 20 feet wide as a dwelling house, it would require 12-foot walls. It will be well to use 16-inch walls in basement.

PAINTING CONCRETE TENNIS COURT.

From "Concretor," New York City.

A. P. H. can make a dark green wash, that will stand by mixing Prussian blue with a little lamp black, and trying often until the proper shade is obtained. The vehicle should be made with clean water and neat cement, about as thick as ordinary whitewash, and may be poured on the cement from a bucket or other vessel, and then spread over by using broom, and well rubbed in. The prepared coloring must be put in the wash and well mixed with it, before poured out on the cement. The whole floor should be well cleaned off and moistened before the coloring mixture is applied.

From S. A. H., Toronto, Ont.: Floors of cement do not take kindly to paints or washes of any kind, for no matter how good the paint or wash may be, it soon wears or chips off and leaves the surface pockmarked and unsightly. It is always best to color the cement before laying. I have tried with some success a mixture of neat cement and water colored with some mineral paint: and applied with a whitewash brush. The work must be well soaked with water and properly cleaned before the wash is applied, the wash being about the same consistency as good thick lime wash.

BOOKS.

From "Contractor," St. Paul, Minn.

The best single book (of Hodgson's), suitable to the wants of a young and inexperienced contractor, in my opinion, is "Hodgson's Estimator," but, if T. L. W. wishes to know how to do the work as well as how to charge for it, he will require all of Hodgson's books, and more too.

CARE OF CIRCULAR SAWS.

From "Old Woodworker," Oshkosh, Wis.

If C. F. C., Budford, Colo., will get a copy of Grimshaw's large works on saws, or "Hodgson's Hand-Saws," he will find pretty nearly all he will ever want to know about saws.

CUTTING WINDOW OPENINGS.

From "Bricklayer," Detroit, Mich.

If G. J. R., Syracuse, N. Y., will be a little more precise in stating what he wants, he would stand a good chance of getting his query answered. Does he mean cutting window openings through an old brick wall, or does he mean preparing the openings in a new wall while building? If the latter, the process is simple, as the frames when set on the sills, are the guides around which the bricks are built. If the former, the openings are marked the proper size and shape on the brickwork outside, and the bricks are carefully removed to the lines made; when the frames may be inserted and the wall properly finished and pointed. Proper provision must be made for supporting the wall above the opening, when such is necessary.

I have noticed that many of your correspondents do not tell exactly what they require, or they ask their question in a loose and slip-shod manner; such kind of conduct makes it very difficult to give correct answers. If a question is worth asking, it is worth asking in a clear and proper way.

QUESTIONS

BACKING A HIP.

From "Young Un," Duluth, Minn.

Is there an easy method of backing a heavy hip rafter?

UNCOURSED RUBBLE, ASHLER QUOIN.

From "Stonemason," Utica, N. Y.

Please describe or illustrate what is meant by Uncoursed Rubble, Ashler Quoin, and benefit one perplexed?

REVOLVING TABLE.

From "Willie H," Granafield, Oklo.:

I want to make a revolving table for a dining room and would be thankful if some reader of the NATIONAL BUILDER would publish some pointers and give the usual size, some details, and send a little drawing of same.

TILING WALLS.

From "E. B.," Dugger, Ind.:

I have to plaster in the walls of a bath room and kitchen, marking same off to imitate tile, and would like some information as to how the work should be done, and what materials to use, and what tools to employ, and where to obtain them. I will be thankful for any information of the subject.

HOW MUCH PAINT?

From "Carpenter's Wife," Sedley, Sask.

How can I find out how much paint I would need to paint any given surface?

MEASUREMENTS OF BRICKWORK.

From "A. G. McF.," Smith Falls, Ont.:

I sublet the building of a brick store with the understanding that the contractor was to furnish all brick and mortar and do all the labor, and I to furnish all bond timbers and wood bricks. The contractor now claims full measurement of wall and will not allow me anything for space taken up by the timbers I supplied. Am I not entitled to the cost of bricks that would have been required to take the place of the bond timbers? Any information on this subject will be appreciated.

CONCRETE BARN.

From "A. O. P." Eastwood, Minn.:

I am building a barn 36x60 feet, of concrete 8 inches thick for first story, with second story formed of studding 8 feet high, and I want a Gambrel roof over the whole. How can I design this roof so that there will be no posts, purlins, iron rods, or other obstructions in hay loft? I will feel grateful for information on this matter.

CUTTING WINDOW OPENINGS

By CHAS CLOUKEY

A SHORT time ago some one said he would like to see an article on cutting openings for window frames for frame and brick building, and it is the intention or purpose of this paper to furnish such practical information as will enable the carpenter to make the frame openings in the walls for standard size windows and sash.

As frames for brick walls are nearly always bricked in as the walls are laid, with the exception of some doors and now and then

a sash, I shall not take up the space of the paper or the time of the reader in treating an unimportant phase of the subject.

The first thing to be determined in cutting window openings is the location of the window, and if possible it should be located so that one of the regular studs will form one side of the opening, allowing for the extra piece which double trims all good work.

The next thing is to determine the height of the bottom of the window from the floor, and in the absence of specifications, about 22 inches is a very good height. If the carpenter is working from a set of plans he can have little trouble in locating his openings in the proper places, but the plans will not tell him just the size to leave the opening in which the frame is to be set.

In most cases the sizes of the windows are given in the dimensions of the lights. Thus, when we wish a 24x24 2-lt. window, we mean a window with a 24x24 glass in the bottom sash and a 24x24 glass in the top sash. As this is all the information we have as to the width and height of the window, it is necessary for us to know how much room is taken up by sash and how much by frame, in order to be able to trim the opening the right size for the window frame to be admitted readily and at the same time not to be so loose that it will be hard to fasten it in.

Some carpenters set the studs in the right place and trim the openings as they go along as is shown in Fig. 8, and some others stud every 16 inches, sheath up the whole house and then cut the openings out afterward; but in either case it is necessary to know about the sizes of windows and frames in order to work intelligently. Also he must know if the windows are to be weighted and the consequent room must be provided on each side for the weights. He should know if the frame is made with a plain sill or with a sub-sill, as it makes an inch difference in the length of the necessary frame opening.

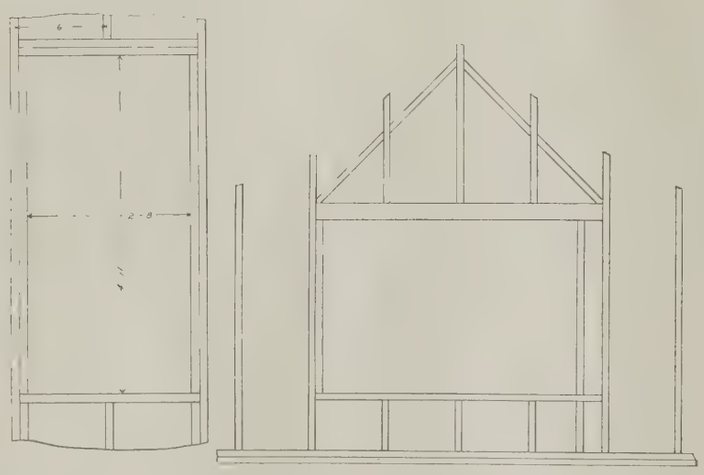
Beginning with Fig. 1, we have a 24-inch glass, 2 inches on each side for sash, and 3½ inches more on each side for the jambs and weight space. This makes the total width between studs 2 feet 11 inches for a 24-inch window, with weight pockets.

Fig. 2 shows a twin window of the same dimension and the spaces on the extreme sides are the same as in Fig. 1, but in the middle or mullion there is a space of 5½ inches besides the sash for each light. Some frames are made with full 6-inch mullions, but this is an unnecessary bother, for the 5½ is wide enough to accommodate the two sets of weights, and it will take 8-inch material to make the full 6-inch casing, both outside and inside.

Fig. 3 shows the opening for a 24-inch frame without weights. The width of the sash is 2 inches on each side and the space for the jamb and play is 2 inches. If the jambs are thin and the windows short, the opening may be an inch narrower, but it is well to avoid making the holes too narrow, for it is a great bother to cut the studs out and set them back after the wall is ready for the frames.

Fig. 4 shows the space for a twin window, 24-inch glass, without weights, and it will be noticed that the mullion is 4½ instead of 5½, as in the weighted method. The reason for this is that the mullion in this style of frame should take the same width of casing as the sides. This is on account of the better looks and the less bother of making all the casings the same width. If the side casings are 4 inches wide then the mullion should be the same. But if there are weights to the windows, the mullion

should never be less than 5½ inches wide, no matter what the side casings are.



So the simple way to determine the width of the window opening to be cut is to add to the width of the glass in a two-light window, 4 inches for sash, and 7 inches for frame and pockets if weighted, and 3 or 4 inches for frame if not weighted. If the window is two lights wide then we must add to the width of the two glass 5 inches for sash. If the windows are 3 lights wide we must add 4½ inches for sash, and so on, according to the size of the glass and the number of lights. If the carpenter can get hold of a sash catalogue he will find the opening sizes given for the windows listed. The opening sizes given are for the outside measure of the windows and to this must be added the space for the frame and the pocket room, if any.

The consideration of the height of the opening includes the length of the two or more lights of glass, the sash and the space for the frame.

Fig. 5 shows the height of opening for 24-inch glass, 6 inches of sash and 5-inch space for frame, making a total of 4 feet 11 inches.

Fig. 6 shows the same window and frame with a subsill which increases the height of the frame 1 inch and makes the trimmed opening for the frame just 5 feet high.

Fig. 7 shows the trimmed opening for a 24x24, two light window frame without weights and without sub-sill. Fig 8 shows

the trimming for a large window in which a heavy header is used and a truss cut in between the studding to support the wall above the large opening. In wide openings for triple or quadruple frames where weights are not used, or are used only in every other frame, a stud may be set in each mullion to help support the upper wall. If the mullions are all full boxes, then the opening should be trussed so that no great amount of weight will come on the pulley stiles, or they may be sprung so that the windows cannot be raised and lowered.

Cutting the openings for sash frames is as easy as for windows without weights, but the carpenter must know the size of the sash or very nearly. The sash is almost sure to have 2 inches on each side for sash unless it should be a large one for plate glass, and in height it may have 4 inches or 5 inches of wood altogether. So if the carpenter is in doubt as to whether the sash has a 3-inch bottom rail, he should trim his opening as if it did, then if the sash is one inch shorter, the frame will go in just the same and the inch of slack at the top will make no material difference.

Openings for circle top and Gothic frames are usually trimmed square at the top and a brace cut in at each upper corner as close as the jamb of the frame will permit. The sheathing is nailed on and then sawed out to fit the required frame. Bulls-eye frame openings are trimmed in the same way except that the corners are braced below as well as above and the full circle sawed out of the sheathing.

The trimming for door frames is like that for window frames without weights, except that the bottom header is omitted. The two inch allowance on each side of the door width is enough to let in the frame even if the jamb is 1¾ thick, if it is rabbeted for the doors. However, there are some special door frames which require wider openings, among which are those having the doors swinging out from a hinge strip on the outside edge of the frame. Of course, this would come under detailed work and each case would have to be considered separately.

A BRICK COMPETITION

The manufacturers of brick, tile and other clay products will hold an International Exposition in the Coliseum, Chicago next March. To encourage beautiful effects among the exhibits, "Brick and Clay Record," are offering $175.00 in prizes for the best designs of exhibition structures, suitable for a show of this character. The greatest latitude is permitted for the display or original ideas in this competition, the terms of which can be obtained from the "Brick and Clay Record," 421 Plymouth court, Chicago, Ill.

CONCRETE IN HOUSE BUILDING

By JOHN UPTON

IN BUILDING a cellar wall of concrete, one man will proceed quite differently from another owing to different conditions and yet both may obtain good results. Under ordinary conditions there will be an abundance of stone. This may differ greatly in different locations. Of course, we must have gravel or sand, and cement. If we use crushed stone, coarse gravel or small cobble, it will be best to mix them in with the other materials—in fact, this would be the only way even if it were necessary to plaster the entire work over to secure a good job. Of course, where such stone were mixed with the finer materials, a facing of fine stuff could be secured by spading the coarser aggregates back from the face of the wall or by using a strip of iron to hold them back and filling in the face with fine material.

Let us suppose on the other hand that we have some quite large stone, as large as one man can handle, and that we are to build a wall eighteen inches thick. After putting up the forms for the inside of the wall, the bank of the excavation being sufficiently straight for the lower half of the outside, we will proceed to mix the concrete and will begin the wall by a row or course of large stones in the bottom, first digging out the extreme bottom of the trench so that it is a few inches wider than the top. These large bottom stones are to extend a few inches (2 to 4 beyond the outside of the wall and can extend somewhat beyond the inside face as the floor will cover them. After these are in place, the concrete or mortar is shoveled or poured around or over them, covering them about three inches.

Next, more large stones are placed in the trench, they being put at the outside of the wall, directly against the bank, and more mortar being poured between them and over them, also between the stone and the forms. The forms can be filled in this manner, using stone and mortar alternately until the top of the ground or grade level is reached. As the stones which we have been using below ground are not suitable for the face of the wall, we must do something else.

We will consider three different methods of procedure: First, use a better quality of stone, have them dressed and continue as before; second, use concrete blocks for the face of the wall; third, make a concrete facing to the wall and lay the stones in the center, out of sight. If we can readily secure a good grade of coursing stone which will work easily, we can lay them for the face of the wall just as such stone are commonly laid, making a course of narrow ones every second or third course so that the concrete will bind the wall, filling in behind them with concrete. If we use blocks, these can be laid up first to the desired level and the concrete filled in back of them.

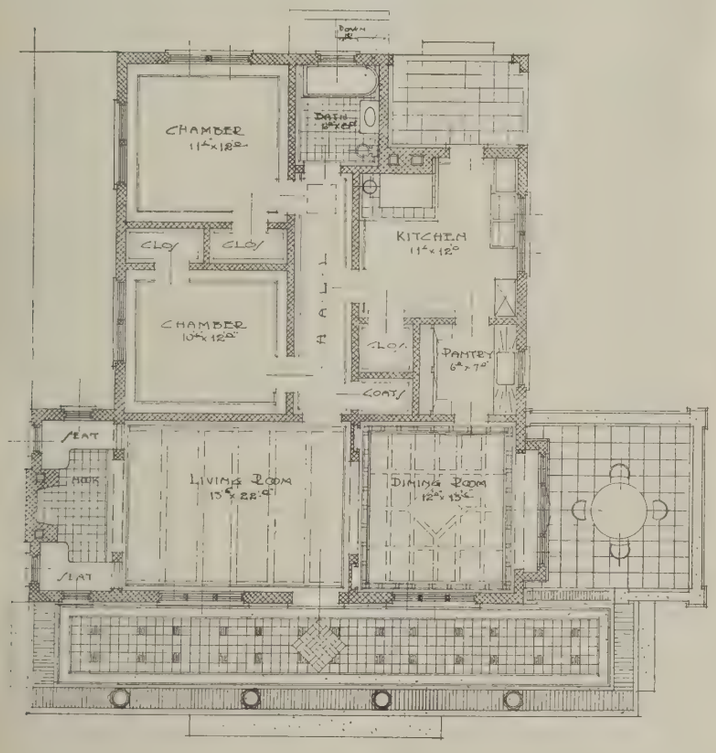
In case we decide to make a wall with a concrete face, it will only be necessary to break the stone up small enough so that they can be placed an inch or two from each side of the forms. This will allow sufficient mortar to cover them and will give a good wall. For this class of work the mortar can well be made a little richer than for work where the aggregates are smaller. A mixture of one to four should be amply strong for any case and if the sand is of good quality, a leaner mortar will give excellent results.

A bit of advice recently seen in an enterprising farm paper was to not use hot water on a grindstone, because hot water takes the grit out, makes the stone slick and destroys free cutting. The recommendation is to use warm water, but not hot. Whether this logic is good or not, it should be interesting to woodworkers who use water on their grinding wheels, as marking the distinction between the comfort of warm water and the extreme of using hot water.—Exchange.

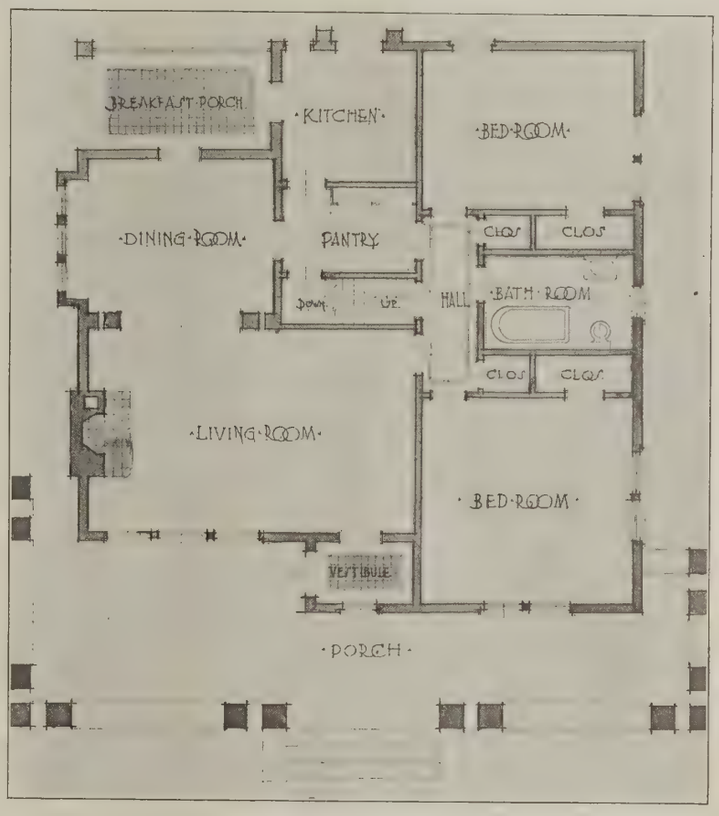
TWO CONCRETE BUNGALOWS

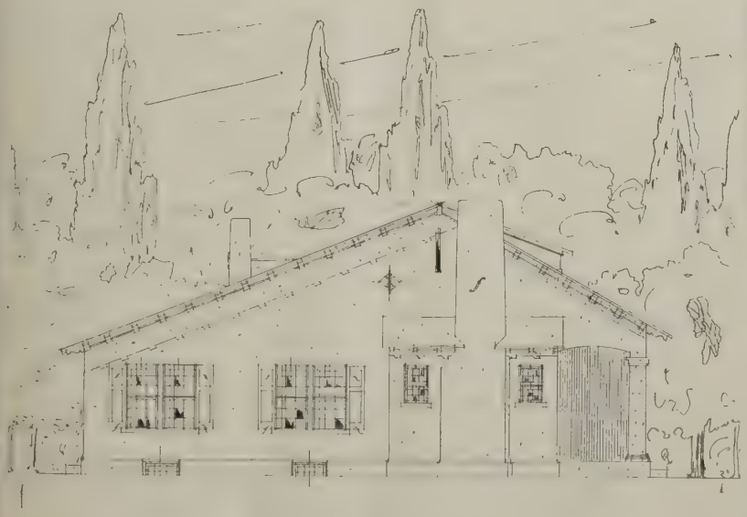
GIVEN the same conditions, it is hard to conceive a much greater variation in design than is shown in the two plans on this page. Each contestant was to provide a building of five rooms, of fireproof construction, not to exceed $4,000 in cost, exclusive of plumbing, heating, lighting and lighting fixtures.

The design by Mr. Pfeiffer is rather more formal than that of Mr. Lane, but both show a familiarity with the requirements of a building of this character, and a building from either plan would be homelike and comfortable.



Both of these designs were submitted in the recent competition held by the Cement Products Exhibit Co., 72 W. Adams street, Chicago, Ill.





J. Bernard Pfeiffer, Architect, New York.

Harry L. Lane, Architect, Chicago.

SIDE ELEVATION

BOOK NOTICES

Notice.—All books noticed in these columns may be obtained from this office at Publisher's prices. All postage or express prepaid. Money and address must accompany all orders.)

THE CHILDREN'S LIBRARY OF WORK AND PLAY: Ten handsome volumes of 425 pages each, sold in sets or by single volume. Published by Doubleday, Page & Co., Garden City, New York.

This set of books consists of Carpentry and Woodwork; Mechanics, Indoor and Out; Working in Metals; Housekeeping; Needle Craft; Home Decoration; Gardening and Farming; Outdoor Sports and Games; Electricity and Its Everyday Uses; Outdoor Work. The set covers almost every department of industrial and domestic art, so far as very young learners can be interested. The books are so written and arranged that any young intelligent mind can grasp the spirit of the contents without difficulty, and the instructions given for the performance of the work presented are so plain and simple that boys and girls of from ten to sixteen years of age find it easy after one or two careful readings to follow every detail given, and make up in goodly manner any one or more of the articles they undertake to construct. Indeed, where there are children, boys or girls, or both, these books should be there also, for, we take it, every normal boy and girl is born with a strong desire to "make things," and "mend things" already made. The boy must have his hammer and his saw, he must cut off boards and drive in nails, he must make kites, boats and wagons and a thousand other things; and the girl must have her doll and must make and sew her doll's clothes, and keep house for it, and it is here where these books come in. Does a boy want to make a garden, build a boat, mend a sewing machine, or repair his sister's typewriter, he refers to his books, finds out what he has to do, and goes and does it. The girl wishes to cut out a dress for her doll, make a cushion, or decorate her bedroom; she looks in her books, finds what she wants and how to go about it, and "Presto," the thing is done. The instructions given are not for making toys alone, but for making and building things, needed in everyday use. Perhaps one of the best volumes in this capital series is "Mechanics," which has in its contents: Making a Cement Sidewalk; Building a Boat-house; Constructing a Foot-bridge; Building and Equipping a Gasoline Launch; Talks About Engines; Propellers, Mechanical Powers; Aeroplanes; Kites; Sundials; Patents; Copyrights; Gravitation, Tides; Phases of the Moon; Plumbing; Painting; Varnishing; Motors; Typewriters; Sewing Machines; Mechanical Movements, and many other things. And all this is written within the range of children whose age is not less than ten years. The ten volumes form a marvelous encyclopedia of good practical matter for youthful minds.

Write Doubleday, Page & Company, or this office, for catalogue or circulars, and if you mention this paper, we think you will meet with prompt attention.

OUR NEW HOUSE. HOW WE PLAN TO BUILD IT.—A Book for Sketch Ideas and Suggestions. With Drawings, By Louis E. Perrett. Half cloth. Illumned cover. Published by The Reilly and Britton Company, Chicago. This is rather a unique book, or rather a sort of repository, or may be a scrap-book, or all. Perhaps the best idea of it can be gleaned from the explanatory note by the author, which we give here in full. "The almost universal ambition of every person to 'some day' build his own home has prompted the publication of this book."

"As indicated in the sub-title, there will be found listed in the table of contents departments for writing or pasting in, Plans, Ideas, Suggestions, Sketches, Photographs or pictures, Clippings from Newspapers, Magazines, or collected from friends and other endless sources, about the arrangement, decoration and finishings of each individual room and nook inside the house, and about the outdoor sleeping-room, the veranda, the garage, the gardens and the other outside accessories."

While this "Note" may convey some little idea of what the book is for and its general usefulness, it falls far short of showing up all the "good in it." It contains some 158 pages, 7x10 inches, most of which may be written on, or may have clippings or sketches of furniture, drapery, fittings, color schemes, utensils, odds and ends, and written notes, memoranda, and anything that may be needed sometime about a happily conducted home. There are departments laid off for every room—pantry, closets, cellar, and every other out-of-the-way place, as well as for the higher class and more dignified rooms, and at the heading of each department, there is an artistically designed picture showing a portion of a drawing room, dining-room, reception room, kitchen, etc. This is just the book which every young couple who contemplate marriage—or married—should possess.

LAMPS AND SHADES IN METAL AND ART GLASS.—By John D. Adams, author of "Arts-crafts Lamps; How to Make Them." The latest Popular Mechanics Series of Industrial Handbooks. 18 complete designs. 128 pages. Cloth. Size, 5x7 in. Printed on good strong paper and well bound. Price 50 cents. Published by "The Popular Mechanics Publishing Company, 318 W. Washington street, Chicago, Ill.

Amateur craftsmen and others will find in this book, complete instructions for making a variety of beautiful electric lamps and shades in metal and art glass at a small outlay of time and money. The subject of lamps is important for four reasons; the necessity of a good and conveniently arranged light; the pleasing decorative effects possible; the variety and number of lamps that may be used to advantage in the home; and the small cost of equipment and necessary materials. Four different kinds of construction are treated: Build-up shades, Soldered shades, Etched shades and Sawn shades. The designs include Drop-lights, Reading Lamps, Dining-room Domes, Mission Chandeliers, Desk Lights and Library Lamps.

The author issued a work on similar lines some time ago, a notice of which was given in these pages at the time, but which dwelt with the subject of lamp making from a less difficult standpoint. The two vols., seem to cover the whole ground of amateur shade and lamp-making.

A TREATISE ON THE DESIGN AND CONSTRUCTION OF MILL BUILDINGS AND OTHER INDUSTRIAL PLANTS—By Henry Grattan Tyrrell, C. E., (Toronto University). Author of Mill Construction, Concrete Bridges and Culverts, History of Bridge Engineering, etc., Illustrated with over 650 sketches, diagrams and photograph reproductions; 490 pages, 6x9 inches, printed on good substantial white paper, and all well bound in greenish-gray, durable English buckram, in good style. Published by the Myron C. Clark Publishing Company, Chicago and New York.

Being interested in the subjects this work discusses, we have gone over the work pretty thoroughly, and feel somewhat surprised at the great amount of material on the subject of mills and similar constructions the author has been able to gather and so present it to his readers as to be easily intelligible and instructive. Among the contents are found chapters on "The Theory of Economic Design," "Static Roof Loads," "Roof Loading," "Steel Framing and Trusses," "Timber Framing," "Details of Construction," "Foundations," "Anchors and Piles," "Thickness of Walls," "Brickwork, Stonework and Concrete," "Floors and Footings of all Kinds," "Roofing of all Sorts and Grades," "Gutters and Downspouts," "Skylights and Ventilation," "Interior Finishings," "Wood and Iron," "Foot Bridges," "Painting Wood and Iron," "Engineering and Drafting Department of Structural Works," "The Drafting Office and Drafting Practice," "Making Drawings and Laying Out Work," "Weight of the Various Materials Used in Construction," "Estimating Cost of Labor, Materials, Supervision, and Contingencies," etc.

Each of these items, and over 400 others, are presented at length in the work, and had we space at our command we would quote some of the remarks made in reference to estimating quantities, drafting and some other matters so that our readers would have some idea of the terse style of the author's work and the useful quality of the subjects rendered. The book may be obtained from the publisher, or from this office.

We have just received a copy of the Proceedings of the Forty-fourth Annual Convention American Institute of Architects, 1910, also a copy of the Annuary of the American Institute of Architects for 1911.

Both of these pamphlets should be in the hands of every architect and prospective architect in the country. Both contain much useful information.

THE CEMENT GUN.

Placing cement mortar and concrete by gravity through tubes has been successfully done for some years. Just now great interest is being taken in the "Cement Gun" which the U. S. Government is using at Panama, Hawaii and elsewhere. From recent reports the machine has been effected so that the operation costs less than the older methods of construction, and good results are claimed. In operation the "Gun" works somewhat on the principle of the atomizer, except that a dry sand and cement mixture is blown through a hose and just before leaving the nozzle it meets a stream of water under high pressure. The mixture can be put on as thick as desired, but the practice thus far has been limited to coating walls and wire lath, in the form of stucco about one and a quarter inches thick.

Tests are now being made to determine the preservative qualities of mortar applied in this manner. Iron plates have been covered with various thicknesses and will be immersed in sea water and the action observed.

OAK, WALNUT AND CHERRY LUMBER.

[From Vice Consul George B. Stephenson, Liverpool, England.]

For white oak and black walnut a fair demand generally exists in Liverpool, but cherry lumber has not been imported to any extent for many years. White oak is received largely in the form of planks 3 by 12 inches, 3½ by 12 inches, 5 by 12 inches, 5½ by 12 inches, 6 by 12 inches, and 7 by 12 inches, in lengths of 12 feet and up—as many as possible 17 feet and up. These sizes are used for railway and general wagon-building purposes, and the value at present for first-class stock rules from 52 to 56 cents per cubic foot, ex quay Liverpool. White oak is also shipped largely in 1-inch boards, 4 inches and up wide to average 9 inches or up, in length of 10 feet and up. These sizes at present in plain oak are worth about 48 to 52 cents per cubic foot, ex quay. Quartered oak is, of course, of more value and is salable at 60 cents to $1.33 per cubic foot, according to specification, quality, figure, etc.

Black walnut reaches this market both in the form of logs and lumber, and to meet the demand the logs should run 10 feet and up and be of fair average length and 18 inches in diameter, with as large an average as possible. Values are from 73 cents to $1.46 per cubic foot, string measure, ex quay, according to quality, size, etc. Walnut lumber is shipped in various grades from 1-inch boards up to 3-inch planks, and here again there is a variety of qualities, running from about 54 cents to $1.58 per cubic foot, ex quay.

The bulk of this business, both in oak and black walnut, is done on consignment, when the goods are inspected on the quay in Liverpool and sold on their merits. It is stated that about 90 per cent of the white oak and black walnut imported is consigned to brokers for sale. The customary brokerage commission is 4 per cent.

RECENT COURT DECISIONS

Under Rev. St. 1889, § 4247 (Ann. St. 1906, p. 2330), requiring the court in an action to enforce a lien to render judgment for the amount of the debt, though the creditor may have unintentionally failed to enter the full amount of credits in his account filed, an inadvertent overcharge by a lien claimant, or the omission by mistake of credits does not defeat his right to enforce his lien.—Shepard v. Atchison, T. & S. F. Ry. Co., 129 S. W. (Mo.) 1003.

One employed as an architect in the construction of a building is not a general agent of the employer; but his powers as agent are limited by the contract, and, unless specifically authorized thereby, he may not modify the contract between his employer and the contractor, nor employ another to do the work which the contractor has undertaken, or substitute a subcontractor for the contractor.—McNulty v. Keyser Office Bldg. Co., 76 A. (Md.) 1113.

Where a written contract between the owners of the property to be improved and the principal contractor provides that certain claims shall be presented in writing to the architects by the contractor within a specified time, or they will not be allowed, that no alterations from the plans and specifications shall be made except upon the written order of the architects fixing the amount due thereon, that no extras shall be furnished except upon similar orders, these and like provisions, if ignored by the parties to the contract and the architects, will be ignored by the courts.—Campbell v. Kimball, 127 N. W. (Neb.) 142.

Under a building contract entitling the owner to retain from payments an amount sufficient to indemnify himself against lienable claims, and providing for payments on architects' certificates, when they were due, the sureties on the contractor's bonds were discharged from liability for mechanics' liens, amounting to less than the final payment, by the owner waiving the right to retain sufficient money to discharge the claims, and by his making final payment on orders of the architects without certificates that payment was due; the sureties being entitled to be subrogated to the owner's rights on paying the lienable claims.—Harris v. Taylor, 129 S. W. (Mo.) 995.

Where a contractor for the construction of improvements upon real estate distributes portions of his contract to subcontractors, no contractual relation arises thereby between the owner and the subcontractors, the liens upon the property in favor of the subcontractors being given by law, and the completion of the work undertaken by the subcontractors creates a debt due from the contractor to them. Upon the failure to pay said debts the contractor becomes liable to the subcontractors for the full amount which the subcontractors are entitled to receive. If the subcontractors find it necessary to file mechanics' liens, the contractor is also liable for the fees paid therefor. For these items the owner is not ordinarily liable.—Campbell v. Kimball, 127 N. W. (Neb.) 142.

PATENTS.

The following list of recent patents and trademarks relating to building interests is especially reported for THE NATIONAL BUILDER by Wm. G. Henderson, solicitor of American and foreign patents and trademarks, Norris building, 501 F street, Washington, D. C. A copy of any of the United States patents will be furnished by him for 25 cents.

1,000,707. Hinge device for doors and the like. Fred G. Borg, Chicago.

1,000,691. Transom support and fastener. Wm. Roper, Philadelphia, Pa.

1,000,699. Floor-cleaning machine. M. Seyferth, Crimmitschau, Germany.

83,055. Cellar-door hinges. Jos. De Rose, Paterson, N. J.

1,001,372. Door-closing apparatus. Wm. Duggan, Jr., Dunedin, N. Z.

1,001,146. Device for supporting and securing plaster-boards used in partition construction. M. H. Jester, Denver, Colo.

1,001,315. Metallic door. Chas. M. Sinclair, Chicago.

1,002,027 Pneumatic door-operating mechanism. Thos. R. Brown, assor. by mesne assignments, National Pneumatic Co., New York, N. Y.

1,002,146. Fire-escape. M. F. Gore, Baltimore, Md.

1,001,865. Fire-escape. Wm. I. Lake, Detroit, Mich.

1,002,166. Fireproof window construction. Ed. H. Lunken, assor, The Lukenheimer Co., Cincinnati, O.

1,002,565. Reinforcing bar for concrete and similar structures. Wm. C. Coryell, Youngstown, O.

1,002,328. Door check. Jno. L. Spoon, Globe, Ariz.

1,003,274. Door-hanger. Geo. H. Knight, St. Johnsbury, Vt.

1,002,999. Fire-escape. Chas. V. Lindholm, Chicago.

1,003,070. Sheet-metal door. Nils P. Sjobring, Chicago.

1,002,940. Casement-window adjuster. I. D. Stine, Decatur, Ill.

1,002,940. Casement-window adjuster. I. D. Stine, Decatur, Ill.

1,003,591. Device for molding concrete walls. Wm. A. Fry, W. C. Darby and T. H. Kershaw, Pueblo, Colo.

1,003,754. Plaster support for wall covering. Fred L. Kane, Huntington, N. Y.

1,003,613. Window fastener. C. A. Kind, Dubuque, Ia.

1,003,652. Door check and closer. J. C. Regan, assor, Yale & Town Mfg. Co., Stamford, Conn.

1,003,552. Lock. H. G. Voight, assor. Russel & Erwin Mfg. Co., New Britain, Conn.

1,003,977. Fireproof window construction. J. G. Braun, Chicago.

1,004,299. Sliding-door construction. V. F. Outland, Indianapolis, Ind.

PEARSON SHINGLE NAILING CONTEST.

Everyone knows that some men can get exceptionally fine results with a machine or tool while others will find the same thing almost useless. This occasionally happens, not on account of one workman being a better mechanic than another, but because one reads the directions the manufacturer gives with the machine or tool more carefully and then endeavors to fit these directions with actual working conditions.

Take the Pearson Nailer for instance. Here is a tool or machine which holds the shingle nails in a metal box in such a manner that the nails slide down with the heads always at the top and the sharp ends at the bottom and one nail at a time is placed directly beneath a plunger. The carpenter or operator strikes one blow on the plunger with his hammer. The nail below is driven half way into the shingle. Another blow with the hammer on the nail and it is clear down.

The Pearson Nailer is a small, well-made machine which can be easily handled on any job. The old way of climbing about on a roof with a face full of shingle nails taken from an open keg in the average store is not a very sanitary way of carrying nails. The Pearson Nailer does entirely away with this old, unhealthy method and besides gives the operator the comfort of wearing heavy mittens or gloves during the cold fall days and still being able to drive the nails at a very rapid rate.

The Pearson Manufacturing Company, the makers of the Pearson Nailer, frankly admit that a certain percentage of their nailers are returned because the buyer does not think he can use it satisfactorily. And the buyer's money is returned at once and without question. This liberal policy of selling, not only clearly shows that the Pearson Manufacturing Company deals squarely with everyone but it also shows that the nailer must be right in both material and workmanship.

The fact that thousands of these nailers are now in daily use by the best shingle experts, shows that it is well worth while to

get one and try it or at least look the nailer over at the nearest hardware store. This latter suggestion might be difficult to follow in some of the smaller towns, although many dealers are now carrying the Pearson Nailer in stock. The Warner Hardware Company, 13 Sixth street, South, Minneapolis, Minn., think so well of this nailer that they made up a window display for them recently. A portion of their big, fine store front was fixed up as shown in the acompanying illustration. One of the best carpenters in the city was secured to show how fast shingle nails could be driven into place with the nailer. Everything was clearly explained to the large crowds that collected about the window by means of a lot of neatly lettered cards.

This exhibit attracted a great deal of attention and added to the Warner Hardware Company's reputation of always having the most interesting and best window display in the Northwest. In fact, Mayor James C. Haynes tested a machine out with evidently the idea, as some one suggested, of buying one to nail campaign lies with.

The nailing contest arranged by the manufacturers was held at the Unique Theater while these window displays were going on. A prize was put up for the man who could drive the most nails in the shortest time. Seven men drove shingle nails before a large

EXHIBIT OF PEARSON MAILERS.

audience, which thought it great fun and very interesting. The best record with just an ordinary hammer was by C. K. Miner. Mr. Miner drove 52 nails in one minute. Fred Holmes, a Robbinsdale carpenter, using a Pearson Nailer, drove nails at the rate of 125 per minute. This nail driving contest and the window displays proved conclusively that people are interested in up-to-date tools and machines. The Pearson Manufacturing Company of Robbinsdale, Minn., are sending out circulars in regard to their nailers and newspaper clippings about the nailing contest. They are well worth looking over.

THE EUREKA SCREWDRIVER.

Mechanical perfection in the manufacture of tools is one of the features of the period. While many tools are more or less special in their use, the screw driver is of general use, and is only imitated by the hammer, which is sometimes called a "Philadelphia screw driver."

Improvements in the special action of the screw are few and far between, as practically the same principle has been in use for centuries. In the manner of driving the screws, however, there have been various improvements, not the least of which is the "spiral" principle,

as used by the Decatur Coffin Company, Decatur, Ill. In this screwdriver the turning action is obtained by merely pushing on the handle, when the shank revolves and turns the screw home. By a simple device the action can be reversed, and the screws drawn with equal ease.

One who has never used a screwdriver of this character might consider the old-fashioned form plenty good enough, but a short practice will allow a mechanic to do several times as much work with less labor than with a plain screwdriver.

The Eureka Special Screwdriver can be obtained from nearly all dealers or the manufacturers, the Decatur Coffin Company, East North street, Decatur, Ill., will be glad to tell you where they are kept in your vicinity.

When your work is a pleasure it is a success. Pleasure comes from Perfect Satisfaction. Why not be a success in your profession and be happy by using Simonds Hand Saws? They prove the Best by Test.

A stranger seeing a carpenter at work on a building noticed that he was using a No. 7½, 26-inch Simonds Hand Saw.

"I see you are using a Simonds Saw," said the stranger.

"Yes."

"How do you like it?"

"Well, I'll tell you. I have been carpentering twenty years and bought that saw four years ago and haven't set it since I had it. It is ground thin on the back and don't need setting, which saves half the labor in sharpening it; and it beats anything I ever saw to hold an edge."

HEATING CHURCH BUILDINGS.

Few church-building committees consider carefully the amount of fuel required to properly warm the rooms. Operating expenses, fuel, etc., are a continual expense, while the exterior is paid for but once. The architect is too often inclined to be concerned with the external appearance and interior decorations, rather than the heating, ventilating and plumbing.

It is therefore up to the committee to see that proper provision is made for heating, and also to see that a large part of the heat is not wasted through improper insulation of walls, ceilings, floors, etc. That such insulation can be done is evidenced by the work on the cold storage warehouses, freight cars, refrigerators and the like. In such structures the cold is kept in, and the heat is kept out, but the principle is the same with churches and other buildings. It is a well known fact that buildings warm in summer are cold in winter, mainly from the lack of proper insulation.

Until recently little attention has been paid to the amount of heat that leaked through the walls, as it was generally considered that the amount was too small to take into account and that the expense of conserving this heat was too great for the results obtained. The heat lost through exposure to glass surfaces (four times as much as through

Clark & Bell, Architects.

a sixteen-inch wall) can be reduced materially by close-fitting sash, double windows, etc., but little attention is paid to the walls, which, on account of their great area, possibly six or eight times the expense of glass really leaks twice the amount that the glass does.

Regarding the manner of insulating the walls, probably the best method is to line the wall with some especially prepared insulation. There are a number of concerns manufacturing preparations, all more or less suited to various conditions. In general, the preparations may be divided into two classes, boards or stiff form and quilt or felt form. The use of either depends somewhat on the construction of the building. When there is a wood surface to nail to the quilt or felt, this makes an ideal insulator, as it is light, pliable and easily applied. For brick or stone walls, the board is more easily applied, and can also be used as the base for decorating if desired.

The saving of fuel by the use of insulation of this character is estimated at from 25 to 40 per cent; with double windows the saving is nearer 50 per cent. The extra cost of the insulation is actually saved in from two to four years, after which there is a clean profit in its use.

The saving in summer is more of a negative character. As no fuel is used, there is of course no money saving, but by keeping the temperature down by keeping the heat out, the comfort of the congregation is greatly increased. Much of the discomfort of summer church attendance will disappear before proper insulation.

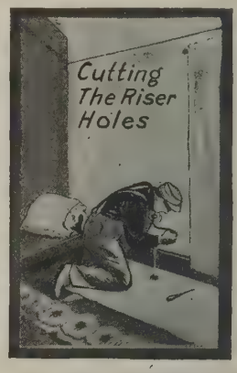
Among the prominent concerns which have given the subject of insulation careful study is the Union Fibre Co., 30 Union avenue, Winona, Minn. This concern employs a staff of skilled engineers to make a study of the conditions surrounding each case before they advise the form of insulation required for the best results. Their product LINOFELT has been used in many places to such advantage that they encourage the use of it wherever the beneficial results are desired.

Church committees and others should be sure to ask concerning LINOFELT, as its use will save both fuel in winter and discomfort in summer.

A BIG HEATING CONTRACT.

We understand that the Buffalo Forge Company, Buffalo, New York, have been awarded the contract for the heating and ventilating system in the new carpenter shop of the Westinghouse Air Brake Company, Wilmerding, Pa. The building, which is of brick, is 210 feet long, and equipped with high grade wood-working machinery, which with the kiln dried material, requires an even temperature and freedom from moisture.

The problem of heating and ventilating industrial buildings of this character is quite different from that of public buildings or residences. In the latter sanitation is the principal requisite, and economy is secondary, while in the factory or shop, economy is of primary importance and sanitation more or less incidental. The efficiency and contentment of the workman depends largely on his comfort and well-being and for this reason the question of an adequate system of heating and ventilating the workroom must be carefully considered.

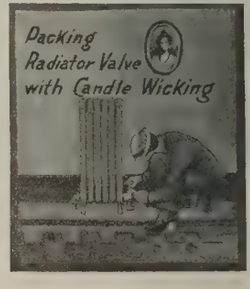


Knowing the care with which the Buffalo Forge Company build their apparatus, and the study they have given the question of industrial heating and ventilation, we feel sure that neither the owners of the plant in question or the workmen employed in this building will find fault with the system to be installed.

MODERN CONVENIENCES.

It is an undisputed fact that American homes are the most comfortable of any in the world. Nor do the wealthy alone possess all the comforts, but in even the most humble do we find conditions materially better than in other countries. Some of this is brought about by the wonderful resources of the country, together with the general good wages and the fact that it costs but little more to build well. Then, too, there is economy in good building. It takes less fuel to keep a well-built house warm, and it takes less fuel to warm a building with a good hot water or steam plant than with the old-fashioned stoves. In the modern, we might almost say the American, method of heating by hot water we have the greatest comfort for the least cost.

There are many manufacturers of heating equipment on the



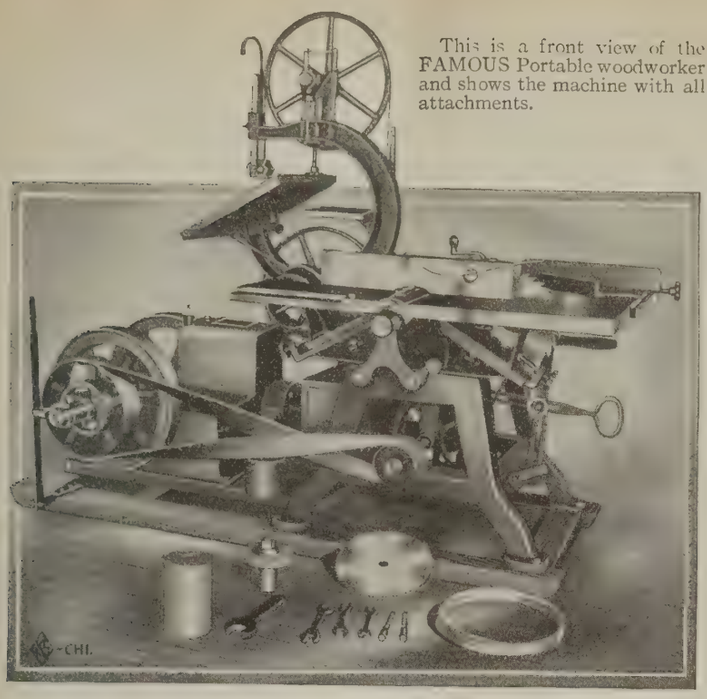
market and one in the trade can order from several manufacturers the material for a complete plant. For instance, the boiler-maker does not always make radiators, piping, etc. To the average contractor this way is costly and inconvenient, and to overcome this difficulty the Andrews Heating Company have devised a plan for furnishing everything complete from boiler to expansion tank.

As there is considerable variation in house plans, local conditions, etc., it is necessary to supply the Andrews Heating Co. with certain data before an intelligent estimate can be given. As soon as this is received, a plan is prepared showing the size and location of boiler, radiators, etc., with an estimate covering all the material necessary to install the plant complete. These plans and estimates are prepared by competent engineers, and the Andrews Heating Co. have so much confidence in their plan that they ship on 365 days' free trial. As this carries the plant through the entire cycle of seasons, there is little chance but that any trouble will be found and remedied long before the guarantee expires.

Mr. Andrews' wide experience as a mechanical engineer has perfected a system for getting out the material in such a way that all the pipe are sent cut to proper lengths, etc., so very little work is required to put one of their plants in place. It has been found that

carpenters can readily install these plants, as very complete plans, diagrams and instructions are sent with the plant.

The Andrews Systems are popular because of their group system of piping, the Andrews Regurgitating Safety Valve, the economy and efficiency of the boiler, and the fact that each system is designed by itself to give the best results.



The Andrews Heating Co. are also manufacturers of Septic Sewage Disposal Systems, which is the ideal system for country houses. They also design lighting plants for residences, and so provide the most remote houses with all the comforts and conveniences of the city.

Carpenters and builders generally are invited to send to the Andrews Heating Co., 1199 Heating Building, for further information. We understand that our readers can, by writing at once, obtain their 72-page book, which describes these several lines of modern house equipment, any one or all of which can be installed in new or old homes.

THE TRADE IN GRINDERS.

Mr. C. J. Luther, president of the Luther Grinder Manufacturing Co., of Milwaukee, has just returned from a trip throughout the west. "The hardware business," he says, "is rather low on the coast. Both dealers and jobbers are carrying light stocks. Throughout the middle west, however, conditions are fine. The drought has affected crops in limited portions, but outside of these the hardware business is in as fine shape as could be asked for.

"The coast has always been a fine field for grinders. This year is better than ever, for our advertising has been doing wonders in educating the public to the great amount of time wasted on the grindstone. The demand for Luther machines was never better. The demand is constantly increasing and we are making preparations for a record business this coming season."

This is a front view of the FAMOUS Portable woodworker and shows the machine with all attachments.

A Remarkable New Portable Woodworker

—called the "FAMOUS"

Imagine *one piece of machinery* that does all kinds of ripping and cutting off, dadoing, surfacing and edging, circular band saw work, boring, grinding and sanding—

—*a complete machine shop*, in fact!

Then imagine such a machine *equipped with its own power plant*—a compact and sturdy three horse-power gasoline engine, complete with batteries and all belts necessary to operate the machine!

On top of this imagine this machine constructed so that it *can be moved from place to place*—wherever your work is—with practically no trouble and little cost!

Imagine all these and you will understand the advantages offered in the *embodiment* of the above features—**the FAMOUS Portable Universal Woodworker.**

800 Famous Universal Woodworkers in Use

We have been perfecting this machine for the past two years—studying contractors' needs and shaping our plans accordingly. Today we offer a portable woodworker that we *know* is the *only one worth while.*

This new machine is backed by the experience and reputation of The Sidney Tool Co. who have built and sold *over eight hundred* Universal Woodworkers. That's why there's *nothing experimental* about it.

A Number of Machines in One

The FAMOUS Portable Woodworker consists of:

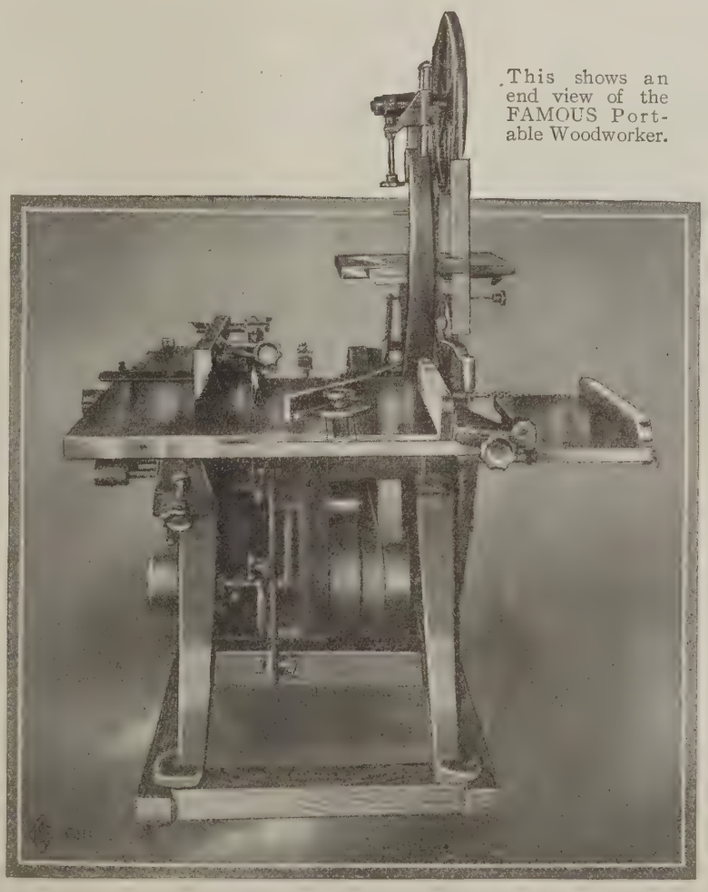
- 8″ Jointer
- 20″ Band Saw
- Saw Table (carrying a 14″ Saw Blade) with raising and lowering arbor
- Mitering attachment
- Cut-off and Ripping Gauge
- Emery Grinder
- Disc Sander

With the outfit is included: 12″ Rip Saw, 12″ Cut-off Saw, ⅜″ and ¾″ Band Saw Blades, ⅜″, ½″ and ¾″ Boring Bits, set of Planer Knives, Sand Drum, Emery Stub (equipped with 6″ emery wheel.)

Every Contractor Can Afford One

It's *not* a question of expense but of *investment.* Don't think you cannot afford it—you cannot afford to do without it! Think of the convenience—think of the time, trouble and dollars you can save!

Illustration shows the woodworker mounted on skids which permit it to be pulled around easily. The machine can also be placed on a specially manufactured wheeled truck, which we furnish at a small additional cost.



Don't Forget to Write for Particulars

The price is so low that it is a good investment for *every* contractor. Write today and get full particulars. Remember, we are making a conservative statement when we say the FAMOUS is so far superior to other types of portable woodworkers as to be *beyond comparison.*

Send us a letter or postcard *today* for full details—get educated to the real advantages we offer.

DAVID WHITE COMPANY, 421 E. Water St., Milwaukee, Wis.
Write for Catalogue and complete price list.

THE JACKSON ALUMINUM LINE LEVEL

Is designed particularly to meet the requirements of all Mechanics in building construction, especially Bricklayers, Masons, Carpenters, Millwrights, Architects, and Cement Workers.

By using the Aluminum Line Level you can take Levels in one-half the time required by the old method of the Straight Edge.

This is possible because the Aluminum Line Level weighs only one-fourth ounce and is easily and quickly attached to a line. Levels thus taken are guaranteed to be accurate on a stretched line from one to forty feet. Besides, from its construction, it can be used as a Pocket Level.

This cut shows the Aluminum Line Level, including Attachment and 40-ft. line. Complete in Leatherette Case.

PRICE $1.00, POSTAGE PREPAID

It is especially adapted for laying out foundations for buildings. It will do the work no other level will do. For sale at hardware dealers, or

CONCRETE MACHINERY.

Every new industry develops a wealth of original ideas, all calculated for the betterment of the industry. In many cases, however, progress has been so rapid that the machinery in use one year becomes practically obsolete the next and it requires far-sighted and cool-headed men to so arrange their affairs that none will pass them in the advance.

When the manufacture of Portland Cement became a certainty in this country, there was immediate response from the building industry. Systems of re-enforcement were designed, some of which are still in use, and many others which have been forgotten. Methods of building also passed through a transitory stage. We have had concrete mixed so dry it required considerable tamping to flush the

8"X 8" X 24" ROCK FACE IN 8"& 16"SECTIONS

surface, and so wet it would flow by itself. Through all this, however, there have survived methods good beyond question and machines whose work is superior to hand work.

One of the first uses for concrete was in the form of blocks, to take the place of brick and stone. It is unfortunate that for a long time these blocks, although equally as good and often better than the materials it imitated, could not at the outset have been given a character of their own. They are fast being recognized as the logical material to use in many places, not only where other materials are unavailable but on account of their own intrinsic values.

Provided the materials, cement, sand, stone, etc., are first class, there are two operations calling for considerable skill and accuracy. The first of these is in the mixing, and the second is in the forming of the block. The mixing must be thorough and quick. It may be said that Portland Cement deteriorates from the moment it is wet until it is in its final position. Therefore, the more rapid and complete the mixing and making the block, the better the product.

Many manufacturers of mixers are justly proud of the work of their machines, and it speaks well for them that they continue making the same models, with only slight changes from year to year. Among the manufacturers of this class of machines, the Ashland Steel Range & Manufacturing Company are well known. Their mixers, known as the U. S. Standard, are made in several styles and sizes to

meet the different classes of work. These machines are designed to measure accurately and automatically the quantities of cement, sand and aggregate, without loss of time in the mixing. This insures the right composition and speed.

Casting the blocks is such a simple operation that almost any old form can be used. For good results, however, only the best machines should be considered. By the use of first-class machines a variety of work can be done impossible on the plainer machines. Then, too, speed—the essense of good results—is more easily obtained with the high-grade machines. It is not permissible in this short space to go deeply into all the reasons why it pays to get the best, but we are sure a careful study of the U. S. Standard block machines, as made by the Ashland Steel Range & Manufacturing Company, will convince the intelligent mechanic of the soundness of their principles.

The increasing use of concrete and of block machines should lead every builder to ask the Ashland Steel Range & Manufacturing Company, Ashland, Ohio, for their Catalogue D, which contains much valuable information about cement and concrete, as well as descriptions of their line of machinery.

REMOVAL NOTICE.

The Corrugated Bar Company have announced the removal of their headquarters from St. Louis, Mo., to Buffalo, N. Y., to occur on the 14th of this month. They will occupy the third and fourth floors of the Mutual Life Building in Buffalo.

The change in headquarters has been decided upon as their stock warehouse and fabricating plants are located near Buffalo. The move will enable them to give their customers better and more prompt service in the handling of orders.

District offices will be maintained in the National Bank of Commerce Building at St. Louis, as well as in New York and Chicago.

DULL-KOTE PAINT.

Progress in the building line has been developed first for construction, the buildings being erected for protection and comfort, and to accommodate numbers rather than to provide luxurious surroundings for a few. The development of the artistic qualities came later, when society had advanced to a place where means and time were at the disposal of the builders. Surface treatment was only possible when construction had advanced until appropriate surfaces were available, where the expense was warranted by the improved appearance, and the desire to express the artistic feeling was prevalent.

At the present time we have construction in the highest development that the world has ever seen. The construction of a modern office building or metropolitan hotel presents problems vastly more intricate than the building of the pyramids. It is not along the cost, the amount of labor, the weight of the materials, but the proper

blending of all the arts and trades to a complete whole, embodying all the necessities and conveniences to which we have become accustomed in these modern times.

While the construction has advanced, can we say as much for the good taste and artistic feeling of the people? Are we, as a whole or individually, superior to the ancient Greeks, Egyptians or Romans in the appreciation of the beautiful and artistic, or are we degenerating more to the taste of the savage? Is it not a fact that our art galleries and museums are deserted for the moving picture shows, our best art stores empty while the ten-cent bric-a-brac stores are crowded with people buying "plunder?" Are the articles selected of good taste, color and finish, or do we find an uncouth "Billiken" supplanting the Venus de Milo?

From the earliest times, colors have been used in decorations. In the ancient building traces of colors still remain, although the entire color scheme is more or less conjecture. The decoration with color has always been present, but the changing conditions, political and constructive, have largely destroyed the best examples, and we are able to find only fragments by which we can gauge the whole.

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

Regarding the surfaces, in all our researches we find a uniformity of flat or matte finish. Ancient bronzes and statuary, although smooth, show not the slightest trace of the "polish" or "shine" with which many modern works are finished, and they would lose much of their charm and value as works of art if they did. Modern decorations and art are the same. Early photographs were made with a high polish on account of the nature of the materials, but one seldom sees photographs now except in the dull "carbon," "velvet" or "platinum" finish. Every element in nature tends to dull the best artificial polish we are able to put on an article, and thus restores to it the artistic feeling, depth and harmony of one which art demands.

Painting and decorating of modern buildings have, like all other arts and trades, had its period of transition, in which high artistic feeling was striving to overcome what might appear to be natural advantages of certain conditions. The use of linseed oil and varnish in paints produced an excellent surface from a sanitary point of view, but the shiny glazed surface destroyed the artistic effect of the colors, was an offense to the artistic eye and a real injury to the health as well. For this reason, calsomine and so-called water-paints were of value, but their other qualities, flaking, rubbing off, difficulty of patching, etc., made them undesirable for permanent work in the better class of buildings. It has remained for the R. F. Johnston Paint Co. to produce a pigment at once possessing the permanency of oil paints with the dull surface of water-paints or calsomine.

DULL-KOTE PAINT, as made by the R. F. Johnston Co., dries with a flat, velvety finish, which can be washed like the best oil or varnish. The colors in which it is made provide an almost endless variety of shades. The surface lends itself to all the decorative processes of fresco, stencil, borders, etc., the nature of the pigment being such that the surfaces naturally blend together harmoniously when various color schemes are used.

Modern construction has evolved a number of items of construction requiring special finishes. Wall-board is supplanting plaster in many places, and possesses many points of advantage for many places. For the proper finish of wall-board Dull-Kote paints are especially valuable, the naturally matte surface of the board making a pleasing finish.

Possibly the best test of the value of a pigment of this character is a statement of some of the places where it has been used. No buildings are more exacting in their requirements than the modern hotel. In the famous Hotel Patten at Chattanooga and the San Antonio at San Antonio, Texas, the interior walls are painted with Washable Dull-Kote paint. Among the modern buildings, schools, theaters, banks, public and private buildings, so many are well known that only a manufacturer's list can properly contain them all. There are few cities in which the manufacturers cannot find samples of their product to which the interested can be referred, and we feel sure that they will ge pleased to hear from any one contemplating the finish of an artistic interior. The R. F. Johnston Paint Co., Pearl and Main streets, Cincinnati, Ohio, are the manufacturers of this point and have a particularly unique method of satisfying the inquisitive by practical tests which cost the inquirer nothing. So sure are they of its approval that they stand back of it to the fullest extent. Their literature, telling all about Washable Dull-Kote Paint is, of course, sent free to readers of the NATIONAL BUILDER.

A HANDY NEW TOOL.

Aggressive contractors and mechanics are always on the lookout for labor-saving tools, realizing that a small amount spent in new tools and equipment may be the means of saving both time and money.

One of the chief requisites of first-class work is that it should be plumb, level or straight, as the case may be. Nothing so detracts from the appearance of otherwise good work as to have one or two lines or surfaces just a trifle out. The cause of the error is

Old Way New Way

immediately apparent to the skilled workman, while the average observer knows something is wrong, but cannot always just place the blame.

Various means are used to secure accurate work. The engineer may use an instrument costing several hundred dollars, which is necessary to secure accurate engineering results. The builder will use a cheap instrument to obtain the results necessary in his work. The mechanic, the carpenter, mason, plasterer, etc., all must put up their work accurately and these have, as a rule, depended on the

Asbestos "Century" Shingle Roof — Residence Frank C. Child Lexington, Mass.

Asbestos "Century" Shingles

"The Roof that Outlives the Building"

If you want to give your client the fullest possible use of the top floor of his house, you must roof it with Asbestos "Century" Shingles.

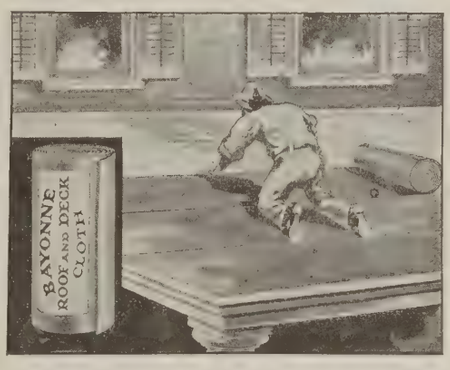
It's the only way to avoid the extremes of heat and cold that bother him with the ordinary roofs.

Asbestos "Century" Shingles are very efficient heat insulators. They are made of reinforced concrete which is celebrated as a non-conductor of heat and cold.

From every consideration, it's worth your while to look into Asbestos "Century" Shingles before recommending a roof, rebuilding or altering.

They are indestrucible by weather. They are the best preventive of fire you could give a building. They last forever without painting or repairs.

And they cost no more than you expect to pay for a first-class roof.



You can get Asbestos "Century" Shingles in shapes to suit any architectural style—in several sizes—and in three colors: Newport Gray (silver gray), Slate (blue black) and Indian Red.

Send for quotations and booklet, "K. & M, 1911." It will settle your roof problems to your great satisfaction.

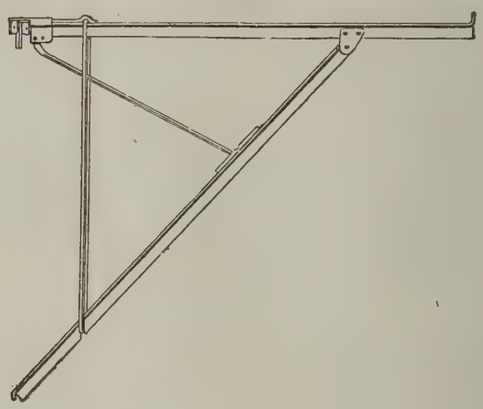
KIMBALL BROS. CO., Council Bluffs, Iowa

old-fashioned level, which gives accurate results when properly used, but in many places is more or less awkward. Whenever it is necessary to use a straight-edge, the use of a separate level with it practically means another man to handle it, or possibly we see a man holding up the straight-edge with one foot while both hands are busy holding the level and straight-edge together at the top.

The Weaver Adjustable Plumb and Level is designed to overcome the objections to the separate level and straight-edge. It consists of a place to which one level is rigidly attached, and a level on an adjustable arm which may be set at any given angle. With this arrangement there is no chance for the level to fall and break and one man easily does the entire work. The adjustable arm is especially useful for grading, splays, battering walls, etc.



Every mechanic has use for an adjustable level at times. The farmer may have to lay out a concrete floor with a pitch to it or dig a ditch across his farm. This instrument aids him materially in setting out the proper grades.

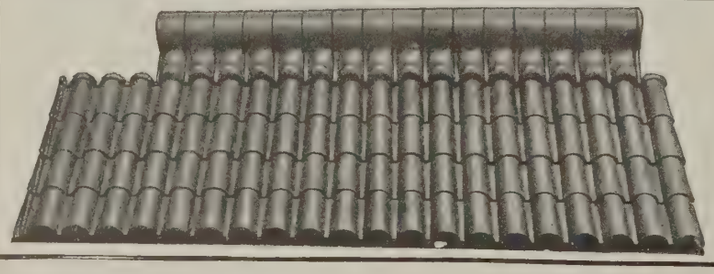
This level is made by J D. Weaver, 718 Hurd street, Jacksonville, Ill., who is anxious to see one or more of his levels on every job. His circulars are interesting and should be in the hands of every NATIONAL BUILDER reader.

SAFETY STEEL SCAFFOLD BRACKETS.

In many parts of a building under construction we find labor and material of a temporary character, which serves to facilitate the erection of the building, but has no place in the completed structure. In these places we find lumber forms for concrete, runways, fences, protection of stone work, watchmen, lights, etc.

One of the most important, however, in the frame building is the scaffolding for the exterior work. This scaffolding is in use for only a comparatively short time, and the tendency of the builder it to make it as temporary as possible to save labor, material and time. The result has been a considerable loss of life through breaking

scaffolding, as well as frequent serious injury. No contractor intentionally builds a weak scaffold, or orders his men to go on one, but the tendency is toward insufficient supports, bracing, etc.



Among the devices calculated to assist the builder along these lines, we find the Wheeler Safety Scaffold Bracket. These brackets are so easily attached to the frame of the wall and so handy to move and work from, that a considerable saving is made, sometimes amounting to 20 or 25 dollars per job. The safety which a workman feels when working on a scaffold of this character adds greatly to the quantity and quality of his work.

These brackets are made by the American Steel Scaffold Company, 61 McGraw Building, Detroit, Michigan, who have a special offer to NATIONAL BUILDER readers. It will pay any builder to communicate with them when considering the subject of safe and economical scaffolding.

LARGE ORDERS FOR SCALES AND TRUCKS.

The Standard Scale & Supply Co., of Pittsburg, Pa., recently made shipment of ten carloads of scales and trucks for use at the new plant of Sulzberger & Sons Co., at Oklahoma City, Okla. This order, as well as the one for 35 scales, mostly 120 ton Railroad Track Scales, for the Bureau of Water, Gas and Electricity, of Brooklyn, New York, also recently shipped, are the largest orders for this class of goods that have been placed in recent years, and the selection of "The Standard" scales and trucks on these large orders demonstrates the merits of the goods manufactured by this company.

In the equipment for Sulzberger & Sons Co. were included a large number of special new pattern Portable Suspension Scales with steel plate platforms, which have recently been put on the market by the Standard Company. This scale eliminates the necessity of cutting the floor where the scale is placed and it is only necessary to use an incline of two inches at each end to run on the platform. This type of scale is particularly desirable for users where the

floors are damp and wet, as there is no opening to allow the water to run through to the floor below. Because of this advantage this scale is being adopted by various packing houses and other users throughout the country.

A SHEET METAL EXHIBIT.

Milwaukee has considerable right to be called an Exhibition City and the recent Manufacturers' Industrial Exhibit was a good example of the harmony among the manufacturers of that busy city. This great Exposition was carefully planned and carried out under the direction of the Merchants and Manufacturers Association and proved to be extremely interesting and educational in portraying the great volume and variety of Milwaukee products.

Among the most interesting of the exhibits from a builder's standpoint was that of the Milwaukee Corrugating Company, a view of which we are able to show herewith. The booth was handsomely

decorated inside with Invisible Joint Metal Ceilings and Side Walls, the exterior being covered with rock face siding, the entrance being flanked with galvanizing steel pillars. The conical roof was covered with Titelock Shingles, made of Cold Rolled Copper, Galvanized Iron and painted tin. The peak was surmounted by a Nu-air ventilator, from which a number of ribbons were blown by an electric fan inside the ventilator.

It was surprising to see how many people had never before seen metal shingles and siding, and the exhibit was a complete success, judging from the educational results.

UNION STEEL COLUMNS.

However must we decorate the interior of our houses, a certain amount must be expended on the exterior to give it a pleasing appearance. As the entire development of architecture is an amplifica-

tion of the column, it is natural to use some form of the column for the exterior as well as the interior decoration.

In the ancient, as well as the modern, monumental building, stone has been almost universally used for the columns, whether

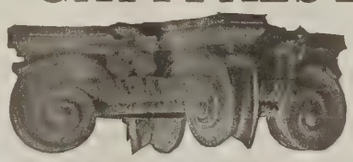
Two Vols., Half Leather Binding	3.00	Single Vols., Part II, Cloth	1.00
Single Vols., Part I, Cloth	1.00	Single Vols., Part II, Half Leather	1.50



NEW and up-to-date. Do not mistake this edition for the one published over twenty years ago. This is the latest practical work on the Steel Square and its uses published. It is thorough, accurate, clear and easily understood. Confounding terms and phrases have been religiously avoided where possible, and everything in the book has been made so plain that a boy twelve years of age, possessing ordinary intelligence, can understand it from beginning to end. It is an exhaustive work, including some very ingenious devices for laying out bevels for rafters, braces and other inclined work, also chapters on the Square as a calculating machine, showing how to measure Solids, Surfaces and Distances—very useful to builders and estimators.

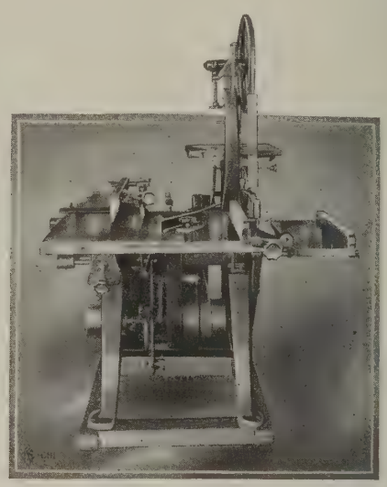
NORTHWESTERN GRILLE WORKS
Office and Showroom, 1824 Milwaukee Ave., CHICAGO

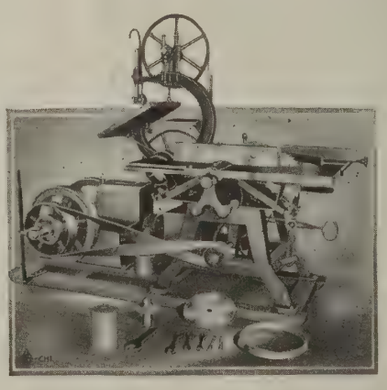


used as supports or for decoration. In the smaller private buildings, residences, etc., wood has been largely used for the columns as well as for the rest of the building, but there are certain disadvantages in its use especially for columns exposed to the weather, whether the snows of the North or the damp atmosphere of the South. Among these advantages are the tendency to check or crack unless carefully made from the best materials, and the liability to decay as soon as a crack appears unless carefully painted at frequent intervals. These disadvantages can, to a certain extent, be overcome by care in manufacture, and during and after erection.

The Union Metal Mfg. Co., of Canton, Ohio, are manufacturing a column which they claim overcomes many of the faults in columns of other construction. As made by them, the column consists of a cast iron base and cap, and a shaft of pressed galvanized steel. They thus have abundant strength as well as correct architectural detail.

As it is manifestly impossible for us to list all the places where these columns have been used, we can only show their use in one building, and ask that our readers write to the Union Metal Mfg. Co., Canton, Ohio, for further information regarding these columns and other goods of similar manufacture.

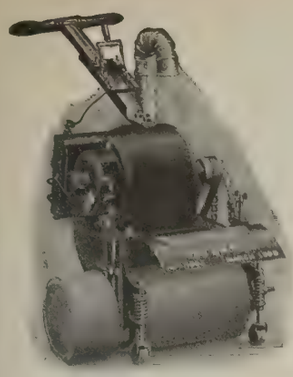
NEW TYPE OF PORTABLE WOODWORKER.



The latest addition to the family of woodworkers now on the market is a new type of portable woodworker, built by the Sidney Tool Co., who have over eight hundred of their stationary woodworkers in use throughout the country. Their latest achievement is sure to be a winner as it meets the demand long existent among the majority of contractors.

As the name implies, it can be moved from job to job as desired, with little trouble. It is usually mounted on skids which permit it to be drawn over the ground very easily; the manufacturers also can furnish a specially designed wheeled truck which, of course, allows it to be moved even easier than on skids.

The machine is furnished quite complete, the outfit including a three horse-power gasoline engine, batteries and all belting necessary to its operation. In fact, it comes ready to begin working with.



In operation the machine is similar to the stationary woodworkers, performing various kinds of work, such as ripping, dadoing, surfacing, edging, boring, grinding, sanding, etc., all of which can be performed by one man. The complete machine includes: 8-inch Jointer, 20-inch Band Saw, Saw Table with Raising and Lowering Arbor, carrying a 14-inch Saw Blade, Mitering Attachment, Cut-Off and Ripping Gauge, Emery Grinder and Disc Sander.

In multiplicity of work, durability and ease of operation the FAMOUS Portable Woodworker is considered far in advance of any similar machine on the market, and the builders have taken steps to supply a big demand. The advantages offered by a machine doing various kinds of work are well known; with the added feature of portability it should prove a boon to every contractor, as he can take his "machine-shop" with him on almost every job he undertakes.

Full particulars of the construction, together with prices and terms, will be sent upon request to the builders, The Sidney Tool Co., Sidney, Ohio.

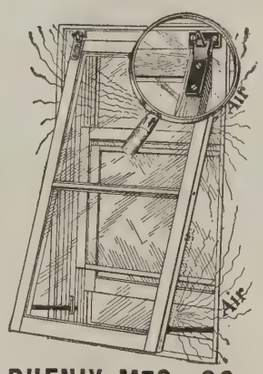
Don't Lug a Heavy Tool Box Around But

CARRY YOUR TOOLS IN THE INDESTRUCTO

CARPENTERS' TOOL CASE



It is made in suitcase style—of three-ply veneer, covered with strong canvas and painted, all edges bound in steel, reinforced corners, secure locks and catches and strong handle. The Indestructo is the handsomest tool case manufactured. It is light, very strong and the inside is so well arranged with separate compartments for saws, planes, level, square, chisels, bits, etc., that the cutting edges can not be injured. Tools can be quickly found and put away. It is made in two lengths, for 26 and 28 inch saws. Special sizes to order. Send for prices.

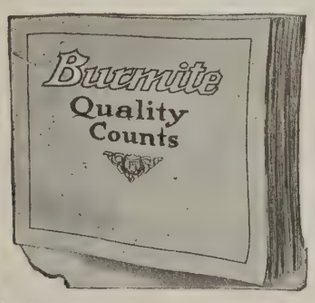
Strength, Beauty and Service

The three necessary elements required in a material of Quality

For ROOFING and SIDING

Buildings—be they NEW or OLD, are combined to the greatest extent in

Ready-To-Lay



Burmite

(*Reg. U. S. Pat. Office*)

It Positively Makes Good, is Guaranteed for 10 Years Without Coating or Painting, and has superior **Fire-Retardative** and Storm-Resisting Qualities—*Sparks, Hail, Sleet, Sliding Ice, Rain, Snow or Wind Storms* do not affect the upper surface of **BURMITE** which is made in two separate and distinct surfaces, i. e.,

Bird-Sand and "*Twolayr*" Slate Chips Patent Pending

Cheap roofing is expensive at any price—must be painted at least three times in the course of from seven to ten years. **"Burmite"** requires no paint—hence is the most economical to buy. It can be used in any climate—does not dry out—remains flexible always. LET US SEND YOU THIS SET OF SAMPLES and our BOOKLET, so that you can compare "Burmite" with other roofings you've handled—apply your own tests in your own way and then let us explain our SPECIAL SERVICE TO DEALERS which will help you to sell it in your locality.

Lasts Longer Than Shingles—costs less, lays smoother, looks nicer—requires no paint to preserve it.

Eminently satisfactory for covering old or defective roofs of all kinds—*can be laid over old Shingles or Tin.*

Mailed FREE of all charges and obligation—

Write for them

Illustrated with buildings beautifully printed in colors showing effect of "Burmite" applied as a roofing and siding on Residences, Summer Homes, Cottages, Bungalows, Garages, Barns, etc.

Amatite ROOFING

Mineral Surfaced

Needs No Painting

EVERYTHING about Amatite appeals to the man with common sense. He can see its superiority at once—the real mineral surface ***which never needs painting;*** the two layers of Pitch which is the greatest waterproofing material known; the two layers of heavy Tarred Felt—all these contribute to the popularity of Amatite.

We can make Amatite better and cheaper than anyone else on account of our greater facilities, and consequently we sell it at a surprisingly low figure.

Simply the fact that it needs no painting is enough to make a man sit up and take notice—especially the man who has spent time and money in painting and repainting smooth surfaced roofings.

Every dealer should push it.

THE GREATEST WORK

ever published on Architecture, Carpentry, Contracting, Building and all allied branches is the new 10 volume edition

Cyclopedia of

Architecture, Carpentry & Building

Ten massive volumes; 4,670 7x10-inch pages; 3,000 full-page plates, detail drawings, plans, color plates and photos of buildings completed and in course of construction. Bound in half morocco leather and printed on special enameled paper in large, clear, readable type. Titles beautifully engraved and stamped in 23 carat gold.

No work so comprehensive, so authoritative, has ever before been placed on the market. This great work is a complete review of architecture, carpentry and building. Every problem likely to confront you in your daily work is solved and the solution placed before you in such a clear manner that you cannot fail to understand and profit by it.

Another Great Offer that Goes with Every Cyclopedia

With each set we include a Consulting Certificate entitling you to the advice of our business and engineering experts free. This will give you practical help in handling working problems which are too specific to be taken up in detail in the cyclopedia. There will be no limit to this service. A single problem solved for you might be worth more than the first cost of the books.

Just examine the "Partial List of Contents" below and you will at once realize how broad is the scope of this work—how thoroughly it covers the building trades.

PARTIAL LIST OF CONTENTS

Reinforced Concrete—Contracts and Specifications—Building Materials—Carpentry—Building Superintendence—Estimating—The Law of Contracts and Liens—Masonry—Stair Building—Heating—Ventilation—Hardware—Steel Construction—Elevators—Architectural Drawing—Freehand Drawing—Blue Printing—Greek and Roman Orders—Water Color Hints for Draftsmen—Painting—Wiring of Door Bells—Sheet Metal Pattern Drafting—Mechanical Drawing—Lettering—Shades and Shadows—Rendering in Pen, Ink and Wash, etc.

READ OUR LIBERAL OFFER

THEN SEND THE COUPON

To prove our absolute confidence in the superiority of this work over all others, we make this liberal offer: Upon receipt of the coupon in the lower right hand corner, we will place the entire cyclopedia of ten volumes in your home or office—you keep the books seven days—examine them thoroughly, critically—subject every formula and problem to a severe test. If you are satisfied, send $2.80 after examination and $2.00 every month until you have paid the special $24.80 price. The regular list price is $50.00. As a further guarantee, we will remove the books at our expense if you are not satisfied. We pay all express charges. The books are compiled from the instruction papers of the American School of Correspondence. If you are interested in our Building Courses, mail the Coupon at the left. It will bring full information and valuable advice by mail at once.

Don't Miss This Opportunity

We Want One Carpenter or Builder in Every Community to Demonstrate, Take Orders for and Apply Our EDWARDS METAL SPANISH TILE ROOFING on a Liberal Commission.

Here is a chance to build up an independent, profitable business for yourself right at home. Many carpenters are now devoting their entire time to selling our metal roofing Others have made big profits simply devoting part of their time to selling and laying our Metal Spanish Tile.

Edwards Metal Spanish Tile

Is being advertised in the leading magazines and is now known to thousands of home builders and owners everywhere. Wherever it has been used it has made a decided "hit" because it shows off to good advantage on the roof and has numerous points of superiority over any other style of roofing.

Architects are specifying Edwards Metal Spanish Tile, for they know it will do away with roofing "troubles." Builders like it because of the finished appearance it gives any house on which it is used.

Our Metal Tile are stamped out of the highest quality Worcester terne plate in exact imitation of the most expensive Terra Cotta Spanish Tile. They come either "dip" painted or heavily galvanized, size 10 x 14 inches. Our patented interlocking side lock makes it possible to make a perfectly moisture-proof roof without soldering. Edwards Metal Spanish Tile afford the fireproof advantages of Terra Cotta Tile, but are much lighter in weight, cost but a trifle more than ordinary roofing and will last a lifetime.

WRITE US TO-DAY ABOUT YOUR TERRITORY. Our business is growing so rapidly that it is necessary to have an agent in every community. The territory is going fast. One day's delay may mean that someone else will be given your territory. DON'T DELAY. WRITE TO-DAY FOR OUR SPECIAL AGENTS' PROPOSITION.

Note the construction of patented interlocking device, protecting nail heads from weather and providing perfectly for expansion and contraction of the metal.

Notes on Heating and Ventilation

Price, $2.00 delivered

By *John R. Allen*, M. Am. Soc. Heating and Ventilating Eng.; Junior Professor Mechanical Engineering, University of Michigan, Ann Arbor.

Second Edition; Bound in Cloth, 6¾x4¾ in.; 200 pp.

This book is a resume of lectures delivered to classes in heating and ventilation at the University of Michigan. It is written primarily for the steamfitter and designer of heating systems It presupposes a knowledge of the construction and operation of the simpler forms of heating systems. Reduced to as brief a form as possible, so that readers can readily find notes or data desired.

Contents—Theory of heat and measurement of temperature. Heat losses from buildings; rules for determining heat losses in different constructions. Different forms of heating systems; their advantages, disadvantages and relative economy. The design of a direct steam heating system. The design of an indirect heating system. Steam boilers and steam piping. Carrying pipes underground, etc.

to you Contractors or Builders that you will profit by handling

CORTRIGHT METAL SHINGLES

Look for the stamp "Cortright Reg. U. S. Pat. Off." on the third corrugation of every genuine Cortright.

First: With that stamp on each shingle you can assure your customer that the roof you put on will last as long as the building, and never need repairs. Our records will prove our statements true.

Second: The man who handles the shingles bearing that stamp is always assured of sales, because—

We create the demand—you get the profit.

Third: It is put there to protect you from unprofitable competition.

The imitator may steal the design, but he dare not steal that sentence, and with that to back you, you'll land your customer every time.

IT'S A SCRAPER BUT IT WORKS LIKE A PLANE

That is what the many satisfied contractors and builders who are using the **Boss Improved Floor Scraper** say.

The **gauge** on the front and wheels at the rear make it like a plane. This gauge, which keeps the knife from making a depression in the floor, gives the knife a double support. It can be set for **any thickness of shaving,** or **instantly removed** for working up into corners.

Deep Cutting is prevented by the pear shaped wheel in front, which lets the knife down gradually to make the cut.

Poor work is **impossible** as with the simple but positive adjustment of this gauge and wheel attachment the knife leaves no mark. The standing attachment cleans the wheel and takes off the rosin when working hard pine.

Price very low. Write for descriptive Circular "N"

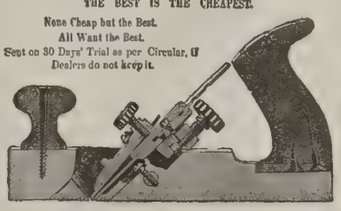
$1.00 Good For $1.00

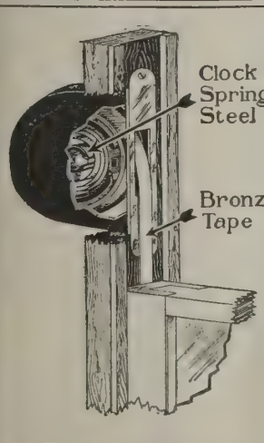
TO INTRODUCE
The SELF-SETTING PLANE
(As long as this Ad appears.)

Any dome in this paper is good for one dollar, in payment for a **Self-Setting Plane,** if sent us with the balance of the list price of a Plane from where our planes are not sold.



If you want more than one Plane and they are not sold in your town we will allow you dealer's cash discount with order, which is 35 & 2% off list.

List price of **Beach Wood Planes:** Smoother $3.25, Jack $3.50, Fore $4.00 and Jointer $4.50



Do not say the price is too high until you try it, then if the Plane is not **worth to you, twice its cost,** return it at **our expense** and the **trial won't cost you a nickel.**

Get one on trial now and let the Plane talk for itself. You run no risk, as this paper guarantees we will do as our advertisement says.

If you don't want a **Self Setting Plane** now, **send us a dome and the addresses of ten carpenter friends, no matter where they live, and we will send you a hard, tough, carpenter's pencil and circulars.**

The Carpenter's First Thoughts—

Sharp Tools and Carborundum Sharpening Stones

A good workman starts the job with every edge tool keen and smooth. He knows that a good tool properly sharpened means more work with less effort. The best, the quickest way to put them in perfect condition is with a ***Carborundum Stone.*** They are hard, sharp, uniform and non-glazing. They *cut* while the others merely rub.

The Carborundum Round Combination Bench Stone is a great favorite:		
It gives full sweep to the tool—it wears evenly.	*No. 107*	*$1.00*
Carborundum Combination Stone, rectangular,	*No. 108*	*$1.25*
Carborundum Pocket Stone, in case,	*No. 146*	*.35*

A Big Hit

Is the new tip with which "NATIONAL" Butts are now equipped, both Common and Ornamental.

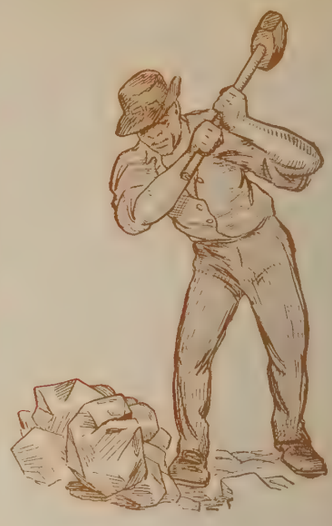
The TIP is threaded and screws into the Butt in both the Jappanned and Plated finishes.

It is also SLOTTED for A SCREW DRIVER, making it easy to remove the tip and affords ready access to the pin.

The slot also indicates instantly which is the bottom of the butt—a feature greatly appreciated by the carpenter. These are exclusive "NATIONAL" features.

Style No. 450

here illustrated is a very popular design and can be furnished in all sizes from 1½ in. to 4 inches inclusive. These butts are highly polished, double plated and have beveled edges.



They match escutcheon plates with beveled edges. Ask for "Catalog B" and give dealer's name.

BRAIN OR BRAWN

YOU EARN your bread with brain and skill rather than with muscle. Otherwise you would be a laborer with pick and shovel, instead of a mechanic with a kit of fine tools.

One day two husky laborers were told to remove a few yards of paving bricks between street-car tracks. They began hammering them to pieces with sledges. Hard work—slow work. Not until they were shown, did they think of loosening the bricks with bars and pulling them out. ALL BRAWN—NO BRAIN.

You use your brain to save your brawn, to save time, to save mistakes, to save you money. And you never make a more profitable use of your brain than in the selection of the saw, for it is the tool that you use most—the tool requiring most energy and most skill in handling. The intelligent mechanic uses

ATKINS SILVER STEEL SAWS

These saws are fully abreast of the times. They embrace the latest and most scientific ideas in saw making. They are so constructed that they run easier than any other saw, and the SILVER STEEL used in the blades will receive that keen, sharp, cutting edge that you high-class mechanics want—and hold it.

How to Get Them

Go to your dealer and tell him that you are a progressive mechanic and you want tools that will save you time and strength. Select a saw with the words SILVER STEEL on the blade. Then you'll be sure of getting a saw representing the highest achievements in saw making. If your dealer does not sell them he will order for you from his wholesale house. If he won't do this, then let us know. We'll help you get the finest saw if you want it.

You Run no Risk

We stand back of every SILVER STEEL SAW with a guarantee so strong that you risk nothing—not one cent. If the next saw you buy is an Atkins saw and if the words SILVER STEEL are on the blade, remember that it is guaranteed to run easier, cut faster and hold its edge longer than any other saw. If it is not absolutely satisfactory, you are authorized to take it back to your dealer and get your money back or a new saw. If he won't refund your money, let us know.

Offer to Carpenters. We are compiling a list of high class mechanics and if you will send us your name, we'll mail you our book on saws free of charge. If you'll send us ten cents to pay postage, we'll forward you free a strong, durable nail apron, our Saw Sense book, monthly time book, and a whole lot of useful information about high grade saws.

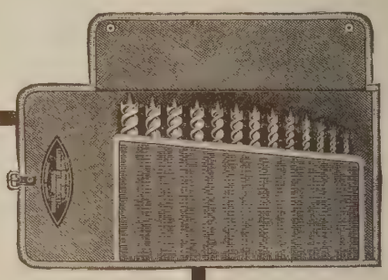
Disston Saws, Files and Tools

For fifty-six years we have been making Disston Crucible Steel. It is made under the exclusive Disston process. The long life and cutting properties of Disston Saws are due to Disston Crucible Steel and the treatment it undergoes in our shops.

The Disston establishment is the ONLY ONE making steel for its full line of saws and tools—one reason why Disston Saws are uniformly durable and efficient.



Disston Saws are hardened and tempered by the exclusive Disston process.

It pays to buy Disston Saws and Tools. For any and every kind of work Disston Saws, Files and Tools are the most reliable.

We have been making saws for over seventy-one years.

BISHOPRIC WALL BOARD AND SHEATHING

BISHOPRIC Wall Board is cheaper and better than lath and plaster. It is the ONLY Wall Board COMBINED WITH LATHS and Asphalt Mastic. Laths are necessary in a Wall Board, just as they are in plaster walls, to prevent warping and to insure solid, rigid, stiff substantial

WALLS AND CEILINGS

Bishopric Wall Board Easily Applied

Bishopric Wall Board also is the only Wall Board with a waterproof body. The Asphalt Mastic in which the laths are imbedded affords absolute protection against dampness. Does away with delays in building. Applied winter or summer. Is nailed to studding dry, ready for immediate application of paper, paint, burlap, or any other kind of decoration.

Bishopric Wall Board is made of kiln-dried, dressed laths imbedded in hot Asphalt Mastic, surfaced with sized cardboard and cut in the factory into 4x4 ft. sheets. Shipped in crates ready for immediate nailing to studs. It is guaranteed not to swell, shrink, warp, crack, flake or blister. It is clean, sanitary and odorless; proof against moisture, cold, heat, and vermin; saves fuel and keeps out summer heat; also deadens sound.

It is suitable for dwellings, factories, new partitions in old buildings, finishing attics, porches, laundries, cellar ceilings, garages, etc.

Shows Construction of Bishopric Wall Board.

PRICE WALL BOARD AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6.40 per crate, or $2.50 per 100 square feet, f. o. b. New Orleans, La., Cincinnati, or Alma, Mich. We ship from nearest point.

T. W. Hanes, Carpenter and Contractor, Mounds, Ill., wrote August 15: "I have used 13 crates of Bishopric Wall Board, and the waste could be put in a hat."

Wm. Cooper, Taxidermist, Milo, Me., March 9, wrote the Philadelphia Farm Journal: "Your interesting paper has been a real bonanza to me. I wanted a cheap, warm method of lining my new work room. An advertisement in your paper gave me the very idea and material at a price that suited my pocket. I wrote to two firms who advertised with you, but selected 15,000 ft. of sheathing from the Bishopric Wall Board Mfg. Co. of Cincinnati. If the stuff was made on purpose, it could not suit me better; and a most prompt, obliging firm they are, too."

Cheaper Than Lumber. Saves 75% on Labor. Does away with Building Paper.

BISHOPRIC SHEATHING

Ideal Material for Cement Buildings or Stucco Exteriors. Proof against Dampness.

Bishopric Sheathing is made of same materials as Wall Board, but finish is not necessarily so fine, therefore costs less. It is of uniform thickness, insuring a perfectly even surface when applied.

Bishopric Sheathing is nailed to studs, with lath and asphalt side exposed. Over laths, weather boards are nailed or cement applied.

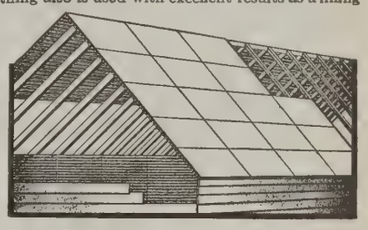
Shows construction of Bishopric Sheathing.

Arrow points to Asphalt Mastic into which laths are imbedded.

Bishopric Sheathing makes a more solid and substantial wall than lumber. There are no gaping joints; no widening cracks due to shrinkage; no knot holes.

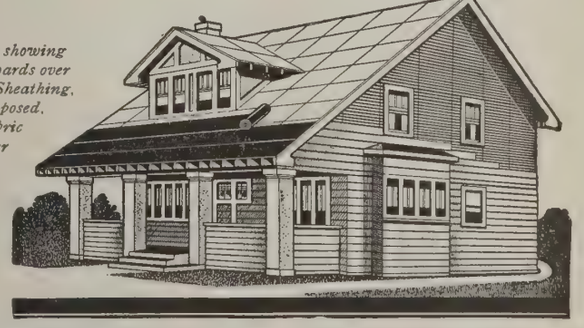
The Asphalt Mastic in Bishopric Sheathing is a non-conductor, moisture cannot penetrate it. It is proof against vermin. The pests cannot bore through the tough, gummy Asphalt Mastic. In applying weather-boards over the laths, dead air space is left between the laths forming splendid insulation. Does away with the expense of building paper and cost of its application.

Wall Board and Sheathing are shipped in crates



The cost of applying Bishopric Sheathing is but $2.50 per 1000 feet—A SAVING OF ABOUT 75 PER CENT. Furthermore, 1,000 square feet of wood sheathing covers but 750 feet of surface, 20% less being due to tongue and groove. In Bishopric Sheathing 1,000 square feet covers 1,000 square feet of space

Bishopric Sheathing insures comfort during the construction of the building. As soon as the building is closed in with Bishopric Sheathing, the men may work in comfort on the inside during bad weather, finishing the outside on suitable days. This insures continuous work, without loss of time, enabling the contractor to hold his men and complete the work in the least possible time.



Bishopric Sheathing is used with equally splendid results under flooring and as a substitute for roofing boards. Used under floors, it serves as a sound deadener and keeps out dampness; used under the shingles, it keeps out summer heat.

ITS MANY USES—Bishopric Sheathing also is used with excellent results as a lining for dairy barns, ranch houses, poultry houses, driving stables or any out-door building where protection from the elements, Summer or Winter is desired.

Bishopric Sheathing is the ideal material for cement exterior or stucco work. Cement firmly adheres to the laths and Asphalt Mastic and makes a solid, smooth exterior. For factory or residence this form of cement or stucco construction is the cheapest and best known.

Shows Bishopric Sheathing over rafters ready for Bishopric Roofing, also Weather-boards over Bishopric Sheathing.

Ideal home showing Weather-boards over Bishopric Sheathing, lath side exposed, also Bishopric Roofing over Bishopric Sheathing. (smooth side of sheathing exposed)

PRICE SHEATHING AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6, or $2.35 per square of 100 square feet, f. o. b. New Orleans, La., Cincinnati or Alma, Mich. We ship from nearest point.

Write for Descriptive Booklet and Samples of Bishopric Wall Board, Bishopric Sheathing and Bishopric Roofing—All will be sent free.

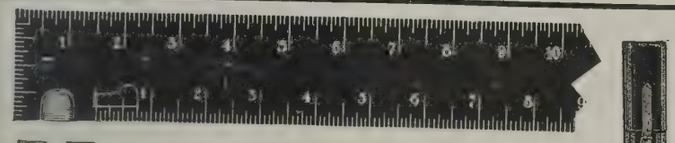
GREYHOUND HAND SAWS

SPEED & EASE
TRADE MARK.

The more you know about hand saws the more you can appreciate "GREYHOUND" hand-made hand saws, with their easy-running and rapid cutting qualities and wonderful durability. This saw will be imitated by others—but not equalled.



They are made from Bishop's Refined "GREYHOUND" Steel—a material which leads everything yet produced for use in hand saws. The purity of the steel, the toughness, the even and accurate temper, gives a saw that is the most suitable for particular work, and the most practical for ALL work where a hand saw is used. Made in both straight and skewback, also narrow patterns. Specify which you desire. Remember our warranty accompanies each saw. And the warranty means that if 30 days' trial does not convince you that the "GREYHOUND" saw is the **best** for your use, you get your money back.

Spring

Locking Device, Pat. Applied for.

NICHOLLS NEW TAKE-DOWN SQUARE

Guaranteed Accurate and to Remain So

The main feature of our new Take-Down Square is that it will always stay true. It is so constructed that the tongue is held down into beveled bearings by a spring, and these bearings are made so as to take up the constant wear which comes in taking square apart and putting it together, thereby producing constant accuracy. Rust-proof canvas case with each square.

OUR NEW LOCKING DEVICE securely locks Tongue to Body and prevents Tongue from slipping out.

Does not lock with a key such as other makes of Take-down Squares, but is simply operated with the thumb.

No running to your Tool Box for a key, or "I forgot the key and left it home." NO KEY TO LOSE. ALWAYS READY. ALWAYS ACCURATE.

If your dealer does not handle our tools and will not order them for you, write us. We have something to offer. **We prepay express if ordered direct.**

The Advantages of a Portable Woodworker

Especially the "FAMOUS"

Stop hauling your millwork to the machine-shop—and hauling it back. Bring your machine-shop to your millwork! It's cheaper—and the saving goes into **your** pocket.

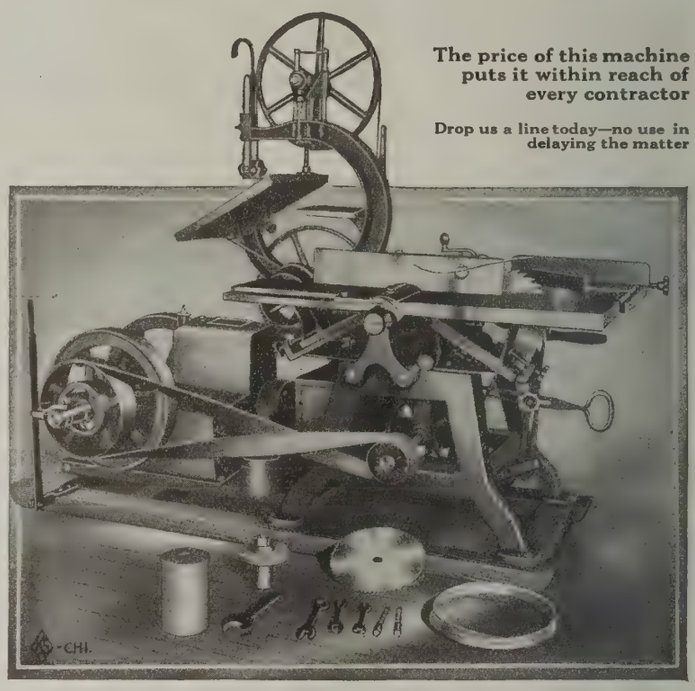
The FAMOUS Portable Woodworker is really a movable machine shop. When you've completed your contract on one job, move the machine to the next. Seven useful woodworking machines—practically all that a contractor requires—are combined into one. And a gasoline engine, complete with belting, is included in the outfit.

A Remarkable Machine

Combining all the remarkable features of the FAMOUS Universal Woodworker—over eight hundred, of which are in use—our Portable Woodworker is a real boon to contractors everywhere. Surfacing and edging, boring, band-saw work, ripping and cutting-off, sanding—all these, and more can be done on this machine **right at the place where your work is!** No planing-mill delays and **no unnecessary expense.**

The FAMOUS Portable Woodworker is mounted on skids and can be moved around without any trouble. A wheeled truck can also be furnished. The engine is three horse power, and batteries and belting come with it. This is by far the best proposition today in woodworking machinery. Write for full details.

The Sidney Tool Co.

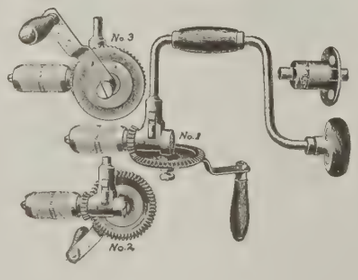


Sidney, Ohio

Several Woodworking Machines Combined in one

The machines embraced in the FAMOUS Portable Woodworker are:

- 8″ Jointer
- 20″ Band Saw
- Saw Table (carrying a 14″ saw blade) with raising and lowering arbor.
- Mitering Attachment
- Cut-off and Ripping Gauge
- Disc Sander
- Emery Grinder



3 H. P. Gasoline Engine, Batteries — All Necessary Belting

The price of this machine puts it within reach of every contractor

Drop us a line today—no use in delaying the matter

You Can Drill a Straight Bore 1 Inch From Wall With This

DRILL BRACE No. 192

The gear, as shown by illustration, is attached or detached by a turn of a thumb screw, but what is not shown is that when set it is as rigid as if keyed on. Its possible adjustment to three positions gives the user 100% efficiency in any corner or in any position or angle.

The ratchet is an improved device, so arranged that both dogs can be thrown out of mesh, at the same time allowing free operation of drill gears.

With drill gear detached, the brace is our regular 10″ Sweep Tool with all its patented improvements—universal chuck, taking all sizes and shapes of shanks, patent ratchet, non-splitting, free acting center handle and ball-bearing head.

This Drill Brace looks and works better than the description sounds

30 DAYS' FREE TRIAL

SHARPENS ALL TOOLS AND CAN BE USED AS A TURNING LATHE, JIG AND RIP SAW, SANDER, POLISHER, ETC.

Will not draw temper

Luther Hummer Tool Grinder

30 days free trial

10 Times More Efficient Than Emery—25 Times Faster Than Grindstone

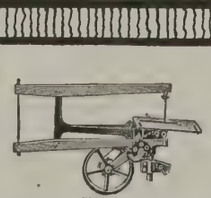
We want you to prove by 30 days' free trial of this machine how it saves lots of money, increases the amount of work accomplished and makes your work amazingly more easy. The Hummer makes it but a few moments' work to do the most difficult job of tool grinding, and with the patent tool rests your apprentice can do it as well as a high-priced mechanic. **Your tools will always have the proper edge,** and keen tools mean at least 20 per cent more work accomplished with a hundred per cent less effort. As a tool grinder alone it is a big profit maker, but it saves and earns money in other ways—as a jig saw, rip saw, sander, polisher, drill, etc.

Bevel Gear Shaft Drive, Angle Steel Frame, Ball Bearing, Gravity Feed Lubrication, Dust-Proof Bearings

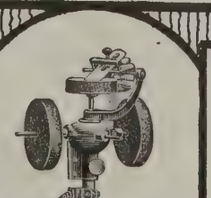
The Hummer will last a lifetime—no chains to break or to be ground to pieces by dust and grit from the wheels. Its construction embraces 26 basic patents. It has 30 different attachments, which make it the most serviceable, easiest-running tool grinder ever built. ***It will outlast any number of grindstones or emery wheels.*** Engine power can be applied, but it runs 4,000 revolutions per minute by foot power as easily as pedaling a bicycle down hill. The angle iron frame is absolutely rigid, nothing to get out of order or wear out. ***The time it saves in tool sharpening, and the more and easier work it does, pays for the Luther Hummer over and over.*** But it saves money in still other ways.

Dimo-Grit—"The Wheel for Steel"

It saves tools. The Dimo-Grit wheels on the Hummer cut hardest steel as emery does soft copper. Dimo-Grit peels steel away in tiny shavings. It does ***not wear*** it away like emery or the grindstone—does not ***heat*** up the tool, requires no cooling with water, and there is ***no danger of drawing temper from tools.*** Few tools are ever worn out. They come to early old age by grinding. You will be surprised at the longer time Dimo-Grit wheels will make your tools last. Dimo-Grit is the latest artificial diamond abrasive, a twin product of Carborundum, but especially suitable for steel. Carborundum wheels furnished if desired.



Thirty Days' Free Trial



Either for the shop or the individual tool-user this Luther Hummer Tool Grinder is a big economy—a real money saver—a money maker. ***Prove*** it. It means money in your pocket to prove it, and ***we will let you prove it by 30 days' free trial, on your own work, on your own tools.*** Write today for 30 days' Free Trial Offer and 40-page illustrated booklet showing the many uses for the Hummer and the numerous ways it saves money. Write today for free trial offer and Free Booklet.

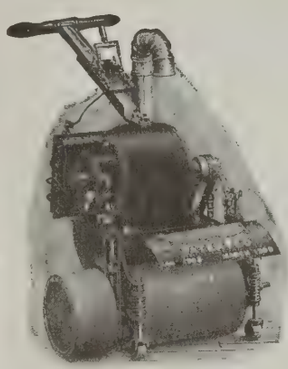
Oak Flooring

Attracts your attention immediately and holds your admiration permanently.

Every **builder, owner** and **investor** should use OAK FLOORING, because its natural beauty combined with its **economical** and **durable** qualities makes it the **King of Flooring.** Any truthful landlord or architect will tell you that OAK FLOORING **increases the renting** and **selling values** of any building more than any other kind of flooring.



OAK FLOORING will harmonize with any kind of trim, furniture or color decoration, and is susceptible to any kind of finish. In color, it is **rich** and **cheerful,** and imparts an air of **refinement** and **elegance** to a home.

OAK FLOORING ⅜" thickness by 1½" or 2" faces can be laid over old floors in old homes or over cheap sub-floors in new homes at a very low cost. It is cheaper than carpets or Pine Flooring.

Write us for further information

THE OAK FLOORING BUREAU

853 Hammond Building - - Detroit, Michigan

Made in three sizes: 8x18, 8x15, and 8x12 in. Roller Edge Roller easily adjusted to either side

Perfect Results are Easily Obtained by Using Schlueter Rapid Floor Surfacer

This machine is built on the only correct principle. It is guaranteed to be **The Best** machine with which to produce an even, smooth service on any kind of large or small wood floor, old or new, hard or soft, and in all buildings: Residences, Stores, Factories, Bowling Alleys, Roller Skating Rinks, Reception and Dance Halls, Etc.

The **Schlueter** will remove all joints or warped edges, and oil, wax, lime stains, or the "muck" from skate wheels, in a most satisfactory manner.

Earning Capacity, $20.00 to $35.00 per Day

WE WANT TO SEND YOU A SAMPLE

We want every carpenter and builder and home owner in America to know about and to have a sample of

UTILITY WALLBOARD

It is to your interest to have this sample and to become thoroughly familiar with this remarkable material.

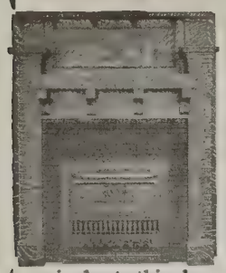
Utility Wall Board marks the greatest advancement that has been made in interior building construction in a hundred years.

It is made of fibre—very hard and tough and durable. It is waterproofed on both sides. Being a non-conductor, it is largely heat and cold and sound proof.

It is very easily put on—nailed right to the studding and takes the place of both lath and plaster.

It is the only wall board on which you can safely use wall paper. At the same time it lends itself admirably to tinting and stenciling, or other forms of decoration. Made in various widths and lengths to meet all requirements of interior finishing.

Write today for the sample and for the new book of interiors.



Utility board is sold through dealers in builders' supplies everywhere.

The Greatest Building, Contracting and Architectural Library in the World

This Library of Architecture is part of the 99 volumes of the International Library of Technology that cost over $1,500,000 in its original preparation. It contains the results of years of experience of the best building experts in the country. It contains the best modern practical methods used in every branch of architecture. The matter has been written by the foremost technical building experts and illustrated by a special staff of artists and craftsmen. Not only is this Library suited for architects already well trained in their profession, but it is especially adapted for the use of laborers, carpenters, and contractors that wish to acquire in the easiest and most thorough manner the knowledge that will qualify them for advancement. This Library is the only practical technical library in existence wherein the subjects treated can be readily understood and practically applied by persons having no knowledge of higher mathematics.

The volumes of the International Library of Technology are used and indorsed by 95 of the leading colleges and universities throughout the country. They are also indorsed by leading engineers. An example of these indorsements is to be found in the statement of **Frank L. Mueller, Assistant Secretary of the O'Rourke Engineering Construction Company, of New York,** who states: **"Some time ago I received several volumes of your Library of Technology and it will certainly give you pleasure to know what I think of these books. I have at my disposal a reference library containing more than one thousand engineering books, but I must say that none of these works contain the information generally desired in such concise and simple form as the volumes of your Library of Technology."**

A partial list of the subjects contained in the Architectural Library is as follows: Excavating, Shoring, and Piling; Footings and Foundations; Areas, Vaults, and Retaining Walls; Cements; Concrete Construction; Stone Masonry; Stone Arches; Carpentry; Mechanics of Carpentry; Joinery; The Steel Square; Building Stone; Lathing, Plastering, and Tiling; Common Brickwork; Ornamental Brickwork and Terra Cotta; Lighting Fixtures; Use and Design of Lighting Fixtures; Architectural Design; Building Superintendence; Specification Writing; Specification-Writing Memoranda; Estimating and Calculating Quantities; Contracts; Permits; Fireproofing of Buildings; Stair Building; Ornamental Metal Work; Builders' Hardware; Roofing; Sheet-Metal Work; Mill Design; Loads in Structures; Properties of Sections; Materials of Structural Engineering; Beams and Girders; Columns and Struts; Details of Construction; Graphical Analysis of Stresses; Roof Trusses; Statics of Masonry; Heavy Foundations; Retaining Walls; Fireproofing; Roof-Truss Design; Wind Bracing; Specifications; Geometrical Drawing; Projection Drawing; Freehand and Ornamental Drawing; Wash Work and Brush Drawing; Elementary Perspective Drawing; Architectural Drawing; Painting and Interior Decoration; History of Architecture and Ornaments.

There are 10 volumes in this Architectural Library, beautifully bound in three-fourths red morocco, stamped and numbered in gold, printed on a very high-grade book paper, and fully and practically illustrated. They may be purchased in sets of five or more volumes. Each volume is 6×9 inches in size. For full information, **send this coupon NOW.**

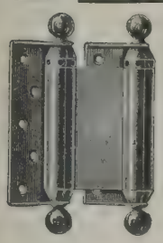
"444"

A Combination Dovetail Tongue and Groove Plane

Something entirely new. A Plane that will at one setting cut a dovetail groove, and in the other setting a dovetail tongue to match.

The operation is simple and the accurate and perfect fitting joints obtained, both parallel and tapering, will convince the workman of the utility of this unique and original tool.

A most valuable addition to the kit of pattern makers, cabinet makers, carpenters and wood workers in general.



Send for complete description.

DUMB WAITERS

Published in a trade paper recently there was an inquiry for working drawings for a Dumb Waiter.

There has never yet been made a dumb waiter which would meet all requirements equally well, and best results will be obtained, therefore, by selecting the dumb waiter best adapted to the particular job in hand.

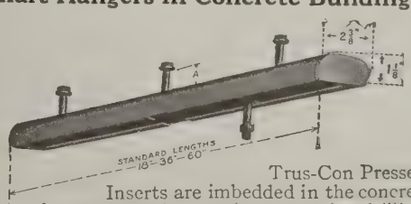
The Sedgwick Machine Works, 130 Liberty Street, New York, will send to any builder or carpenter on application their catalogue "K", which shows various types of Dumb Waiters and Hand Power Elevators. Every builder should have this catalogue for reference and then whatever his requirements, he can select the particular size and style of dumb waiter which will best meet the conditions. Machines only or complete outfits may be purchased.

In addition the Sedgwick Machine Works will furnish working drawings free of charge to any builder who will write them what his needs are.

Made in all sizes and styles for use with brick or concrete block walls or with wooden or steel beams.

TRUS-CON JOIST HANGERS

Avoid cutting away and weakening of timbers and walls—save labor, time and money.



Trus-Con Joist Hangers are made from open hearth steel plates, and are proven by actual test to be the strongest on the market. Note the bulb-shaped reinforcement at upper angle.

We also furnish Post Caps, Post Bases, Wall Plates and Base Plates made in rolled steel, malleable iron, or cast iron.

Write for catalog and prices.

SHAFT HANGER SUPPORTS *for* CONCRETE BUILDINGS

Trus-Con Pressed Steel Inserts for Supporting Shaft Hangers in Concrete Buildings.

Trus-Con Pressed Steel Inserts are imbedded in the concrete during construction, saving expensive drilling after completion of the work. The long slots allow a wide variation in position. Special washers prevent bolts turning in the slots. Write for details and prices.

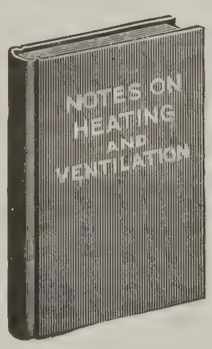
ATLANTIC ENGINE CO., Inc.

Mercer Street Meadville, Pa.

Canadian Office Bridgeburg, Ont.

"The latest invention, and without comparison the most practical, up-to-date woodworker made."



Buffalo Crain Combination Woodworker

Note the ample size and capacity of the parts which perform the four vital operations in your shop: **1. Lathe**—40″ between centers; **2. Band Saw**—taking 12″ under the guide; **3. Saw Mandrel**—taking saws up to 12″ dia.; **4. Planer Head**—taking 5″ or 10″ bits. The convenient location, strength, simplicity and easy adjustment of these vital parts, are of the greatest advantage. Drilling, boring, sizing, jointing, moulding work, tenoning and, in short, practically every operation of daily occurrence in a woodworking shop, can be performed on it **without extra attachments.** As an investment, it is a true gold mine. **Three men can work at it at one time.** Lowest power cost. Ask for Booklet 1785.

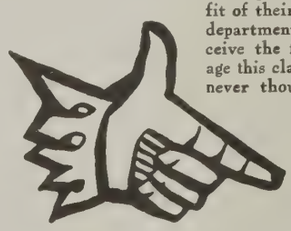
Buffalo Forge Co., Buffalo, N. Y.

Notes on Heating and Ventilation

Price, $2.00 delivered

By *John R. Allen,* M. Am. Soc. Heating and Ventilating Eng.; Junior Professor Mechanical Engineering, University of Michigan, Ann Arbor.

Second Edition; Bound in Cloth, 6¾x4¾ in.; 200 pp.



This book is a resume of lectures delivered to classes in heating and ventilation at the University of Michigan. It is written primarily for the steamfitter and designer of heating systems It presupposes a knowledge of the construction and operation of the simpler forms of heating systems. Reduced to as brief a form as possible, so that readers can readily find notes or data desired.

Contents—Theory of heat and measurement of temperature. Heat losses from buildings; rules for determining heat losses in different constructions. Different forms of heating systems; their advantages, disadvantages and relative economy. The design of a direct steam heating system. The design of an indirect heating system. Steam boilers and steam piping. Carrying pipes underground, etc.

Hodgson Book Co., 358 Dearborn St., Chicago, Ill.

A Competition

Among our readers we know we have a great many mechanics who are looked upon as authorities by their fellow-workmen. Their knowledge of their trade has been gained at the bench or on the scaffold, and perhaps is more varied than the average workman can expect to acquire in these days of specialization. Should he keep his knowledge to himself, or should he pass it on to others? In the belief that many are not only willing, but anxious, to give others the benefit of their experience, we have instituted a department in which this knowledge will receive the fullest consideration. To encourage this class of workmen, who possibly have never thought their experience was worth talking about, we are offering a

Prize of Ten Dollars

for the best article on either of the following subjects:

1st—Brick Veneer Houses. Their advantages and disadvantages from a construction standpoint.

We must have houses to live in. Why are not brick veneer houses a good thing? Let us hear from those who have planned them, repaired them, lived in them. Tell it in your own way. Your own words. Your own drawings.

2nd—The personal appearance of the small contractor.

Many contractors wear their overalls on the job, on the street, in the house, in the bank. Is it a good plan? Or should he dress neatly and look the boss as well as be one? You who are just taking a contract—does it pay to dress well and look prosperous, or should you put every penny into your job?

Now, let us hear from all of you who know about these things. The best answer gets *ten dollars* and every other answer will be paid for at our regular space rates on publication.

Conditions:—The articles should not exceed one thousand words. Write on one side of the paper only. Submit drawings or photographs if they will help.

We will pay for the idea, so write it as you think will describe your thoughts best.

The competition for this prize closes Dec. 31, 1911, and the winner will be announced Jan. 15, 1912.

Another prize next month—watch for it!

Address your article,

Literary Competition, National Builder

Not a Joint, Seam, Crack or Pore in J-M SANITOR Seats and Tanks

They are moulded in one solid piece under heavy hydraulic pressure from specially treated indurated fiber. There are no sections to come apart—no bolts, braces, screws or nails to work loose—no pores, cracks or crevices to harbor disease germs.

They cannot crack, split or warp. Seats and tanks made of this material have been in continuous service for more than twenty years, and are still in good condition.

Are furnished complete with fittings in mahogany, oak and white enamel finishes. Only an expert can detect them from wood.

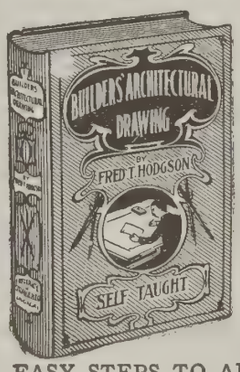
PRACTICAL BOOKS FOR THE BUILDING TRADES



THE STEEL SQUARE—TWO VOLUMES. A PRACTICAL TREATISE ON THE USES OF THE STEEL SQUARE. By Fred T. Hodgson. 600 Pages, 500 Illustrations.

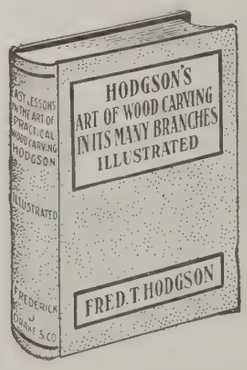
Two Vols., Cloth Binding. Price.....$2.00
Single Vols., Part I, Cloth. Price..... 1.00
Single Vols., Part II, Cloth. Price..... 1.00

Mr. Hodgson was the first—as well as the last—person who has written on this important tool, and the two volumes now issued contain the earliest and the latest up-to-date methods of applying the STEEL SQUARE for the solution of the many problems this wonderful instrument can solve when in capable hands. The two volumes, named herewith, contain about all that is possible to be done with the square, that is of practical value to the workman, and, as they show nearly all the simple, as well as the difficult things, that can be accomplished with the aid of this tool, there will be little trouble for the workman to work out any minor problem that may confront him, if it is within the purview of the tool. In short, the two volumes contain all that can now, or hereafter, be accomplished with the square. They are profusely illustrated with diagrams, and explanatory sketches, which cover the whole ground of steel square practice. Two volumes of the greatest possible value to the young carpenter.

BUILDERS' ARCHITECTURAL DRAWING SELF-TAUGHT. By Fred T. Hodgson. F. A. I. C. 336 Pages, 250 Illustrations and 18 Folding Plates, 12mo, Cloth Binding. Price.....$2.00

This work is especially designed for carpenters and for students of architecture, woodworkers and others who desire to learn drawing at home, and who have not the means, time or opportunity of taking a regular course in school, or college, nor of availing themselves of the offers made by one or other of the "Correspondence Schools."

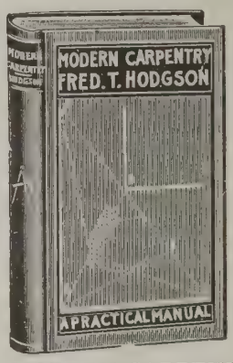
The work commences with a description of drawing instruments and accessories, with rules for using them, and hints as to their care and management. Rules for laying out simple drawings and executing same are given, and the student is taught step by step to draw to scale, first the plans, next the elevations, and finally the details of a cottage, including foundations, walls, doors, windows, stairs and all other items required for finishing a small building complete in every particular.



EASY STEPS TO ARCHITECTURE. PARTICULARLY DESIGNED FOR HOME STUDY. By Fred T. Hodgson, F. A. I. C. 350 Pages, 230 Illustrations, 12mo, Cloth Binding. Price .$1.50

As every mechanic employed in the building trades must necessarily have some knowledge of architecture, a book of this kind will be found by him to be a great assistance in acquiring such knowledge without a great expenditure of effort. A part of this work has been for years a sort of text-book in schools where architecture is taught, and is a catechism to some extent. The questions and answers are easily understood and as easily remembered.

The second part of the book deals more particularly with architectural styles, while the first part is mostly devoted to the classic orders, Greek and Roman. Full explanation of the latter styles are made, and illustrations show these styles and give a brief history of their growth and decay.



EASY LESSONS IN THE ART OF PRACTICAL WOOD CARVING. By Fred T. Hodgson, F. A. I. C. 284 Pages, 200 Illustrations, 12mo, Cloth Binding. Price.....$1.50

This work, "Easy Lessons in Practical Carving," is prepared in the same happy, easily understood style of writing that has made the name of the author so famous among the working men of English-speaking countries.

The lessons given in this new book begin at the very beginning of carving and lead the young workman by easy steps through the mazes of the art, until he is able to turn out work of a creditable character. The use and care of carvers' tools are given and explained, and the tools described and shown in illustrations, with methods of sharpening and honing the tools, in a clear and interesting manner. All necessary appliances are shown, described, and illustrated, both for holding the work, and for preparing the tools and finishing up the carvings. The various styles of carving are fully explained, such as flat carving, chip carving, incised carving, scratch carving, figure carving, carving in relief, round carving and jewelry carving.

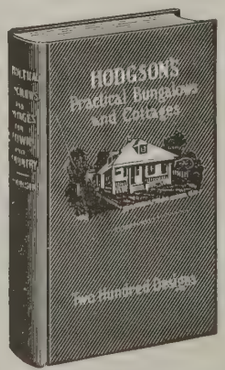
MODERN CARPENTRY AND JOINERY—VOL. I. By Fred T. Hodgson, F. A. I. C. 300 Pages, 318 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This is a real modern work, and the large numbers of it that have been sold (over one million) is an evidence that American workmen have found in it the things they expected. It is one of the best books of the kind ever brought out for teaching the young workman the art of correct and easy wood-working. It shows how to lay out roofs, rafters, stairs, hoppers, bevels of all kinds, mitering, coping, circle work, flooring, splayed work, plain stairs and handrailing, cornicing, dove-tailing and many other things the young carpenter will require to know in the performance of his regular work. It is written in a very simple style, and can be understood by any person who can read every-day English. Unlike other works prepared for workmen, it is void of bewildering formulae and algebraic puzzles, and the reader is not asked to wade through long mathematical calculations to get at the kernel of the subject before him. The work contains some 300 illustrations and diagrams, all of which are explanatory and instructive.

MODERN CARPENTRY AND JOINERY—VOL. II. ADVANCED SERIES. By Fred T. Hodgson, F. A. I. C. 400 Pages, 300 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This volume is somewhat similar to Vol. I, only on advanced lines, and is intended to follow up the progress made by a study of the first. Indeed, it is simply a continuation of the first volume, on a higher plane, and no workman having mastered the contents of one, will rest satisfied, until he has also mastered the contents of the second volume.

This volume contains some examples of work, with a description of the way the work is performed, and the materials employed. Many very difficult problems are here shown and the solutions and explanations are given and fully explained, many things that at first seem formidable to the unpracticed workman, become quite easy of solution under the magic wand of the author's method of explanation.



COMMON SENSE STAIR BUILDING AND HAND-RAILING. By Fred T. Hodgson, F. A. I. C. 300 Pages, 300 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This is an excellent work for the young carpenter who is ambitious of becoming an expert in handrailing and stairbuilding, inasmuch as it commences at the very beginning of the art, and shows how to lay off a stair on the floor, placing the newels, laying off treads and risers, strings, winders, wells and flyers.

The object of the author is to lead the student step by step, in such a way that he takes in the whole art of stairbuilding before he is aware of it. This is decidedly the best and most practical work on stairbuilding in the market, and just what the untrained workman wants. The part of the book devoted to handrailing exhibits three different methods of laying out and working handrails suitable for any kind of stairs, straight, circular, elliptical, or for stairs with landings, doglegged, newels, or cylinders. These systems of handrailing have been taken from the best sources on the subject, and have been revised and edited in the most careful manner.

PRACTICAL BUNGALOWS AND COTTAGES FOR TOWN AND COUNTRY. Arranged and Edited by Fred T. Hodgson, assisted by E. N. Braucher, Architect. 12mo, Cloth, 420 Pages, 400 Illustrations. Price.....$1.00

This work contains perspective views and floor plans of over two hundred choice bungalows, cottages, houses and flat buildings, selected with great care to combine architectural beauty, convenience and economy of construction, ranging in prices from $500.00 to $3,800.00. Every plan shown is made by a licensed architect and has been built from, to the entire satisfaction of the builder and within the estimated cost. This work will be found invaluable to the home builder, furnishing many new and up-to-date ideas and suggestions in modern architecture. The number of California bungalows, which the editors have taken great pains to select, are without question the most attractive modern low cost homes ever built. We are prepared to furnish blue prints at a very moderate cost, ranging from $5.00 to $15.00, according to cost of erection, consisting of floor, roof and foundation plans, front, side and rear elevations, with complete type-written specifications.

Any of the above books sent Post or Expressage Prepaid on receipt of price.

DID you ever see it fail—where modern forces are pitted against the out-of-date?

The successful general plans his campaign in advance, pays close attention to details of equipment and practically has the battle won before begun.

The Contracting Business also requires good generalship. The contractor who plans his work in advance and is provided with up-to-date equipment has a powerful advantage over his competitors.

Strategy is largely a matter of fortifying the weak points. Suppose you glance over the situation for a moment—What is your state of equipment? You may not be interested in guns and battleships but you cannot help being interested in contractors' equipment.

There's one class of contractors' equipment in particular that is being rapidly displaced by a modern, powerful machine, adding about a thousand per cent efficiency. That is, the old, slow and laborious method of scraping floors with hand scrapers or old style dead-weight machines is rapidly giving way to the modern, rapid and easy system of using the TRIPLE "A" SPRING-DRIVEN FLOORSMOOTHER.

"In the time of peace prepare for war"—now is the time to strengthen your weak points. If you haven't an up-to-date floor surfacing outfit it may be the cause of your losing the next job you bid on; so beat the other fellow to it by being prepared and knowing how much cheaper you can do a floor job.

Write us today and we will send you some interesting facts on laying, surfacing and finishing floors.

Furthermore, we are willing to send you a complete TRIPLE "A" FLOORSMOOTHING OUTFIT and let you use it for a whole week free of charge—just to try it. Then you can decide whether you want to buy it or send it back, and your decision will be final.

Buy a "DREADNAUGHT"—not a "Deadweight."

GREAT NEWS FOR BUILDERS

Shipments Have Begun From Our Second and Newest Great Lumber Plant in Illinois

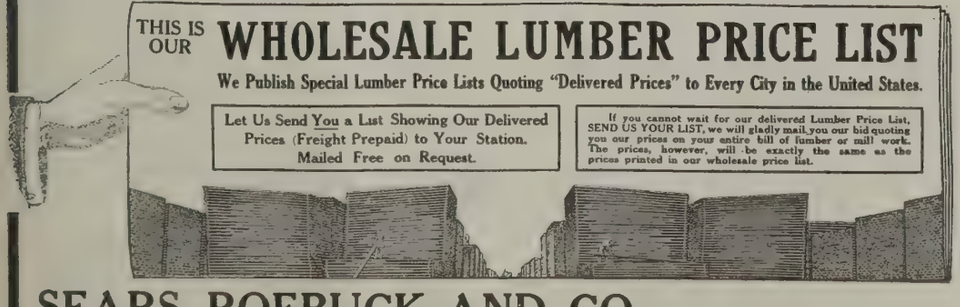
We can deliver you bright, fresh, clean lumber at Manufacturers' Prices almost as quickly as you can haul makeshift sizes and weatherworn stock from a high priced neighboring lumber yard.

We have doubled our stocks and facilities for handling your orders quickly. From our big new mill and yards in Illinois we are now making deliveries in from two to five days to points that were formerly two weeks distant from our Northern Louisiana Mill.

Quick Shipments

No matter where you live, no matter how urgent your needs, you can now buy your lumber, even for rush work, at manufacturers' cost plus only one profit. Our new Illinois plant is located on two of the largest and fastest railroads in the North and we guarantee prompt delivery of all stock sizes.

For many weeks we have been hard at work improving and perfecting our manufacturing, loading and shipping facilities and in storing up at our new Illinois plant a tremendous stock of every kind and dimension of lumber used in building work.



Our arrangements are completed. Our improved service is ready and shipments have begun. No matter how big a rush you are in, you need not deny yourself the benefit of the savings in our low prices.

From our enormous mills situated in Northern Louisiana we can make prompt shipments to all points in the South and west of the Mississippi River. From our new Illinois mill we can ship quickly into all states east of the Mississippi River.

In our two enormous plants we have ready for shipment over 20,000,000 feet (1,670 carloads) of bright, fresh lumber of the best quality produced anywhere. With 930 different sizes, kinds and grades on hand we can fill almost any order directly from stock without an hour's delay.

We can save you from $100.00 to $150.00 on an average house or barn bill of lumber—enough for a minimum carload of 30,000 pounds. Why pay retail prices for makeshift sizes and weatherworn stock?

Start right. Begin making profits before you commence work on your buildings. You can do that by buying your lumber at wholesale from one of our big mills.

New Lumber Price List, Free

Our Wholesale Lumber Price List quotes prices to your station. It gives you the exact cost of our lumber, lath and shingles delivered at your depot. We pay the freight.

New Books for Building Mechanics

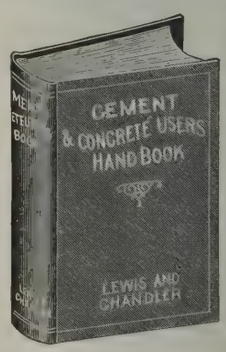
MODERN PLUMBING ILLUSTRATED. By R. M. Starbuck.

This book represents the highest standard of plumbing work. It has been adopted and used as a reference book by the United States Government, in its sanitary work in Cuba, Porto Rico and the Philippines, and by the principal Boards of Health of the United States and Canada.
It gives connections, sizes and working data for all fixtures and groups of fixtures. It is helpful in demonstrating and in figuring work. It gives the mechanic quick and easy access to the best modern plumbing practice. Suggestions for estimating plumbing construction are contained in its pages. This book represents, in a word, the latest and best up-to-date practice, and should be in the hands of every architect, sanitary engineer and plumber who wishes to keep himself up to the minute on this important feature of construction. 400 octavo pages, fully illustrated by 55 full page engravings. Price.....$4.00

STANDARD PRACTICAL PLUMBING. By R. M. Starbuck.

A complete practical treatise of 450 pages covering the subject of Modern Plumbing in all its Branches, a large amount of space being devoted to a very complete and practical treatment of the subject of Hot Water Supply and Circulation and Range Boiler Work. Its thirty chapters include about every phase of the subject one can think of, making it an indispensable work. Fully illustrated by 347 engravings. Price.....$3.00

PRACTICAL STEAM, HOT-WATER HEATING AND VENTILATION. By A. G. King.



This book is the standard and latest work published on the subject and has been prepared for the use of all engaged in the business of steam, hot water heating, and ventilation. It is an original and exhaustive work. Tells how to get heating contracts, how to install heating and ventilating apparatus, the best business methods to be used, with "Tricks of the Trade" for shop use. Rules and data for estimating radiation and cost and such tables and information as make it an indispensable work for everyone interested in steam, hot water heating and ventilation. It describes all the principal systems of steam, hot water, vacuum, vapor, and vacuum-vapor heating, together with the new accelerated systems of hot water circulation, including chapters on up-to-date methods of ventilation and the fan or blower system of heating and ventilation. 367 pages. 300 detailed engravings. Price.....$3.00

CONCRETE CHIMNEYS, SLATE AND ROOF TILES. By A. A. Houghton

The manufacture of all types of concrete slate and roof tile is fully treated. Valuable data on all forms of reinforced concrete roofs are contained within its pages. The construction of concrete chimneys by block or monolithic systems of is fully illustrated and described. A number of ornamental designs of chimney construction with molds are shown in this valuable treatise.....50 Cents

POPULAR HANDBOOK FOR CEMENT and CONCRETE USERS. By Myron H. Lewis

This is a concise treatise of the principles and methods employed in the manufacture and use of cement in all classes of modern works. The author has brought together in this work, all the salient matter of interest to the user of concrete and its many diversified products. The matter is presented in logical and systematic order, clearly written, fully illustrated and and free from involved mathematics. Everything of value to the concrete user is given, including kinds of cement employed in construction, concrete architecture, inspection and testing, waterproofing, coloring and painting, rules, tables, working and cost data. Price.....$2.50

ORNAMENTAL CONCRETE WITHOUT MOLDS. By A. A. Houghton.

The process for making ornamental concrete without molds, has long been held as a secret and now, for the first time, this process is given to the public. The book reveals the secret and is the only book published which explains a simple, practical method whereby the concrete worker is enabled by employing wood and metal templates of different designs, to mold or model in concrete any Cornice, Archivolt, Column, Pedestal, Base Cap, Urn or Pier in a monolithic form—right upon the job. These may be molded in units or blocks, and then built up to suit the specifications demanded. This work is fully illustrated with detailed engravings Price.....$2.00

CONCRETE FROM SAND MOLDS. By A. A. Houghton.

A practical work treating on a process, which has heretofore been held as a trade secret by the few who possessed it, and which will successfully mold every and any class of ornamental concrete work. The process of molding concrete with sand molds is of the utmost practical value, possessing the manifold advantages of a low cost of molds, the ease and rapidity of operation, perfect details to all ornamental designs, density and increased strength of the concrete, perfect curing of the work without attention and the easy removal of the molds, regardless of any undercutting the design may have. 192 pages. Fully illustrated. Price.....$2.00

CONCRETE WALL FORMS. By A. A. Houghton.

A new automatic wall clamp is illustrated with working drawings. Other types of wall forms, clamps, separators, etc., are also illustrated and explained.....50 Cents

CONCRETE FLOORS AND SIDEWALKS. By A. A. Houghton.

The molds for molding squares, hexagonal and many other styles of mosaic floor and sidewalk blocks, are fully illustrated and explained.....50 Cents

CONCRETE SILOS. By A. A Houghton.

Complete working drawings and specifications are given for several styles of concrete silos, with illustrations for molds for monolithic and block silos. The tables, data and information presented in this book are of the utmost value in planning and constructing all forms of concrete silos....50 Cents

MOLDING AND CURING ORNAMENTAL CONCRETE. By A. A. Houghton.

The proper proportions of cement and aggregates for various finishes, also the methods of thoroughly mixing and placing in the molds, are fully treated. An exhaustive treatise on this subject that every concrete worker will find of daily use and value.....50 Cents

Brings the Biggest Dividends to any Carpenter or Builder

THE International Auto Wagon is the most practical commercial vehicle you can buy. It will do all your light hauling in less time and at less cost than a horse-drawn vehicle. With it you can do all your necessary running around in one-third the time.

¶ If you are a carpenter, contractor or builder, you know from experience that tools, finishings, and working material must be on hand just when they are needed—or money is lost. With an

International Auto Wagon

there will be no delays—no unprofitable holdbacks.

¶ Two trips after material can be made in the time required to make one with the horse-drawn wagon. This means both time and money saved.

¶ The International Auto Wagon has solid rubber tires (no delays due to punctures), sufficiently high wheels for perfect clearance, and an air-cooled engine that can't freeze in cold weather. There are many other features that help to make it the most practical car for commercial purposes.

¶ Why not find out more about the International Auto Wagon? Write for catalogue and further information.

HE WHO USES CYPRESS BUILDS BUT ONCE

CYPRESS

"THE WOOD ETERNAL"

CYPRESS DEFIES DECAY

SO MANY PEOPLE KNOW
so little about woods
(and their relative values — How is it with you?)

CYPRESS LASTS PRACTICALLY FOREVER

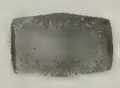
SO MANY PEOPLE THINK

that "LUMBER IS LUMBER"—(How often do YOUR CUSTOMERS *specify the kind* of wood they want you to use?)

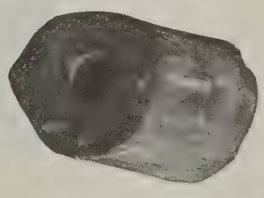
SO MANY PEOPLE BELIEVE

THAT FREQUENT *REPAIR BILLS* ARE *"NECESSARY EVILS"*

that we believe we are doing a public service in informing BOTH BUILDERS AND THEIR CLIENTS on



CYPRESS

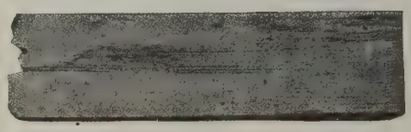


("THE WOOD ETERNAL")

HERE IS CYPRESS *VS.* AN IRON PLUG:

About 110 years ago, when Louisiana was a French Province, the Water Mains of New Orleans were CYPRESS logs, 18 feet long by 22 inches diameter, with a 5-inch hole bored lengthwise. These were joined by short iron tubes, tapered at both ends. A few years ago these were replaced by the most modern system. Below is a photograph of a section of one of the CYPRESS mains just as it was dug up—as sound as ever after 100 years contact with wet earth.

Below is a photograph of one of the iron connections just as dug up—most of them rusted past all usefulness.



HERE IS CYPRESS *VS.* WEATHER:

A photograph of a CYPRESS SHINGLE from the Austen Homestead, Staten Island, N. Y., built in 1710, and at last accounts still occupied by descendants of its original builders, with the original CYPRESS roof practically intact.

"He who uses CYPRESS *builds but once."*

CYPRESS is in truth "the wood eternal." If you are putting up a palace or a pasture-fence, and want to build it "FOR KEEPS"—USE CYPRESS. ***USE CYPRESS.*** **USE CYPRESS.**

There will continue to be a liberal education (and a wonderful INVESTMENT value for *everyone*) in this CYPRESS advertising —and in the detailed information and reliable counsel to be had promptly *WITHOUT COST*, if you will *WRITE US YOUR OWN NEEDS* (big or little), and *ASK YOUR OWN QUESTIONS* of the **"ALL-ROUND HELPS DEPARTMENT."**

Send at once for list of 32 VOLS. of the famous CYPRESS POCKET LIBRARY. Any (or all) volumes FREE to you in a hurry for your reliable guidance on "THE WOOD everybody is asking about."

UNCLE SAM SPEAKS ANOTHER GOOD WORD FOR

"THE WOOD ETERNAL" **CYPRESS** *"THE WOOD ETERNAL"*

Department of Agriculture, Forest Service, Bulletin 95, Page 44, issued June 30, 1911, says of *Cypress:*

"The properties which fit it for such wide use are the freedom of the wood from knots and other defects . . . and the *long period which the wood may be expected to last.* To this might be added handsome appearance, which frequently has much to do with popularizing a wood."

Further on CYPRESS, the same Government Report says: "The wood contains little resin and thus affords *a good surface for paint,* which it holds well . . . It is a popular wood where it is subjected to dampness and heat. It shrinks, swells or warps but little . . . For the parts of houses exposed to the weather it serves equally well."

Both quotations above are from Bulletin 95 (page 44), U. S. Dept. of Agr. (Forest Service), June 30, 1911.

"The Money You Don't Have to Spend on Repairs is ALL PROFIT."

When planning new improvements or repairs to old ones, just remember—*"With CYPRESS you BUILD BUT ONCE."*

WRITE TODAY for VOLUME ONE of the CYPRESS POCKET LIBRARY, with Full Text of OFFICIAL GOVERNMENT REPORT. *Also Full List of 31 Other Volumes.* (FREE on request.)

Let our "ALL ROUND HELPS DEPARTMENT" help YOU. Our entire resources are at your service with Reliable Counsel.

Slim Files for Trim Work

It takes an E. C. S. Keen Kutter Special Slim Taper File to make a good job of a fine tooth saw. From the start these files are made expressly for this work. They reach the bottom of the teeth no matter how fine, and cut true and quickly without a stutter or jump.

E. C. S.

KEEN KUTTER

Special Slim Taper Files

are accurately cut by unerring machinery on blanks of the best tool steel. Special tempering gives them unequalled hardness and toughness. Every tooth is of the same depth; every file is inspected and tested before leaving the factory, and is fully guaranteed. A set of these files should be included in every mechanic's kit.

LEARN ONE OF THESE TRADES

Electricity, Mechanical Drafting, Painting and Decorating, Bricklaying, Plumbing

They Pay Best

Hundreds of our graduates are now earning from **$5** to **$8 per day.** Many are in business for themselves and making big money.

OUR HOME

By the Coyne (Practical) Method you can learn one of the above trades easily and quickly, and at low cost. Living expense can be earned while attending school.

Our instruction is individual and given by experts in these trades. Actual work takes place of books.

Tools and Materials Furnished FREE

You can enter at any age, we have students 16 to 60 years old. We assist graduates to obtain a profitable position. Easy payments.

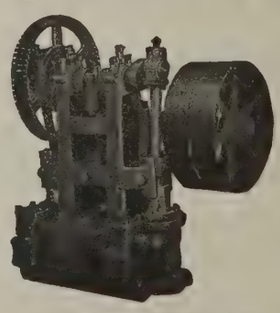
Don't Lug a Heavy Tool Box Around But

CARRY YOUR TOOLS IN THE INDESTRUCTO

CARPENTERS' TOOL CASE



It is made in suitcase style—of three-ply veneer, covered with strong canvas and painted, all edges bound in steel, reinforced corners, secure locks and catches and strong handle. The Indestructo is the handsomest tool case manufactured. It is light, very strong and the inside is so well arranged with separate compartments for saws, planes, level, square, chisels, bits, etc., that the cutting edges can not be injured. Tools can be quickly found and put away. It is made in two lengths, for 26 and 28 inch saws. Special sizes to order. Send for prices.

	Incidentals, 10 per cent	66.47
	Total carpenter labor	$731.21

RECAPITULATION.

Excavating and masonry	$439.40
Lumber bill	832.21
Mill work	641.03
Carpenter labor	731.21
Hardware	65.00
Tin work	45.00
Plastering 780 yards, 28 cents	216.40
Structural iron	15.00
Plumbing	310.00
Electric wiring	50.00
Painting	220.00
Heating, furnace	160.00
Incidentals, 5 per cent	186.16
Total estimate	$3,911.41

Approximately this house contains 38,000 cubic feet, which makes the cost about 10 1/3 cents per cubic foot.

EDITORIAL NOTES AND COMMENTS

What with floods, fires, railroad wrecks, automobile accidents, losses at sea, deaths from collapse of buildings and defective scaffolds, we would almost be led to believe the earth would soon become depopulated.

The great bulk of humanity takes little or no heed of this continual drain and so it goes on apace, but if a puff of smoke or the crack of a rifle takes place on the coast of Africa, or a few shots destroy the lives of a dozen or more heathen Chinese, the papers blaze it forth to the whole country in striking headlines, and the woes and losses of the Native American are soon overlooked and forgotten, until another flood, shipwreck or railway disaster comes to the front again to remind us that some other natives have been sacrificed by carelessness or greed on the altar of a never satisfied Moloch.

A few weeks ago, a public speaker, Mr. F. H. Schwedtman said that the total number killed, wounded, and missing in the United States in the six bloodiest battles of the Civil War was less than 105,000 men, while the total number killed and injured upon railways during the year ending June 30, 1906, was 108,324.

Notwithstanding this great loss of life and the regular losses occurring daily to working men, by accidents that are continually bringing poverty and untold miseries to thousands of worthy citizens and children, the highest court of New York unanimously annulled a workmen's accident compensation act, which involved the element of compulsion. The act was limited to hazardous trades and required employers to compensate injured workmen or their families regardless of negligence or responsibility for the deaths or injuries; and this was held by the court to constitute the taking of employers' property without "due process of law."

The question now is can the ruling of the New York court obtain in other states? We are inclined to believe it can be rendered in-operative, and that eventually the law of compulsory compensation will be accepted in every state in the Union. Recently the Supreme Court of the State of Washington, passing on a similar cmopulsory compensation act, sustained it as valid, sound and constitutional. The Washington act is also limited to contribute to a fund from which the state disburses fixed payments to injured workmen or families of killed workmen. The Washington court had the New York case and decision before it and very carefully considered the alleged constitutional objections to any kind or scheme of compulsory compensation. It deliberately declared that "It could not yield its consent to the view" taken by the New York court. It agreed with those eminent lawyers, teachers of law, sociologists and economists who severely criticised the New York decision and its technical construction of the phrase "due process of law."

The New York case could not be carried to the United States Supreme Court, but the Washington case can and doubtless will be taken to that tribunal. We may, therefore, look for a thorough and authoritative discussion of the meaning of "due process of law" and the validity of the kind of industrial compensation statutes, now demanded by enlightened public opinion and indorsed by progressive employers.

The old idea, that a workman would injure himself to get a generous compensation, has been found untenable in countries like Great Britain and Germany, where the workers enjoy the most modern legislation in this direction. It has also been found out that while factory inspection results, generally speaking, in protection of machinery after an accident has happened, or in case of very glaring danger, workmen's compensation legislation has resulted in the adoption of the most modern protective devices available, in time to prevent accidents. This is natural, as an employer finds it cheaper to protect his employees than to pay compensation. Surely the reducing of the dangers of employment, the lessening of the number of the maimed and crippled in industry, cannot but meet with the approval of all reformers, who have the welfare of the workman at heart.

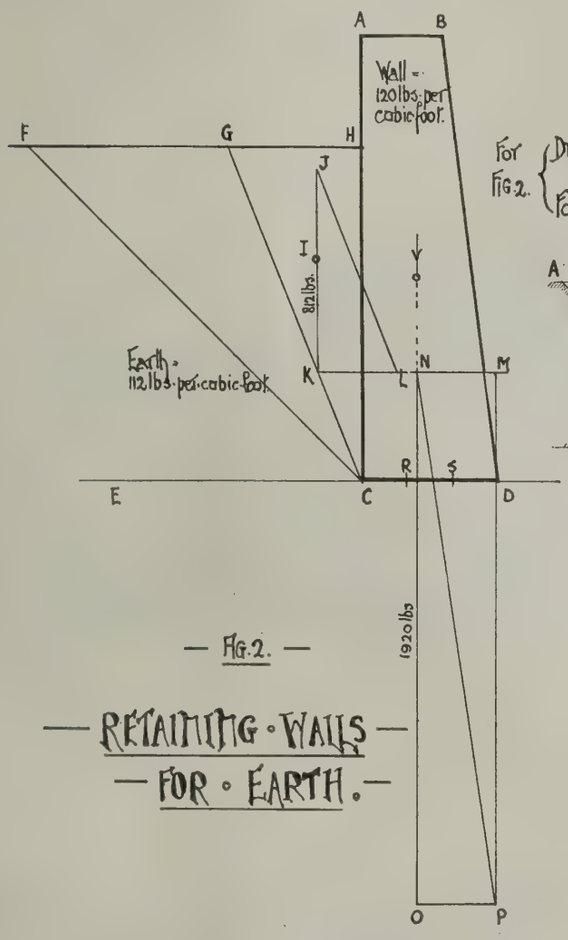
The lack of men not only skilled of hand but developed mentally has been a feature of modern industrialism. It is so easy for a mere lad to "get a job" in a shop where he learns only the mechanical part of the trade that the high school or grammar school graduate considers it degrading to start at the bottom with the younger boys. At the same time there is abundant opportunity for those who will combine book knowledge with shop training. Manual training schools were a step in the right direction, and the apprentice system helps, but it was left to Professor Herman Schneider of the University of Cincinnati to devise a plan which would give the student both practice and theory. His plan was first applied to the technical students of his university in such a way that the shops of the city took charge of the practical training and the university taught the theory.

By this method the university is relieved of the expense of laboratories and shops with expensive machinery, which becomes more or less obsolete in a few years. The students receive a practical training which no school could possibly furnish, as they are part of a commercially operated plant, and push and energy are necessary to hold their places in the shop organization.

The system appealed strongly to several manufacturers of Fitchburg, Mass., who recognized the need of a similar school in their city. As a result the Simonds Manufacturing Company, manufacturers of saws and knives; the Fitchburg Steam Engine Company, manufacturers of steam engines; the Bath Grinder Company, manufacturers of grinding machinery; the Blake Steam Pump and Condenser Company, manufacturers of pumping machinery; the Cowdrey Machine Company, manufacturers of special and woodworking machinery; the Putnam Machine Company, manufacturers of lathes, planers, railroad tools and general machinery; the Fitchburg Machine Company, manufacturers of the "Lo-swing" lathe; the Brown Steam Engine Company, manufacturers of steam engines; the Jennison Company, tinsmiths and piping engineers; and the L. H. Goodnow Company, iron founders, arranged with the school authorities to work together in training young men for shop work. On the one hand the city was not obliged to pay out one dollar for the shop training, and on the other hand the manufacturers agreed to pay considerably more than apprentice wages to the students while in the shops. Practically every other week was spent in the shops, and at the end of four years the boy had a trade, had earned on the average eleven cents per hour while working, and was a student at the public schools at the same time. Every boy who wished to could continue his shop work after his four-year course was over, and as he knew just what the shop practice was, he was far better fitted for the work.

For the three years this system has been in operation in Fitchburg there have been few indications that the idea was not a success. Of course, some boys dropped out, as they would out of business, but on the whole the results are such as to warrant an extension of the system. The manufacturer is really getting a chance at the pick of the boys for his shop, drafting rooms, offices, etc., and the boy is contented because he is a man in the shop among men, earning money and learning. The antagonism of some workmen to apprentices is scarcely noticed, for their own boys are frequently candidates for the shop classes. The extension of the Professor Schneider's plan, or the Fitchburg plan, could well be adopted in many other cities and would go far toward settling the industrial unrest which periodically seems to sweep the country. With educated men in the shops and shop-trained men in the office, there would be far less cause for complaints of injustice toward either employer or employe.

The astonishing transformation that can be effected by an intelligent system of afforestation is strikingly illustrated by what has happened in the Department of Lands in France. At the close of the Eighteenth century about 2,500,000 acres in that region were little more than shifting sand dunes and disease-breeding marshes. But the planting of pine trees has made the desert rejoice and blossom as the rose. At the present time these lands are among the richest, most productive, and healthful in all France. Even the character of the climate of the region has been modified, becoming milder and more balmy. A thin layer of clay beneath the sandy upper surface of the soil, formerly impervious to water, has been piereced by the pine roots, until a thorough drainage is established to the spongy earth that lies below.



LEAVES FROM A STUDENT'S NOTEBOOK—No. 6

By GEO. METSON

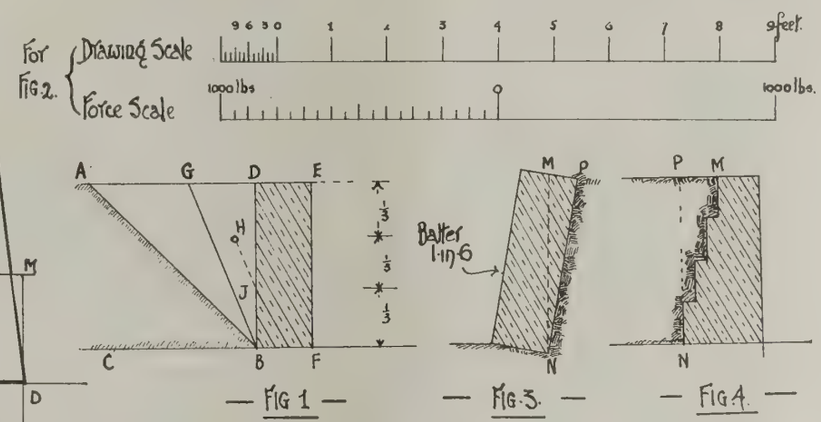
RETAINING WALLS FOR EARTH.

JUST as in designing a dam to retain water, it is easiest to assume the dimensions of the wall, and then to check it for stability by finding the resultant of the forces, so the same system is simplest in dealing with walls to retain earth; but it is first necessary to ascertain the line of rupture, and the maximum of the horizontal thrust.

First dealing with the line or plane of rupture. If earth be tipped from a wagon, it forms a certain natural angle; similarly if a mound of earth is left exposed to the weather, it falls particle by particle until it forms the natural angle of such earth. The angle so formed with the horizontal is called the "angle of repose."

— FIG. 2. —

— RETAINING WALLS — FOR EARTH. —



The following table gives the approximate angles of repose, and the weight per cubic foot of various earths.

Nature of soil.	Natural angle of slope with the horizontal line = angle of repose.	Weight per cubic foot in pounds.
Gravel	40°	112
Dry sand	38°	92
Sand	22°	116
Vegetable earth	28°	83
Compact earth	50°	100
Shingle	39°	141
Rubble	45°	153
Clay well drained	45°	112
Clay wet	16°	124

In Fig. ABC is the angle of repose, then ABD is the complement, and if DEFB is the proposed retaining wall it is clear that the earth ABC cannot exert a force on it. It has been established by eminent engineers that the whole of the complement ABD does not exert a force, but that it is the wedged-shape mass between the wall and a line bisecting the complement ABD that tends to break away and overturn the wall. In Fig. 1 this would be GBD. GB is termed then the plane of rupture. If the wedged-shape mass GBD should move, it would slide down this plane, and would act as a wedge on the wall and force it out horizontally.

The force of this wedge GBD will be parallel to the plane and the mass of it can be considered as concentrated at its center of gravity, through which the force will act. In Fig. 1, H is the center of gravity and HJ the line of direction of the force, intersecting the wall at J. This point J is always one-third the vertical distance of the earth up the wall. If the horizontal reaction of the wall at the point J is not equal to the force acting on HJ the wall will overturn.

An example can now be worked out. Let it be required to

— FIG 1 — — FIG 3. — — FIG 4 —

determine the stability of the masonry wall ABCD in Fig. 2, when the earth weighs 100 pounds per cubic foot and its angle of repose is 45°.

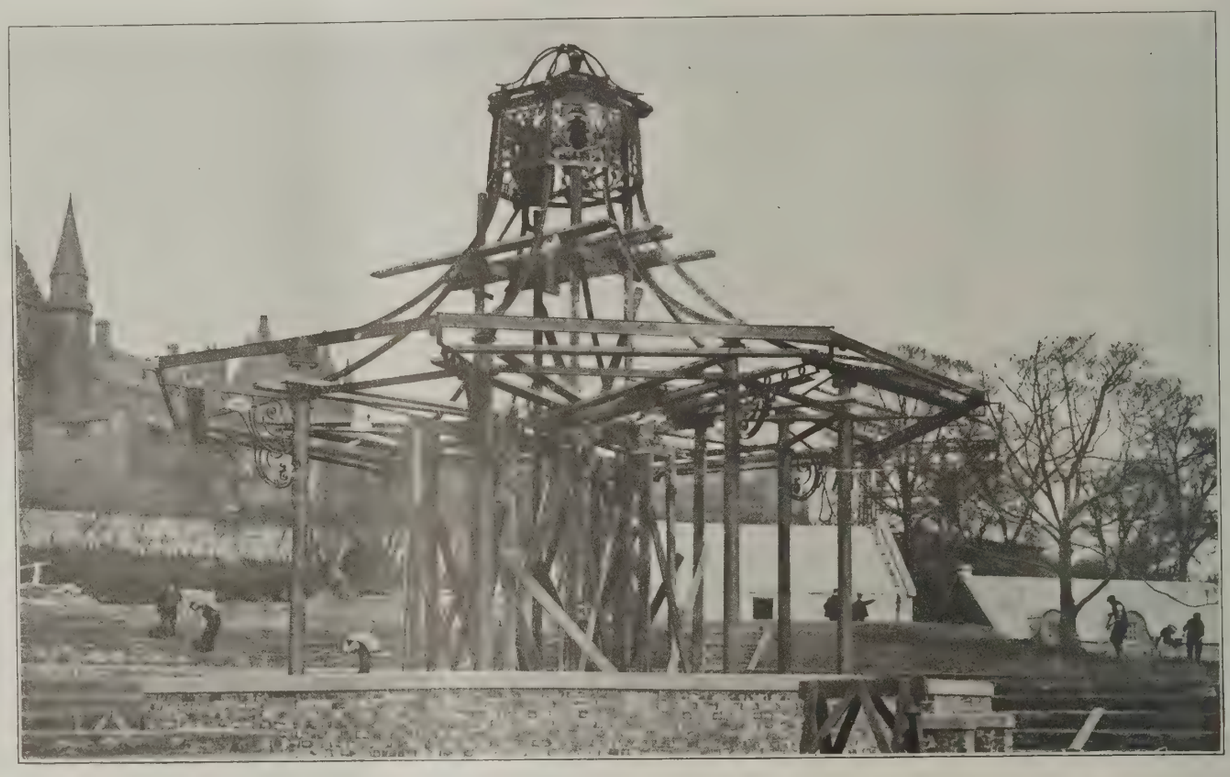
First set out the angle of repose 45° = FCE. Bisect its complement FCH to obtain the line of rupture GC. The wedge of earth to be considered is GCH. This mass will act through its center of gravity I. Through I drop G perpendicular to the plane of rupture meetng it in K (always 1-3 up from base); a horizontal line through K will give the direction of the resultant of this force as KL. Draw KJ to represent the weight of the wedge of earth to any convenient scale. Set out the angle KJL equal to the angle GCH (or 90° — angle of repose, divided by 2). JL will cut KL in L; when KL equals the magnitude and direction of the force exerted by the mass of the wedged-shape earth GCH.

The weight of the wall will exert a force through its center of gravity X. From N, where the direction of the force of the wall meets the line denoting the direction of the force of the earth, drop a perpendicular, making NO equal to the weight of the wall (to the same scale as used for KJ). Make NM equal to KL, i. e., to the magnitude of the resultant of the force of the earth, and complete the parallelogram MNOP and join NP which line represents the direction of the combined forces. For the wall to be stable it is generally considered necessary this diagonal should cut the base of the wall within the middle third (R. S. is the middle third of the base in Fig. 2).

The following general notes should be kept in mind.

The batter of a retaining wall should not be too great, otherwise water will find its way into the brick or masonry joints. In any case the wall should be built with cement, and it is best to have a soakage of from 9 to 12 inches in thickness at the back of the wall, formed of gravel, hard coal or other porous substance to allow the water to find its way to the weepholes which should be provided about every 8 feet apart. The weepholes should discharge into a properly formed channel and from there be connected to a proper surface water drain.

Earth that when sodden is practically fluid, must be treated as such, and the wall be calculated for as a dam.



In a retaining wall of the section shown in Fig. 3, in calculating the weight of the wall the portion MNP must not be reckoned. For one of the sections shown in Fig. 4 the weight must be taken as the weight of the wall together with the weight of the earth on the wall side of the line PN.

CONSTRUCTION OF TERRACED BAND STAND

By JOHN F. DUNLOP

THE terrace bandstand which has been erected in Kelvingrove Park for the Scottish National Exhibition and is to remain the property of the Glasgow Corporation has produced fascinating results.

The base of the stand is formed of pressed brick and finished with a red sandstone cope, on the top of which is erected the wrought-iron bandstand.

The choice of the site, which is partly on ground sloping towards one of the carriage drives, is a very happy one, and the whole arrangement is a vast improvement on the old style of bandstand where only a small portion of the audience were able to see what was going on.

Fig. 1 shows the plan of the terrace and Fig. 2, the section in which the various steps have been turned on the end, so as to follow the sloping surface of the ground.

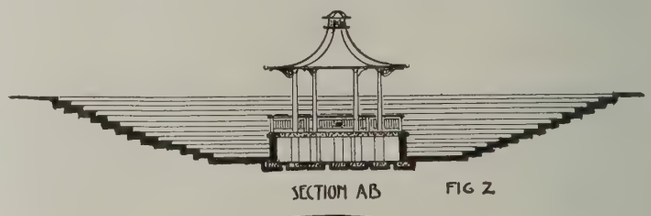
The terrace throughout is of concrete four inches thick, which has been laid on a footing consisting of shapeless ashlar stones and pieces of hard rock, the least fit for cutting, and small fragments of stone, which have been rejected as quarry debris.

The craftsmanship required for this work was perfectly simple for rough labor only sufficed.

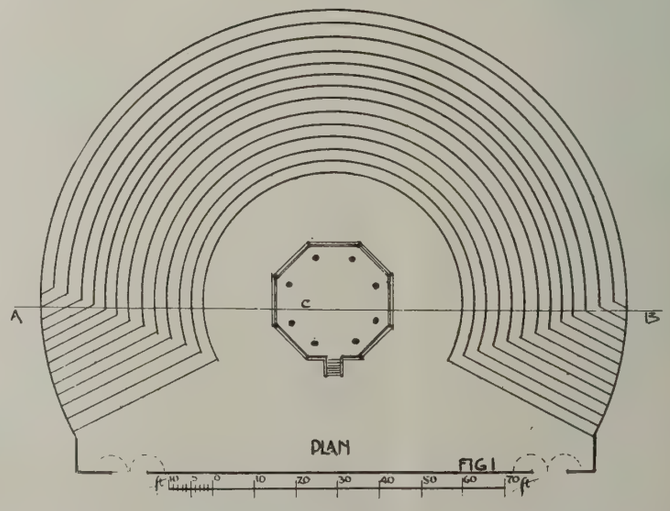
The most important part of the constructive feature was the cutting out of the various stages of step on the ground, and the fixing of the timber framing to form the breast of the terraces.

The boarding had to be very securely fixed to prevent bending under the weight of the concrete, and was coated with a strong solution of soft soap to prevent the adhesion of the concrete.

The plastic concrete was made up of Portland cement and broken bricks, which had been well wetted with water before mixing, turned over, and allowed to drain so that the surfaces would be damp, but not wet, when required for use. In mixing the material, after being properly gauged, it was twice mixed in a dry state and was ridged around a central cavity prepared to receive the water, which was applied from a watering can with a hose, and the concrete afterwards mixed twice.



For setting the concrete in position, care was taken that none of it was thrown from a height to prevent the larger and heavier portions becoming separated from the remainder of the falling material and the air included rendering it less compact.



Immediately after the removal of the wood framing, the horizontal and vertical surfaces of the steps were finished with cement, Fig. 3.

The bandstand, which is in the center of the circular gallery, is built on a concrete foundation, the wall being in brickwork built in Flemish bond with asphalt damp-proof course introduced at the ground level.

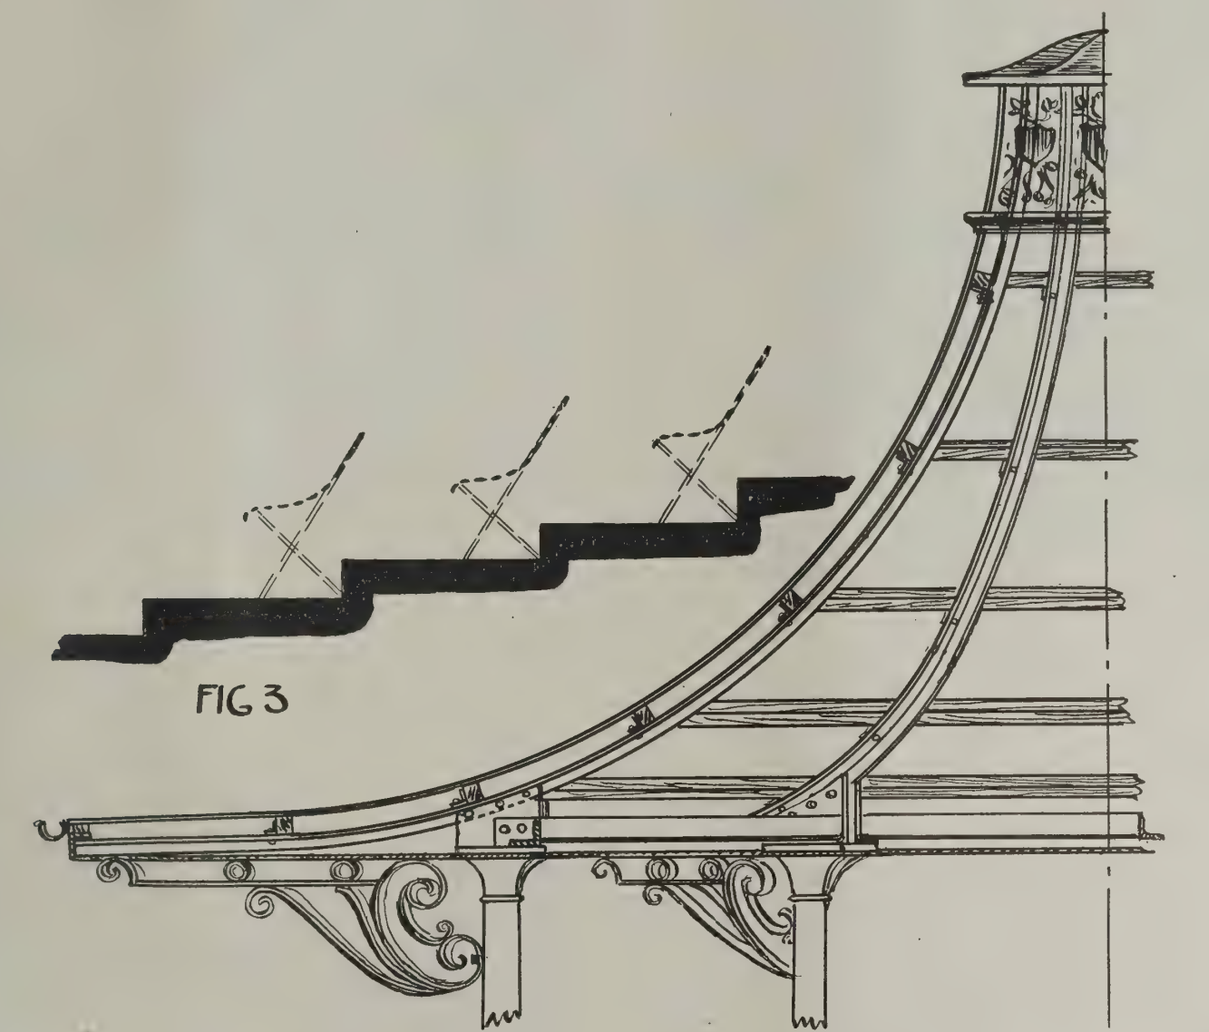
Internally, the brick piers, which are the main support for the castiron columns supporting the structural iron work of the roof are square in section and are carried up to the underside of the concrete floor.

Fig. 4 shows a detail at *C* in which the construction of the roof is shown. Here modern architecture has progressed and is progressing, only we are allowing our structural engineers to take the lead. It is encouraging, however, that the general outline and design of detail was prepared in this case by an architect and that the whole being composed of ordinary sections of steel placed to-

gether in an artistic manner has given a bandstand which is as characteristic of the material of which it is built as a building in brick, wood, or any other material.

Fig. 5 shows the erection of the structural iron work, the roof trusses which supported the various wood purlins being covered with boarding.

The roof is covered with red composite slates, which have produced a very pleasing effect.



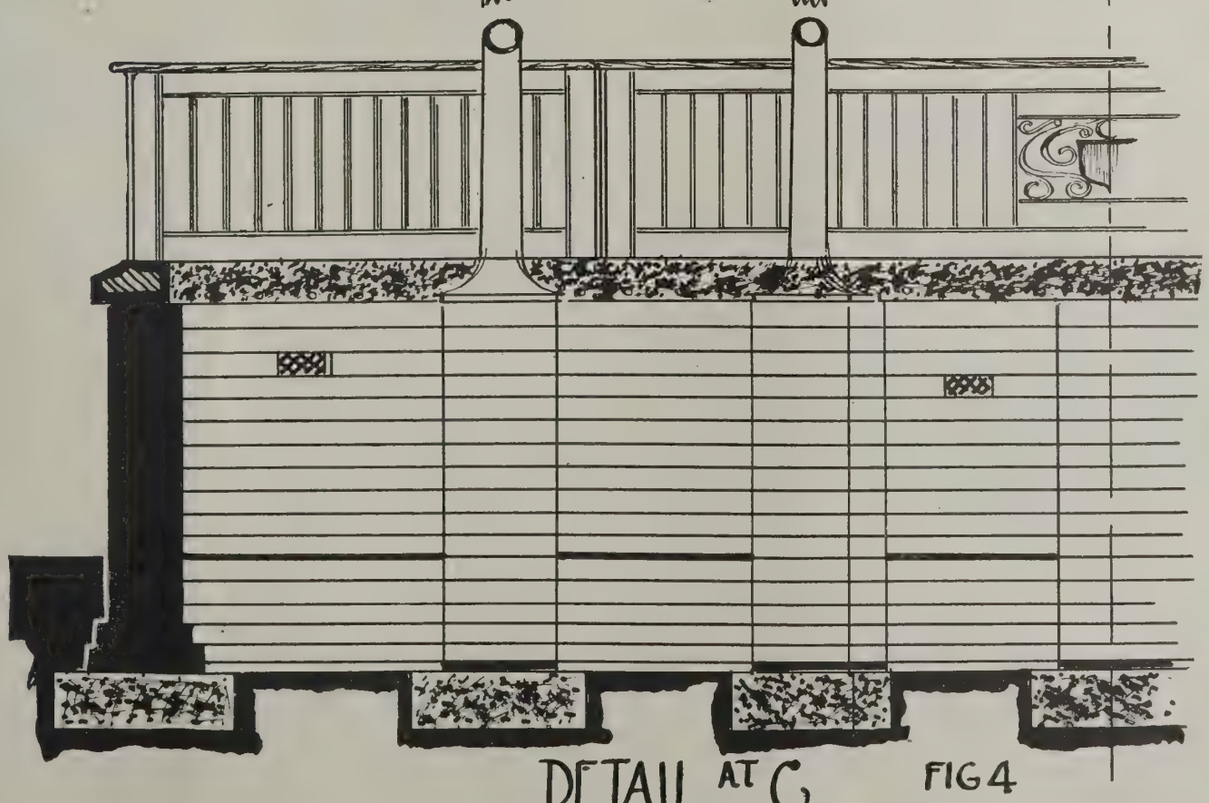


FIG 3

DETAIL AT C FIG 4

ROOFING WITH THE STEEL SQUARE

By J. H. B.

ALTHOUGH the roof dealt with in the present article has framed principals, with tie beams and collars, there will require little explanation beyond what has already been given, the principal rafters themselves being connected to the tie beams with mortise-and-tenon joints, and in practice the usual iron straps would be fixed.

The angles of the rafters where they come to the ties, in a roof of square pitch such as this, will be 45 degrees, which means that it will be given correctly if the square is placed on the wood

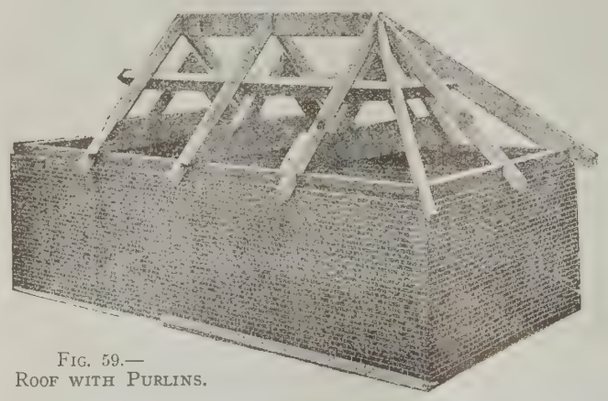

FIG. 59.—ROOF WITH PURLINS.

to the 12-in. line on each arm. This will also apply to the shoulders of the collar beam and the mortises to take the same. The principal rafters are usually mortised and tenoned, or halved together at the top. In either case it means square joints only.

The ends of the tie beams will project over the plates, and must be cut off at an angle of 45 degrees. As they should finish level with the back of the rafters, the width of the building to the outside edges of the wall plates, plus the backing of the rafters, measured at an angle of 45 degrees, will give the correct length to the longest points.

In the case of a roof with gables, the purlins are an extremely simple matter; but with a hipped roof such as that shown in the photographs, Figs. 59 and 60, they should be mitred at the hips. And it is the correct angles at the mitres which require getting correctly. These are by no means easy to get by any rule-of-thumb methods, and the same remark applies to getting the correct lengths.

Theoretically, the correct position of the purlins is midway between the plate and ridge, but practically it is as well to place

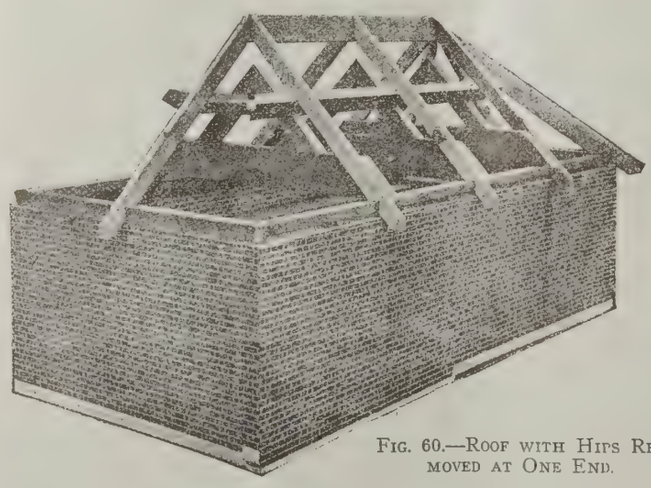

FIG. 60.—ROOF WITH HIPS REMOVED AT ONE END.

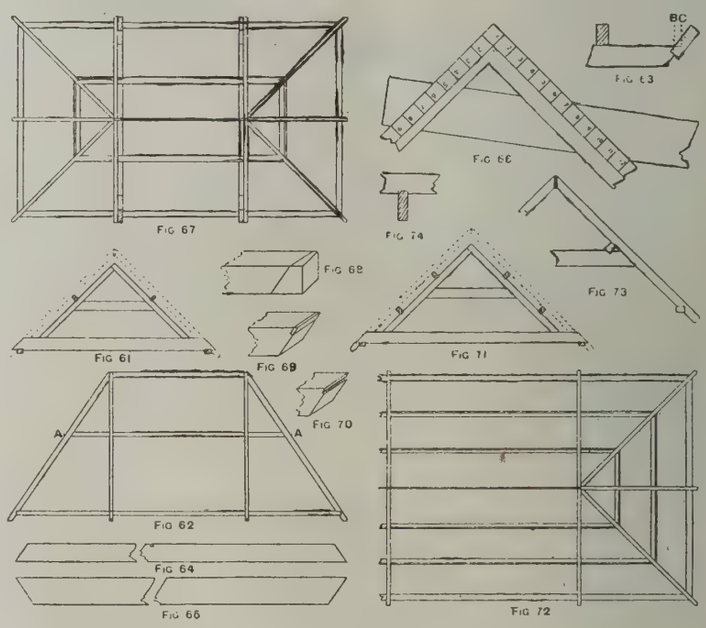
it somewhat closer to the ridge, as shown in the section Fig. 61, as otherwise the collar beam is brought very low down.



The correct length of the purlins may be obtained in two different ways. One way is by developing one side of the roof, as Fig. 62, and marking the purlin as shown, at the height it has to be fixed to. The measurement from the two points A will then be the length to the outside and the top of the hip rafters; but as the purlin will come down from the top of the latter, a distance equal to the depth of the common rafters, this must be allowed for, as in Fig. 63, where line B shows the length up to the hip, and line C the actual length required to come halfway on to the thickness of the hip.

In a roof of square pitch, such as is now being dealt with, the bevel of the top and side cuts on the purlin comes the same as shown in Figs. 64 and 65, the one showing the edge and the other the flat. The correct angle is obtained by placing the square to the 12- and 9-in. marks, as in Fig. 66. The reduction in length of the hip required when taking the measurements from Fig. 62 can easily be worked out as Fig. 63, by using the square as in Fig. 66.

The length of the end purlins will be found in the same way as that of the side ones, by developing the end of the roof, and the angle will, of course, work out the same as the others. An alternative method of obtaining the length of the purlins, and one which has the advantage of giving both side and end at the same time, is shown in Fig. 67. A complete plan of the roof is drawn to a fairly large scale, with the purlins in position, when the lengths can be taken halfway on to the hips at both sides and ends. This will be found to come perfectly correct, the angles being worked by the square in the same way as given above.

As the hip rafters will in all cases be of greater depth than the ordinary rafters, the purlins will require fitting to them, the depth of the notch from the end of the purlin being in all cases equal to half the thickness of the hip rafter, the depth of the other varying according to the width of the latter. It is, however, easily worked out as in Fig. 63.

In cutting the ends of the purlins, the dead length should

first be cut to. The end as shown marked in Fig. 68 should be cut off and the notch marked as in Fig. 69, the notch cut being as in Fig 70.

The purlins can always be placed slightly higher or lower in the roof if cut too short or too long. This, however, is not workmanlike, and of course it will not do to get over a mistake in this way with both the side and end purlins, or they will not intersect.

If double purlins are to be used in a roof as in section, Fig. 71, the lengths may be obtained by either method given above. Perhaps working by the plan is the best way, as in Fig. 72. The purlins should be placed as nearly equidistant from plate and ridge as possible; the angles will, of course, be the same as when single purlins are used, although the lengths are different.

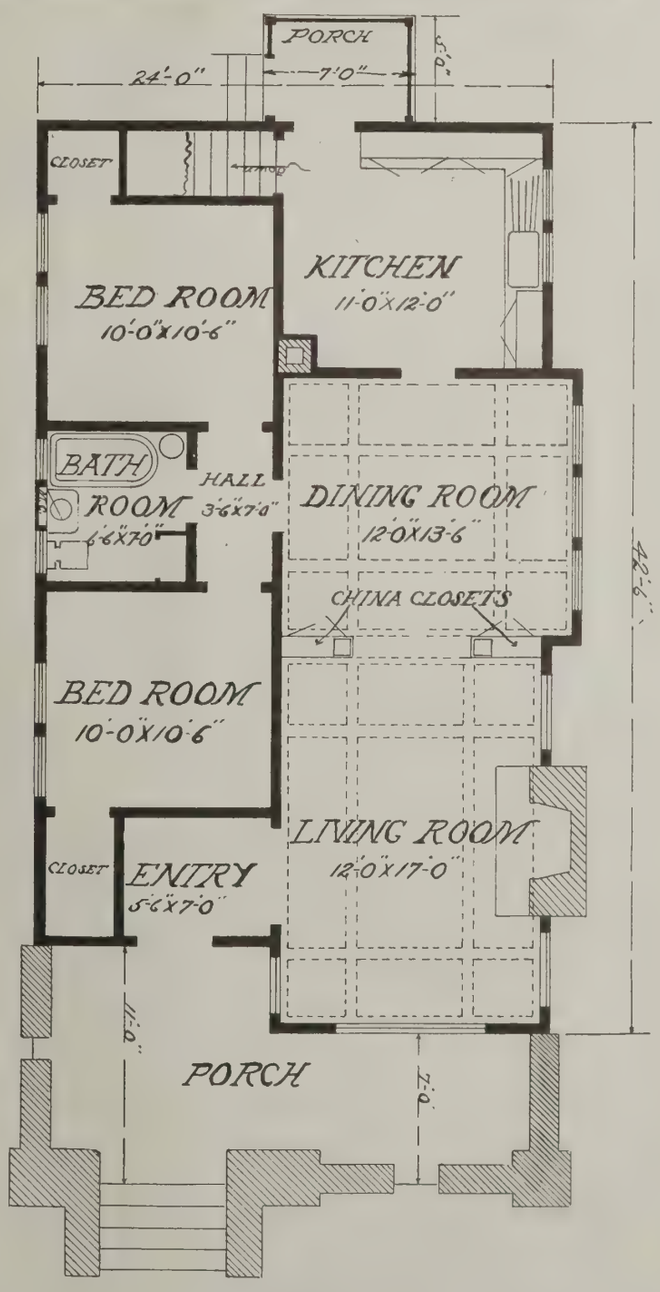
In a collar-beam roof of a lighter kind, framed without separate principals, as Fig. 73, the purlins are laid in notches cut for them in the collar beam, over which the purlins should fit, as in Fig. 74 (though they sometimes are not made to do so). In this case the purlins must be made correct in length, as they cannot be raised or lowered to rectify an error, the position being fixed by the framed-in collar beam.

It will be noticed that the purlins have been shown at right angles to the rafters, not vertical as they are often placed under the mistaken idea that the pressure on them is vertical, and this position is thus stronger. The pressure on a roof is at right angles to the rafters; thus the purlin should be placed edgeways to this pressure, so that it may withstand it as far as possible.

A SEATTLE BUNGALOW

Designed and Built by JUD YOHO

THIS bungalow is built on a new and unusually interesting plan, especially suited to a narrow lot. On the ground, the building is 24 ft. by 42 ft. 6 inches, not including porches, and the compactness and absence of waste space is accountable for the very low price for which it was built. This house has been

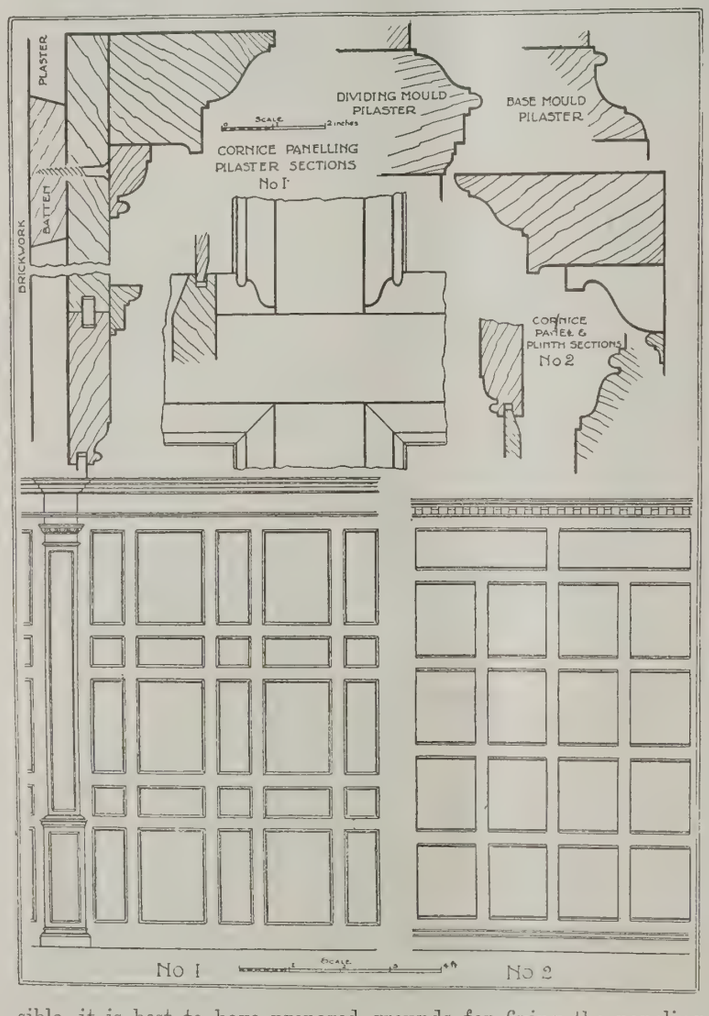


built a number of times for $1,600, although it would probably cost more in places not so favorably situated for lumber and other materials.

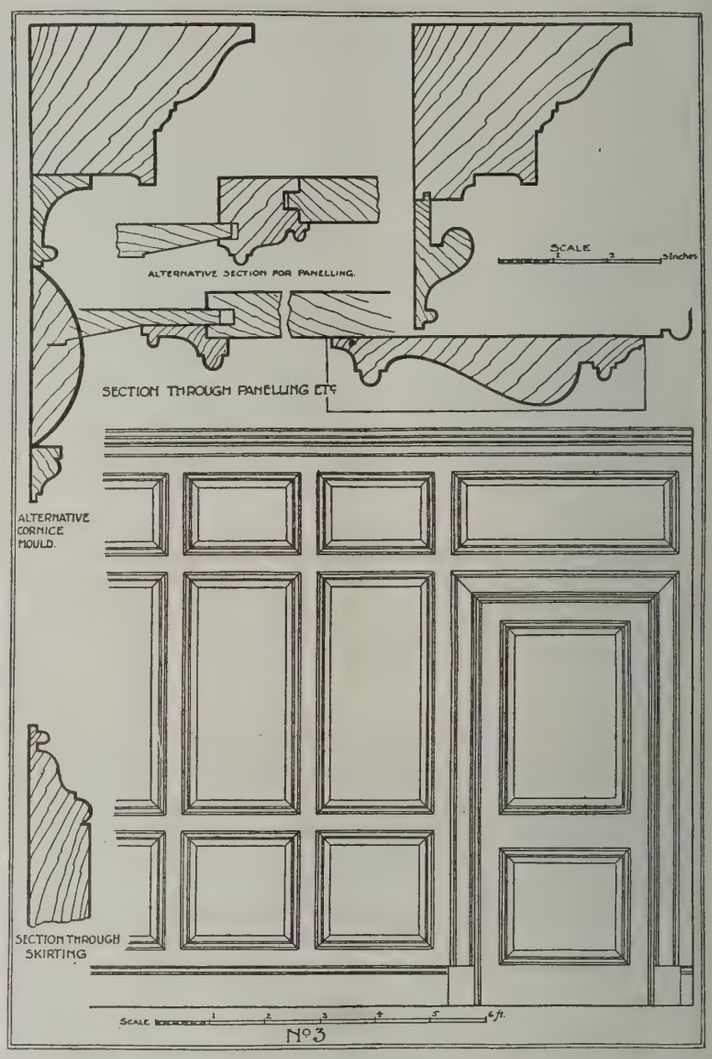
Five rooms are provided on the ground floor, and there is sufficient space in the upper story for two more small rooms. These could, with considerable advantage, be finished off in wall board, or similar wall covering, making excellent space for play-rooms or storage.

Many conveniences are provided in the rooms. The arch between the living room and dining room contains built-in china closets with adjustable shelves. The kitchen and bath-room have an enameled plaster wainscoat five feet high, marked off in imitation of white tile. Every requirement of a small family is well met.

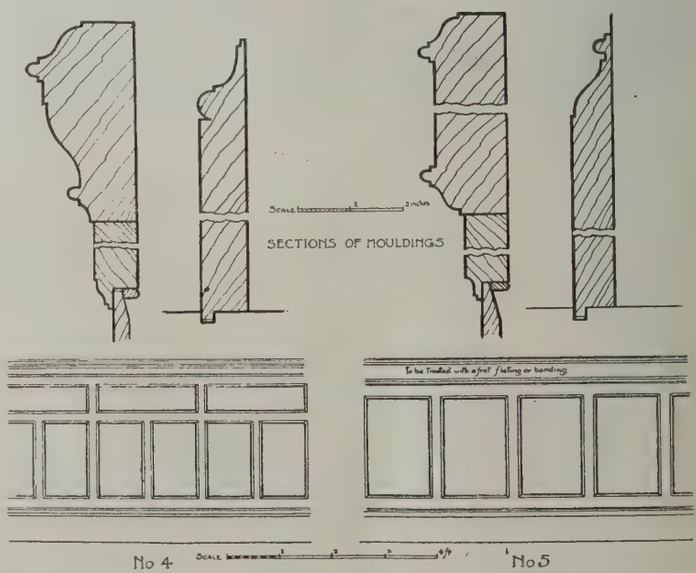
For the exterior, the re-sawed siding makes a pleasing appearance and the use of clinker brick in fantastic arrangement relieves the lines of the porch and chimney. The porch has a cement floor.



While the general tone of the exterior is that of dark brown pine, the unusually wide verge boards and outside casings are painted a light tan, which greatly offsets the darker color.



PANELING: ITS CONSTRUCTION AND FIXING

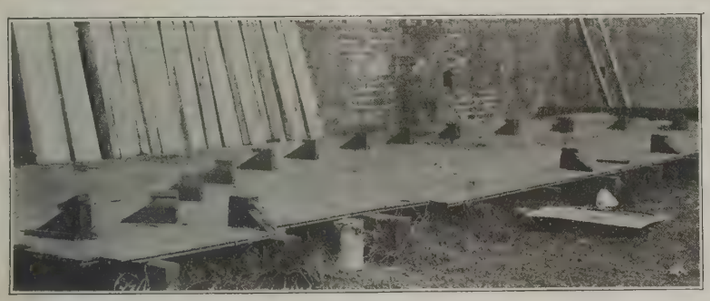


From The Cabinet Maker and Furnisher—All Rights Reserved

IN THE early years of the 16th century paneling became a somewhat common form of covering for the interior walls of the best houses, and even today we have nothing better or more artistic as a background. The edges of the framing were almost always moulded; at first the mould was formed on the framing, but later separate mouldings were mitred and applied around the panels. No. 1 scheme shows the panels with a moulding on three sides, finishing on a bevel at the bottom for convenience in dusting. This bevel is a survival of the weathering on exterior work of the Gothic period. As regards thickness, the panels should be handtight in the grooves, which should be made deep enough to allow the panels to swell. To break the monotony of the design, pilasters are often introduced to emphasize important features of the room, such as windows and doors. The old paneling was usually carried down to the floor with a plinth or skirting. In first-class work, when a skirting is used, it is provided with a tongue at the bottom edge which fits into a groove cut in the floor, thus if shrinkage takes place, there is no open joint. If it is possible, it is best to have prepared grounds for fixing the paneling to the walls. These consist of a series of battens fixed to the wall before plastering, in a favorable position for the screws. The battens are generally 3 in. by ¾ in., and have beveled edges, as shown in the illustration. In cases where the walls are not prepared as described, plugs are used, and the paneling is screwed to these, and thus secured to the walls. Often a room has to be measured for fitments and paneling when the building is still in the brick-work stage; 1½ in. should be taken off each measurement to allow for this, as the plaster on each wall will be ¾ in. thick when the work is finished.

Small panels are characteristic of nearly all paneling down to about the middle of the 17th century, after which the panels were much larger and surmounted by heavier mouldings. The great width of the panels in the paneling made during the second half of the 17th century, and its splendid condition today as regards freedom from shakes and warping, is remarkable of the workman cognisant of the varying conditions found in much of the wood now used. The details and general dimensions as shown on Scheme 3 would harmonize with the furniture of the latter part of the 17th century. It will be noted that a picture moulding forms the bottom of one of the cornice sections; this is an unusual feature in old work, but a very useful one in modern times. The

cornices of the period under consideration were generally elaborately carved, and often a molded chair rail was fixed between the lowest and upper panels. In the alternative section the panels are raised above the framing; this plan was often followed. Perhaps the most fitting form of wall decoration for an 18th century interior is a dado of paneling, the walls being covered with paper or damask, surmounted by a modeled plaster freize and cornice. The dado is generally painted white, but where hard woods are used it is, of course, possible to carry out the decoration in harmony with, rather than in contrast to, the furniture. For instance, the introduction of a fret in the freize of a dado for a Chippendale drawing-room, fluting and paterae for a room in Adam's style, and bandings and inlaid lines for Hepplewhite and Sheraton. Taking the walls as a background for furniture, a white dado is very much to be preferred from a decorative point of view. In much of the best-class work mahogany finished white is the material used. Unfortunately, it frequently happens that paneling has to be fixed in position before the building is quite dry; as a precaution against the expansion of the woodwork from dampness, the back of the paneling is treated with lead paint.



THE CONSTRUCTION OF BELFAST TRUSSES

By J. W. OVEREND

ONE of the best adaptable roofs and roof trusses for temporary structures, and not only the latter, but for permanent buildings also is the segmental curvilinear roof used first at Belfast in Ireland, hence the name.

Where timber construction is largely used it is very adaptable and the only drawback to it being used more is the absence of any architectural features in it, although by careful design this objection can be got rid of, especially at the gable ends.

On the other hand the advantages are many, the trusses can be built up cheaply, short pieces being used for the lattice bars; the curved form enables the rain-water to flow quickly away, the trusses are lightly constructed, lightness combining with great strength,

and here it may be remarked that the curvature for strength is greatest, when the trusses in height at the center are less than half circle, in fact some builders have the segmental height to the half height of the semi-circle height of the span to be crossed.

Again the building up of the trusses economizes material, they can be used for large spans that are in positions where iron pillars for supporting purposes cannot well be used, and if properly made and built up they will last the life of any other ordinary truss or trusses.

For motor garages, sheds for air ships, bi-planes, skating rinks, cinematograph halls, etc., they are often used.

Although the trusses can be built up in the builder's yard, the general practice is to build them up on the site of the building itself.

A platform is usually made of tongued and grooved floor boards, and on this is marked out the curvilinear shape of the truss, etc., the boards resting on battens, and it may here be remarked that the boards for the covering of the roof are often utilized for this purpose.

After having marked out the form, etc., on the setting out board, guide blocks are fixed on same with one side or edge at right angles to board in order to receive thrust of curved pieces or rafters, on the external side when being built up.

Photograph No. 1 illustrates the method generally adopted of fixing blocks on board; although not shown in the photograph, it is as well to use twin blocks for the sandwich tie beams, allowance being made for camber, and to keep the flitched beams "camber wise" until the lattice bars are fixed into position. The roof shown in illustration No. 2 was for a clear span of 36 feet, and the number of trusses used for same was 29, placed 10 feet apart, covering an area of 300 feet by 35 feet, for a building to be used for the making of galvanized tanks, etc.

The sandwich tie beams were made of pitch pine, the lattice bars and curved rafters of red deal, the twin tie beams being composed of two 9-inch by 2-inch pieces of timber bolted together at suitable places; the skeleton struts or lacings were 3 inches by 1 inch, while the curved rafters were made up of four pieces of 2-inch by 2-inch square material sandwiched together in couples. In fixing the rafters the same are pulled to the guide blocks, and either spiked or bolted to the lattices.

In the construction or building up of the trusses on the fixing board, the lacing pieces which form the herring bone strutting in the trusses are carried forward in order to form the pockets into which rest, and are fixed the purlins as seen in Fig. 2.

The lattices themselves should be at an angle of about 60 degrees to the tie beam, and at the intersection of crossing of the bars, bolts could be placed in, although this is unnecessary, as the stresses at that particular part are practically nil, and any lateral movement would be due to the twisting of the material itself.

After being made on the ground the trusses are lifted bodily into position, the purlins then being dropped into the pockets provided. In some cases struts are fixed directly under the purlins and birdsmouthed on to the tie beams. This is a preventative for any lateral motion occurring.

In this particular case this roof was an extension of a building already in place and bearing for the carrying of the tie beams was provided at one end, while the other end is carrying on an 11-inch by 4-inch horizontal wood plate or lintel which is halved together at various places throughout its length.

This plate is supported by brick piers (seen in Fig. 2) 14 inches square and these again have their base on a sandstone template.

A good method is to plane the lattices and members of the trusses, and paint same before building the trusses up. This preserves same wonderfully, and makes them in a condition to be painted afterwards periodically.

For the covering of the roof 1-inch tongued and grooved boards could be used, these also should have two to three coats of paint before being fixed. On the top of these can be used many of the

various roofing felts as advertised by many makers of such coverings, and particular attention should be given to seeing that the flat headed nails by which the covering is attached to the boards do not come opposite the joints of the roof boarding, that is at intervals where the joining of the covering occurs.

If properly built up, well spiked, small bolts used at various places in the trusses, also straps at the connection between the tie beam and curved rafter, these trusses and this form of roof construction can be made very serviceable either for temporary or permanent structures.

MECHANICS' LIENS ON BUILDINGS NOT COMPLETED

By W. J. STANTON

THE decisions of the courts are not entirely harmonious upon the question as to what will, or will not, defeat a claim of lien by a sub-contractor, materialman or laborer, where there is a failure to complete the building according to the terms of the contract. The right to a lien in any particular case depends upon the wording of the statute. There may be a failure to complete the building because it was not built according to the terms of the contract, or within the term therein specified; or because of its severance from the freehold, or removal, or destruction by fire, wind or water before completion. It is clear, however, with respect to abandonment, that the right of a materialman to a mechanic's lien depends on whether he furnished material on the credit of the structure of which it was to form a part, and whether it was of the kind and quality specified in the contract of the owner with the builder; and does not depend on the conduct of the builder after the materials have been furnished. The abandonment of the contract by the builder will not, in such a case, deprive the materialman of his lien.

Parties intending to assert liens rather that rely upon the personal credit of the debtor must be vigilant to ascertain when the work is completed or abandoned, and not be too early or too late in filing their statements, because the premature filing of a statement for a lien on a building is as ineffective as one filed after the statutory limitation has expired. In determining the question when work is completed or abandoned, one case has said that "the court should not take a technical or narrow view, but should save to the parties entitled to liens any rights they may justly have, under a fair and equitable construction of the facts and law applicable thereto." And it would seem inequitable and contrary to the spirit of the law to hold that parties are absolutely barred of all rights to the lien law where the work is permanently stopped or abandoned without fault of such parties, as such a construction would place materialmen and laborers at the mercy of the dishonesty, fickleness or misfortunes of the owner or contractor. It has, therefore, been held that, in case of abandonment of the enterprise, the building is to be deemed completed, so far as concerns the rights of the parties not in fault, to file and assert their liens.

The time of presentation of the claim is material under a statute prescribing when it must be presented. If such time is fixed at ten days after the contract let by the owner shall have been fully completed, the time allowed for presenting the claim must be computed from the completion of the work under such contract, as its completion need not be the completion of the contemplated improvement. It may be that only a part of the work done has been let, or that the completion of the structure is not in present contemplation. If the principal contractor abandons his contract the work under it must be regarded as completed within the meaning of the statute, else the sub-contractor could not enforce his lien at all when the owner has seen fit to pay off the contractor. But in such a case the sub-contractor must present his claim within ten days after such abandonment, and cannot postpone the presentation until the work is completed under a new contract with a stranger to the first one, or is completed by the owner himself.

With reference to the completion of the building, the contractor and sub-contractor should be considered as substantially one and the same person, as between them and the owner of the property. The building should be considered as completed when, and only when, the contractor has completed his part thereof. The sub-contractor's rights are based solely upon his contract made with the contractor. The contractor, and not the owner of the building, is the sub-contractor's debtor, and the sub-contractor has no right to claim that the building has been completed, until the contractor under whom he claims has such right. Under the contract between the owner and the contractor the owner agrees to pay the contractor a certain sum for constructing the building, and this sum is a fund which may be held under the statutes for payment, so far as it will go, of all the claims of the various sub-contractors, for work and materials furnished by them to the contractor, who is the principal and head of them all; and all the parties entitled to payment or contribution out of this fund should be able to reach the fund and get their proportionate shares thereof, at the same time, or within the same period of time. Besides, one sub-contractor ought not to be able to reach this fund and appropriate it to the extent of his claim before another sub-contractor can reach it.

The amount of all the claims of all the sub-contractors can be ascertained only after all the work and materials have been furnished, and after the building has been completed so far as the contractor is required to complete the same; for the whole of the work may in fact be done by sub-contractors only, or the last item of work performed or materials furnished may be performed or furnished by a sub-contractor. The building, in such a case, would be completed by a sub-contractor, and the sub-contractor completing the building or furnishing the last item of work or material therefor is entitled to his proportionate share of the general fund equally with the sub-contractor who furnished the first item or work or material, or any intermediate portion thereof. Of course, when the contractor has furnished through himself or his sub-contractors, all the work and material which he had agreed to furnish, then the building is completed, so far as he is concerned, and is also completed so far as all the sub-contractors under him are concerned; and the contractor and each of the sub-contractors may then file their respective statements for liens, and each will then become entitled to his proportionate share of the fund.

The statutes of some states make a cessation from labor for a certain number of days upon any unfinished contract as equivalent to a completion thereof, for all who claim a lien by virtue of that contract, as fully as though that contract was completed. Under such contracts it is immaterial whether the building is subsequently completed by the owner or not, or if completed, whether such completion is effected by the owner directly, or through a contract with another. For the purpose of creating a lien thereon through the terms of the unfinished contract, the cessation of labor under the contract for the number of days specified is a statutory completion of the building which sets the time running within which the claim of lien must be filed. The claim under such circumstances must be filed within thirty days after such time commences to run, although it may be filed within thirty days from the actual completion of the building.

A subsequent contract by the owner, after an abandonment of the original contract is, as it were, for the construction of a different building. Hence, if the original contractor under a building contract gives to the owners of the building written notice that he abandons the contract, and that he declines to proceed further in its execution, and thereafter does no work upon the building, whereupon the owner contracts with another builder to complete the building, it is necessary for those claiming mechanics' liens by virtue of the original contract to file them within the time provided by the statute after there has been a cessation of labor for the number of days specified.

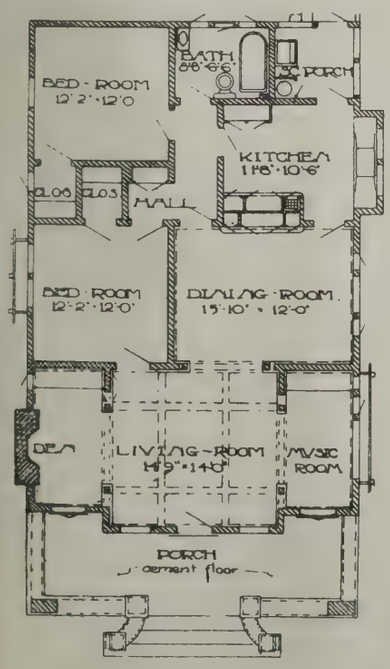
A sub-contractor's right to a lien is not necessarily defeated by the contractor's abandonment of the work, and the owner may be held for the balance due. If a materialman files his lien when nothing is due the contractor, who afterwards abandons his contract without just cause, and the owner completes the building for less than the contract price, under a provision of the contract authorizing it, and stipulating that the cost should be deducted from the contract price, the lien attaches to the extent of the difference between the cost of completion and the amount paid on the contract when the lien was filed.

The law does not allow a contractor, mechanic or materialman to violate a contract and claim a lien for work done, because of an apprehension or fear that he will not receive his pay at the time for payment. If he quits work under such circumstances the owner's real estate cannot be subjected to a lien even for the work already done, as there has not been a compliance with his contract by the person claiming the lien which is a prerequisite to the attaching of the lien. A materialman's right to a lien, as against the owner, for materials furnished the contractor, depends for its existence upon the fact of an indebtedness from the owner to the contractor at the time of or subsequent to the notice. If, therefore, the contract for the erection and completion of the building is entire, and the contractor is to be paid as the work progresses, but he abandons it before it is completed, he loses the right which he would have had to the full compensation agreed upon, although the owners may complete the building for less than the difference between what they have agreed to pay and what they have paid.

No. 560.

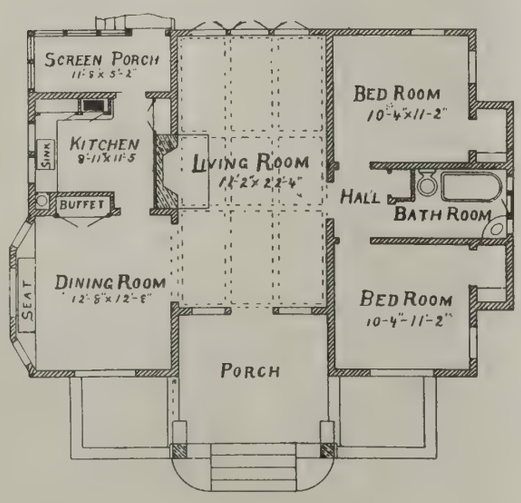
THREE LOS ANGELES BUNGALOWS

While California has for a long time been considered the home of the one-story house, other sections of the country are realizing the advantages of this style. With little or no modifications, these California bungalows may be adapted to any section of the country and their attractive appearance and plan make them very desirable homes.

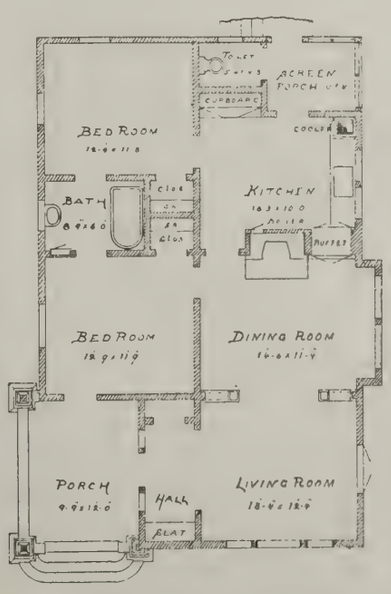


No. 501.

Through the courtesy of the Los Angeles Investment Company of Los Angeles, Cal., we are permitted to reproduce these plans and photographs of the completed buildings. While the appearance of each is unique from the manner of utilizing the materials at hand, the cost is kept within reasonable limits. It is claimed that as built in Los Angeles, the cost of the buildings was as follows: No. 560 was built for $3,100, although the builder claims the cost could be reduced somewhat by using cheaper materials. The simple but artistic No. 240B cost about $1,900, while No. 501 cost $2,600.



No. 240B.



It is noted that each of these buildings is exceptionally complete as regards interior finish, such as mantels, buffets, cupboards, closets, plumbing, etc., making the house ready for occupancy.

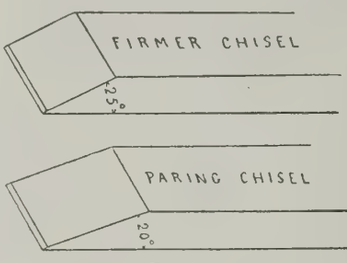
PLAN NO. 560.

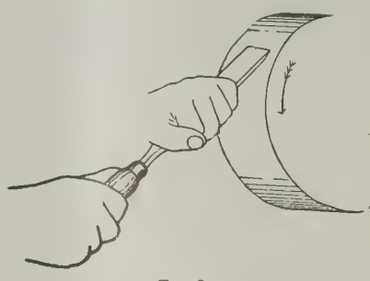
PLAN NO. 501.

PLAN NO. 240B.

THE SHARPENING OF WOODWORKING TOOLS

THE TOOLS used for woodworking are ground and sharpened to more acute angles than those used for cutting harder substances, such as metal. The most suitable angle for any given tool is decided by the character of the material it has to cut. As there is a considerable difference in the hardness of different kinds of wood, the tools used for cutting it vary also in their cutting angles, tools used for soft wood being more acute than those for hard. This does not mean that tools must be kept specially for each kind of wood, or must be reground to suit each. A patternmaker working with soft pine or a joiner working chiefly with whitewood or cypress would sharpen their tools suitably for these woods and use them on hard woods occasionally, but if their work was chiefly with hard wood they would find the tool edge too acute. They would become dull very quickly, and if heavy cuts were taken would get broken and notched. A more obtuse angle would give a more durable cutting edge.





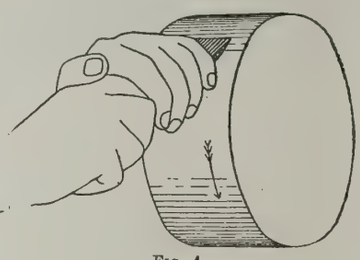


FIG. 1.

FIG. 3.

FIG. 4.

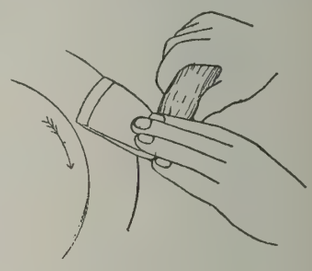

FIG. 5.

Fig. 1 shows two chisel edges, one ground for hard wood and the other for soft. Another reason for the difference is that the firmer chisel is intended for rougher work than the paring chisel, and is often driven with a mallet. It is the chisel used for ordinary work, and is shorter and thicker than the one intended for paring. The difference in their angles is often greater than illustrated. The angles are not measured in any way, but the workman judges by his eye when they are about right as he grinds them.

In all cases the angle of sharpening on the oilstone has to be more obtuse than the grinding angle. This is necessary in order to save labor and time in sharpening. The ground facet of a chisel extends perhaps half an inch from the edge, and if this facet was laid flat on the oilstone and rubbed till the edge was keen, it would be a very slow process, for the oilstone cuts very slowly

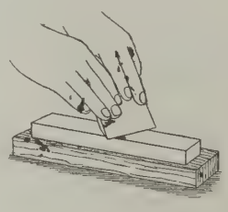

FIG. 2.

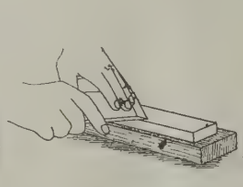
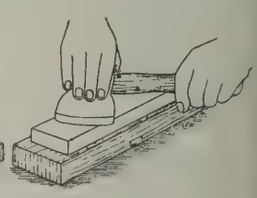


indeed, compared with the grindstone. By tilting the chisel slightly a very narrow facet is rubbed, just sufficient to make the edge keen and leave most of the ground facet untouched. This narrow facet made by rubbing on the oilstone is shown by the double lines close together at the edges of the chisels in Fig. 1. After repeated sharpenings without grinding the chisel edge becomes thick, as in Fig. 2, and regrinding is necessary. The sharpening angle on a newly-ground tool can be almost the same as the grinding angle; but as the edge wears back, as in Fig 2, the chisel has to be tilted more and more on the oilstone to avoid a wide sharpening facet.



Grinding is a simple matter, requiring chiefly a knowledge of the most suitable angle to grind it. It is done either on a grindstone or emery wheel. In the latter case great care must be taken not to heat the tool. The pressure must be very light and the tool should be frequently removed and examined. An emery wheel on which water can be used is preferable to a dry one. A grindstone cuts slowly and the pressure on the tool must be comparatively heavy. Water is always used on it to prevent the stone from glazing. A person accustomed to the work will grind a tool more neatly than a beginner. The facet should be straight and uniform, not broken up into a number of flats with an edge perhaps not keen or not straight. In the latter respect a plane-iron is much more difficult to deal with than a chisel because of the greater width and the necessity of a correct edge, slightly curved, or bellied, more or less according to the kind of plane. A chisel can simply be ground straight at its edge, and it does not matter if it is not quite at right angles with the sides of the chisel. Figs. 3, 4 and 5 show tools being ground—a chisel, plane-iron and hatchet respectively. They are generally moved to and fro sideways on the stone to lessen risk of glazing and unequal wear. It is usual to let the stone revolve towards the tool, so that burr which forms when the edge is thin shall not cling and make it difficult to properly examine the edge as the grinding proceeds.

Grinding leaves a rough edge quite unsuitable for cutting wood, and it must be followed by sharpening on an oilstone and in some cases still further by stropping on leather. Some workmen use two oilstones, one coarse and the other fine; but one stone of suitable grade is sufficient unless a very wide range of work is done. It is a waste of time to put a very keen edge on a tool used for rough work. A coarse, quick-cutting stone should be used for the purpose. Carpenters and joiners use coarse and medium stones, of which there is considerable variety, both natural and artificial. The Canada is a popular stone because it is cheap, but it wears away fast. The Charnley Forest is a well-known English stone, very durable, but rather slower cutting than some workmen like. The Yellow Lake is another very much like it, but slightly cheaper and quicker. The Turkey stone is quarried in Turkey. It is rather expensive and brittle, and too fine for most classes of woodwork. India stones are artificial, made in three grades, and are expensive. The Washita is a popular American stone of good quality at moderate price. The Arkansas is the most expensive stone on the market and is the best for very fine work. It is too slow and too costly for the average woodworker. Now, however, all ordinary stones seem to be obsolete, as Carborundum has the advantages of much faster cutting surfaces, and being an artificial product is made in a number of grades of fineness, from coarse grinders to the finest razor hones.

In using an oilstone a little oil is put on its surface and the tool tilted to the correct angle, is rubbed backwards and forwards on it with moderate pressure. At intervals it is turned over, and the other face of the steel rubbed slightly to remove burr. Figs. 6 and 7 show these two operations with a plane-iron. A chisel is treated similarly. Fig. 8 shows a hatchet being sharpened. This, being ground on both sides, must be tilted accordingly for sharpening instead of lying flat one way, like the plane-iron in Fig. 7. For splitting wood it is not essential to do more than grind a hatchet, but as a rule they are sharpened, and otherwise will not cut chips properly. Sometimes instead of rubbing the

FIG. 6.

FIG. 7.

FIG. 8.

hatchet on the stone, the reverse process of rubbing the stone on the hatchet is preferred.

Gouges, especially those ground on the inside, are more troublesome to sharpen than tools with straight cutting edges. An oilstone slip is required for the insides of gouges. When the gouge is ground on the outside the slip is used as in Fig. 9 to remove burr only. When it is ground on the inside the slip is used as in Fig. 10, and burr on the outside is removed by rubbing on the back of the gouge on the oilstone. Sometimes the inside gouge is held in the hands for sharpening, like the outside gouge in Fig.

9, but with the slip tilted to the angle. The method shown in Fig. 10, with the gouge bearing on the edge of a bench, is generally preferred, as there is less risk of cutting the fingers. Another way is to put the slip in a vise and rub the gouge on it. In grinding outside gouges a constant rolling movement of the gouge on the stone is necessary, and in sharpening on the oilstone there must be both rolling and reciprocal movement. This is quite easy with a little practice. An inside gouge is more troublesome to deal with. Generally they are ground on one edge of the grindstone, and neat grinding is almost impossible unless the rounding of the edge happens to correspond with the curve of the gouge. Special stones are sometimes used, having a series of beads to fit gouges of different curvatures. Sometimes a revolving cone of emery or wood covered with emery is used for grinding inside

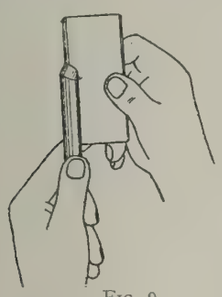


Fig. 9.

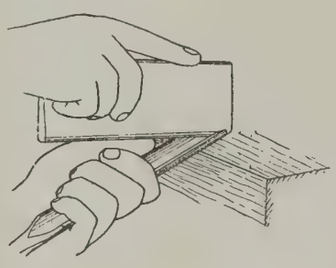

Fig. 10.

gouges, those of quick curvature being done near the apex of the cone, while flatter ones find a surface to fit them nearer the base where the diameter is large.

Saws are sharpened with a file, as in Fig. 11, the saw being held in a vise. The file used is of triangular section as indicated by the dotted triangle in Fig. 12. This fits the teeth of ordinary saws of all sizes, and files the front of one tooth and the back of the next one simultaneously. The correct rake for the teeth must be maintained, and also the correct slope for the file in plan, as shown by dotted lines. That shown is correct for ordinary purposes and soft wood. For hard wood the file is held more nearly at right angles in plan, giving practically square edges instead of rather acute ones to the teeth. For ripping with the grain the teeth are given more rake—that is, the triangle in the side view in Fig. 12 would be tilted more forward to undercut the fronts of the teeth. Rip-saws cannot be used for cross-cutting, but the

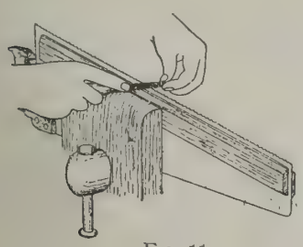

Fig. 11.

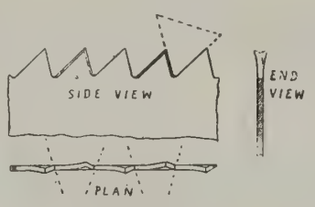

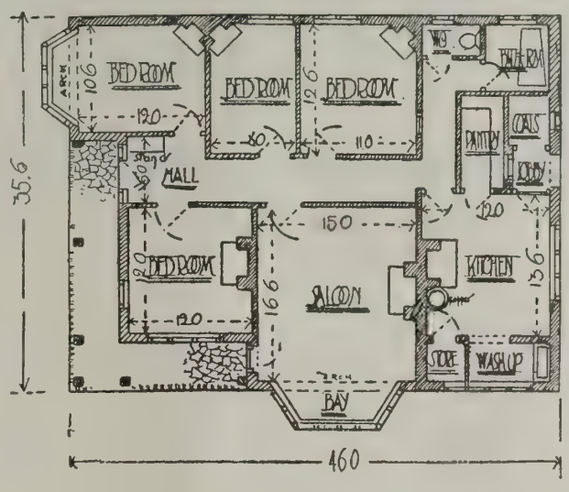

Fig. 12.

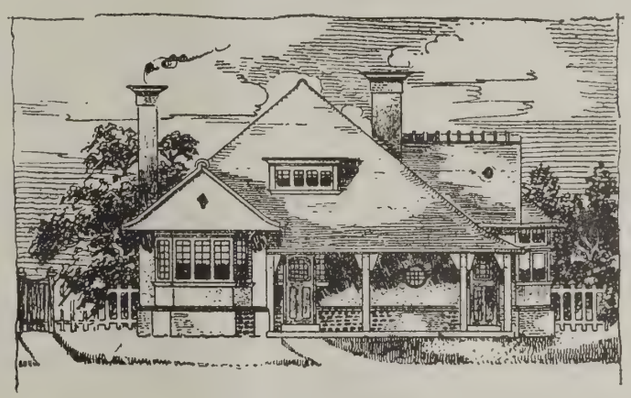
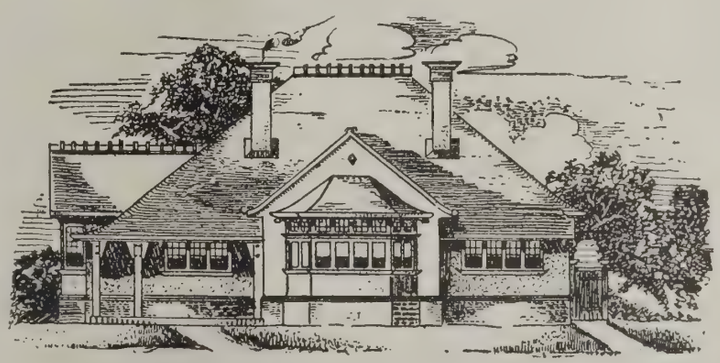
teeth in Fig. 12, intended primarily for cross-cutting, can be used for ripping if necessary. Variations in size of saws and teeth make no difference in the shape and angles of the latter, those of a large hand-saw being of the same form as those of a fine dovetail saw. Saw-teeth occasionally require setting as well as filing, especially when intended for cutting soft wood. The amount of set is shown in plan and end view in Fig. 12. The teeth are bent alternately to each side, so that the blade will follow easily through the wood. For hard and dry wood little or no set is necessary. It is imparted by bending with a slotted saw-set or by punching with the saw laid on a block of wood, or by means of other setting appliances of various kinds. In sharpening the teeth it is best to file too little rather than too much if the operator is attempting it for the first time. When teeth have been spoilt by unskilful filing it is troublesome to get them correct and uniform again. When they are correct, but merely dull, the existing angles are a useful and reliable guide to the file and should be carefully followed.



Bits for boring are sharpened with suitable oilstone slips preceded by filing if very dull. In some cases filing alone is sufficient. A slip is used for spoke shaves and other tools which cannot be conveniently rubbed on the large oilstone. With the exception of saws, all cutting angles are about the same as the chisels shown in Fig. 1.

AN ENGLISH BUNGALOW

Designed by H. BINGOLD



THIS arrangement of six rooms on one floor is somewhat unusual in this country, but it has several advantages. The side entrances add privacy to the house, and allow more window space on the front. All the rooms are reached from the

well-lighted hall, and the kitchen surroundings are well separated from the rest of the house, and at the same time readily accessible.

It will be noted that each bedroom has a fireplace, a distinctly English convenience, which would be appreciated in many parts of this country when the nights are damp or cool. When the

garden is properly developed, the bedrooms on that side possess an added charm of seclusion.

The attic is not intended to be used as here designed, but it could be easily fitted up for additional bedrooms or a play room.

Michael Dugan, a journeyman plumber, was sent by his employer to the Hightower mansion to repair a gas leak in the drawing room. When the butler admitted him he said to Dugan:

"You are requested to be careful of the floors. They have just been polished."

"They's no danger iv me slippin' on thim," replied Dugan, "I hov spikes in me shoes."—Paint, Art and Drug Review.

A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.

BUILDER'S COURSE IN ARCHITECTURAL DRAWING

By RALPH F. WINDOES

WE WILL now undertake the drawing of the four elevations. An elevation, it should be understood, is simply a projection of the different sides of a building upon the vertical planes. It is not merely given for "looks" but it includes some characteristics that cannot be shown upon the floor plans. Elevations are always made from the plans and are governed entirely by them. The plans may give the location of the windows and doors, give the size of the building and a number of other things, but it remains for the elevations to show the height of the floors and the height of the building, the appearance of the windows and doors, etc.

The front elevation is generally drawn first, then the right side, then the left side and lastly the rear, though there seems to be no good reason why this order is followed. The front elevation is generally accompanied by a vertical section whic gives the ceiling heights of the different floors, the sizes of the lumber used, the window heights from each floor, the material used in the foundation, etc.

No definite rules can be laid down for the student to follow while drawing his elevations, but there are a number of things which he should observe.

His ceiling heights should be determined with a consideration to "cozyness" and cost of heating. The old fashioned house with a high ceiling is fast becoming a thing of the past. There is nothing "cozy" about it and it costs considerable to heat that unused space.

He must establish a grade line that does not put his building down in a hole, or up in the air. If the basement is too far below ground it is hard to light and is generally damp. If too high it puts his first floor up disagreeably high, and the basement is liable to be cold in winter.

His windows should be at a convenient distance from the floor. His porch floors should be lower than his house floors, with a little slant away from the house. The porch columns should not be too numerous, but should still conform to the general lines of the building. They should not cut off a view from the windows or doors if it is possible to prevent this.

The shape of the roof is decided entirely by the draftsman. It may be hip, gable or curb, though the mansard roof is often used on high cost dwellings. The pitch he may also decide upon. Most modern houses have a half-pitch roof. That is, the span is half the rise of the roof.

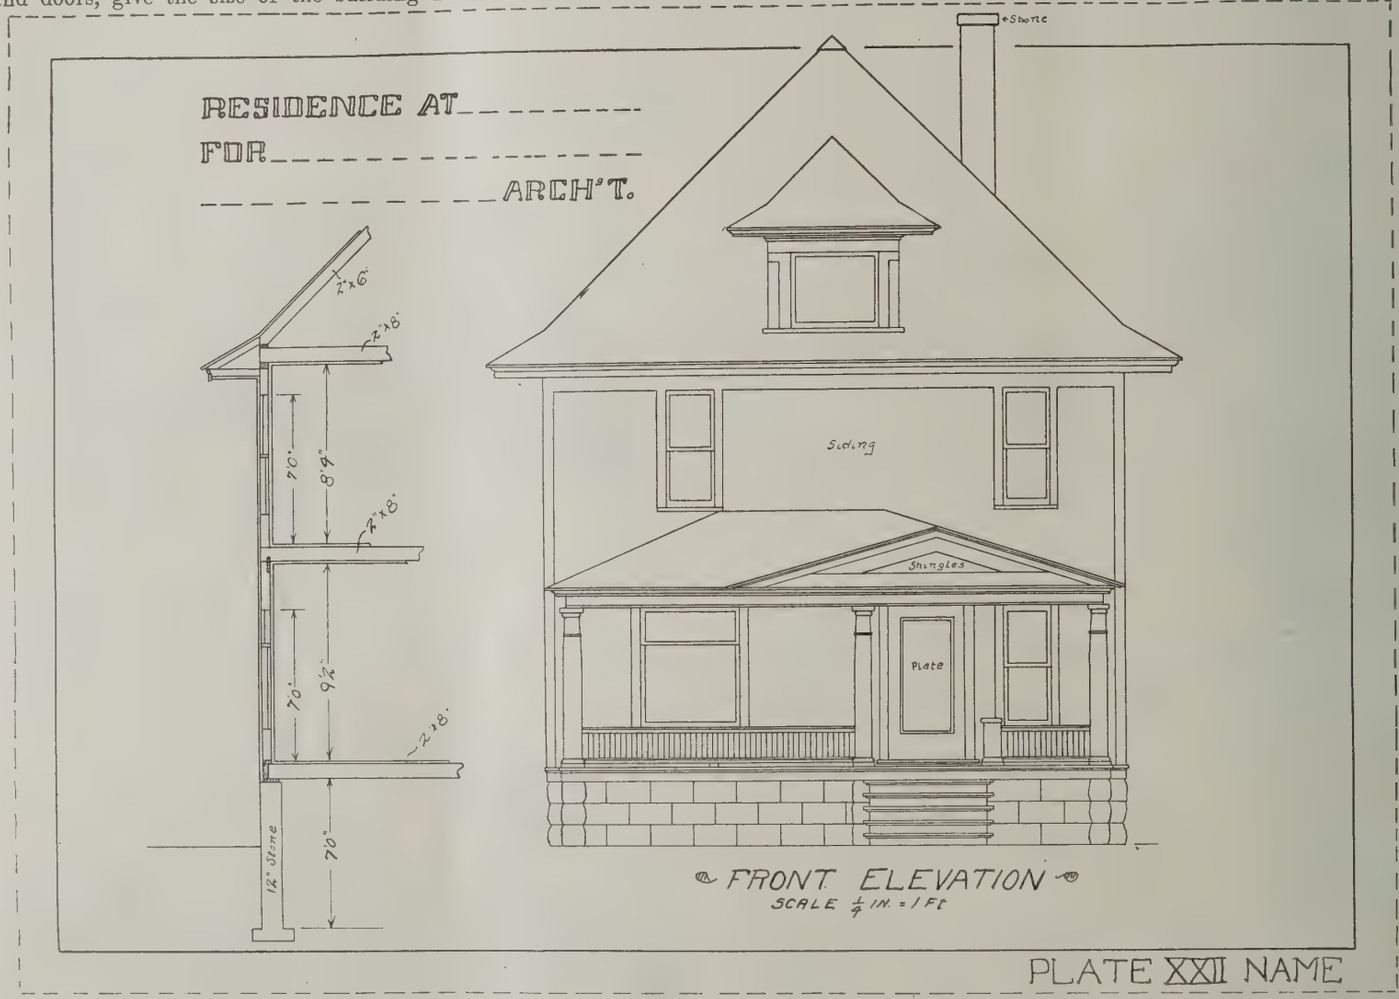


PLATE XXII.

FRONT ELEVATION.

Begin the drawing with the vertical section shown. Notice the dimensions given, the method of showing interior and exterior finish, the cornice, plates, etc.

When this is completed establish your grade lines. The one here shown is about 30 in. from the top of the foundation. Draw a vertical axis for the elevation and work from it. Take all of the dimensions of width and thickness needed from the floor plans, also the height of the doors and windows. Notice that one of the porch columns is cut off so that it does not obstruct the view from the door and window. Put the casing and the rest of the trim in as shown, and put on the roof. This is a hip roof of one-half pitch. Notice how the cornice is built up and is not a continuation of the rafters. The dormer should have a hip roof of the same pitch to conform with the house roof. Take its dimensions from the roof plan. When a hanging gutter is used it is customary to omit it from the elevations. Do not forget to show the chimney and remember to place any necessary information upon the elevations that cannot be put upon the plans.

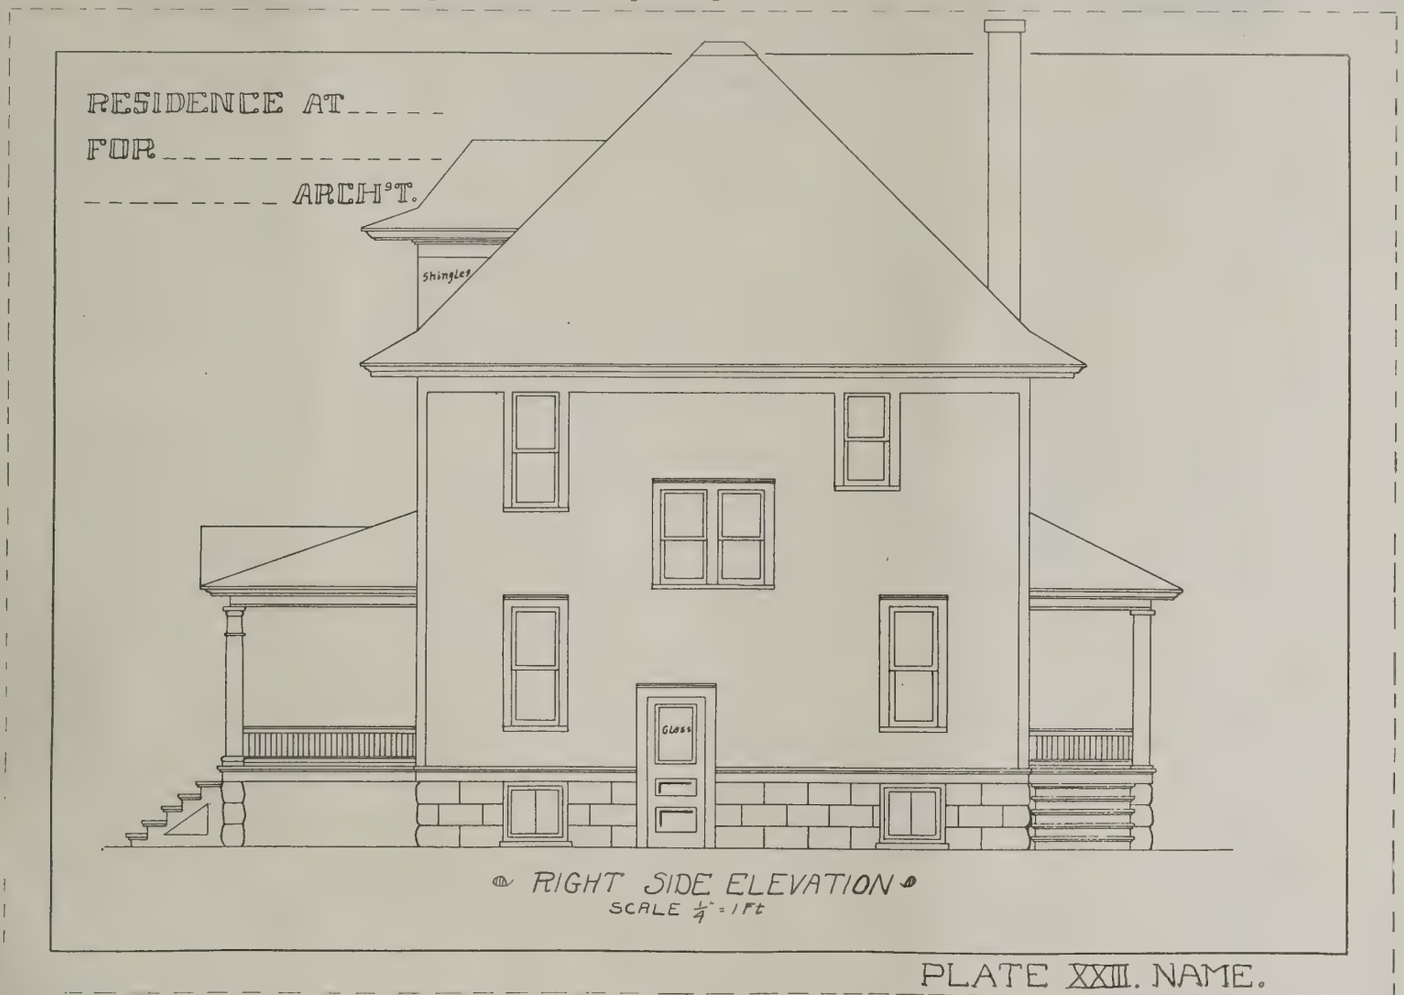

PLATE XXIII. NAME.

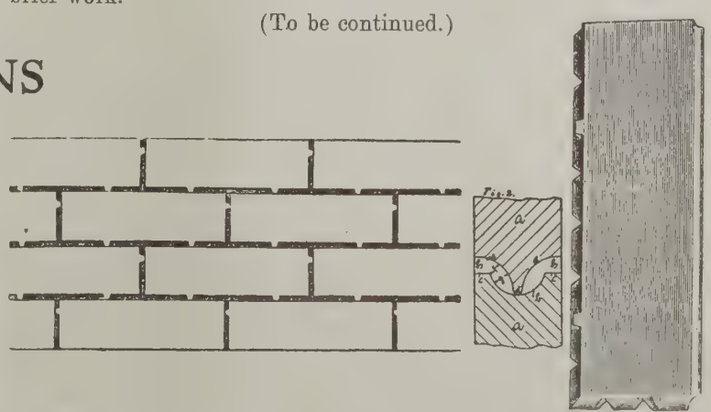
PLATE XXIII.

RIGHT SIDE ELEVATION.

Little need be said concerning the drawing of this elevation as the method is similar to that of the front elevation. Notice the heights of your windows in this elevation. The bath room window and the two stair windows are not as high as the others. The grade door shows a glass, and two wooden panels.

Of course, the principal heights on this elevation will be the same as on the front elevation, so the draftsman can save much time by placing his front elevation where he can project its dimensions over to the side. If his drawing board is too small he may have part of the front elevation sheet under his drawing of the side elevation.



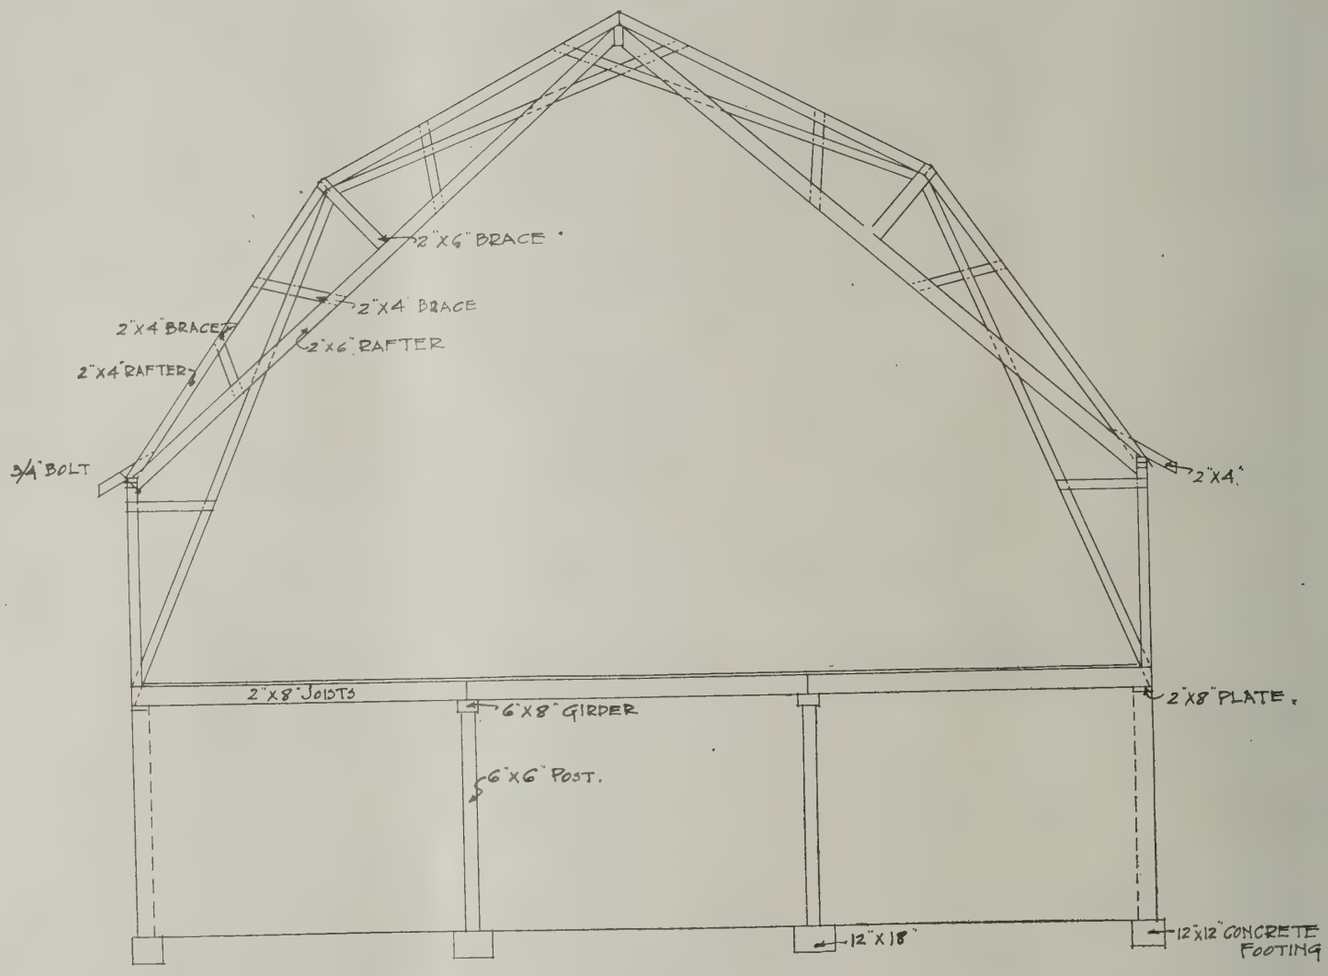
It must be realized that there will be a number of little problems that will occur in the student's work in this course that have not been mentioned in our discussions. Some of these have been omitted intentionally for want of space and others because they have appeared so simple that we have left it to the common sense and judgment of the student to supply them. He must realize that if he were working with an architect, he could not ask the latter the way out of every little difficulty that beset him, but that he would have to figure them out for himself. And remember that the same difficulties would not occur to every student and that it would be impossible to solve all of the possible ones in our brief work.

(To be continued.)

GYPSUM BLOCK PARTITIONS

ONE difficulty with the thin partition walls of gypsum cement, etc., made in slab form or otherwise, is that being made with a very considerable percentage of uncombined water, and usually delivered shortly after manufacture, they take too long a time to dry out naturally, so that papering or painting them must be postponed, or artificial means of drying them out be employed.

One way of getting around this difficulty is shown in practical form in the Dresden Hygiene Exposition, and here illustrated. The slabs employed are 100x33 1/3 centimeters = 90"x30" in surface dimensions, and of any desired thickness, and their faces are as rough as it is practical to make them, to permit of plastering upon them and to facilitate drying. Their edges are tongued and grooved but the tongue is very thin at the edge, and is nicked at intervals, so that air passages are left, which, as well as the grooves, are closed with mortar or plaster when the wall has dried out—a process which takes place more rapidly than where only one side of the slabs is exposed to the air. The exhibitor is Wilhelm Schugk, of Dresden.



OUR READERS' PAGES

[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. These columns are open to our readers at all times without cnarge, and any questions or experiences will be given proper space.—Editor.]

ANSWERS

CROSS SECTION OF SELF-SUPPORTING GAMBREL ROOF.

CONCRETE BARN SPAN ROOF.

From R. E., Albion, Nebr.

Replying to "A. O. P.," Eastwood, Minn. I am submitting a roof design which can be built of 2x4s and 2x4 braces.

Five trusses will be required to carry a roof of 60′ 0″ length, with purlius cut in between the trusses to carry sheathing boards, which should be nailed on diagonally.

HOW MUCH PAINT?

From "Dauber," Chicago, Ill. In answer to Carpenter's wife, Sedley, Sask., I submit the following general rule, which will give her some idea of the quantity of paint required to cover any given area. It is impossible to give a rule that will apply in all cases, as the amount varies with the kind and thickness of the paint, the kind of wood or other material to which it is applied, the age of the surface, etc. The following is an approximate rule: Divide the number of square feet of surface by 200. The result will be the number of gallons of liquid paint required to give two coats; or divide by 18 and the result will be the number of pounds of pure ground white lead required to give three coats.

MEASUREMENT OF BRICKWORK.

From "Contractor," Rochester, N. Y. Replying to A. G. McF., Smith Falls, Ont., the usual custom here is if the contract is given and the owner agrees to find all the bond timbers, he has no claim on the bricklayer for unused bricks caused by the placing of the timbers. It is generally supposed that placing and setting the bond timbers, and furnishing mortar for same, costs as much as the bricks are worth, and sometimes more. I am inclined to think that without some special agreement, there can be no claim made on the bricklayer for bricks that should have taken the place of the bond-timbers.

LENGTH OF RAFTERS.

From C. A. M., Chicago, Ill., to E. D. Z., Fitchburg, Mass.

The manner of finding the lengths of rafters is comparatively simple and is fully shown in a great many books and has been described a great many times in the columns of the NATIONAL BUILDER. For instance, on page 49 of the June BUILDER you will find nearly a page showing how the lengths of rafters can be obtained by the use of a steel square. This shows not only common rafters but hips and valleys as well.

BACKING A HIP.

From "Jura," Windsor, Ont.:

There are many ways of "backing hips," one of the best of which is shown in Fig. 1. Here let A B, B C be the common rafters, A C the span of the roof, and D E F the plan of the hip. From E set off the height of the roof E H, E G, equal to E B and

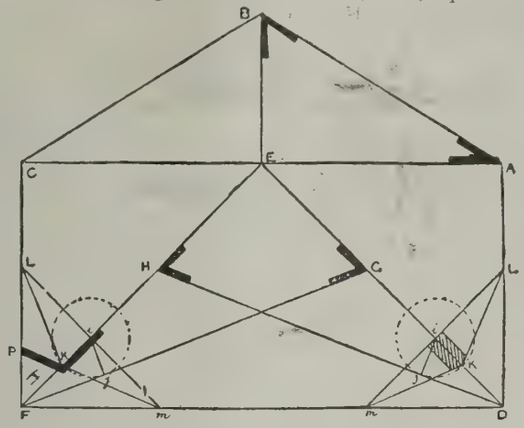


Fig. 1.

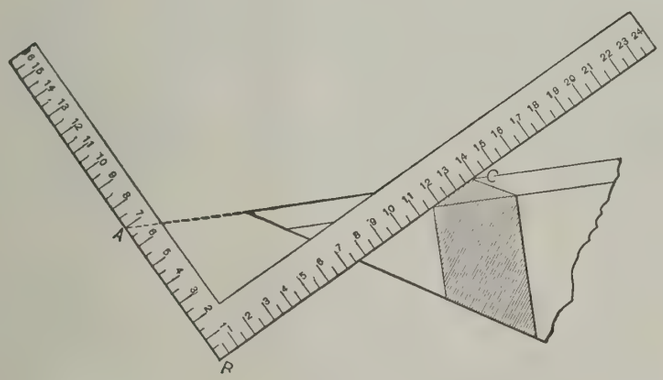

Fig. 2.

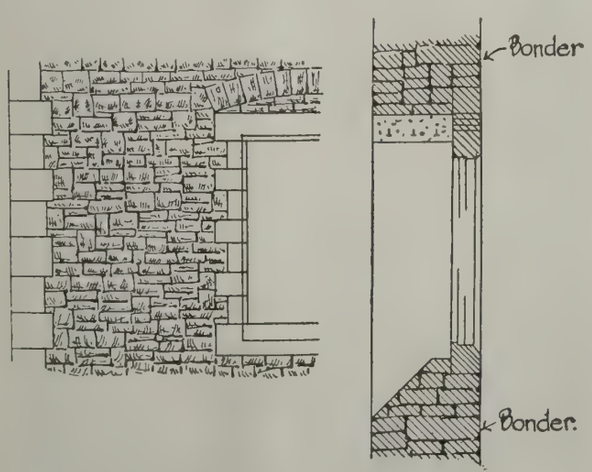

join H D, G F, then H D, G F are the hip rafters. In order to find the bevel of the back of these from any point j in F G draw the perpendicular ji, cutting E F in i, and through i draw perpendicular E F the line Lm, cutting F C and F D in L and M; make i K equal to i j, and joint K L, K m and the angle E K P is the angle of the back of the hip rafter.

Figs. 2 and 3 show two other methods which are so obvious as to require no further explanation.

UNCOURSED RUBBLE, ASHLAR QUOIN.

From "Mason," Scranton, Pa.:

For the benefit of "Perplexed," I submit the inclosed illustrations which show a very good example of Uncoursed Rubble, Ashlar Quoin, etc.

Uncoursed Rubble, Ashlar Quoin.

SIDE CUT OF HIP AGAINST RIDGE.

From "Lloyd S," York, Pa. In reply to Engineer, Edmonton, Alta., I may say, hip rafters are laid out the same as common rafters, except that 17 inches is used for run instead of 12 inches as for the common rafter, because it requires 17 inches run for the hip rafter to equal 12 inches run for the common rafter, or because 17 inches is the hypotenuse of 12 inches square. Lay the square on the side of the stick at the top end, as shown in plan (Fig. 5), with 6 inches and 17 inches the pitch hip rafter, and mark the down bevel A B. Find the exact thickness of the stick at this end, and set it off at right angles to the down bevel A B, and mark the top

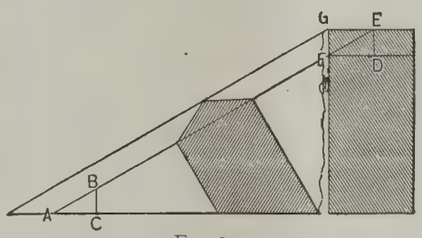

Fig. 3.

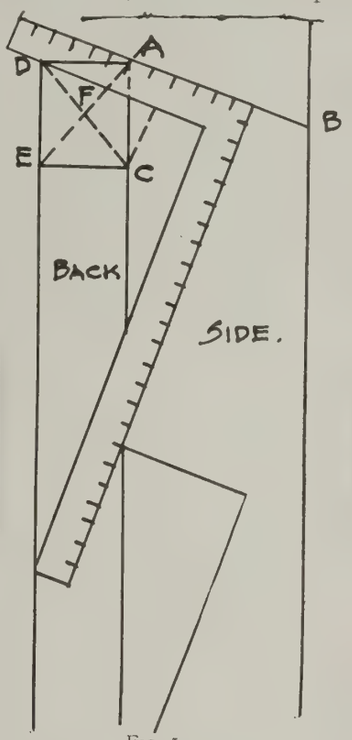

Fig. 5.

corner of the stick at C. Square across the back of the stick C to the opposite side E. Mark the diagonal A E. Cut to marks E A B, which will give the side and down bevels against the ridge poles; if the hip rafter is to fit against the corner of deck plate then square across the back from A to D, and lay out the opposite side the same as above, and mark diagonal, D C. Cut to marks A B, to the center F, and D B on opposite side of center F. If the hip is to fit against the straight ridge pole, cut through one way only, either right or left, as may be required, or as first laid out. This will complete the lay out of the top end of the hip rafter.

QUESTIONS

HOME-MADE REFRIGERATORS.

From E. G. M.:

Would like it if you would give me some information through your paper on how to build an ordinary refrigerator.

CEMENT FLOORS IN DWELLING HOUSES.

From W. H. C., Des Moines, Iowa:

I am endeavoring to get some information concerning the practicability of using cement floors on the second and third stories of a dwelling house, and it occurred to me that possibly you might be able and willing to give me some information on this matter. I would appreciate it very much if you can do this, and also if you can refer me to any people who have had experience in this matter.

PLACING HINGES ON DOORS.

From "Frank C. N." Ponoka, Alta., Canada. Please inform me as to the proper distances to place the hanging hinges, on top, and on bottom of doors of different sizes; also how high should door locks be from the floor? I would also like to have some detailed information regarding the construction of eye-brow windows on roofs.

HIP AND VALLEY RAFTERS.

From "John T. F.," Rochester, N. Y. What is the proper way to obtain the check cuts for a hip or valley rafter? Some workmen contend that the length of hip and run of roof are the proper figures on the square to use, while others use the length of common rafter on run of roof, which method also gives cuts for jack rafters as well. Which of these methods is the proper one?

DOVETAILING.

From "S. J. C.," Brooklyn, N. Y.

I would be pleased if some reader would illustrate a good and easy method of making dovetail joints for drawers, boxes and similar work, and describe the process.

MORTISE & TENON JOINTS.

From A. S. W., Peoria, Ill.

I would like to ask through the NATIONAL BUILDER if some brother reader will give some information on the proper proportions and laying out of mortise and tenon work. I believe there is some standard rule to go by. I have some large heavy door stuff with the panels made of D. & M. material, these doors being so large and heavy I intend to make them on the job. And would appreciate some pointers, as I will not get to them before about January 1st. I hope some fellow reader will reply in time for the December number.

ESTIMATING FLOORING.

From W. C. A., Chicago,

Editor NATIONAL BUILDER.

Dear Sir:

Will you kindly publish the methods used by lumber men for figuring D. & M. lumber, or in other words, how much must we buy of the various widths to cover say a 100 square feet of surface. This information will, I am sure, interest a large number of your readers, as it seems very confusing to many.

MEASURING FOR GLASS.

From W. A. H., Gillespie, Ill.:

Please answer through the columns of your valuable paper the following questions: Some time ago I ordered from a planing mill four single sash 18 inches by 42 inches, 1⅜-inch thick leaded glass. When the sash came they were 4 inches wider and 5 inches longer than I ordered. The mill claims to have taken the size I gave for the glass size. I claim the sash are wrong. Will you please advise which is right and what the rules are in regard to ordering material of this character?

AMATEUR WOOD CARVING

So much has been written on the subject of wood carving that we are pleased to show some examples of amateur work. The

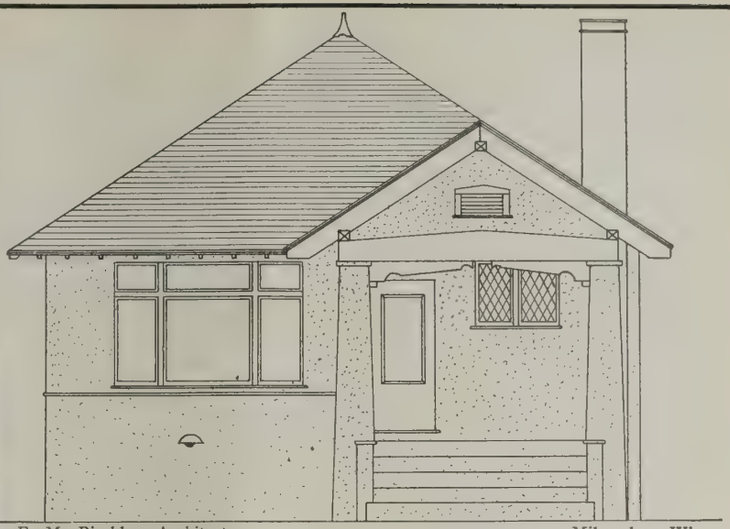
three cuts shown on this page are the work of Mr. Chas. Saffer of Erie, Pa., and show a good understanding of the beautiful art of carving.

Wood carving is one of the arts which call for a great deal of thought and care, and offers a free field for the artistic imagination. The finished carvings may be used as ornaments to otherwise plain furniture, or may decorate the trim, stairs, mantels, etc., of the house. The exposure of the grain by carving often brings out many beautiful variations of the grain of the wood which would otherwise remain hidden.

We feel that the designs offered from time to time in the magazine are of great value to any one interested in this line of work.

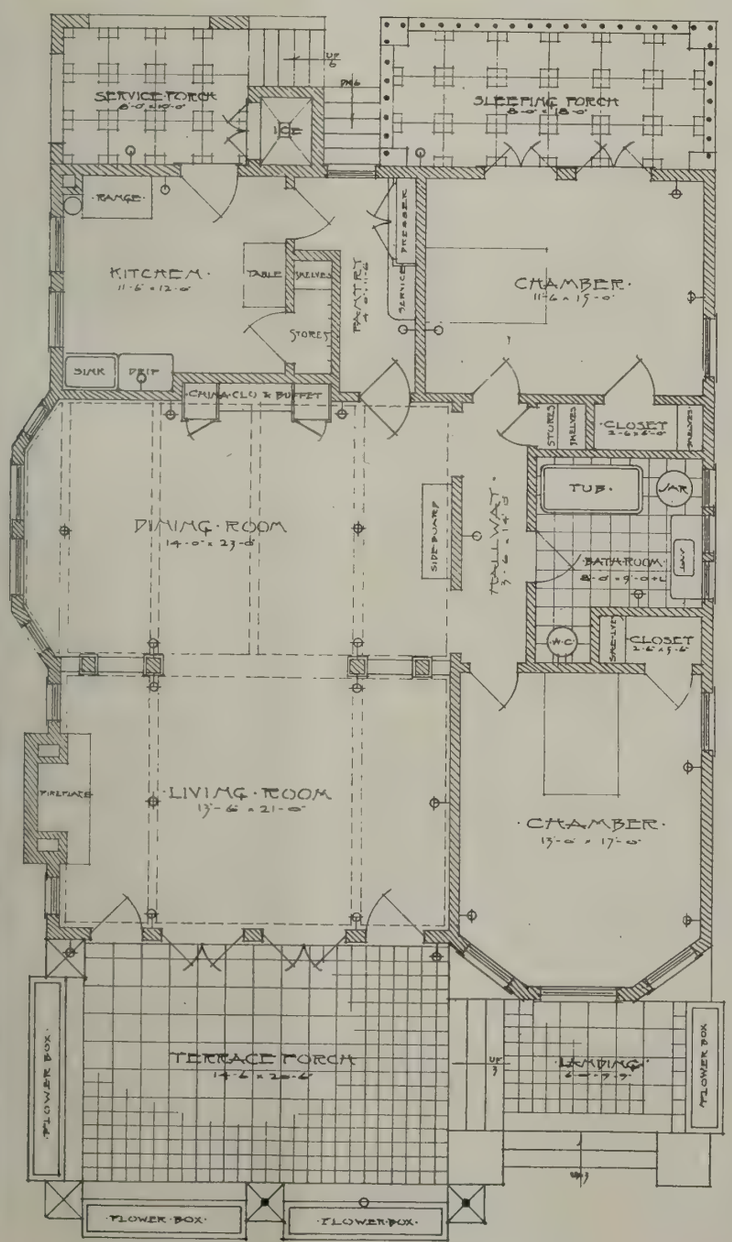
TWO MODERN CONCRETE BUNGALOWS

(From drawings submitted in a competition by the Cement Products Exhibition Company, Chicago, Ill.)

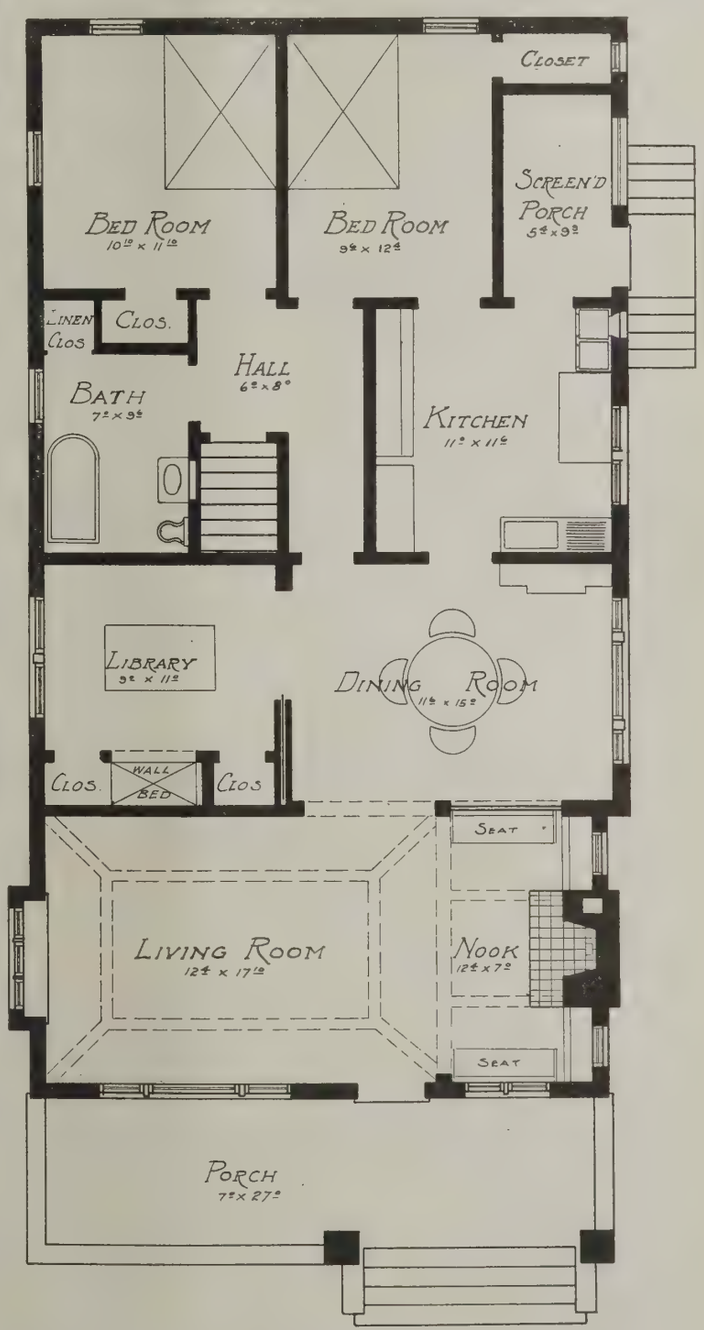


As a competition rarely restricts the draftsman as much as a private owner does, it is possible in plans of this character to display to the fullest extent the ideals in design and construction.

The drawings by Mr. Wilcox embody many excellent features in the way of closets, cupboards, and general arrangement, and show the possibilities of a practically square house. With concrete block walls, reinforced concrete floors and roof, the cost is estimated at $4,230.00, exclusive of plumbing, heating and lighting fixtures.



Mr. Birchler, by economy in design and materials, using monolithic walls and floors and roof, wood partitions, etc., keeps the estimate of his design down to $2,076.00.



F. Nelson Wilcox, Architect. New York.

E. M. Birchler, Architect. Milwaukee, Wis.

BOOK NOTICES

Notice.—All books noticed in these columns may be obtained from this office at Publisher's prices. All postage or express prepaid. Money and address must accompany all orders.)

THE CONTRACTORS' SEARC LIGHT: This is a book specially arranged for Carpenters, Contractors and Builders, containing estimate record forms, time book, itemized lists of lumber and hardware, estimating materials, excavation table, nail table, bridging table, capacity of cisterns, area of gables, dimensions of furniture, rafter pitches, rafter tables, table of weights and capacities, etc. Compiled by M. M. Ferguson. Published by The Searchlight Publishing Company, Des Moines, Iowa. Paper cover, 92 pages, on good paper, nicely printed and the whole gotten up in a handy form for use as a pocket book. Price, postpaid, one dollar. Can be obtained at the office of publication, or from the office of the NATIONAL BUILDER.

The main features of this book may be given as follows: First, printed estimate forms for making estimates, each form having an itemized list so arranged that no material or sub-bids need be omitted when making an estimate. Second, itemized lists of lumber and hardware, to prevent omission of material necessary for the whole building when listing from a plan.

There can be no question on the usefulness of the book, and every man who takes a contract—large or small—would save many times its cost, if he only makes proper use of its pages.

THE CONTRACTORS' AND BUILDERS' HANDBOOK. By William Arthur, author of "The New Building Estimator," 370 pages, 3x5 inches. New York, David Williams Company, Publishers. Price, $2.00.

This is a well gotten up book—in every particular—the paper, binding and press work being considerably above the average, like unto most of the books published by the well known firm of David Williams Company. The contents, for a technical work, are somewhat unique and lead out of the old and beaten paths as first laid out by Halfpenny, Moxen, Paine, Peter Nicholson, Riddell, and a hundred lesser lights. Mr. Arthur brightens up his work with flashes of quaint humor and amusing satire, and occasionally a pleasing joke, always suited to the condition in hand.

The real value of the book to the contractor, however, consists partly in the way he places before his readers the advice, hints, and methods of procedure in contracting, estimating and prosecuting the work.

The book is divided into three parts or chapters, each part being a sort of treatise unto itself, and complete, so far as it is intended to be so, and may be studied with profit, even if the other parts are not in the curriculum; though it will be much more to the interests of the contractor, if he reads the book as a whole—and digests the whole oyster.

Part 1 deals with the business side of contracting, showing what ought to be done when arranging with architects, owners, material men, insurance men, sub-contractors and others.

Part 2 gives hints, and exhibits proper methods of arriving at the exact cost of labor and materials in given blocks of work, and removing that terrible nightmare—guess work, from the contractors' dreams.

Part 3 is written in a vein of satire, and gives some sharp finger raps, to some of those foolish braggarts who are continually claiming for themselves, and their friends, all the biggest things that ever were, or ever can be built, also all the most beautiful, the most dazzling and most useful, in architecture and in their own persons, can only be found in—let us say—Timbuctoo. This part is very interesting, and those whose thinking spheres are too large for their hats might learn something that may prove of value to them when discussing the greatest and best things of this little world.

PATENTS.

The following list of recent patents and trademarks relating to building interests is especially reported for THE NATIONAL BUILDER by Wm. G. Henderson, solicitor of American and foreign patents and trademarks, Norris building, 501 F street, Washington, D. C. A copy of any of the United States patents will be furnished by him for 25 cents.

1,004,208. Window-lifting mechanism. H. H. Schroyer, assor. General Railway Supply Co., Chicago.

1,004,477. Sash-lock. Jos. F.; M. J.; and L. D. Schwer, Pittsburg, Pa.

1,004,100. Wall with metallic lathing. P. Stolte, assor. ½ S. Katbenstein, Charlottenburg, Germany.

1,004,844. Composition for coating molds for concrete. Wm. W. Bennett and C. S. Pilkington, Westerville, Ohio.

1,004,873. Pivoted sliding window. M. Haberle, Brooklyn, N. Y.

1,005,114. Sound-proof door. I. Hamlin, Chicago, Ill.

1,004,672. Window construction. F. L. Molby, Detroit, Mich.

1,004,938. Skylight construction. J. D. Thompson, Washington, D. C.

BUILDING TRADES INTERESTS IN THE COURTS.

Where the time fixed for the completion of a building contract is extended, the owner may cancel the contract for the contractor's failure to complete within the extended time.—Fraenkel v. Friedman, 92 N. E. (N. Y.) 666.

Where a building contract provides that materials shall be furnished and labor performed for a gross sum, and the contract completed by a specified day, the owner may insist on a strict performance, and put an end to the contract for failure to perform by the day fixed.—Fraenkel v. Friedman, 92 N. E. (N. Y.) 666.

Where on a building contractor's failure to perform within the time fixed, as extended, the owner did not cancel the contract, but notified the contractor that his employment was terminated, and that the owner would enter and complete the work included in the contract himself, the contractor was entitled on completion of the work to recover the contract price less the cost to the owner of completing the work.—Fraenkel v. Friedman, 92 N. E. (N. Y.) 666.

Where a building contract provided that on the contractor's default the owner might terminate the contract and enter and complete the work at the contractor's expense, such provision did not preclude the owner from canceling the contract for a substantial failure of the contractor to perform.—Fraenkel v. Friedman, 92 N. E. (N. Y.) 666.

Where payments of the contract price to a contractor erecting a building were made with the knowledge and consent of a materialman who directed the owner to pay the contractor, the materialman may not enforce a lien for the materials furnished.—Capital Lumber & Mfg. Co. v. Crutcher, 131 S. W. (Ky.) 176.

Under Rev. St. Me. c. 93, section 29, giving a mechanic's lien for labor or materials furnished in erecting, altering, or repairing a house, building, or appurtenance by virtue of a contract with or by consent of the owner, as contrued by the Supreme Judicial Court of the State, the lien relates back and becomes effective as of the date of the contract under which the labor or materials are furnished—Central Trust Co. v. New York v. Bodwell Water Power Co., 181 F. (U. S.) 735.

The surety for a contractor on a building contract cannot maintain an action for the foreclosure of a lien for materials furnished in the carrying out of the contract and erection of the building, where it appears that the full contract price has been paid to the contractor, or on his order, prior to any claim being made by the surety or notice being given to the owner of the building.—Sanders v. Keller, 111 P. (Idaho) 350.

Where a building contract was indefinite or uncertain in certain particulars, and the principal obligor placed his own construction and interpretation on the contract, and erected the building in accordance therewith, and there does not appear to have been any fraud or collusion between the contractor and the owner of the building, **held** that the surety will be bound by the construction placed on the contract by his principal.—Sanders v. Keller, 111 P. (Idaho) 350.

The lien upon buildings or other improvements and upon the land upon which they are situated, created by section 2869, Ind. T. Ann. St. 1899 (section 4402, Mansf. Dig. St. Ark.), in favor of any person who performs any work or furnishes any material for the erection of such buildings or improvements, does not attach to the buildings or improvements separate and apart from any interest of the owner of the improvements in the land on which the same are located—Keel v. Ingersoll, 111 P. 214.

Where a contractor, putting up several buildings for different persons, bought the material therefor from one man and made payments on the price thereof from time to time, without any application of the payments to any particular purchase, the seller could apply the payments to the debts as he chose, and enforce the materialmen's lien against one of the buildings for which he had supplied lumber, though the owner of such building had paid the contractor in full.—Thacker v. Bullock Lumber Co., 131 S. W. (Ky.) 271.

Where a building contract provided for payment only on an architect's certificate, which was refused, and the builder sued, alleging that the certificate had been fraudulently withheld, an instruction authorizing a recovery on the contract in case the jury found from all the evidence that the architect ought reasonably and fairly to have been satisfied with the work and approved it, and issued his final certificate, was erroneous, as substituting the judgment of the jury for that of the architect.—Cope v. Beaumont, 181 F. (U. S.) 756.

Decedent was struck by a stone dropped by defendant's superintendent from a staging. It was customary to lower large stones by a derrick, at the foot of which decedent was working, and to drop smaller ones after warning. The superintendent, being about to drop the stone that struck decedent, gave two warnings, both of which were heard by decedent, who, after the second warning, left a place of safety and ran out from under the staging just as the stone was dropped, and was struck. **Held** that the mere fact that the stone was dropped, instead of being lowered, was not in itself evidence of negligence.—Wicklund v. Howard, 92 N. E. (Mass.) 705.

Where plaintiff contracted to make certain alterations and additions to a building under the directions and to the satisfaction of an architect, acting as agent for the owner, who agreed to make final payment within thirty days after the contract was finished, provided the architect should certify in writing that all the work, on the performance of which payment was to become due, was done to his satisfaction, and, after the contractor had completed performance, the architect refused a final certificate, plaintiff could recover on the contract, provided he could prove substantial performance, and that the architect's certificate had been fraudulently withheld, and if the contract had not been substantially performed, but the work done was accepted by the owner, then plaintiff could recover the reasonable value thereof on quantum meruit under the common counts.—Cope v. Beaumont, 181 F. (U. S.) 756.

FIREPROOF CONSTRUCTION

By WARFIELD WEBB

THERE are two factors that stand foremost today in the matter of construction, one of which, at least in the past, has been considered in a kind of vague or desultory way by the majority of builders. This refers to protection against fire. It was but natural, to a great degree, that such should be true. It was not altogether carelessness or ignorance, grossly speaking, but came of a lack of knowledge of the proper materials that would resist the flames to a greater degree.

Beauty is the other factor that comes in for a more general consideration now. If we are to combine beauty in with fire-resisting attributes in the matter of building construction, shall we not have the highest ideals that are possible? If a building is beautiful and still lacks in ability to resist the all-devouring element of fire, there is little use to expend money in rearing it. The element of constant danger is far too great to repay one for the outlay.

It is beginning to become more universally recognized as a fact that this is so. Men are now combining these two important details into one, and the result must be the highest possible ideal in house construction. There are several reasons for this change. One is due to the increased losses from fires annually in this country. These have grown with bounds almost unprecedented in the world's history. Then there has been the steady rise in fire insurance rates, made possible by the disregard for the risk in erecting our buildings of materials that will prove a bulwark against fire. It was noted that the most elaborate structures were sometimes destroyed within a short time on account of laxity in protection.

These were sufficient at least to awaken in the minds of the building public a desire for a greater caution, and the outcome is now seen in the care that is being made in the matter of constructing many of our buildings. Some of us, and it may be added that this includes a large number, have had to learn these things from actual experience. We might have deplored the loss that was sustained by others, but it has taken an actual loss to ourselves, in a number of cases, to prove the real necessity of more and greater protection.

It must not be supposed that this protection can be had simply by making the walls of the structure fire resisting. The beams, girders, joists, studding, floors, partitions, windows, roof, all these must combine to reduce the risk that is encumbent upon every structure. The more congested our cities become the greater danger from fire, unless we all unite in building to prevent the spread of flames. If one owner will erect a fireproof building and another a semi-fireproof structure, there will be at least some danger to some property. What is desired is the entire erection of buildings that will withstand the ravages of the flames, and in this way save us many thousands of dollars losses annually.

The old fear and the old story of first cost has stood in the way of progress along this line for years. That the average builder cannot afford to erect a building that is proof against the flames is no longer an argument against the erection of such buildings. Can he afford to take the risk, and can he afford to pay the increased insurance rate in order to save a few dollars in the first cost? If he cannot afford to build in a sane way far better had been that he build not at all.

Along with the demand for better buildings, and more pleasing forms of architecture, there must come a greater revision of our building laws. Without this assistance there shall continue to be a large number of buildings erected that will serve only as inviting fires, and of endangering lives and other property with a greater or less amount of loss.

Our laws should be as iron clad as our regulations against the spread of disease. In protecting the lives by our health departments we should seek to protect them from the awful results of fires. There have been instances in the past few years appalling in their consequences, as statistics will prove, that could and should have been prevented.

It must be stated that there are many buildings today that pass muster as fireproof, that will not withstand the flames an hour. These are still being erected under the guise of fireproof buildings. The fault lies for the most part in our laws. They are weak in some respects, and the only way to make them perfect is through Government action. Make them universal, as far as certain points are concerned, and in this way secure the lives and the property of many who now are satisfied to risk so much for the sake of saving a few dollars.

FLOOR SCRAPING.

However good material is furnished for flooring, there are many opportunities for producing an inferior floor. The material may be damaged by careless handling or exposure to the weather. Plasterers, masons, etc., may work over it and grind the sand and lime deep into the grain. Inferior workmanship may jamb the sharp corners, producing unsightly bruises, or the painter may save a few cents or a few minutes' time and so ruin the appearance.

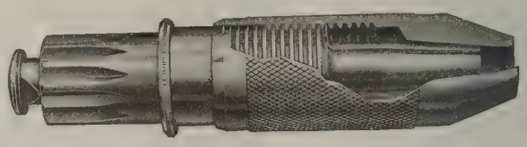
But probably the greatest possibility for good and evil lies in the scraping. A dull or loose knife chatters across the floor and leaves a succession of ridges; a high corner on the knife leaves a sharp cut groove wherever it travels. Various makes of machines have more or less good points in construction, but the main idea is to produce a perfectly smooth floor with the least possible labor.

The Fox Floor Scraping Machine was designed to produce an even, smooth surface on any kind of hard wood floor. The simplicity of its construction not only insures a minimum of breakage, but places a Scraping Machine on the market at a price that is exceedingly interesting to the contractor. The manufacturers are the Fox Supply Company of 115-123 King St., Brooklyn, Wis.

	Inches.
Height of frame.....	4
Width of frame.....	9
Length of frame....	14
Blade 3x9	
Weight, pounds.....	80

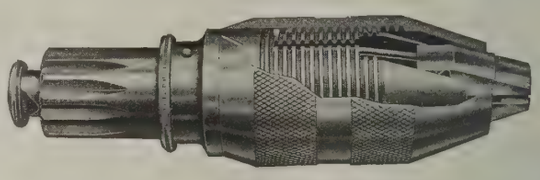
The machine is so perfectly balanced that the weight is exactly where it should be at all times. When in operation, 85 per cent of its weight is resting on the blade, exactly where the weight is required, making the work of the machine purely automatic and requiring no skill on the part of the operator. When not in operation the weight is so perfectly balanced on the wheels that it automatically raises the blade clear of the floor, eliminating all danger of marring or scratching the floor through carelessness.

The frame of this machine is carried on three rubber-tired wheels, two working independently on a roller bearing, the third wheel acting as a rest on the back stroke. A brush upon the forward stroke throws the shaving away from the knife, and also enables the operator to easily turn the machine in any direction and do perfect work in any position.



After this machine had been placed on the market it was improved to its present state of perfection and is now fully guaranteed by the manufacturers to do rapid and perfect work under all ordinary conditions. One of the marked improvements is the addition of a rubber pad, 3x9 inches, placed over the knife, which consumes all the jars, protects the knife and insures a floor free from all waves and chatter.

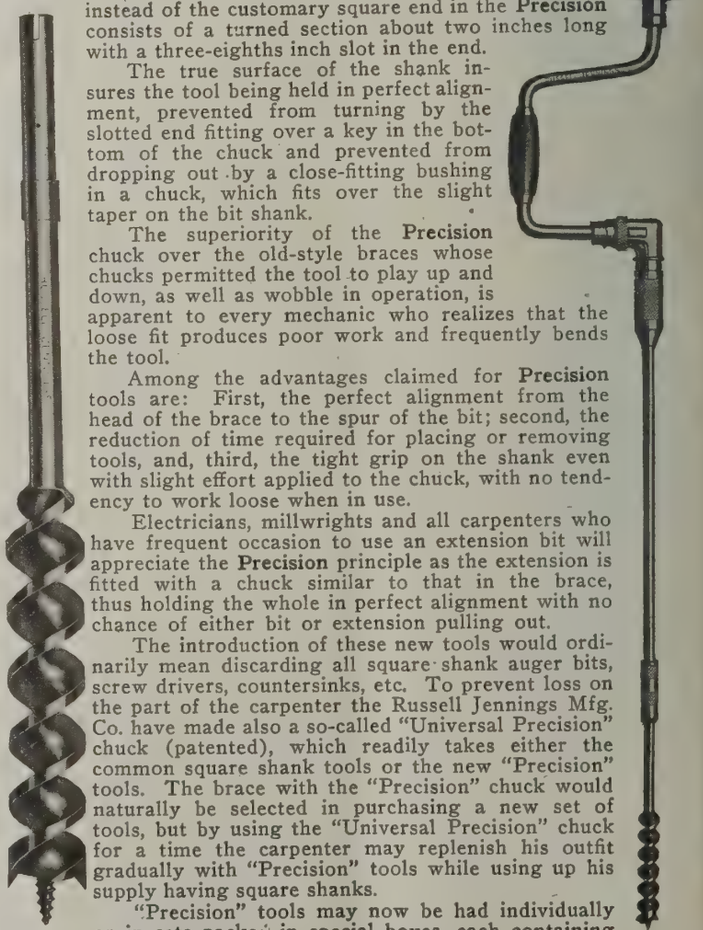
The Fox Supply Company is making a specialty of Scraper Knives. They have established a reputation for the tempering of their blades and their facilities insure prompt deliveries.



NEW AUGER BITS AND BRACES.

The first-class mechanic appreciates quality in tools of every description, whether it is a saw, a plane, a hatchet or a bit. Not alone must the temper of the cutting edge be just right, but the very form, action and balance of the tool must be suited to the work. In the manufacture of auger bits and braces, the workmanship must be such that accurate and rapid work is possible, and this calls for a high grade of workmanship as well as material.

The methods of finishing the shank of bits and the chucks of



braces has been more or less unsatisfactory for many years. There has been too much opportunity for slipping, bending the shank, boring a hole not exactly in line with the brace, etc. Various manufac-

turers have endeavored to overcome these troubles, and we show in this article the method devised by the Russell-Jennings Co.

Because of the accurate results obtained by these tools, the makers have applied the name "Precision" to them. The new features apply principally to the shank, which instead of the customary square end in the **Precision** consists of a turned section about two inches long with a three-eighths inch slot in the end.

The true surface of the shank insures the tool being held in perfect alignment, prevented from turning by the slotted end fitting over a key in the bottom of the chuck and prevented from dropping out by a close-fitting bushing in a chuck, which fits over the slight taper on the bit shank.

The superiority of the **Precision** chuck over the old-style braces whose chucks permitted the tool to play up and down, as well as wobble in operation, is apparent to every mechanic who realizes that the loose fit produces poor work and frequently bends the tool.

Among the advantages claimed for **Precision** tools are: First, the perfect alignment from the head of the brace to the spur of the bit; second, the reduction of time required for placing or removing tools, and, third, the tight grip on the shank even with slight effort applied to the chuck, with no tendency to work loose when in use.

Electricians, millwrights and all carpenters who have frequent occasion to use an extension bit will appreciate the **Precision** principle as the extension is fitted with a chuck similar to that in the brace, thus holding the whole in perfect alignment with no chance of either bit or extension pulling out.

The introduction of these new tools would ordinarily mean discarding all square shank auger bits, screw drivers, countersinks, etc. To prevent loss on the part of the carpenter the Russell Jennings Mfg. Co. have made also a so-called "Universal Precision" chuck (patented), which readily takes either the common square shank tools or the new "Precision" tools. The brace with the "Precision" chuck would naturally be selected in purchasing a new set of tools, but by using the "Universal Precision" chuck for a time the carpenter may replenish his outfit gradually with "Precision" tools while using up his supply having square shanks.

"Precision" tools may now be had individually or in sets packed in special boxes, each containing one brace fitted with either the "Precision" chuck or the "Universal Precision" chuck, one bit exten-

The demand for Architectural Perspective is increasing yearly because those who build are demanding, in addition to the plans, perspective drawings of their buildings. A well made perspective drawing, properly shaded and set off by a little landscape and secondary detail, pleases the eye, and is a valuable adjunct to the regular plans and elevations. Our correspondence course in ARCHITECTURAL PERSPECTIVE and DRAWING of BUILDINGS is complete, practical, and can be learned at home at odd times. Instruction likewise given in twelve separate, complete Art Courses, for pecuniary profit, or pleasure only, as desired. Year Book sent upon request.

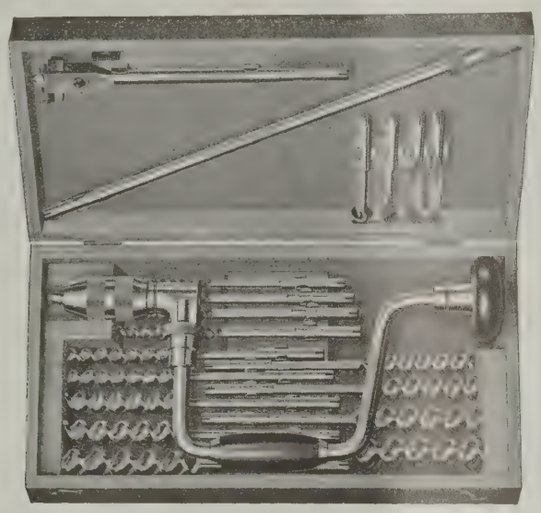
SCHOOL OF APPLIED ART
Battle Creek, Mich. U.S.A.
677 APPLIED ART BUILDING

¶ That's what one Carpenter said when writing about his experience with Simonds Hand Saws.

¶ It would be entirely too broad a claim to say that none of them ever did come back, but we believe that dealers have to give "money back" on fewer Simonds Saws than any other brand of Hand Saws.

¶ Here's what one dealer in a large city in Pennsylvania writes: "The Saws I return you by express are the only ones to my knowledge returned for exchange in all the years I have bought your line. We have less exchanges on Simonds Saws than on any other brand and sell twice as many of them."

¶ A Carpenter in Cairo, N. Y., writes: "Five years ago I bought two Simonds Hand Saws, one Rip and one Cut-off. They are certainly the nicest running saws I have ever used. The Dealer said if they were not better than any other make I ever used to bring them back. I never took them back."



¶ Ask your Hardware Dealer for Simonds Hand Saws or write us about the kind of a Saw you are wanting.

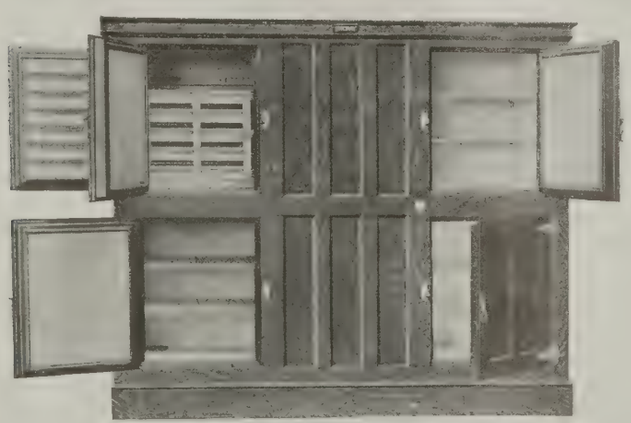
sion having small "Precision" chuck, one expansive bit with large and small cutter, and a set of bits from ¼ inch to 1 inch by sixteenths (32½ quarters), two screw drivers, and one countersink for metal and one for wood. This complete set of finely finished tools is made of

selected tool steel and with the fine workmanship that characterizes all Russell Jennings bits. All these tools bear the name "Russell Jennings" on the "Precision" shank, which name is the sign of boring tool perfection.

REFRIGERATORS.



Nature has been lavish in the supply of raw materials, coal, wood, minerals, etc., and the ingenuity of man has found many ways to use the materials and modify conditions to his own uses. Until a few years ago the use of ice, except in favored places where it could be stored in winter, was unheard of. Now, through modern conditions, ice, natural and artificial, is considered a necessity, not only in the temperate zone, but in the tropics and the demand is met by artificial ice made on the spot or by natural ice shipped from the large storehouses on the Northern Lakes.

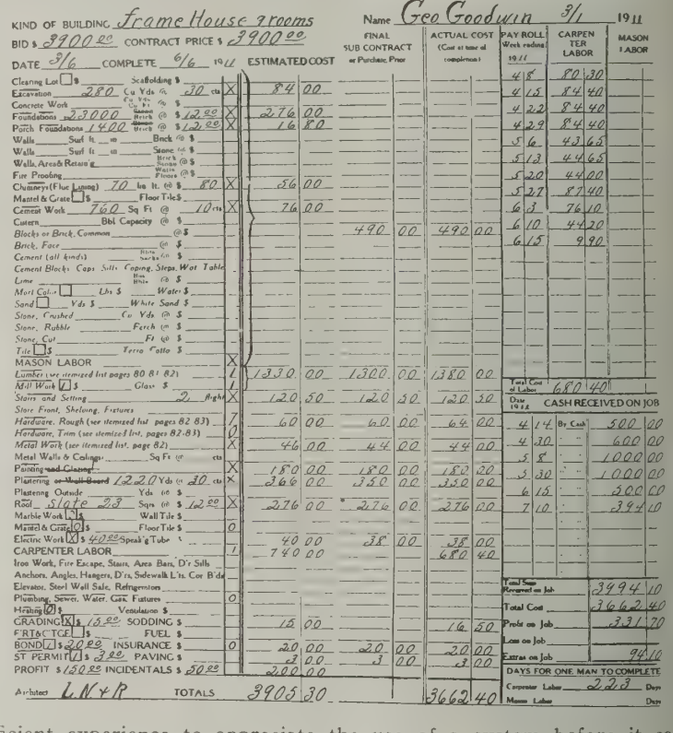
One of the features of the modern house to which more attention is being paid than formerly, not only by the owner, but by the builder, is the refrigerator. This may either be built to order or be a stock size box with rear or side icing door, adapted to the space where it is intended to go.

The McCray Refrigerator Company of Kendallville, Ind., has paid special attention to built-in refrigerators and co-operates with owner, architect and builder in planning and building the style best suited to the needs. It maintains a special drafting department for the sole purpose of preparing plans for prospective purchasers.

There are many ways in which a refrigerator can be located so as to combine convenience with economy in space. The illustrations

show a very desirable arrangement. The refrigerator, which is lined with Opal glass, is 84 inches wide by 30 inches deep by 72 inches high. It is placed in the corner of the pantry and has an ice door in the left end opening onto the rear porch. It has three storage doors, that to the center compartment opening into the butler's pantry.

"McCray Refrigerators in American Homes" is an illustrated book published by the McCray Refrigerator Company and in it are illustrated and described every conceivable arrangement for both built-to-order and stock refrigerators. One of these booklets may be had by mentioning THE NATIONAL BUILDER.



THE CONTRACTOR'S SEARCHLIGHT.

Whatever light can be thrown on the subject of estimating is of great value to the contractor. Nearly every contractor is enough of a mechanic to direct his work and see that it is finished properly and on time, but how many can readily take off a set of quantities for even a simple job and be sure they are correct and complete?

Specializing may be carried to the extreme in this branch of the work and in our larger cities are many men who do nothing but estimate one job after another. To such the routine gets them into a system such that the tendency to omit anything is reduced to a minimum, but can the same be said of the small contractor, who must not only estimate, but construct, worry about payments and payrolls, and see that material is on hand? The opportunities for mistakes increase rapidly with the cost of the building, a frame barn contains little besides foundation, lumber, hardware and paint, but how often we see a shortage of material in even these small jobs. A shortage, as a rule, means a mistake in estimating either in quantity or omitting an item entirely.

For more elaborate buildings there are further items which might easily be forgotten when one has many things on the mind. Such items as hardware, glass, anchors, hangers, metal work, plumbing, gas fitting, etc., each have subdivisions which must be watched carefully to make sure everything is included.

When one has a system for making estimates the chance of forgetting something is considerably reduced. One must have sufficient experience to appreciate the use of a system before it can be of much value, so the simpler it is the better.

Under the name "The Contractor's Searchlight" the publishers, the Searchlight Publishing Company, Des Moines, Iowa, have prepared an excellent outline for the use of the contractor. This form, a reduced page of which we show, serves as a guide for lining up the work when making up the estimate and checking the estimate up when the building is finished.

Another part of the searchlight is ruled off to serve as a weekly or two-weekly time book. This is an always handy section, for too many contractors take a chance on remembering that it rained last Tuesday and the men quit at 3 o'clock.

For the benefit of those who do not care to make many extensions the Searchlight gives excavation tables showing the yardage for foundations of various sizes from 16x20 feet to 40x42 feet and in depth to 7 feet, another table gives the feet of lumber for the commonly used sizes and will aid materially in checking lumber bills, while one can also find the number of nails required for various purposes. A large amount of valuable matter is collected into a comparatively few pages ready for immediate references.

One of the ever present questions is how to cut a rafter, and this subject is given careful attention.

The Searchlight Publishing Company, who are placing this book on the market are confident that every contractor who sees the Searchlight will appreciate its value, and as they offer to refund the price if the contractor is not satisfied, it shows their confidences in it. They have an advertisement on another page of the NATIONAL BUILDER which the reader will no doubt see.

Douglas Fir—"A block-head like you don't need a hair-cut."
Red Cedar—"Oh, I don't know; I can get shingled."

"Mamma," asked a little girl of her mother one day. "Do men ever go to heaven?"

"Certainly," said her mother, "why do you ask?"

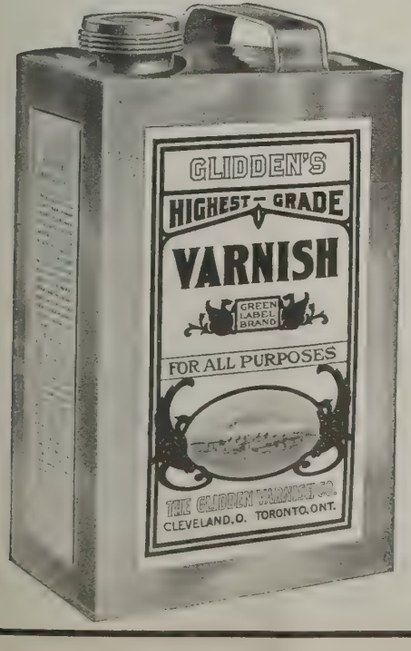
"Well, then, why don't angels ever have whiskers?"

"Because," said her mother "they get there by a close shave."
—National Monthly.

Glidden

to the Better Builders

THE BETTER BUILDERS know that in the art and science of building there are no details unworthy of their most exacting and minute attention—no paltry things of little value or of little importance—but that, "from turret to foundation stone," ***all*** is of importance. Wherefore, in their most exacting avocation an aptitude and capacity for taking infinite pains is, of necessity, the rule, where in other fields of endeavor it is too often the exception.



Knowing this, we have prepared for the use of the better builders, Glidden's Green Label Varnishes, Endurance Wood Stains and Specialties. They are being specified by architects and the better builders for the finishing of the finest interior trim in private residences, banks, office buildings, etc.

IF you sublet the varnishing on your jobs, see that the painters use M. P. Durable Interior (the best varnish for interior trim), M. P. Durable Floor (the strongest floor varnish made), Glidden's Velvet White Enamel (the ideal egg shell finish), and Glidden's Superior White Enamel (the perfect gloss white).

When you have to guarantee work make sure that the best material is used.

We will gladly send you, free of charge, a beautiful panel frame showing our Endurance Wood Stains in fourteen different color effects, and the same stains finished with our best interior varnishes. We maintain a special department devoted exclusively to reproducing any color scheme you may care to suggest, and you are welcome to avail yourself of the services of this department ***without cost.***

Glidden's Endurance Wood Stains are the finest in the World—the ultimate wood stains—the stains you will always specify and always use, once you know them. Those who have used them declare that they are so far superior to any other stains that there is no comparison. They enhance the natural beauty of all woods. They penetrate ***without raising the grain,*** and all the colors are permanent.

Write us for free panel frames and literature. Use the attached coupon.

THE JACKSON ALUMINUM LINE LEVEL

Is designed particularly to meet the requirements of all Mechanics in building construction, especially Bricklayers, Masons, Carpenters, Millwrights, Architects, and Cement Workers.

By using the Aluminum Line Level you can take Levels in one-half the time required by the old method of the Straight Edge.

This is possible because the Aluminum Line Level weighs only one-fourth ounce and is easily and quickly attached to a line. Levels thus taken are guaranteed to be accurate on a stretched line from one to forty feet. Besides, from its construction, it can be used as a Pocket Level.

This cut shows the Aluminum Line Level, including Attachment and 40-ft. line. Complete in Leatherette Case.

PRICE $1.00, POSTAGE PREPAID

It is especially adapted for laying out foundations for buildings. It will do the work no other level will do. For sale at hardware dealers, or

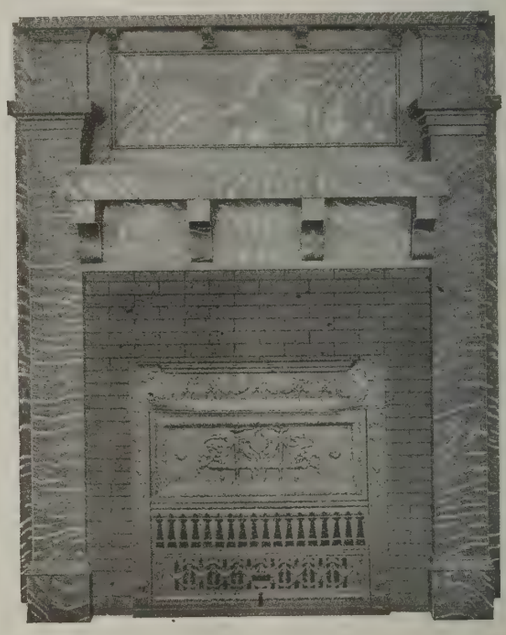
THE PANAMA CANAL.



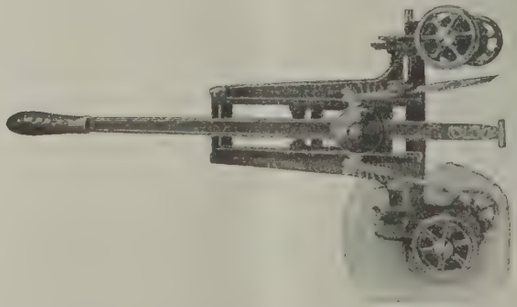
This gigantic enterprise is attracting a great deal of attention on the press as well as among engineering societies, and its completion at an early date should be reason enough to compel every NATIONAL BUILDER reader to be posted on its many peculiar characteristics. For many years we have had the price hurled at us by those who could say millions without using their imagination, the vast quantities of material glibly rattled off exactly as the boulders as big as a house are tossed about by the steam shovels.

But the canal will soon be a reality. It is expected that the first boat will go through the locks January 1, 1913, little more than a year away. It is rumored that the warship "Oregon" will have the honor of first passing through and it is fitting that she should. Probably many NATIONAL BUILDER readers will pass that way, so everyone should look up, read up, and be posted.

Possibly no better map of the Canal Zone has been published than that being distributed by the Tidewater Cement Co. It is printed in colors, the hills, locks and prominent features being highly embossed. A close inspection will show that at this point the ship must go east to get from the Atlantic to the Pacific, and the sun rises out of the Pacific on the Pacific end of the canal and sets in the Atlantic on the Atlantic end. We understand that this map can be obtained by mentioning the NATIONAL BUILDER to the Tidewater Portland Cement Co., Keyser Building, Baltimore, Maryland.

MODERN MANTELS.

The Huber Builders Material Company, 3943 Vine street, Cincinnati, call attention to the illustration of wood mantel which they are featuring and offering at what they state is an unusually low price for such a fine mantel. It is described in their catalogue as being eight feet one inch in height, four feet ten inches wide, wall plates five feet and pilasters six and one-half inches, tile opening 42x42 inches, profile 5 inches. The



wide panel shown in the illustration aids in making this a very attractive piece of furniture. A fine French beveled plate mirror can be had in place of the panel when desired.

Many other views of mantels are shown in a special booklet issued by the Huber Builders' Material Company. They also issue a catalogue on sash doors, frames, flooring, wallboard, builders' hardware, etc. Both of these will be sent on request.

THE A. W. MILLER MFG. CO.

This company call attention to their lock mortiser, which has been improved until it is now recognized as one of the greatest time and labor saving mortisers on the market. It is no exaggeration or misstatement when the claim is made that this mortiser will cut an opening in any kind of wood complete in three minutes and any carpenter can do it in that time. Many builders who are using the Miller lock mortiser repeatedly

state that they can do the complete job of mortising in two minutes. Of course results always come from the manner in which a tool is handled, whether it is an ax or an up-to-date device. If the builder will have one man bore the two holes and another follow up with the cutter, the job can be done in one minute. There is no other mortiser operated by hand that can beat this time. The A. W. Miller Manufacturing Company have

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

made a study of mortisers for years. All kinds of methods and devices have been carefully tried out, and the cumulative good results embodied in the present form. The mortiser is as handy in the shop as on the job, as it frequently happens that the door is fitted and hangs on the frame before going to the building. This greatly lessens the time spent on the job and allows other mechanics to start their work sooner.

Contractors generally are enthusiastic over the results of the Miller Mortiser and the manufacturers are daily receiving letters from pleased customers.

Mr. D. H. Minton of Panama City, Fla., under date of January 30, 1910, writes as follows: "I have thoroughly tested your lock motiser and find it is one of the greatest time savers I have ever seen. It is a complete piece of machinery and it does the work perfect in every respect. I fully recommend it to any man who wants to put his money in something to get it back at once. It is just everything you claim for it. With thanks for the trial and having notified the agent to forward your money, I remain."

When a contractor talks this way there must be something to the Miller Lock Mortiser. Circulars and price can be had by writing A. W. Miller Manufacturing Company, Nevada Building, Cincinnati. Ohio.

PHENIX REVERSIBLE WINDOWS.

Many of the so-called improvements in building construction are not always an unmixed blessing. As the size and height of buildings increased, the danger from accidents also increased, the loss from fire was much greater on account of the concentration of material.

Among the places where improvement over the accepted forms of construction is noticed is in the windows. To keep the old style

windows clean required getting out on the sill and either sitting on the sill or being held in place by a belt and straps. So dangerous are these windows in the high buildings that many cities require that all sash must be so constructed as to permit being cleaned from the inside. This ruling has brought out several devices for accomplishing this purpose; in some the sash is pivoted, other hinged. In the Phenix Reversible Window the entire frame swings into the room, so that there is no occasion whatsoever for going outside. The

method of doing this is shown in the accompanying cuts. The manufacturers of these windows, The Phenix Manufacturing Co., 0.28 Center St., Milwaukee, Wis., will be very glad to hear from anyone interested in this life and trouble saving device.

EDWARDS PRESSED STEEL CEILINGS AND WALLS FOR THE AMEER OF AFGHANISTAN'S PALACE AT KABUL.

Snobbishness is a characteristic of money laden people whose brains have not been developed. You very often hear people tell—with much pride and gusto—of how they were entertained at some prominent man's house—or of the great time they had at a banquet given in honor of some lord or duke.

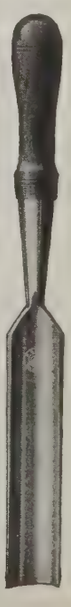
These things we know and hear. But to associate and do business with princes and rulers is beyond the dreams of even the most snobbish. However, the Edwards Manufacturing Company, "The Sheet

Look for the "Big Chuck" when you buy a brace

THEN look for "The MARK of the MAKER" and you can be sure it's a

P.S.&W. "SAMSON"

YOU can't mistake the Samson Ball-bearing Chuck. It fits the hand comfortably and the weakest wrist can release it instantly, or get a tighter grip than you can get with any other brace by using a vise.



The Samson is the top notcher in the most complete brace line on the market.

Don't forget to look for the trade-mark. It stands for 92 years of experience, ability and progress in tool-making and is put on every item in our line of Guaranteed Tools for Carpenters.

P. S. & W. Guaranteed Chisels

THIS is another of our guaranteed lines that you ought to know. It leads in the big things—variety, completeness, quality, design, workmanship; and it leads in every little detail—finish, temper, perfect fit of handle and shank, blade ground to a sharp edge, etc.

Write today for our Free "Mechanics' Handy List," a 170-page book containing 35 pages of valuable information and a complete catalog of over 200 tools for Carpenters, Machinists, Electricians and Tinsmiths.

Metal Folks," Cincinnati, Ohio, whose products enjoy a world-wide reputation, had the honor of having their metal ceilings and walls specified by one of the most aristocratic and exclusive rulers in the world.

Yet, if you step into their place of business you can detect no aloofness, no exclusion, no snobbishness, although their various products are known over the entire civilized globe. Instead of trying to climb the ladder of success by looking well in a dress suit, they put their entire energies into the manufacturing of products that would be the best on the market.

This rule they claim to be responsible for the success of their business. Their latest achievement was the securing of an order from

the Ameer of Afghanistan for pressed steel ceilings and walls for his entire palace at Kabul, an order amounting to a goodly sum.

It would take an artful imagination to trace a relationship between Afghanistan and Cincinnati, but the matter is very simple. The present Ameer, Habibullah, ascended the throne in 1901, at the death of his father. Since his ascendancy the kingdom has undergone a complete change—the Ameer is progressive—he is introducing American people and American customs into his country.

He has lifted Afghanistan from a sleepy, monotonous life into the realms of science and better things. So when the time came to remodel his palace he wanted the best and from the metal ceilings and walls brought from the markets of the world he chose the the product of the Edwards Manufacturing Company, as the most artistic and up-to-date in design, finish and material.

BURMITE.

Whether exposed to the burning glare of the mid summer sun, or the chilling blast of the Northern blizzard, the roof is expected to fulfil its primary purpose of protecting the interior from damage by the elements. In many locations there are local conditions which greatly modify the qualities of good roofing. In some cities the gases from manufacturers render some materials short lived, in other places, the danger from fire, from the exposure hazard is a prominent factor.

The model roofing is a rare combination to meet the diversified requirements, but quality will tell and the good reputation of a material on one building leads to its use on one of another character, and thus the line is extended from sheds to factories, from factories to loft buildings, to office buildings, to cottages and residences. Bermingham & Seaman Company, 1208-26 Tribune building, Chicago, are securing the specifi-

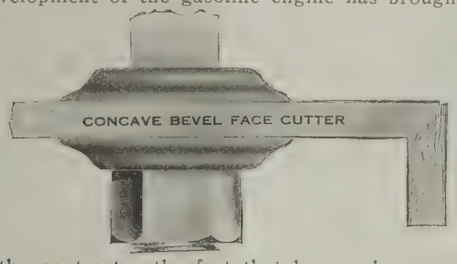
ELLIOT HOTEL, LES CHENAUX ISLANDS, MICH.

cations of their red slate surfaced and green slate surfaced Burmite roofing for fine residences and buildings. The samples of this roofing show a very fine material, not only in looks but in wearing qualities. The illustration shown here of the Elliot Hotel, Les Cheneaux Islands, Michigan, gives an idea of what this roofing is used for. The roofing of the hotels and summer cottages in the Les Cheneaux Islands, which lay far up at the head of Lake Huron and close to the Michigan shore, where forest fires in the dry season are a constant danger, should be fire proof as well as water proof. In placing Burmite roofing on the Elliot Hotel, not only is this feature considered but also the fact that there can be no leaking of the roof when the heavy snows arrive early in October and remain until late in the spring.

The Bermingham & Seaman Company show in their advertisement in this number a very artistic little cottage with Burmite used as a roofing material and also Burmite siding on the sides. It will be seen by the manner of clap-boarding that a very nice effect is obtained and at the same time the owner has a water and fireproof roofing and siding.

Many people when looking at this cottage are under the impression

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

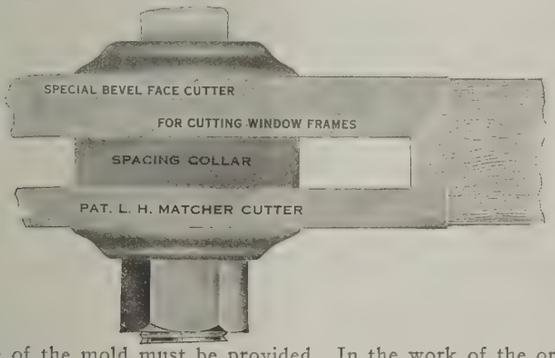


that the sides are rough cast cement or plaster. The difference in cost between plastering or cementing the sides of this cottage and Burmiting is is considerable and takes an entirely different class of labor. Most anyone can put Burmite on either as roofiing or siding with satisfactory results, while it takes an unusually good workman to cement or plaster a building properly. Circulars are being mailed on Burmite and can be had by writing the Bermingham & Seaman Company, 1208-26 Tribune building, Chicago.

WOODWORKING SPECIALTIES.

Mechanical work has to a large extent superseded the expensive and slow hand work of fifty years ago. Then the larger part of a building was made by hand; the sash, doors, blinds, etc., were made one at a time. The work was generally good, depending on the skill of the individual workman and the sharpness and variety of his tools as much as on the quality of the material.

The advent of planing mills to a large extent did away with this form of hand work. The doors, sash, blinds, trim, etc., all came to the job ready to nail in place. In some cases, even the doors were hung in the frames, the locks fitted, etc., and the painting and varnishing practically complete.



The development of the gasoline engine has brought to the at-

tention of the contractor the fact that he can be more or less independent of the planing mill, especially on rush and repair work. Where only a few pieces of an odd size are to be gotten out, there is usually a long delay at the mill. By the use of the portable saw rigs and similar shop machines, all this work is easily gotten out in a hurry.

The saws and tools used for the various classes of work on these machines vary greatly. In the cut herewith we show the shape of some of the saws as made by the Huther Bros. Saw Mfg. Co., 500 University Ave., Rochester, N. Y. The tooth best fitted for each kind of work is carefully designed to produce the greatest and fastest result with the least power.

For special work on moldings, sash, etc., a cutting face with the

reverse of the mold must be provided. In the work of the ordinary small shop these are comparatively few, and elaborate moldings may be cut with a combination of simple saws or knives. In the illustrations herewith we show combinations for sticking sash, cutting convex and concave bevels, etc.

Knives of this character are easily applied to any of the numerous "saw rigs" now on the market. A full list of available knives is, of course, impossible, as each shop might require a few special patterns. The Huther Bros. Saw Manufacturing Company, 500 University avenue, Rochester, N. Y., are well known as manufacturers of saws and knives for this class of work and will be glad to send their catalogues on request. The general information is valuable to anyone using or contemplating the use of a saw rig or similar machinery.

THE PERRY LUMBER RECKONER.

Mathematics have ever been a stumbling block to most mechanics. The schooling necessary to make a fine scholar has too often been denied the men who have worked up from the ranks. This lack of the knowledge of the tricks of rapid calculation of quantities frequently handicaps them in securing work, as from uncertainty they are apt to "figure high" or, if the truth were known, "guess" when they should be accurate.

No one book is large enough to provide all the tables and calculations required about the building. For this reason, The Perry Lumber Reckoner contains little besides lumber, but it has lumber down to a fine point. Beginning with 1x1-t foot long the tables run up to 12x14-34 ft. long and in quantities from one to a hundred.

A unique table shows how many pieces of various timbers are required to make 1,000 feet. From this table the contractor can easily check the quantities as delivered, and should too many be delivered, call the attention of the lumberman to the error.

Under the head of remarks, a number of other items of information are given, which will well repay close study. Rules are given for estimating lath and shingles required, and even the simple rules of interest.

The Reckoner is provided with a cut index for readily finding the various timbers and is sold exclusively by Benjamin L. Jenks, 906 Williamson Building, Cleveland, Ohio.

Asbestos "Century" Shingle Roof—Residence Dr. Robt. Damerell, Red Cloud, Neb. Architect, C. M. Way & Co., Hastings, Nebr. Contractors, S. Beckwith, Red Cloud, Nebr.

Asbestos "Century" Shingles

"The Roof that Outlives the Building"

PEOPLE often write us to know if we can supply Asbestos "Century" Shingles for some special style or kind of building.

Our answer to that is that we can fit out any building with an Asbestos "Century" Shingle roof.

Our assortment of shapes is universal.

It has to be.

Asbestos "Century" Shingles are in use today on practically every kind of building occupied by civilized man.

You will find them on residences of all types—from the cottage and bungalow up to the most costly mansions of America and Europe.

You will find them on office buildings, public buildings, museums, factories, railroad stations and workshops.

You will find them in the temperate zone, in the tropics, near the Arctic Circle—impervious to every climatic condition and immune from fire risk.

Write us for information about the shapes of Asbestos "Century" Shingles—the sizes—and the three colors: Newport Gray (silver gray), Slate (blue black) and Indian red. We will send you quotations and our booklet "K. & M., 1911."

BLUE PRINTS.

For many years the reproduction of original drawings in the form of blue prints, black, brown and Van Dyke prints has been quite a problem to the majority of manufacturing, railroad construction, engineering and architectural firms using them. The original drawings are of considerable value, and must therefore be kept as permanent records. While not allowed outside of the drafting room or office of the firm owning them, the necessity for numerous exact reproductions for use in the operating end of the plant, mailing and advertising purposes arises.

This has been accomplished in the past by Solar printing, using many unwieldly sun print frames for exposing the tracing and sensitized paper. The objectionable features of this method, such as the impracticability of making these frames large enough, unfavorable weather conditions, complications arising—among these the demand for prints by the night working force, large quantities at reduced cost, uniformly clear and distinct prints at all times. These conditions opened a field for an electric blue printing machine, substituting electric for sunlight, thus working independently of weather conditions and increasing the output by its convenience.

The first machines built involved such a high cost and heavy operating expense, because of the many lamps used and electric motors for power, that the sale was limited. It was apparent that a medium priced, highly efficient machine operating at low cost would meet with popular favor.

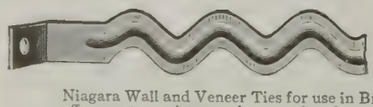
The Buckeye Engine Company, themselves large users of blue prints, undertook to design a printing machine which would overcome many of the serious objections to the machines then in use. The result was the Buckeye Electric Blue Printing Machine, which, with a single lamp, vertical cylinder and other distinctive features of construction, proved not only most efficient but of the utmost simplicity in operation.

As will be seen from the illustration herewith, the machine consists of two vertical half cylinders of glass, with a lamp traveling up and down between them. The tracing is placed on the outside of the glass, covered with the sensitized paper, and a curtain drawn over them to hold the whole in place. By suitable mechanism the lamp travels slowly down between the plates of glass, and the print is made. The machine typically illustrates the necessity for speed under all circumstances. The operator can make prints at any time, independent of time or weather, in size up to 42x72, or can make a number of small prints at once. To make a print of this size with a Solar frame would require a space of at least 40 square feet inside the building and an extension outside with tracks, etc., half again as much, while the Buckeye requires about 3½ feet square on the floor.

So general are these machines in use that we believe the manufacturers, the Buckeye Engine Works, Salem, Ohio, can direct one to a machine in their neighborhood. We are sure that mention of the NATIONAL BUILDER will bring a prompt reply to any questions regarding their operation, maintenance, etc.

WATERPROOFING AND FINISHING SPECIFICATIONS.

Possibly no one item gives the architect or engineer more trouble than protection against water. Not only the roof must form a protection from the rain and snow falling on it, but it must be proof against all the tricks of the weather, piling up snow and ice, expansion, etc.



The sides of the building must be tight against not only actual openings, through which the weather may enter, but also proof against moisture and dampness workng through the composite materials of the wall.

But however much trouble the roofer or the mason may have above ground, their troubles are simple compared to the problems confronting the man working below the ground. Until the last few years it was generally considered that basement walls must be damp and that water would always stand on the cellar floor. It has remained for the engineers who designed buildings several stories below the street and natural water level to provide dry walls and floors for those places. How well they succeeded is shown by the fact that basements are being built where it was considered impossible a few years ago and the masonry walls, both below and above ground, are kept dry.

While there are a number of methods for securing these results, there has always been the thought that complicated and expensive work was required, so that only the largest and most expensive buildings were benefited by the processes. Such is not the case at present. The requirements of the large buildings produced the systems in use which are now as applicable to the one-story cottage as to the skyscraper, and just as necessary. Health demands dry walls as much as expensive machinery does.

Be the Man Who Superintends
Be the Man Who GIVES Orders

The man who superintends now was once the man who was given orders. Special training has raised him in salary and position.

You who hold minor positions now have the same opportunity for quick advancement that thousands of our graduates have had.

The "hard-working, oldest employees" advance very slowly nowadays. It is the man with individual training who jumps over their heads.

That is the reason why you see men of 25 and 30 years superintending men of 40 and 50 years.

Our special training in

Architectural and Mechanical Drafting

Estimating, Plan Reading
BY MAIL

will increase your salary

You know the advantages of being able to read plans and estimates, and the opportunities for promotion and prosperity that come to those with that ability. We can positively teach you, with our simply written, practical lessons. Hundreds of plans of buildings, in course of construction in Chicago, are studied from.

As a practical man you can see the advantage of studying blue print plans, specifications, and estimates for buildings *now being built* or recently completed. You do not receive a lot of books to read *about* some building which exists only on a printed page, as your problem. To *learn* a thing you must *do* it—reading about it is not sufficient.

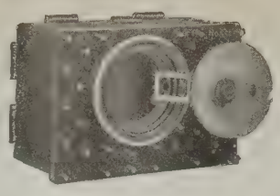
If you are a bricklayer, mason, carpenter or builder, you need this course—it will bring you higher wages.

If you are a foreman or superintendent, you need this course—it will enable you to become a successful contractor.

If you are a contractor you need this course—it will help you to figure closer. It will eliminate mistakes—increase your profits.

The lessons are approved by well-known Chicago architects and engineers. We have partial courses to fit your individual need, if you have had previous experience.

Start now on your journey to success. Don't say you can't do it—you can; don't say you haven't time—take it; don't say you haven't the money—earn it as you study.



Determine now whether you will advance in salary and position or let other men go ahead of you.
Send for free folder, now.

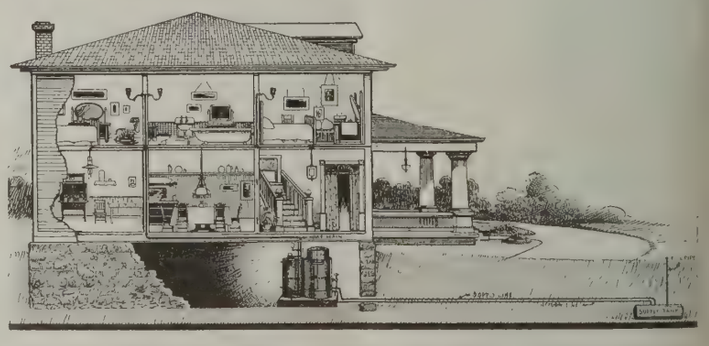
have from time to time described the various methods of waterproofing. Manufacturers of preparations have advertised their wares and made their names familiar. One of the latest to prepare explicit specifications and directions for waterproofing under various conditions is the Trussed Concrete Steel Co., 384 Trussed Concrete Building, Detroit, Michigan. Under the above heading they have prepared



an excellent description of their products with directions for use in the shape most desired by intelligent mechanics. The specifications are illustrated by diagrams showing the proper construction to give the best results and the booklet provides an excellent guide to the architect, engineer, contractor, mechanic and owner.

We understand that anyone interested in this subject is entitled to a copy of this excellent work.

GAS FOR HEAT AND LIGHT.

One by one the advantages of the city life are being carried to the suburbs and country. Few small cities and towns are without adequate water supply, telephone systems, gas and electricity. Suburban towns where any of these are lacking soon find themselves regarded as behind the times.

But the introduction of all of these into country places, farms, etc., has required more time. The cost of long runs of pipe and wire for a few customers made the service expensive and frequently unsatisfactory, and has led to the introduction of systems in which the individual owner was practically independent of a central source of

"Economy" System in a Country Home.

supply. This has been adapted to particularly water supply and gas. The former is frequently surprisingly easy to install, a hillside spring often having sufficient head to pipe directly to house and barns.

In the manufacture of gas systems operating in enormous quantities are in use in the larger cities, and it is frequently overlooked that there are systems adaptable to small villages, county estates or single farm units.

The Economy Gas Machine Company, 437 E. Main St., Rochester, New York, have for some twelve years been making a gas plant adaptable to places of this character. In general, the system consists

Build Artistic Stairways From Gordon-Van Tine Stock!

A Flight of Stairs Complete for $23.93

Our Stair Department Will Save You Big Money

Through our ceaseless efforts of selling reliable stairwork at cost plus one small profit, we have been able to produce and sell stairwork at prices which leave a handsome profit for the contractor. In our Grand Free Millwork Catalog we itemize individually, each and every article required for the stairs, and explain fully just how this material comes to you and attach net prices. With this information at your command, an infinite variety of arrangements of stairs can be figured within a few moments, and you know the exact cost without entrusting your interest to any outsider.

The fact that part of this material is already machined ready to go right into the stairs, reduces the erecting cost very materially. We use only thoroughly kiln-dried material in making up the different parts of this stair stock, and only the most skilled and expert mechanics are employed in the production of the finished article. By using kiln-dried lumber you avoid any of the annoying effects of shrinking or coming apart of the stairs after they are put in the building. The itemized list for a flight of stairs which is given on this page, shows you at a glance how reasonable the material for a complete stairs can be purchased.

The fact that you have had no previous experience in the stair building line should not deter you one moment from learning its simplicity now. If there are any points which are not practically clear to you regarding the proposed stair for which you are in the market, write us, and we will give you the advice of an expert stairbuilder.

Vast Assortment of Oak and Yellow Pine Stair Material

Our stock designs of Stair Newels, Rails, Balusters, Steps, Risers, Face and Wall Stringers and miscellaneous materials in Oak and Yellow Pine is very complete. A line which is at once adapted to the swell and modest cottage or most elaborate home.

Correct in Every Detail

We call particular attention to the style of construction, for instance, of our posts; the correct size of all mouldings, in order that the assembled effect may be harmonious and complete. Likewise, the turning of the balusters and shape of rails are especially adaptable for these specific purposes.

With the styles illustrated, an infinite variety of arrangements of stairs is permissible, and it is a very rare exception when special work will be required for any particular purpose. Our designs are modern and up-to-date. All Newels are hand smoothed and made from thoroughly kiln-dried stock. All carvings are handmade and not composition ornaments. Every Newel from one-inch lumber, with glued lock joint. Height of all starting Newels 4 feet, with 8x8 base and 6x6 shaft, suitable for open or closed stringboard. Base of post, 20 inches long, allowing one or two risers. Every Newel wrapped in paper and carefully packed. The stock is all thoroughly machined, well kiln-dried and can be shipped promptly.

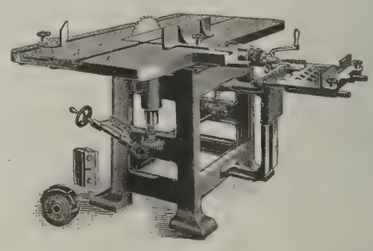
SEND FOR CATALOG No. 16

It contains many beautiful designs of Consoles, Columns and Grilles.

NORTHWESTERN GRILLE WORKS
Office and Showroom, 1824 Milwaukee Ave., CHICAGO

of a tank buried in the ground some distance from the building, to hold the required supply of gasoline, and a machine to mix air and gasoline vapor in the proper proportion to form a perfect illuminant. It will be noted that only a few ounces of gasoline are in the house at any time and the gas is generated only as used. The smiplicity of the system may be judged from the fact that no attention is required except to fill the supply tank, the gas machine being entirely automatic in its action. The tanks shown in the illustration contain only air, and as the supply tank should be lower than the basement floor, no gasoline can flow into the house except when gas is being used.

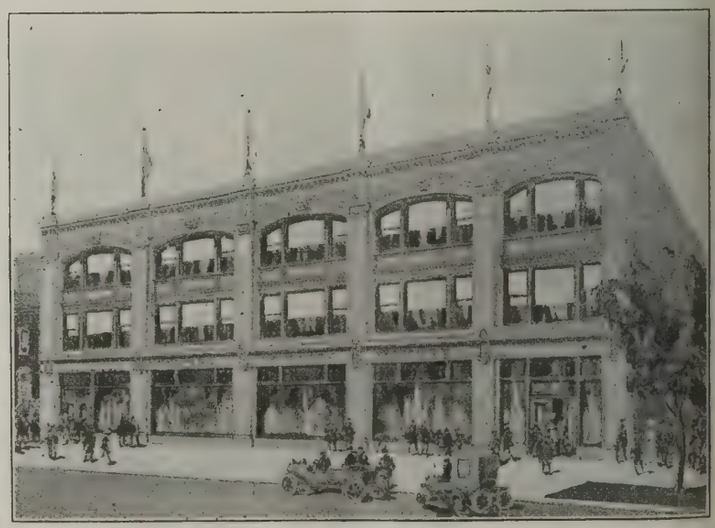


As the working parts are all metal there is nothing to require lubrication and there being no friction between the metal parts, there can be no wear.

Contractors and builders will find the installation of these machines very simple, and their use so economical and satisfactory that no country place should be built without one. The prospective builder should investigate this machine when planning his house and the contractor should be posted on it in good season. We are sure the Economy Gas Machine Co., 487 E. Main St., Rochester, N. Y., who manufacture this machine, will be glad to have you ask for further information.

NEW HOME OF THE CHICAGO MACHINERY EXCHANGE

Even at this time in many cities any old kind of a building is good enough for a machinery business, but the progressive men manufacturing and selling machinery now have as finely constructed buildings and as attractive show rooms and offices as manufacturers of other lines.



Among the larger companies owning their own building and having everything right up-to-date in it for a display of fine woodworking machinery, is the Chicago Machinery Exchange, 1217-25 Washington boulevard, Chicago. This new home of the Chicago Machinery Exchange contains sixty thousand square feet of floor space. It is well lighted and arranged to display every machine so that the buyers can see exactly what he is getting. Among the many different woodworking machines carried in stock by them is their number one and a half Universal Saw and Dado Machine. For the contractor and builder who is obliged to save floor space, this machine is one of the most popular. It can do a large range

of work and is used either in planing mills, furniture factories, jobbing shops, carriage and wagon factories and pattern shops. It is a rip saw, cross cut saw, mitre saw, bevel saw, jointer, dadoing machine and boring machine all combined in one.

The number one and a half machine is furnished complete with all attachments or with parts of the attachments omitted as required. It is sold at a very low price and is furnished with one fourteen-inch cross cut saw and one-fourteen-inch rip saw, one dado head for making any size grooves. The jointing head is six inches long and is furnished with two straight knives. One boring attachment is also furnished with five boring bits.

It will be seen from the accompanying illustration that this machine is built for service on each equipment. To get full information and description it will be better to write the Chicago Machinery Exchange

for their circulars about it. For a contractor and builder who has plenty of floor space in his shop, attention is called to the Chicago Machinery Exchange's advertisement in another part of this issue where two separate machines are offered for the price of one.

The Chicago Machinery Exchange has been doing business continually for many years in Chicago and is well and favorably known to many of our older subscribers. They will be glad to renew old acquaintances and make new friends if given the opportunity.

SAVING A MONTH IN BUILDING.

SPEED is demanded in Twentieth Century building. More durable building and more sanitary building are engaging agricultural science as never before—and wonderful progress is being made along these lines. But durability and sanitation must be worked out in rapid construction methods.

BISHOPRIC WALL BOARD.
Lath Is Necessary in Wall Board as in Plaster, to Keep from Warping.

Every owner likes to be able to say that his cottage or his skyscraper is better than his neighbor's. But from the moment he decides to build his main desire is to "get into" the building.

In the old days—not so very old either—the most exasperating delay was due to the drying of the plastering. There was no way to avoid it—except hastening the drying by putting on more artificial heat. Every one in the building professions and trades can tell of losses and even disasters resulting from that plaster freezes. Therefore, plastering in the winter was commonly out of the question.

NEED BROUGHT FORTH THE BISHOPRIC WALL BOARD.

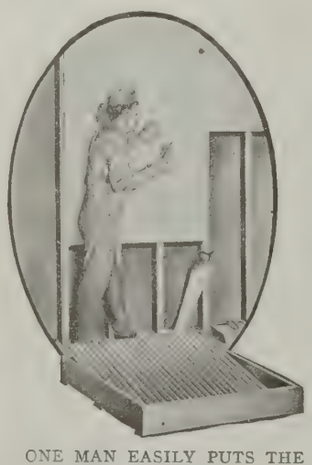
There are many other objections to plaster. It absorbs moisture. It cracks. It crumbles. It lets out the heat and lets in the cold, wind and rain. It also lets in vermin. It does not deaden sound.

So it is a great need that brought forth Bishopric Wall Board to take the place of the old combination of lath and mortar.

It does away with all the old plaster troubles—is actually less expensive—and saves a month in the building of residence factory or business block. It comes in sheets all ready to be nailed at once to the studding.

Any man who can drive nails can put on Bishopric Wall Board. It can be applied in half the time required for lath and plaster. This means a saving of fifty per cent in labor. An ordinary lather can finish a wall with it in less time than he can put on laths for plastering.

As soon as it is on, the wall or ceiling is ready for immediate decoration. There is no waiting until it sets or drys. There is no delay until artisans are available for the work. The finishing goes right on. Time is saved. Labor is saved. Expense is saved.



KILN DRIED LATHS IMBEDDED IN ASPHALT MASTIC.

Bishopric Wall Board is made of kiln dried, dressed laths, imbedded in hot Asphalt Mastic (99%) pure at a pressure of 500 pounds to the square inch. It is surfaced with heavy, sized cardboard and cut at the factory into sheets (laths and Asphalt Mastic combined), 4x4 feet in size, and three-eighths of an inch thick—all of uniform size and thickness.

It is shipped in crates of 16 sheets. Each sheet is 4 feet square and three eighths of an inch thick. One crate of Bishopric Wall Board therefore will cover 256 square feet of wall surface. One crate weighs 250 pounds.

ASPHALT MASTIC IS TOUGHENED ASPHALT.

To produce it, Carbonate of Lime is combined with pure asphalt, producing a hemogeneous mixture.

ONE MAN EASILY PUTS THE WALL BOARD ON.

It is a patented discovery. Asphalt Mastic withstands all climatic and weather conditions. It will not soften under the hottest summer sun nor crack in zero weather. It stands a pressure of 500 pounds to the square inch, which is a guarantee against breaks or cracks. Asphalt Mastic is proof against moisture, heat, cold, wind or air, sound, vermin, acid and fire. No paint or other coating is required for protection for the reason that the mastic process so toughens the asphalt that it withstands the hardest tests of wear to which it can be subjected in a building.

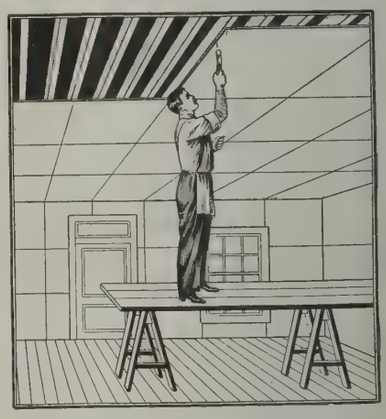
The laths which are inseparably imbedded in Asphalt Mastic make the best kind of a binder. With the laths thus imbedded, there is no danger of Wall Board warping or getting twisted out of shape. Furthermore, the laths make it possible to nail the Wall Board securely to the studding.

ASPHALT MASTIC DOES NOT BURN, PROTECTS LATHS FROM FIRE.

Oils mixed with asphalt for tempering purposes burns. But Asphalt Mastic being a homogeneous mixture of special process lime and asphalt does not burn.

Laths imbedded in Asphalt Mastic therefore do not burn so readily as laths in plaster.

As a matter of fact, Bishopric Wall Board under fire sticks to the studding longer than laths and plaster, because Asphalt Mastic adheres to the laths much longer than plaster. Under fire and water plaster soon crumbles, exposing the laths. By sticking to the laths, the non-burning Asphalt Mastic protects the laths. This enormous advantage, has saved many buildings finished with Bishopric Wall Board.



A special reason for using Bishopric Wall Board was found in California. It was found to withstand the tremors of the earth which plays such havoc with plaster. A San Francisco builder writes that it ought to have a good market in California for this reason alone.

USED IN EVERY KIND OF BUILDING, SMALLEST AND LARGEST.

Bishopric Wall Board is suitable to every building. It is now in use in the most expensive residences, cottages, bungalows, flats, pleasure and health resort buildings, schools, colleges and churches, office and factory building and garages. New partitions in old buildings are made of it. Attics have been turned into ideal billiard rooms, playrooms, and even bed chambers with this wall board. Cellars are ceiled with it. Back porches and laundries are finished with it. In fact it goes anywhere that a smooth weather-proof interior is desired.

TAKES PAPER, PAINT OR ANY OTHER DECORATION.

Bishopric Wall Board sheets are cut square. Therefore, in fitting, neat, close, snug unions are produced. In sawing sheets for fitting around doors, window and wall projections, it is only necessary that the sheets be cut true. When, through imperfect fitting, the pieces are not closely joined the seams may be covered with cheap muslin, manila paper, or cheese cloth. It is a common practice, when an exceptionally fine job is desired, to cover all seams with narrow strips of cheese cloth or manila paper.

Comes in Sheets 4x4 All Ready to be Applied. May be Painted, Papered, Covered with Burlap of Any Other Wall and Ceiling Decoration.

By applying a lining paper (cheap grade of wall paper or manila), over the entire wall surface, the result is a spirit level wall surface.

Oil or water colors may be used in painting Bishopric Wall Board. The surface is first covered with muslin or canvas.

Any of the artistic systems of paneling may be used. Strips of decorative wood, beading or timber is applied over the seams. For mission panel ceilings Bishropric Wall Board is ideal.

It insures the utmost in smoothness, and adhesion to any wall paper, as the wall board is sized before leaving the factory.

Bishopric Sheathing is made of precisely the same materials as Bishopric Wall Board but finished surface is not necessarily so smooth. It is less expensive than lumber sheathing; is applied in less time, does away with building paper and makes a more solid and wind proof job.

It is nailed to outside of studs with lath side of Sheathing exposed. Over the Sheathing, weatherboards are nailed or cement or stucco applied. When weatherboards are applied, dead air space is left between the laths, furnishing excellent insulation. The same spaces between the paralleled laths form an excellent key where a cement or stucco exterior is desired.

Bishopric Roofing is made of woolen felt covered on both sides with Asphalt Mastic and surfaced with flaked mica producing a handsome as well as most durable roof.

A national demand has been created for Bishopric building materials. They now are extensively sold in every state in the Union, as well as in Alaska, Canada, the West Indies, South America, Africa, Asia and Australia.

Bishopric Wall Board Sheathing, and Roofing are manufactured by The Mastic Wall Board and Roofing Manufacturing Company of Cincinnati, Ohio. On request they will send free samples of the Wall Board, Sheathing or Roofing, and a booklet fully explaining these products and all their uses. Dealers are especially requested to write for their special proposition.

A national advertising campaign is being carried on in leading publications. Prospective builders everywhere have become acquainted with these products and are inquiring about it. The company is desirous of placing the business through local representatives in all parts of the country. The growing demand surely means profits for all who begin handling these products now.

Amatite ROOFING

Why the Buyer of Amatite Never Complains

WHEN a man buys ordinary ready roofing he usually neglects to paint it and after three or four years he comes back to the dealer with a protest. It is human nature to neglect painting roofs.

When a man buys Amatite Roofing he lays it on his building and in three or four years it is still as good as new and does not need any paint. He forgets he has such a roof but no harm is done by that.

There is nothing to neglect in the case of Amatite. Amatite has a peculiar surface—a sort of plastic concrete made of pitch and mineral matter.

This surface is plastic enough so that the material can be rolled up into handy rolls in the usual manner and handled just like any other ready roofing. When unrolled on the roof and nailed down it presents to the weather a continuous surface of mineral matter and pitch. On this surface wind, rain, storm, heat and cold have little effect. Year after year it looks up to the sky undisturbed and unaffected. It costs nothing to maintain and relieves the owner from all responsibility.

Dealers can improve their business by selling Amatite and buyers make a good bargain when they buy it. The price of Amatite is less than that of most painted roofings of less weight and durability.

Sample and further information on request.

Compo-Board

THE MODERN WALL LINING

Better than Lath and Plaster in Every Way

Compo-Board will outlast lath and plaster several times over—in fact it will outlast the building itself.

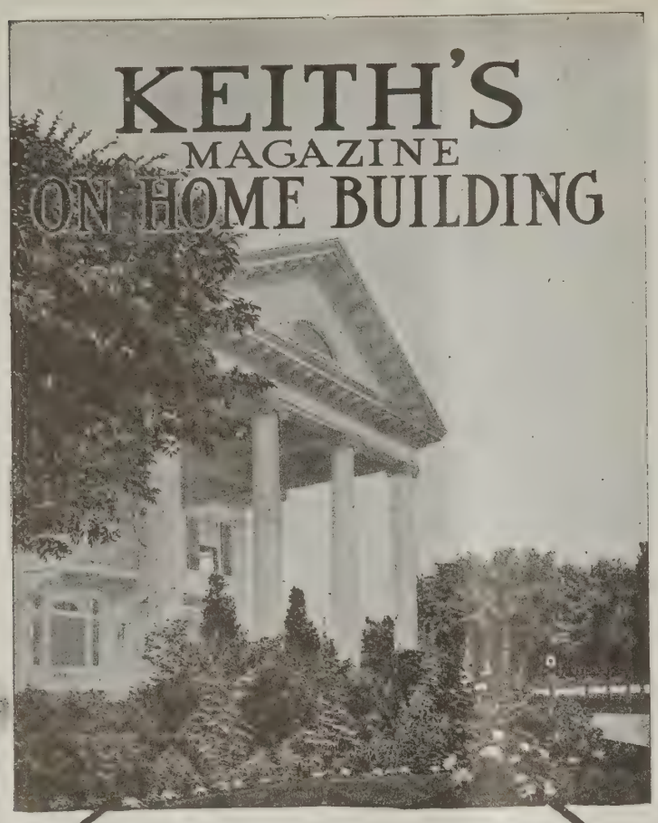
Makes absolutely dry, warm, moisture proof walls and ceiling. Cannot crack, crumble or chip off like plaster. Keeps the rooms warm in winter and cool in summer.

Compo-Board can be used in any climate. It is quickly and cheaply put on in any kind of weather—no muss or dirt or waste of time waiting for plaster to dry.

Not only is Compo-Board a superior wall lining, but it has a multitude of uses in the home, around the yard, and in the office and factory.

Made of thoroughly seasoned kiln dried strips of lumber covered with a thick coat of cement and heavy durable paper put on under intense heat and pressure.

You can buy it in strips four feet wide and one to 18 feet long, any length you want in even feet.



SEND FOR BOOKLET AND SAMPLE

And you can see just what Compo-Board is, and read all about its many advantages and numerous uses.

THE GREATEST WORK

ever published on Architecture, Carpentry, Contracting, Building and all allied branches is the new 10 volume edition

Cyclopedia of Architecture, Carpentry & Building

Ten massive volumes; 4,760 7x10 inch pages; 4,000 full-page plates, detailed drawings, plans, color plates and photos of buildings completed and in course of construction. Bound in half morocco leather and printed on special enameled paper in large, clear, readable type. Titles beautifully engraved and stamped in 23 carat gold.

No work so comprehensive, so authoritative, has ever before been placed on the market. This great work is a complete review of architecture, carpentry and building. Every problem likely to confront you in your daily work is solved and the solution placed before you in such a clear maner that you cannot fail to understand and profit by it.

Just examine the "Partial List of Contents" below and you will at once realize how broad is the scope of this work—how thoroughly it covers the building trades.

PARTIAL LIST OF CONTENTS

Reinforced Concrete—Contracts and Specifications—Building Materials—Carpentry—Building Superintendence—Estimating—The Law of Contracts and Liens—Masonry—Stair Building—Heating—Ventilation—Hardware—Steel Construction—Elevators—Architectural Drawing—Freehand Drawing—Blue Printing—Greek and Roman Orders—Water Color Hints for Draftsmen—Painting—Wiring of Door Bells—Sheet Metal Pattern Drafting—Mechanical Drawing—Lettering—Shades and Shadows—Rendering in Pen, Ink and Wash, etc.

READ OUR LIBERAL OFFER THEN SEND THE COUPON

To prove our absolute confidence in the superiority of this work over all others, we make this liberal offer: Upon receipt of the coupon in the lower right hand corner, we will place the entire cyclopedia of ten volumes in your home or office—you keep the books seven days, examine them thoroughly, critically—subject every formula and problem to a severe test. If you are satisfied, send $2.80 after examination and $2.00 every month until you have paid the special $24.80 price. The regular list price is $50.00. As a further guarantee, we will remove the books at our expense if you are not satisfied. We pay all express charges, The books are compiled from the instruction papers of the American School of Correspondence. If you are interested in our Building Courses, mail the Coupon at the left. It will bring full information and valuable advice by mail at once.

Free with every order received before January 1st, 1913

With every set we include a Consulting Membership entitling you to the advice of our business and engineering experts free. This will give you practical help in handling working problems which are too specific to be taken up in detail in the Cyclopedia. There will be no limit to this service. A single problem solved for you might be worth more than the first cost of the books. Order the books now.

Don't Miss This Opportunity

We Want One Carpenter or Builder in Every Community to Demonstrate, Take Orders for and Apply Our EDWARDS METAL SPANISH TILE ROOFING on a Liberal Commission.

Here is a chance to build up an independent, profitable business for yourself right at home. Many carpenters are now devoting their entire time to selling our metal roofing Others have made big profits simply devoting part of their time to selling and laying our Metal Spanish Tile.

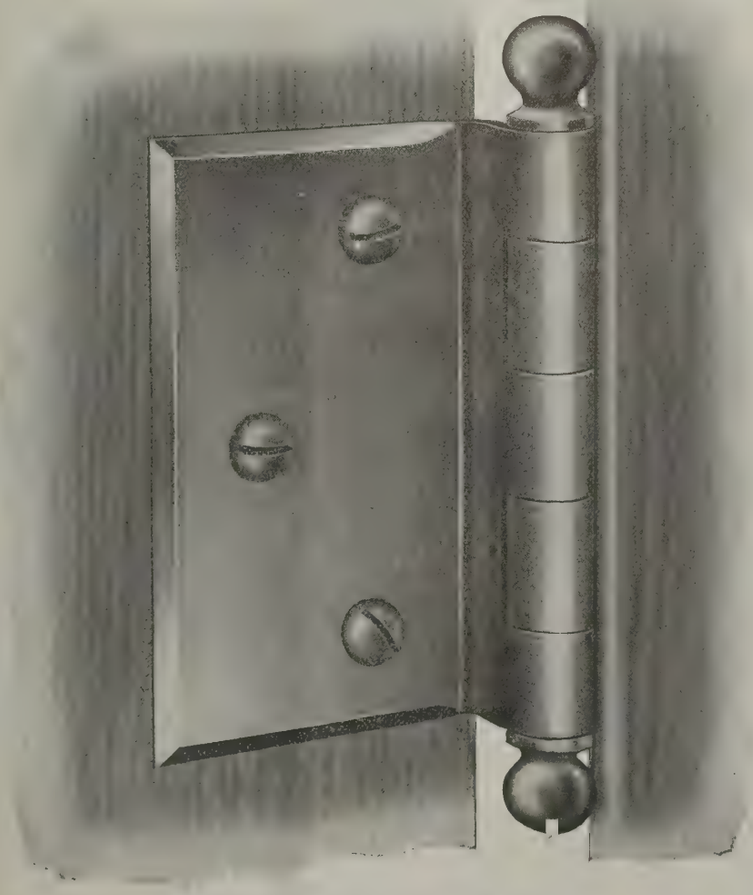
Edwards Metal Spanish Tile

Is being advertised in the leading magazines and is now known to thousands of home builders and owners everywhere. Wherever it has been used it has made a decided "hit" because it shows off to good advantage on the roof and has numerous points of superiority over any other style of roofing.

Architects are specifying Edwards Metal Spanish Tile, for they know it will do away with roofing "troubles." Builders like it because of the finished appearance it gives any house on which it is used.

Our Metal Tile are stamped out of the highest quality Worcester terne plate in exact imitation of the most expensive Terra Cotta Spanish Tile. They come either "slip" painted or heavily galvanized, size 10 x 14 inches. Our patented interlocking side lock makes it possible to make a perfectly moisture-proof roof without soldering. Edwards Metal Spanish Tile afford the fireproof advantages of Terra Cotta Tile, but are much lighter in weight, cost but a trifle more than ordinary roofing and will last a lifetime.

WRITE US TO-DAY ABOUT YOUR TERRITORY. Our business is growing so rapidly that it is necessary to have an agent in every community. The territory is going fast. One day's delay may mean that someone else will be given your territory. DON'T DELAY. WRITE TO-DAY FOR OUR SPECIAL AGENTS' PROPOSITION.



Note the construction of patented interlocking device, protecting nail heads from weather and providing perfectly for expansion and contraction of the metal.

OLDEST AND BEST

TREATISE on the PRACTICAL USES of the STEEL SQUARE

By FRED T. HODGSON, Architect

Two Vols., Cloth Binding	$2.00	Single Vols., Part I, Half Leather	$1.50
Two Vols., Half Leather Binding	3.00	Single Vols., Part II, Cloth	1.00
Single Vols., Part I, Cloth	1.00	Single Vols., Part II, Half Leather	1.50

NEW and up-to-date. Do not mistake this edition for the one published over twenty years ago. This is the latest practical work on the Steel Square and its uses published. It is thorough, accurate, clear and easily understood. Confounding terms and phrases have been religiously avoided where possible, and everything in the book has been made so plain that a boy twelve years of age, possessing ordinary intelligence, can understand it from beginning to end. It is an exhaustive work, including some very ingenious devices for laying out bevels for rafters, braces and other inclined work, also chapters on the Square as a calculating machine, showing how to measure Solids, Surfaces and Distances—very useful to builders and estimators.

SAMSON CORDAGE WORKS
BOSTON, MASS.

Besides a good profit to you, Contractors and Builders,

CORTRIGHT METAL SHINGLES

are—as an old builder once described them—self-sellers.

Besides the demand created for them by extensive advertising, the reason is very evident.

Backed by 26 years of exacting service—(for a fight against the elements—snow, rain, wind and sun is exacting service)—they offer the most exceptional advantages.

Think of roofing that never leaks—lasts as long as the building, is fireproof, handsome, durable and never needs repairs, and you have an exact idea of a "Cortright" roof.

But we don't want to simply tell you these things. We want to prove them.

That's just the reason we have a catalog ready to send to you, completely describing this superior **Cortright** construction, if you'll simply send us a postal with your name and address. Write today.

IT'S A SCRAPER BUT IT WORKS LIKE A PLANE

That is what the many satisfied contractors and builders who are using the **Boss Improved Floor Scraper** say.

The **gauge** on the front and wheels at the rear make it like a plane. This gauge, which keeps the knife from making a depression in the floor, gives the knife a double support. It can be set for **any thickness of shaving,** or **instantly removed** for working up into corners.

Deep Cutting is prevented by the pear shaped wheel in front, which lets the knife down gradually to make the cut.

Poor work is **impossible** as with the simple but positive adjustment of this gauge and wheel attachment the knife leaves no mark. The standing attachment cleans the wheel and takes off the rosin when working hard pine.

Price very low. Write for descriptive Circular "N"

Here's a "Shadow Picture" or "Double Photograph"

which emphasizes the important position achieved by

RED GUM

(*AMERICA'S FINEST HARDWOOD*) in hundreds of typical

HIGH-CLASS INTERIOR SCHEMES. There is not an interior trim wood in the market as good as good *RED GUM.* Although peculiarly amenable to staining in simulation of other fine woods (and often so used)

RED GUM'S NATIVE BEAUTY AND DIGNITY

render its *"NATURAL FINISH"* preferable in the eyes of many exacting critics.

ITS DISTINCTION AND ELEGANCE ARE NOT COSTLY.

DON'T FORGET that RED GUM equals Circassian Walnut and costs only a fraction as much.

View in the six-story "OXFORD APARTMENTS," Union and McPherson Avenues, St. Louis.
Mariner & Le Beaume, Architects. W. H. Sutherland Bldg. Co., Contractors. GUM TRIM by Mechanics Planing Mill Co

At its present price RED GUM is the most remarkable purchase in the entire hardwood field.

ALSO DON'T FORGET **ALSO DON'T FORGET**

SAP GUM

In places where White Enamel trim is required *SAP GUM* is the ideal material. Not only does it take and hold the White Enamel better than any other wood, but it is possible to get good *SAP GUM* cheaper than any other wood hitherto used for White Enamel Woodwork. *SAP GUM* presents remarkable qualities where moderate priced trim of good appearance is desired. Another field in which *SAP GUM* has reached supremacy is in the manufacture of porch columns. *SAP GUM* takes stains and wood dyes beautifully, and the popular Flemish, Mission and Weathered Oak finishes are easily reproduced in *SAP GUM.* STAINS ON GUM DON'T FADE. (Store up that point.]

Anyone planning to build apartment houses, office buildings, hotels. residences or specially designed furniture, should defer final arrangements and correspond at once with any of the following firms regarding samples, prices and lists of important buildings of all types wherein RED and SAP GUM have been used with eminent practical success and signal artistic satisfaction.

They Save Man Power

ATKINS Silver Steel SAWS

HERE is a clear demonstration of only one of the scientific advantages of SILVER STEEL SAWS. In the picture you will see ATKINS' Famous No. 53 with Perfection Handle. Follow the line down the man's arm and see where the force of stroke is centralized. On the saw teeth. You know that you can push harder and easier from an elevation that is in a direct line. Just so with the Perfection Handle. What could be easier than the motion shown in the picture above? The Perfection Handle is the only shape of Handle that naturally places the saw blade in this position. That's why we recommend it.

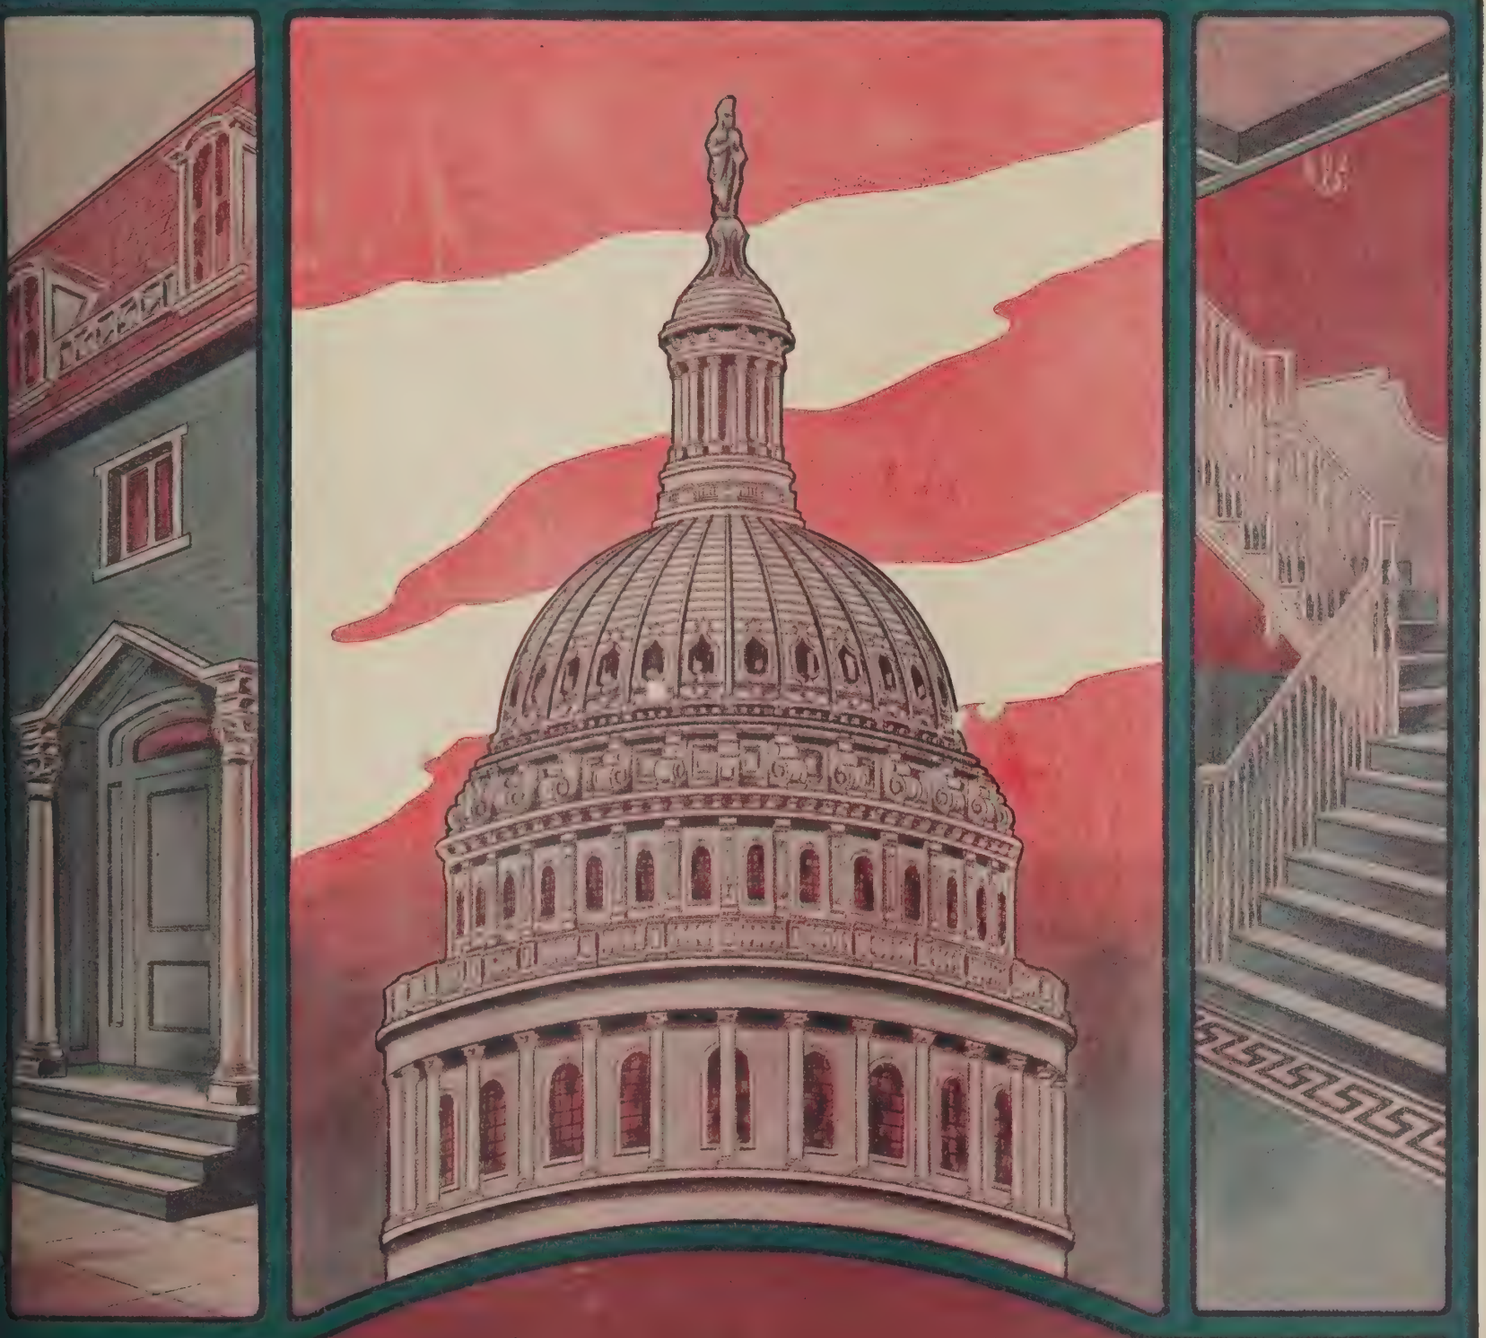
Now Note the Dotted Line

See how the straight handle throws the saw blade downward. See where the greatest force is exerted. On the back of the saw. Is this not energy wasted needlessly?

WE MAKE BOTH KINDS

If you still prefer the old style straight handle, ask for the following skew back Saws—Nos. 51, 52, 66, or the following straight back saws—Nos. 54, 55, 64 or 67.

The following are the most popular saws fitted with Perfection Handle. In skew back, Nos, 400, 53, or 68. In straight back, Nos. 65 and 69.



OUR FREE OFFER. If there are any carpenters who have not as yet received one of our aprons free of charge, we will be glad to forward one upon receipt of ten cents to pay postage and will send with it full information in regard to High Grade Saws.

HOW TO BUY THEM. Your dealer most likely sells SILVER STEEL SAWS. If not, he will be glad to order for you from his wholesale house. Specify ATKINS SILVER STEEL. None genuine unless plainly marked "SILVER STEEL" on the blade. If your dealer won't supply you, write to us. We'll see that you are taken care of.

Save a Month's Time in Building

Applying Wall Board to Studding | Applying Wall Board to Ceiling | Applying Bishopric Sheathing

Send for Free Illustrated Book and Big Free Sample of Bishopric Wall Board

WITH BISHOPRIC WALL BOARD IN PLACE OF PLASTER you can make the finest kind of walls in your house in the coldest weather. Save a month's time! Bishopric Wall Board comes in sheets 4x4 feet, ready to go on. It goes on ***dry***. You don't have to wait for setting or drying as you do with plaster. Bishopric Wall Board does not freeze—has none of plaster's troubles—costs far less to put on. You don't have to wait for a skilled workman. Any man who can drive nails can put on Bishopric Wall Board and have a wall all ready for paint, paper, burlap—any decoration. Or with panels it makes a handsome wall just as it is.

Fire-Resisting—Air-Tight—Moisture-Proof Rat, Mouse and Cockroach Proof!

Here is the reason: Bishopric Wall Board is made with Asphalt-Mastic. This is asphalt toughened by a patented process and **it won't burn.** In hot Asphalt-Mastic kiln-dried dressed laths are imbedded at a pressure of 500 pounds to the square inch. The other side of the Asphalt-Mastic is surfaced with heavy sized cardboard.

The non-burning Asphalt-Mastic protects the lath. Buildings have been saved because of Bishopric Wall Board. Imagine a rat trying to gnaw through that asphalt. He can't do it. It gums up his teeth. He just has to give it up and go where they use crumbling plaster.

Bishopric Sheathing

Bishopric Sheathing is made of precisely the same materials as Bishopric Wall Board, but finished surface is not so smooth. It saves 75 per cent of the cost of lumber sheathing and building paper; is applied in less time; does away with building paper and makes a more solid and windproof job.

It is nailed to outside of studs with lath side of sheathing exposed. Over the sheathing weatherboards are nailed or cement or stucco applied. When weatherboards are applied, dead air space is left between the laths, furnishing excellent insulation. The same spaces between the paralleled laths form an excellent key where a cement or stucco exterior is desired.

Sheathing may be used in place of Wall Board where a fine finish is not necessary.

Use Wall Board or Sheathing in All Your Buildings

The finest homes as well as cottages are finished with Bishopric Wall Board. Use it in your new house and get it ready to occupy right away, no matter how cold the weather gets. Use it in your present home. Close up your attic and make a comfortable room with it. Make new partitions with Bishopric Wall Board. Finish the porch—ceil and wall the cellar with it.

Make Rat-Proof Bins, Cribs and Poultry Houses

Use the Bishopric Sheathing in your barn. Make your bins, your poultry house, your milk house rat-proof, rain-proof, frost proof. It takes only a few minutes. It makes the neatest as well as the strongest walls of all materials invented—and remember, they are **fire resisting.**

Be Sure You Have the Wall Board Made With Laths

Bishopric Wall Board is the only wall board made with laths. Laths are positively necessary to back up a wall board—to make it rigid and substantial—and to keep a perfectly flat surface. Without lath, wall board swells, warps, cracks and pulls away from the joints.

Bishopric Wall Board never warps, never cracks, never pulls away from the joints. It keeps its flatness as long as your building lasts. It is sold to you on one binding, money-back guaranty that it will make good on every claim.

Contractors and Builders! Write for Our Liberal Proposition

There is big business and generous profit for you in Bishopric Wall Board and Bishopric sheathing.

We have a new proposition for the live contractor and builder in every town.

Write for it at once. You put yourself under no obligation.

Our advertising is bringing inquiries from people all around you. We prefer to fill orders through you.

BISHOPRIC WALL BOARD AND SHEATHING

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

HE WHO USES CYPRESS BUILDS BUT ONCE.

You Know the Ancient fame of

CYPRESS

But do you know its uses *today*, and their significance to *you*?

CYPRESS is ***the*** wood of Scriptural history, and of romance; CYPRESS was the mystic wood of mythology—and it was the reliance of the sturdy builders of early America; CYPRESS always has been a magnet for those who have wrought sentiment and beauty into useful things—and CYPRESS is ***today*** the ***staple wood*** of the hard-headed calculating buyer who seeks the most ***lasting*** values for his lumber money.

This concerns ***YOU***—if you like to avoid repair bills on anything made of wood.

It was of CYPRESS, according to Pliny, that the famous statue of Jupiter was carved; it existed more than six centuries without a sign of decay.
The historic Gates of Constantinople were of CYPRESS; they were on duty for eleven centuries without a furlough.

The CYPRESS doors of ancient St. Peter's, in Rome, were in a state of perfect preservation when removed by Eugenius IV; they had been swinging on the faithful for twelve centuries.
The only Egyptian mummies that survive intact and unblemished are those whose executors filed them in CYPRESS receptacles.

To bring the record nearer home—there was Thomas Lyon, who in 1640 built him a house in Greenwich, Connecticut. He put CYPRESS shingles on its roof and sides. With no exterior repairs of consequence, this house is today occupied as a residence.

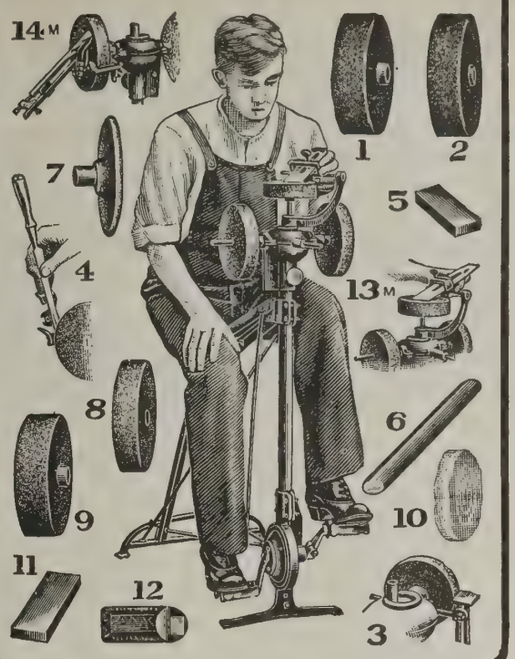
THIS WAS **AMERICAN** CYPRESS—the kind we own and cut and are selling you.

CYPRESS is in truth "the wood eternal." He who uses Cypress builds but once. If you are putting up a palace or a pasture-fence, and want to build it "for keeps"—USE CYPRESS.

There will continue to be a liberal education (and a wonderful *investment* value for you) in the CYPRESS advertising—and in the DETAILED INFORMATION and RELIABLE COUNSEL to be had promptly, *WITHOUT COST,* if you will *WRITE US YOUR OWN NEEDS* (big or little), and *ASK YOUR OWN QUESTIONS* of the **"Builders' Department"** of the

Southern Cypress Manufacturers' Association

1212 HIBERNIA BANK BUILDING, NEW ORLEANS, LA.



Probably your lumberman sells CYPRESS; if not, *WRITE US,* and we will tell you the dealer handiest to you.

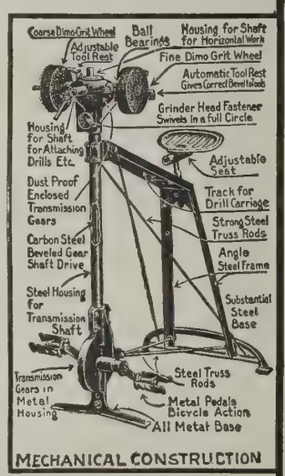
Sharpen Tools 30 Days FREE

NO PROMISES! NO RED TAPE! NO MONEY NEEDED!
You can try this all-metal, shaft-drive tool grinder, with its Dimo-Grit (artifical diamond grit) wheels for **30 days absolutely free, and without putting yourself under any obligations.** You can put all your tools in bright, shiny, keen condition, and you will be amazed how quickly and easily you can do it. You can **sharpen your chisels, twist drills, draw knives, hatchets, augers—gum your saws and put a keen edge on every tool—all at no cost.** Use the outfit 30 days—then if you want to part with it, **send it back at my expense.**

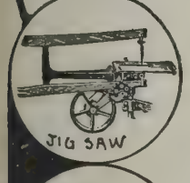


Dimo-Grit Wheels—"the wheels for steel"—25 times faster than grindstone—10 times more efficient than emery—Will not draw temper—no need to cool with water

DIMO-GRIT is the new artificial diamond abrasive, a twin product of carborundum you have heard so much about, but **DIMO-GRIT** is especially adapted to steel, leaving the **keenest, smoothest edge.**

DIMO-GRIT cuts hardest steel as easy as emery does copper. The **DIMO-GRIT** wheels of this grinder, turning **4,000 revolutions per minute,** make the hardest job of grinding but a few minutes easy work. **Prove it by trying this outfit on your own tools 30 days free.**

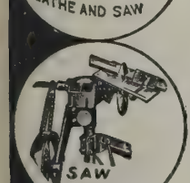
DIMO-GRIT crystals are really artificial diamonds as hard as real diamonds, made of the same elements as real diamonds and fused in the marvelously hot electrical furnaces at Niagara Falls, in which fire brick and metal melt like bees-wax and is vaporized like water in a kettle. Genuine South African diamonds could cut steel no quicker than **DIMO-GRIT.** Carborundum wheels furnished if wanted.



MECHANICAL CONSTRUCTION

Luther Hummer Tool Grinders

Mechanic's outfit consists of machine and 14 attachments—16 other attachments from which you can select what you want.



No machine ever built is like the "Hummer"—**it is all steel and iron—nothing to wear out**—steel shaft drive like automobile—ball bearing, dust-proof bearings. **Costs no more than cheap chain-drive grinders.** Runs as easy by foot as a sewing machine—engine power can be applied. The 14 mechanic's attachments **equip you for all kinds of sharpening, buffing and polishing.** From the other attachments, such as jig-saw, rip saw, lathe, drill, etc., you can select what you want. No other machine so moderate in price saves money so many different ways. **You can prove it by 30 days free trial. 5 years guarantee. Over half a million Luther Grinders now in use.**

Choose what you want

Besides the sharpening attachments which are included in the sharpening outfits, there are 16 other attachments from which you can select what you want. In this way you can secure a turning lathe, drill, circle saws, jig saws, metal polisher, etc.—16 in all—simply by getting these attachments to go on your "Hummer" Grinder.

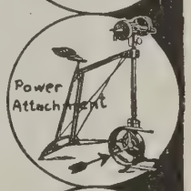
If you were to purchase machines to do the same work that these attachments will do, it would cost a good deal, but by getting these attachments for your grinder you can completely equip your workshop at amazingly small cost. Our Free Book describes all attachments.

DIMO-GRIT
Sharpening Stones
Ask your dealer for **Dimo-Grit** sharpening stones, the fastest and smoothest cutting sharpening stones in the market—look for the name "Dimo-Grit" on the stone.

Big illustrated 40 page book FREE

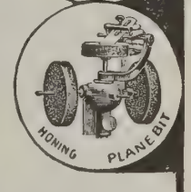
Contains the story of artificial diamond sharpening substances, and of the marvelous electrical furnaces at Niagara Falls, exactly as printed in McClure's Magazine. It fully describes the Luther "Hummer" Tool Grinder and attachments and gives pointers on tool sharpening. You will find it valuable to you in many ways. This book is free. Return the coupon and get it, along with our 30 days FREE TRIAL OFFER.

The Wonderful Ways This Grinder Saves Time and Money



Day by day, year after year the work you do depends on tools. The amount of work you get done, and the ease with which you do it, depends on how sharp your tools are. This grinder, because it makes tool sharpening so easy, enables you to keep your tools always in perfect edge, making all your work go twenty percent faster and easier.

These patent tool rests enable an apprentice boy to do most difficult sharpening, such as sharpening twist drills, gumming saws, etc., and do it exactly as well as a high priced mechanic.



It saves tools—ninety percent of tools come to an early old age because of grinding on grindstones and emery wheels. **Dimo-Grit** wheels do not draw temper—make your tools last twenty-five percent longer. The saving in tools alone will pay for the grinder outfit over and over. This mechanic's outfit equips you to do all grinding, polishing, buffing, etc., for carpenters, mechanics, contractors, shops, etc.

WHAT OTHERS SAY:

Most Practical Grinder Made

I received the grinder the 18th of April. I am highly satisfied with it. I consider it the best and most practical all-purpose machine so far manufactured.
ALLEN STOODLEY, Goldfield, Nev.

The Best Grinder

I wish to write you with regard to my grinder. I am well pleased with it. It is the best grinder we have around here.
E. N. EARLES, Bealsville, Ohio.

Better Than Expected

The grinder arrived here some time ago, and have found after testing same it works very good indeed, better than expected. I shall let everybody know about it that comes within my hearing.
THOMAS HEMLER,
Thetis Island, B. C. Canada.

What Neighbors Say

I received your grinder a few days ago, and it more than comes up to expectations. I am pleased with it. It does everything you claim for it and more, too. I have shown it to my neighbors, and they say it is one of the finest things they ever saw.
LEW KNUSTON, Leland, Ill.

Just as Represented

I have just received the grinder and find it is just as represented. I am very well pleased with it
C. H. THOMPSON, Cheyenne, Wyo.

Obtains Keen Cutting Edge

Your machine reached me in due time, in good shape and as represented. I am a template maker by trade and I have a great many tools that require a very sharp edge, which I can obtain through using one of your machines. I enjoy good tools and have as many of them about me as possible.
E. R. WEESNER, New Castle, Ind.

GREYHOUND HAND SAWS

SPEED & EASE
TRADE MARK.

The more you know about hand saws the more you can appreciate "GREYHOUND" hand-made hand saws, with their easy-running and rapid cutting qualities and wonderful durability. This saw will be imitated by others—but not equalled.

They are made from Bishop's Refined "GREYHOUND" Steel—a material which leads everything yet produced for use in hand saws. The purity of the steel, the toughness, the even and accurate temper, gives a saw that is the most suitable for particular work, and the most practical for ALL work where a hand saw is used. Made in both straight and skewback, also narrow patterns. Specify which you desire. Remember our warranty accompanies each saw. And the warranty means that if 30 days' trial does not convince you that the "GREYHOUND" saw is the **best** for your use, you get your money back.

Storm Sash and Screen Hanger No. 1 and 2

The time is drawing near at hand when carpenters and builders begin putting up storm sash and it might be well to say that the best and most convenient goods are always the cheapest in the end.

We make the only Ball and Socket Hangers on the market. One trial will convince you that they are the best.

Our No. 1 Fastener is made of the best steel wire. It holds the sash firmly against the blind stop and prevents rattling.

No. 1

Our Literary Contest

for December struck a live wire all right, and as a number of replies are already in, we are going to keep this contest up for another month at least, and we are again offering

A Prize of Ten Dollars

for the best article on either of the following subjects:

1. What Shop Machinery Do You Find Most Useful?
2. Cost Keeping on Small Contracts.
3. How to Keep Busy in Winter.

More or less shop machinery is necessary in every line of work. Power is so cheap and labor so high nowadays that it is almost a crime to rip up a lot of furring strips by hand, yet we see it done. Why doesn't every contractor have a well equipped shop? Tell us your experience with machinery.

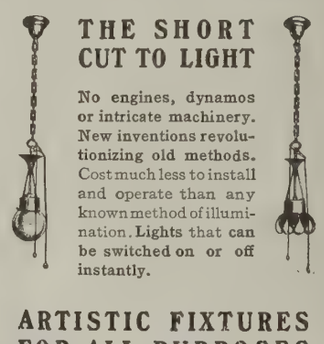
That ast house you built! Did you make money on it? How do you know? If it is necessary for a ten-cent store to have a cash register to keep track of the dimes, why don't you have some accurate system? If you do, tell us. We know lots of our readers who are hungry to hear it.

Possibly you haven't been idle a day all last winter. Were you just lucky or did you figure it out we would have cold weather and snow about December and January? Tell us, so we can tell our readers. Lots of them were out of work, for they told us about it.

Tell us in your own words, make drawings in pencil if you want to, but give us some ideas and get them to us before February 1, 1912. Write from 500 to 1,000 words, and try to

Get the Ten Dollars

The best answer gets the prize, and any others that we can use we will pay for at our regular rates on publication.



LITERARY COMPETITION

ANYONE CAN INSTALL

THIS SIMPLE LIGHTING SYSTEM

IN TWO HOURS TIME

THE SHORT CUT TO LIGHT

No engines, dynamos or intricate machinery. New inventions revolutionizing old methods. Cost much less to install and operate than any known method of illumination. Lights that can be switched on or off instantly.

ARTISTIC FIXTURES FOR ALL PURPOSES

such as the lighting of stores, homes, churches, halls, streets, etc. Nothing to wear out or get out of order. A positive guarantee for a life-time furnished with each system.

HOW IT IS DONE

From a tank placed anywhere most convenient a small flexible hollow wire no larger in diameter than a match is used to convey the gasoline from the tank to the different lamps, where it is converted into gas and mixed with 94% of air. A few strokes of a small pump once a week is all that is necessary to produce the softest, steadiest and most brilliant light known to science. **Safer** from an insurance standpoint than electricity, gas, gasoline engine, kerosene or acetylene. No unsightly black pipes or insulated wires to be seen. Anyone can install and operate them. **It does not require a mechanic to run this wonderful system.** Five hundred Candle Power two hours a night for a NICKEL A WEEK. Send for our thirty day trial introductory proposition and complete descriptive matter.

RESIDENT AGENTS WANTED. An opportunity of a lifetime is offered to get into a permanent money making business. Every system installed sells others. Every user an enthusiastic booster.

A RED GUM TRIUMPH

The Woodmen of the World are erecting a beautiful building at Omaha. It is not surprising that they are using America's finest hardwood, ***RED GUM.***

This wood would not have been selected had not the architects, Messrs. Holabird & Roche, used ***RED GUM*** with such eminently satisfactory results in a number of the great buildings they have erected within the last few years.

RED GUM is **the wood** used throughout this beautiful eighteen story **Woodmen of the World Building.**

Architects are also "tumbling to" the value of ***RED GUM'S*** half brother

SAP GUM

as an equally good wood for building purposes where the beautiful grain of ***RED GUM*** is not needed—for instance where a rich, fine effect is desired from a good wood stained to carry out a desired color scheme.

SAP GUM is **great** for White Enamel trim.

Before you let **any** contract, get prices on ***SAP GUM.*** They will be interesting.

TRIPLE "A" SPRING-DRIVEN FLOORSMOOTHER

DID you ever see it fail—where modern forces are pitted against the out-of-date?

The successful general plans his campaign in advance, pays close attention to details of equipment and practically has the battle won before begun.

The Contracting Business also requires good generalship. The contractor who plans his work in advance and is provided with up-to-date equipment has a powerful advantage over his competitors.

Strategy is largely a matter of fortifying the weak points. Suppose you glance over the situation for a moment—What is your state of equipment? You may not be interested in guns and battleships but you cannot help being interested in contractors' equipment.

There's one class of contractors' equipment in particular that is being rapidly displaced by a modern, powerful machine, adding about a thousand per cent efficiency. That is, the old, slow and laborious method of scraping floors with hand scrapers or old style dead-weight machines is rapidly giving way to the modern, rapid and easy system of using the TRIPLE "A" SPRING-DRIVEN FLOORSMOOTHER.

"In the time of peace prepare for war"—now is the time to strengthen your weak points. If you haven't an up-to-date floor surfacing outfit it may be the cause of your losing the next job you bid on; so beat the other fellow to it by being prepared and knowing how much cheaper you can do a floor job.

Write us today and we will send you some interesting facts on laying, surfacing and finishing floors.

Furthermore, we are willing to send you a complete TRIPLE "A" FLOORSMOOTHING OUTFIT and let you use it for a whole week free of charge—just to try it. Then you can decide whether you want to buy it or send it back, and your decision will be final.

Buy a "DREADNAUGHT"—not a "Deadweight."

Triple "A" Machine Co.

28 N. Clark St., Chicago, U. S. A.

Made in three sizes:
8x18, 8x15, and 8x12 in. Roller
Edge Roller easily adjusted to either side

Perfect Results are Easily Obtained by Using Schlueter Rapid Floor Surfacer

This machine is built on the only correct principle. It is guaranteed to be **The Best** machine with which to produce an even, smooth service on any kind of large or small wood floor, old or new, hard or soft, and in all buildings: Residences, Stores, Factories, Bowling Alleys, Roller Skating Rinks, Reception and Dance Halls, Etc.

The **Schlueter** will remove all joints or warped edges, and oil, wax, lime stains, or the "muck" from skate wheels, in a most satisfactory manner.

Earning Capacity, $20.00 to $35.00 per Day

It Works Like a Plane

The Boss Floor Scraper

The Boss is the only Floor Scraper made that will plane a floor without leaving a square cut where knife first starts cutting. **Why?** Because the Boss is made with a gage on front to which is attached a pear-shaped wheel which raises when the machine is pulled and lets the knife down gradually.

The Boss can be set for any thickness of shaving. It is guaranteed to give absolute satisfaction.

WHY SCRAPE FLOORS BY HAND

The Acme Floor Scraping Outfit

when you can do it so much better and in one-fourth the time with the **Acme Floor Scraping Outfit?** If you are still using hand scrapers you are losing 75 per cent on every job of floor scraping that you have to do.

This is a positive fact and can be vouched for by thousands of Carpenters and Contractors who have bought my equipment during the past five years.

Every Acme Outfit I sell is guaranteed to give satisfaction or I do not want any money for it. You can judge the merits of my tools on your own work, for I will ship the machines to you on **One Week's Free Trial** and if they do not meet with your entire approval, just return them to me at my expense and you will owe me nothing. This is my method of doing business. Does it sound reasonable to you? If so, write me now for booklet describing the best floor scraping outfit on the market.

The Advantages of a Portable Woodworker

Especially the "FAMOUS"

Stop hauling your millwork to the machine-shop—and hauling it back. Bring your machine-shop to your millwork! It's cheaper—and the saving goes into **your** pocket.

The FAMOUS Portable Woodworker is really a movable machine shop. When you've completed your contract on one job, move the machine to the next. Seven useful woodworking machines—practically all that a contractor requires—are combined into one. And a gasoline engine, complete with belting, is included in the outfit.

A Remarkable Machine

Combining all the remarkable features of the FAMOUS Universal Woodworker—over eight hundred, of which are in use—our Portable Woodworker is a real boon to contractors everywhere. Surfacing and edging, boring, band-saw work, ripping and cutting-off, sanding—all these, and more can be done on this machine **right at the place where your work is!** No planing-mill delays and **no unnecessary expense.**

The FAMOUS Portable Woodworker is mounted on skids and can be moved around without any trouble. A wheeled truck can also be furnished. The engine is three horse power, and batteries and belting come with it. This is by far the best proposition today in woodworking machinery. Write for full details.

The Sidney Tool Co.

Sidney, Ohio

YOU WANT THE BEST

Several Woodworking Machines Combined in one

The machines embraced in the FAMOUS Portable Woodworker are:

- 8" Jointer
- 20" Band Saw
- Saw Table (carrying a 12" saw blade) with raising and lowering arbor.
- Mitering Attachment
- Cut-off and Ripping Gauge
- Disc Sander
- Emery Grinder

Pointers On Pipe Covering

Most people know that insulation is based on the fact that heat cannot pass through dead or *motionless* air; and that the efficiency of a pipe covering is in direct ratio to the volume of dead air it confines. But how many know the difference between *dead* air spaces in a pipe covering and *live* air spaces.

The ordinary air cell coverings used for heating work confine *live* air and *not motionless* air—they have large air spaces running from end to end which allow air to travel back and forth. Therefore, they do not prevent the loss of any great amount of heat any more than you could keep heat from escaping from a pipe or a radiator in a room by closing all the doors, windows and vents.

J-M Asbestocel Pipe Covering

is made on a different principle from all others. The air cells run around the pipe instead of lengthwise. This makes the air spaces so small that there is no place for the air to circulate, and it must be motionless—dead. Consequently ASBESTOCEL confines a much larger volume of dead air than any other low pressure covering.

If you have hot water or low or medium pressure steam pipes to insulate, compare Asbestocel with all others. You can quickly see that it contains the greatest number of dead air spaces.

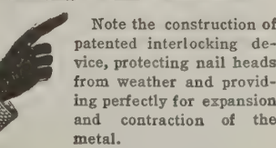
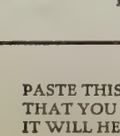
Don't Miss This Opportunity

We Want One Carpenter or Builder in Every Community to Demonstrate, Take Orders for and Apply Our EDWARDS METAL SPANISH TILE ROOFING on a Liberal Commission.

Here is a chance to build up an independent, profitable business for yourself right at home. Many carpenters are now devoting their entire time to selling our metal roofing Others have made big profits simply devoting part of their time to selling and laying our Metal Spanish Tile.

Edwards Metal Spanish Tile





Is being advertised in the leading magazines and is now known to thousands of home builders and owners everywhere. Wherever it has been used it has made a decided "hit" because it shows off to good advantage on the roof and has numerous points of superiority over any other style of roofing.

Architects are specifying Edwards Metal Spanish Tile, for they know it will do away with roofing "troubles." Builders like it because of the finished appearance it gives any house on which it is used.

Our Metal Tile are stamped out of the highest quality Worcester terne plate in exact imitation of the most expensive Terra Cotta Spanish Tile. They come either "dip" painted or heavily galvanized, size 10 x 14 inches. Our patented interlocking side lock makes it possible to make a perfectly moisture-proof roof without soldering. Edwards Metal Spanish Tile afford the fireproof advantages of Terra Cotta Tile, but are much lighter in weight, cost but a trifle more than ordinary roofing and will last a lifetime.

WRITE US TO-DAY ABOUT YOUR TERRITORY. Our business is growing so rapidly that it is necessary to have an agent in every community. The territory is going fast. One day's delay may mean that someone else will be given your territory. DON'T DELAY. WRITE TO-DAY FOR OUR SPECIAL AGENTS' PROPOSITION.

Note the construction of patented interlocking device, protecting nail heads from weather and providing perfectly for expansion and contraction of the metal.

DUMB WAITERS

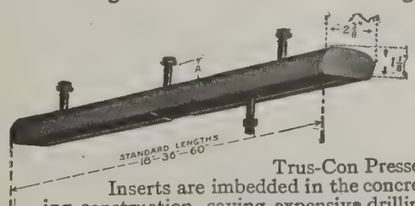
Some builders buy a Dumb Waiter Outfit and then build the enclosure to fit it. Others build the enclosure and then build or buy the Dumb Waiter to fit the enclosure.

The Sedgwick Machine Works carry in stock catalogue sizes of Dumb Waiter and Hand Power Elevator Outfits for prompt shipment (within twenty-four hours of receiving order) and make up promptly special sizes when stock sizes cannot be used. They sell complete outfits or any dumb waiter material wanted and every builder should keep their catalogue for ready reference, as it contains much valuable information resulting from their fifty years' experience as specialists in Dumb Waiters and Hand Power Elevators. Catalogue "K" sent free on request to Sedgwick Machine Works, 130 Liberty Street, New York.

Made in all sizes and styles for use with brick or concrete block walls or with wooden or steel beams.

TRUS-CON JOIST HANGERS

Avoid cutting away and weakening of timbers and walls—save labor, time and money.



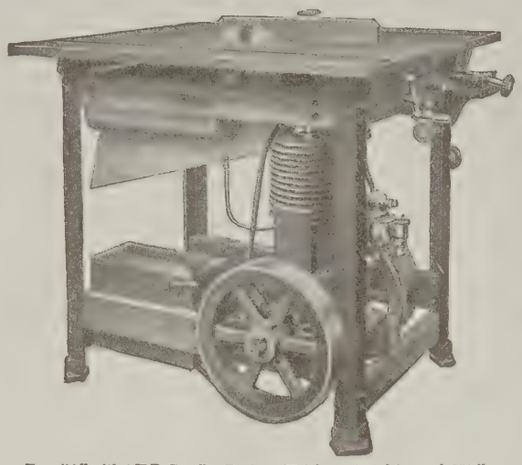
Trus-Con Joist Hangers are made from open hearth steel plates, and are proven by actual test to be the strongest on the market. Note the bulb-shaped reinforcement at upper angle.

We also furnish Post Caps, Post Bases, Wall Plates and Base Plates made in rolled steel, malleable iron, or cast iron.

Write for catalog and prices.

SHAFT HANGER SUPPORTS *for* CONCRETE BUILDINGS

Trus-Con Pressed Steel Inserts for Supporting Shaft Hangers in Concrete Buildings.



Trus-Con Pressed Steel Inserts are imbedded in the concrete during construction, saving expensive drilling after completion of the work. The long slots allow a wide variation in position. Special washers prevent bolts turning in the slots. Write for details and prices.

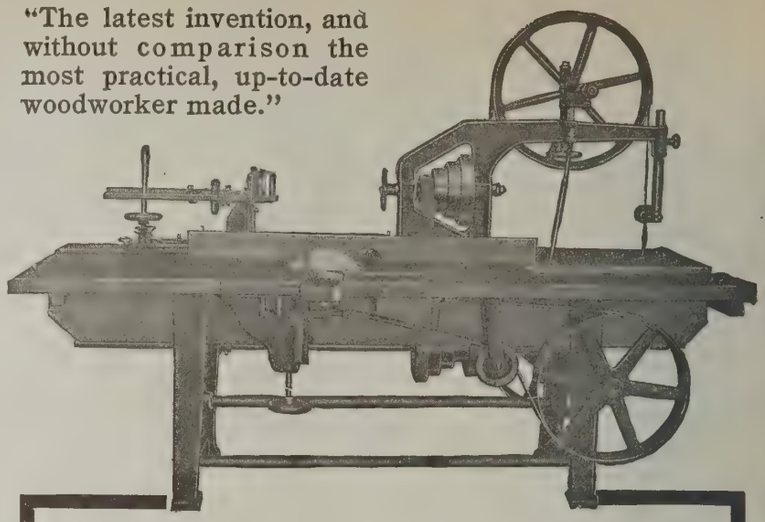
Nine Machines in One



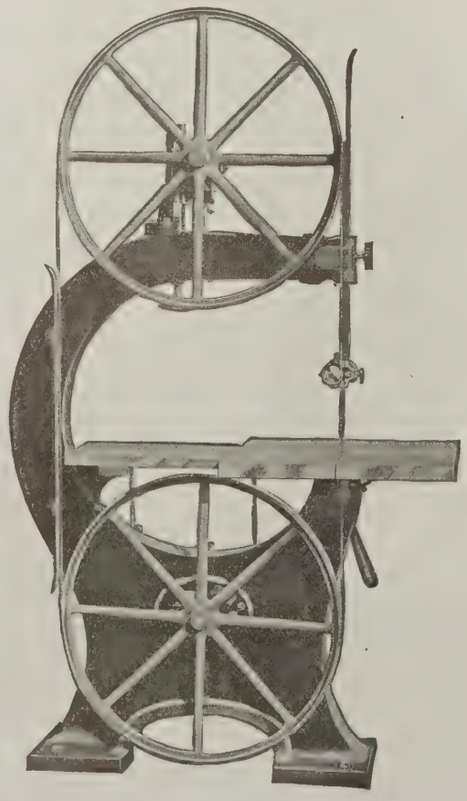
8-inch Rip Saw	Boring Machine (3 bits)	4-inch Jointer
8-inch Cross Cut Saw	Moulder (8 prs. knives)	Jig Saw (3 blades)
6-inch Dado Head	10-inch Sander	Two Emery Wheels

Progressive building contractors are fast coming to realize the importance of substituting practical machines for hand labor. The **Grimm Woodworker,** furnished either with gasoline engine or electric motor and combining so many important attachments in one machine, is undoubtedly one of the greatest time, labor and material savers yet brought out.

Write for descriptive booklet and our attractive selling plans.

Grimm Manufacturing Company
42 Erie Street, Buffalo, N. Y.

"The latest invention, and without comparison the most practical, up-to-date woodworker made."



Buffalo Crain Combination Woodworker

Note the ample size and capacity of the parts which perform the four vital operations in your shop: **1. Lathe**—40″ between centers; **2. Band Saw**—taking 12″ under the guide; **3. Saw Mandrel**—taking saws up to 12″ dia.; **4. Planer Head**—taking 5″ or 10″ bits. The convenient location, strength, simplicity and easy adjustment of these vital parts, are of the greatest advantage. Drilling, boring, sizing, jointing, moulding work, tenoning and, in short, practically every operation of daily occurrence in a woodworking shop, can be performed on it **without extra attachments.** As an investment, it is a true gold mine. **Three men can work at it at one time.** Lowest power cost. Ask for Booklet 1785.

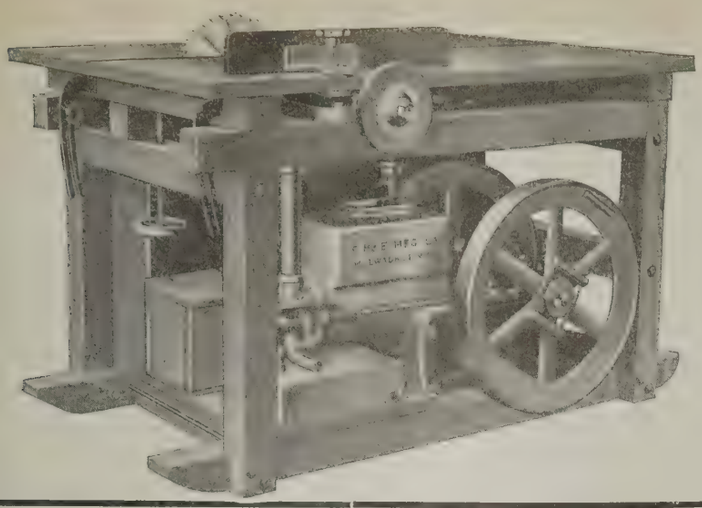
Buffalo Forge Co., Buffalo, N. Y.

BUY A BAND SAW THAT IS DURABLE

CRESCENT

Band Saws satisfy those practical, experienced mechanics who need strong, substantial tools.

The reason CRESCENT Band Saws are so popular is because they have earned a well-deserved reputation for durability and accuracy where hard service is demanded of them. Each day they are pleasing some of the most exacting band-saw operators in every civilized country, and as you appreciate what it means to have a thoroughly dependable, well-built, practical band saw, you should certainly look into the merits of the CRESCENT line before you order.



Send for a catalog telling all about these splendid machines, and our line of Saw Tables, Jointers, Borers, Swing Saws, Planers, Planers and Matchers, Wood-Workers, Disk Grinders.

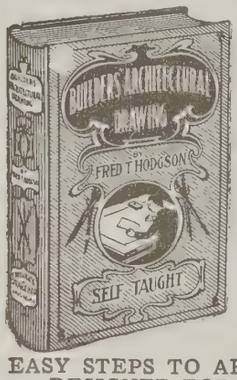
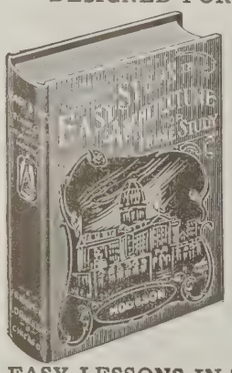
PRACTICAL BOOKS FOR THE BUILDING TRADES



THE STEEL SQUARE—TWO VOLUMES. A PRACTICAL TREATISE ON THE USES OF THE STEEL SQUARE. By Fred T. Hodgson. 600 Pages, 500 Illustrations.

Two Vols., Cloth Binding. Price.....$2.00
Single Vols., Part I, Cloth. Price..... 1.00
Single Vols., Part II, Cloth. Price..... 1.00

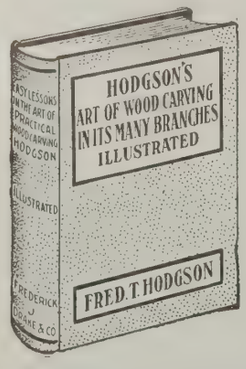
Mr. Hodgson was the first—as well as the last—person who has written on this important tool, and the two volumes now issued contain the earliest and the latest up-to-date methods of applying the STEEL SQUARE for the solution of the many problems this wonderful instrument can solve when in capable hands. The two volumes, named herewith, contain about all that is possible to be done with the square, that is of practical value to the workman, and, as they show nearly all the simple, as well as the difficult things, that can be accomplished with the aid of this tool, there will be little trouble for the workman to work out any minor problem that may confront him, if it is within the purview of the tool. In short, the two volumes contain all that can now, or hereafter, be accomplished with the square. They are profusely illustrated with diagrams, and explanatory sketches, which cover the whole ground of steel square practice. Two volumes of the greatest possible value to the young carpenter.



BUILDERS' ARCHITECTURAL DRAWING SELF-TAUGHT. By Fred T. Hodgson. F. A. I. C. 336 Pages, 250 Illustrations and 18 Folding Plates, 12mo, Cloth Binding. Price.....$2.00

This work is especially designed for carpenters and for students of architecture, woodworkers and others who desire to learn drawing at home, and who have not the means, time or opportunity of taking a regular course in school, or college, nor of availing themselves of the offers made by one or other of the "Correspondence Schools."

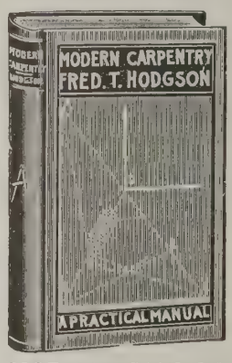
The work commences with a description of drawing instruments and accessories, with rules for using them, and hints as to their care and management. Rules for laying out simple drawings and executing same are given, and the student is taught step by step to draw to scale, first the plans, next the elevations, and finally the details of a cottage, including foundations, walls, doors, windows, stairs and all other items required for finishing a small building complete in every particular.



EASY STEPS TO ARCHITECTURE. PARTICULARLY DESIGNED FOR HOME STUDY. By Fred T. Hodgson, F. A. I. C. 350 Pages, 230 Illustrations, 12mo, Cloth Binding. Price .$1.50

As every mechanic employed in the building trades must necessarily have some knowledge of architecture, a book of this kind will be found by him to be a great assistance in acquiring such knowledge without a great expenditure of effort. A part of this work has been for years a sort of text-book in schools where architecture is taught, and is a catechism to some extent. The questions and answers are easily understood and as easily remembered.

The second part of the book deals more particularly with architectural styles, while the first part is mostly devoted to the classic orders, Greek and Roman. Full explanation of the latter styles are made, and illustrations show these styles and give a brief history of their growth and decay.



EASY LESSONS IN THE ART OF PRACTICAL WOOD CARVING. By Fred T. Hodgson, F. A. I. C. 284 Pages, 200 Illustrations, 12mo, Cloth Binding. Price.....$1.50

This work, "Easy Lessons in Practical Carving," is prepared in the same happy, easily understood style of writing that has made the name of the author so famous among the working men of English-speaking countries.

The lessons given in this new book begin at the very beginning of carving and lead the young workman by easy steps through the mazes of the art, until he is able to turn out work of a creditable character. The use and care of carvers' tools are given and explained, and the tools described and shown in illustrations, with methods of sharpening and honing the tools, in a clear and interesting manner. All necessary appliances are shown, described, and illustrated, both for holding the work, and for preparing the tools and finishing up the carvings. The various styles of carving are fully explained, such as flat carving, chip carving, incised carving, scratch carving, figure carving, carving in relief, round carving and jewelry carving.

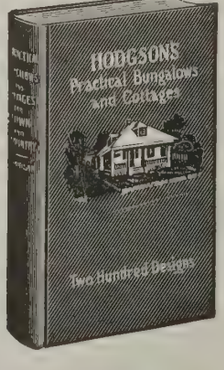
MODERN CARPENTRY AND JOINERY—VOL. I. By Fred T. Hodgson, F. A. I. C. 300 Pages, 318 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This is a real modern work, and the large numbers of it that have been sold (over one million) is an evidence that American workmen have found in it the things they expected. It is one of the best books of the kind ever brought out for teaching the young workman the art of correct and easy wood-working. It shows how to lay out roofs, rafters, stairs, hoppers, bevels of all kinds, mitering, coping, circle work, flooring, splayed work, plain stairs and handrailing, cornicing, dove-tailing and many other things the young carpenter will require to know in the performance of his regular work. It is written in a very simple style, and can be understood by any person who can read everyday English. Unlike other works prepared for workmen, it is void of bewildering formulae and algebraic puzzles, and the reader is not asked to wade through long mathematical calculations to get at the kernel of the subject before him. The work contains some 300 illustrations and diagrams, all of which are explanatory and instructive.

MODERN CARPENTRY AND JOINERY—VOL. II. ADVANCED SERIES. By Fred T. Hodgson, F. A. I. C. 400 Pages, 300 Illustrations, 12mo, Cloth Binding. Price.. .....$1.00

This volume is somewhat similar to Vol. I, only on advanced lines, and is intended to follow up the progress made by a study of the first. Indeed, it is simply a continuation of the first volume, on a higher plane, and no workman having mastered the contents of one, will rest satisfied, until he has also mastered the contents of the second volume.

This volume contains some examples of work, with a description of the way the work is performed, and the materials employed. Many very difficult problems are here shown and the solutions and explanations are given and fully explained, many things that at first seem formidable to the unpracticed workman, become quite easy of solution under the magic wand of the author's method of explanation.



COMMON SENSE STAIR BUILDING AND HAND-RAILING. By Fred T. Hodgson, F. A. I. C. 300 Pages, 300 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This is an excellent work for the young carpenter who is ambitious of becoming an expert in handrailing and stairbuilding, inasmuch as it commences at the very beginning of the art, and shows how to lay off a stair on the floor, placing the newels, laying off treads and risers, strings, winders, wells and flyers.

The object of the author is to lead the student step by step, in such a way that he takes in the whole art of stairbuilding before he is aware of it. This is decidedly the best and most practical work on stairbuilding in the market, and just what the untrained workman wants. The part of the book devoted to handrailing exhibits three different methods of laying out and working handrails suitable for any kind of stairs, straight, circular, elliptical, or for stairs with landings, doglegged, newels, or cylinders. These systems of handrailing have been taken from the best sources on the subject, and have been revised and edited in the most careful manner.

PRACTICAL BUNGALOWS AND COTTAGES FOR TOWN AND COUNTRY. Arranged and Edited by Fred T. Hodgson, assisted by E. N. Braucher, Architect. 12mo, Cloth, 420 Pages, 400 Illustrations. Price.....$1.00

This work contains perspective views and floor plans of over two hundred choice bungalows, cottages, houses and flat buildings, selected with great care to combine architectural beauty, convenience and economy of construction, ranging in prices from $500.00 to $3,800.00. Every plan shown is made by a licensed architect and has been built from, to the entire satisfaction of the builder and within the estimated cost. This work will be found invaluable to the home builder, furnishing many new and up-to-date ideas and suggestions in modern architecture. The number of California bungalows, which the editors have taken great pains to select, are without question the most attractive modern low cost homes ever built. We are prepared to furnish blue prints at a very moderate cost, ranging from $5.00 to $15.00, according to cost of erection, consisting of floor, roof and foundation plans, front, side and rear elevations, with complete type-written specifications.

Any of the above books sent Post or Expressage Prepaid on receipt of price.

If every Architect, Contractor and Owner in the country knew of the REAL MERIT and ECONOMY of Wall Board and the decorative and artistic possibilities of this material when finished with

Johnston's WASHABLE Dull Kote Paint

we assure you more Wall Board would be sold and a dozen factories could not supply the demand for Dull Kote Paint.

Write for free color folder and suggestions for Interior Decoration. It will show you why you should specify and buy JOHNSTON'S Dull Kote Paints.

The R. F. Johnston Paint Co.

Pearl and Main Streets

CINCINNATI, OHIO

YOU CAN SAFELY RECOMMEND

Compo-Board

It makes the best walls and ceilings. Dry, warm, fire-resisting and moisture proof.

Compo-Board walls will outlast lath and plaster; will not crack, crumble or fall off. Can be easily put on without waste of time waiting for plaster to dry.

They always look well. No ugly blotches where moisture has gathered. No unsightly scars where the walls have been patched. Will take paint, paper or kalsomine perfectly.

In addition to being a perfect wall lining, Compo-Board can be used as a back plaster for partitions, for lining summer cottages, barns and poultry houses. It has many uses around the house and in the office and factory.

Compo-Board is made of strips of thoroughly dried lumber matched together and well glued. These strips are then covered with a specially prepared moisture proof paper, which is cemented under intense heat heavy pressure. This makes a wall lining that will last indefinitely.

Can be had in strips four feet wide and one to eighteen feet long, any length you want in even feet.

SEND FOR SAMPLE AND BOOKLET

Fully describes Compo-Board and its many uses and advantages, and the sample will show you what it is.

WE WANT TO SEND YOU A SAMPLE

We want every carpenter and builder and home owner in America to know about and to have a sample of

UTILITY WALLBOARD

It is to your interest to have this sample and to become thoroughly familiar with this remarkable material.

Utility Wall Board marks the greatest advancement that has been made in interior building construction in a hundred years.

It is made of fibre—very hard and tough and durable. It is waterproofed on both sides. Being a non-conductor, it is largely heat and cold and sound proof.

It is very easily put on—nailed right to the studding and takes the place of both lath and plaster.

It is the only wall board on which you can safely use wall paper. At the same time it lends itself admirably to tinting and stenciling, or other forms of decoration. Made in various widths and lengths to meet all requirements of interior finishing.

Write today for the sample and for the new book of interiors.

Utility board is sold through dealers in builders' supplies everywhere.

Brings the Biggest Dividends to any Carpenter or Builder

THE International Auto Wagon is the most practical commercial vehicle you can buy. It will do all your light hauling in less time and at less cost than a horse-drawn vehicle. With it you can do all your necessary running around in one-third the time.

¶ If you are a carpenter, contractor or builder, you know from experience that tools, finishings, and working material must be on hand just when they are needed—or money is lost. With an

International Auto Wagon

there will be no delays—no unprofitable holdbacks.

¶ Two trips after material can be made in the time required to make one with the horse-drawn wagon. This means both time and money saved.

¶ The International Auto Wagon has solid rubber tires (no delays due to punctures), sufficiently high wheels for perfect clearance, and an air-cooled engine that can't freeze in cold weather. There are many other features that help to make it the most practical car for commercial purposes.

¶ Why not find out more about the International Auto Wagon? Write for catalogue and further information.

INTERNATIONAL HARVESTER COMPANY OF AMERICA
(INCORPORATED)
81 Harvester Building **CHICAGO U S A**

Genasco is the roofing of the age. Its foundation has stood for ages past.

It beats shingles. They warp, crack, split, and rot—more so now than ever before (lumber is getting scarcer, and shingle-quality is becoming poorer every year).

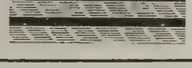
Beats tin, which rusts and needs painting regularly. And even with paint tin doesn't last like it used to—quality has deteriorated here, also.

Coal tar roofings have the same old faults they have always had—get soft and melt in the summer sun, and get brittle and crack in the cold, and leak.

Genasco

the Trinidad-Lake-Asphalt Roofing

is the one roofing that lasts. It is made of Nature's everlasting waterproofer. Trinidad Lake Asphalt has withstood the suns and storms of centuries; and in Genasco it gives this same lasting resistance to sun, rain, snow, wind, heat, cold—and even fire. The oily nature of this natural asphalt keeps Genasco alive and strong to defend itself; and this is why Genasco is lastingly waterproof.



The Kant-leak Kleet waterproofs the seams of Genasco without cement, and prevents nail-leaks besides. It gives the roof an attractive appearance.

Ask your dealer for Genasco mineral or smooth surface Roofings with Kant-leak Kleets packed in the roll. Guaranteed, of course. Write us for samples and the Good Roof Guide Book.

The 20th Century Bricklayers and Mason's Assistant

By FRED T. HODGSON

This work is in two parts combined in one volume, the first part being devoted altogether to brick work of all kinds; and this includes an explanation of the various terms employed in the trade with illustrations and definitions showing what the terms really mean.

There is a chapter on Foundations which goes into the matter at great length, and is fully illustrated and explained, and which shows how to lay out and prepare any kind or shape of foundation.

Damp courses are dealt with in a separate chapter in which the various methods of constructing damp courses are fully illustrated, described and explained are shown. Various methods of forming brick pilasters, columns, quoins and pands are explained, illustrated and described. Joints in brick work are illustrated, described and explained in a separate chapter in which the kinds of mortar to employ for various works are defined. Chimney breasts, flues, stacks, fire-places and chimneys of all kinds are described and illustrated.

Brick bonding for all sorts of work is shown and illustrated by a large number of diagrams and the manner of bonding is fully explained. Brick arches of every kind, gauged and ungauged, are explained at length, and a large number of illustrations are shown, giving methods of describing the arches and obtaining the joints for same. Bay and oriel windows are discussed and the methods of working them are shown and described both by text and diagrams. Methods of measuring brickwork, pointing, concrete and other matters for the estimator are fully described. The tools used by the bricklayer and his helpers are fully illustrated and described. Bricklayers' mortar and other useful memoranda close Part One of the book.

Part Two deals with the stone mason's work altogether and opens with a chapter on definitions of technical terms used in masonry. Tools and appliances are fully described and as fully illustrated, with explanations and methods of using them. The trade names of wrought stones are given with illustrations showing the work in progress and in a finished state; also methods of working them. Methods of building walls in rustic rubbie, ashler square, uncovered, random coursed, irregular corners, snecked and squared rubble, picked polygonal ragwork and other styles of work are explained and illustrated. Finished stones such as window sills, window heads, copings, arch stones, key stones and other dressings are described and illustrated. Stone arches and joints are described and illustrated, with ample instructions for working them. A chapter on preparing stone steps and stairs is given, along with complete diagrams and instructions showing how the work is done. There is also a chapter explaining the method of building a circular headed window or door in a circular tower or other circular wall. A chapter on estimating stone work, with a copious specification is also included along with a short treatise on building skew arches and skew bridges, and which is illustrated with a large number of diagrams and working sketches, showing how to do the work in a proper manner. This part is illustrated with over 200 working drawings and diagrams.

The whole work contains over 450 fine illustrations and diagrams, and is complete cyclopedia of practical instructions in brick-work and masonry and must prove of inestimable value to the operative bricklayer and mason. 12 mo., cloth, price, $1.50; half leather $2.00.

Send postpaid to any address in the world upon receipt of price.

The Carpenter's Greatest Aid to Smooth and Rapid Work

Carborundum
Sharpening Stones

JUST go to your hardware dealer, or write us direct for one of these wonderful sharpening stones—then begin your day's work by sharpening your plane bits, chisels, or other edge tools—note how quickly and easily the Carborundum stone brings the tool to an edge. It cuts the edge on—doesn't merely rub it on—gives an edge that will stay keen and smooth longer. Carborundum stones are always clean and free cutting, they don't fill or glaze. You can get them in any grit, shape or size; their use means better conditioned tools—better work.

Miller's Two Minute Lever Lock Mortiser

Actual Use of Tool ½ Minute

Chisels the opening for Locks. Over 5000 Mortisers Sold Mean Something.

One builder wrote us: "I was surprised, I did not think it would do the work so quick. This is the best I ever saw."

THINK THIS OVER, MR. CONTRACTOR AND BUILDER

Our patent double edge, side cutting chisel can cut more wood, four times more rapidly and 100% less exertion than any boring bit. Mortise to be of the same size.

MILLER'S TWO MINUTE LOCK MORTISERS
GUARANTEED

to be as we represent, and will send on trial to any reliable contractor and builder. We will return all money paid if it does not cut an opening in a door for a mortise lock in three minutes.

We also make a Butt Mortiser and Rule Gauge which cuts out the seats for butt hinges in soft or hard doors, jambs, and similar work which we will send you postpaid for ***75 cents.***

A Helping Hand

The only difficult part of GOING UP is in making up your mind to START. After that, the road is smooth, and the higher you go the easier it becomes. You may be working under such circumstances that advancement seems impossible, but YOU CAN GO UP. You may now have a fairly good position, but you can go still higher. Just follow the example set by thousands of I. C. S. students who have made good and are making good. Every month an average of over four hundred students of the International Correspondence Schools **voluntarily** report an increase in their earnings.

The I. C. S. actually takes the workingman by the hand and helps him to prosperity.

Think of a man who a short time ago was earning but $10 a week and is now earning five times that amount.

Think of a day laborer being qualified as a superintendent by I. C. S. training.

These are not exceptional cases. There are thousands and thousands of them. The I. C. S. will tell you who they are and where they are.

Architects, Engineers, Electricians, Designers, Draftsmen, Inventors, have been and are students of the I. C. S. Large employers of labor regard I. C. S. training as proof of ability.

Do you doubt its power to help you? If you do, here is an offer to prove it. Mark and mail the coupon at once, and the I. C. S. will send you more evidence. If you are not perfectly satisfied you are under no obligations to proceed further.

Mark and Mail the Coupon TODAY

The demand for Architectural Perspective is increasing yearly because those who build are demanding, in addition to the plans, perspective drawings of their buildings. A well made perspective drawing, properly shaded and set off by a little landscape and secondary detail, pleases the eye, and is a valuable adjunct to the regular plans and elevations. Our correspondence course in ARCHITECTURAL PERSPECTIVE and DRAWING of BUILDINGS is complete, practical, and can be learned at home at odd times. Instruction likewise given in twelve separate, complete Art Courses, for pecuniary profit, or pleasure only, as desired. Year Book sent upon request.

Sheet Metal Statuary *of* Rare Artistic Worth

WITHIN the last quarter of a century there have been reproduced at the Mullins Factory, Salem, Ohio, statues of Sheet Bronze and Copper that are nothing short of marvelous. Many of them were made from the models of famous sculptors, to their entire satisfaction.

We are prepared to reproduce, in minute detail, the most delicate lines of any model. It is this faithful portrayal which helps to account for the world-wide fame of Mullins Sheet Metal Statuary. Diana on the top of Madison Square Garden, the group on the New York Life Building, the Statue of Progress, Chicago, are among our earlier achievements.

We al-o make Fireproof Metal Windows, Skylights, Cornices, Finials, Metal Tile Roofing and Sheet Metal Ornamental Work of every description

Tell us what you're interested in and we'll send the proper catalogs at once. Estimates promptly submitted on architect's drawings. Attractive prices. Quick, satisfactory service. Discounts to the trade on application.

NATIONAL BUILDER DESIGN No. 348

L. E. Russell, Architect, Chicago

For Floor Plans, Elevations and Details, See Supplement Sheet of this number. Estimated Cost, $10,940.20

THE WISCONSIN BIRCH APARTMENTS

While the exterior is somewhat an index to the style of the house, in our modern conditions it really plays a small part in the comfort of an apartment. Aside from supplying light to some of the rooms the exterior influences the room but little, as the restricted lot limits the viewing of the property from a distance.

The apartment house architect, therefore, confines himself principally to the interior arrangement and decoration, the former being restricted by building ordinances, conditions of light, etc.

The value of birch is shown in the interior. In beauty of grain and color it resembles mahogany and at a cost that is very little above soft woods. Its adaptability to various finishes makes it a wood which harmonizes with almost any wall finish, fixtures or furniture.

*Materials figured at Omaha prices. Carpenter labor figured at 40 cents an hour.

Heating plant	950.00
Incidentals, 5%	521.39
Total estimate	$10,949.20

The above estimate has been made for birch finish with oak floors in dining rooms. The estimated cubic feet is 64,500, making the cost per cubic foot approximately 17 cents per cubic foot.

EDITORIAL NOTES AND COMMENTS

A MERRY CHRISTMAS TO YOU ALL!

With this number of THE NATIONAL BUILDER, we complete another volume and we feel assured that while we have not been able to serve our readers and advertising patrons in a manner we would have liked, we have done for them more, perhaps, than they expected, and we feel we have not been wanting in our efforts to give our patrons such material as their needs called for; if we judge correctly, the contents of the many letters we have received during the past year, giving us credit for being in line with modern advancement and progress. There was quite a pleasant feeling pervading our editorial rooms when, in summing up our year's work, to find we have less than a dozen complaints—all told—among the great many communications we have received. This condition of affairs is certainly encouraging, and tends to stimulate editors, publishers, and all concerned to better efforts in the future.

We make no boast because of our large circulation—the largest of any building journal published—and we only mention it as an evidence of our popularity among builders, contractors, and operative building tradesmen. We have avoided making boisterous claims as to what we have done or what we intend to do in the future, preferring to leave to the good judgment of our patrons the adjustment of our merits or demerits, and are willing to abide by their decision, as given by their continuation as readers, or otherwise. We do not claim to be the greatest, the biggest or the most unique building paper in existence, and no one has a truer knowledge of our shortcomings and defects than ourselves, and this knowledge tones down any exalted ideas we may have garnered concerning ourselves, and puts us closer, and in more direct touch with the people for whom this journal is intended, and to whom we are much indebted for many good and useful suggestions which we have adopted and profited thereby, and for which we have always been thankful; and this policy we intend to continue, with the expectation of holding our readers as helpers and fellow advisers.

As a rule we do not care to talk of ourselves, but the season of the year, and the closing of the volume, offer an excusable opportunity for placing ourselves in the limelight, for just a few moments, and this will answer for the year. We believe we are modest, and not at all given to "spread eagleism" on any subject, but there are times when we must make ourselves known, or we drop behind the procession, and soon get out of sight and lost for all time, something a great journal like THE NATIONAL BUILDER cannot afford. The journal is not up to our ideal of what a building paper should be, but we are gradually getting it up to that position, and in another year we hope to have so improved it in so many ways that its friends will be gratified at the changes, and will profit thereby to a measurable extent; and, while we are not expecting a very large addition to our subscription list, we are assured, judging from present indications, that a substantial gain in this direction is certain, which is a gratifying condition.

It may not be out of place at this juncture to say a few words regarding our contemporaries who are catering to the building public on the same lines as ourselves. We feel these journals are doing the very best for the interests they represent that can be done, and the men "behind the guns" are earnest and painstaking and possessed of more than average ability and are well equipped with the necessary mechanical knowledge to enable them to place before their readers, with a clearness unknown to ordinary newspaper men, the many technical and scientific subjects with which they are so often confronted. Only fellow editors of the technical press can fully realize, or appreciate the many difficulties and awkward situations the editor of a journal similar to THE NATIONAL BUILDER has to wrestle with, if they deal fairly with their readers, and we are persuaded that each and every one of the building papers published in America have been honestly, fairly and ably edited for many years. May all our contemporaries prosper—as we have—and may they all merrily enjoy the coming festive season and feel thankful—as we do—for all the blessings they and we have received in the past.

There are hundreds of unfinished buildings of all sorts in the northern states at this date on which there will be much plastering and stucco work, that will require a great deal of attention and care to prevent the work from being more or less injured by frost. Indeed, it is certain that a very large percentage of the plastered work completed after this date will prove unsatisfactory, as such work getting chilled by a frost-ridden gust of wind, while in a raw state, inflicts a damage on the setting mortar, that causes eventual "rotting" and consequent deterioration of the whole work, causing cracks in the walls and ceilings and final breaking away. All plastering should be done in fairly warm weather, and should not be dried out too rapidly, as this also tends to impoverish the mortar and weaken its adhesive qualities. We cannot understand why prepared wall boards and sheet plaster are not used to a greater extent, particularly in cold weather, as either one is easily applied, clean, requires no lath, makes an even smooth wall, cannot well crack and gives the best of satisfaction wherever used. While in some localities, prepared wall board, of one kind or another, is pretty extensively used, in others it is almost unknown, and we are inclined to think that if contractors, owners and architects knew more of it, and could be persuaded to try it once, its use would soon become general in finishing many kinds of buildings. It is particularly suited for bungalows, summer cottages, garages and structures of a similar nature, and owing to its being easily applied, and as easily finished and transported, it should commend itself to those who desire to build in a hurry.

The journalistic world has lost one of its greatest figures in the passing of Joseph Pulitzer. He was a wonderful man, and from a poor untutored emigrant lad, without a word of English in his vocabulary or a dollar in his pocket, he hewed his way to the highest position in journalism. It is true, he founded that school of newspaper practice known as "yellow," which was not, perhaps in the best interests of the people, but he more than compensated for this by his forceful advocacy of every movement that he thought would bring good results to suffering humanity. Blind for nearly twenty years, he still kept in touch with the world outside himself, and remained managing editor of the New York World, and cared for his large interests which amounted to millions of dollars, until his death.

Joseph Pulitzer's name in journalistic history, will range alongside the names of Thurlow Weed, Bennett, Bonner, Horace Greeley, Raymond, Bryant, Dana, and other shining lights of newspaperdom.

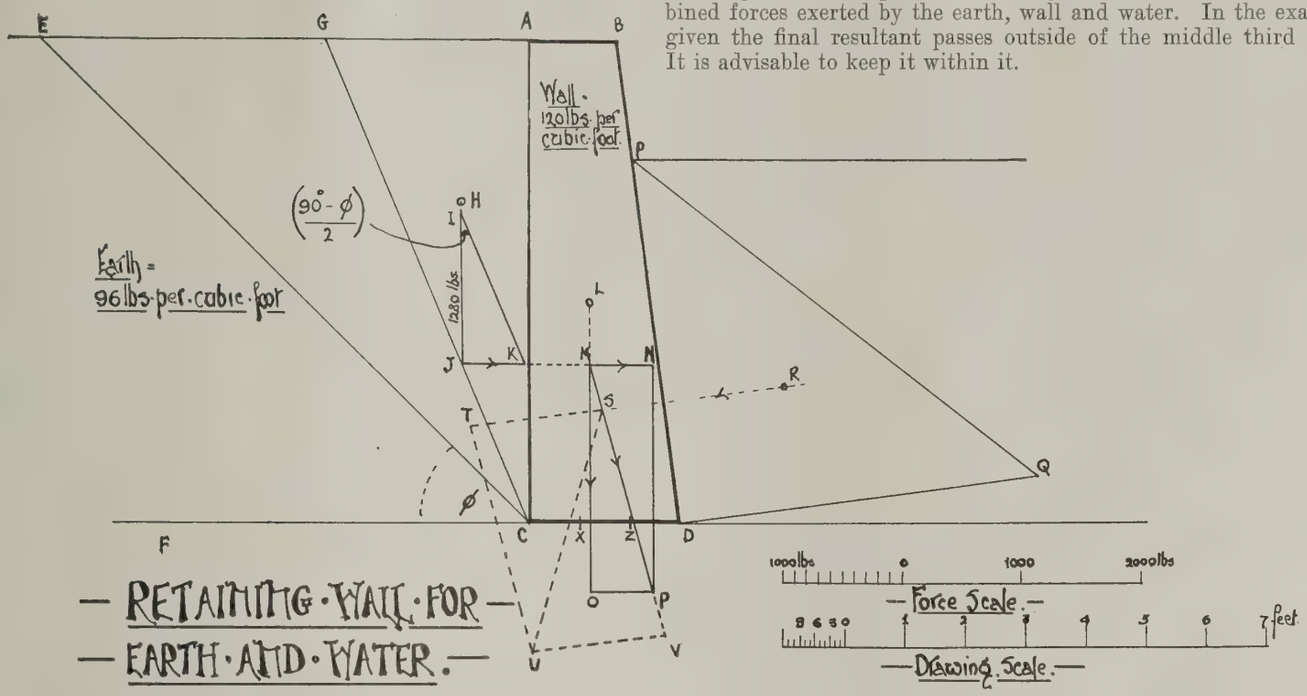
There are several morals to be found in the life and work of a man such as this, not the least of which is that sometimes a handicap, helps make a man great.

Many interests are at work to provide trained workmen, or educated workmen, in our varied industrial lines. One of the active agencies is the National Society for the Promotion of Industrial Education, which recently held its fifth annual convention at Cincinnati. Among the speakers were union leaders, prominent educators, and others interested in the subject. Not the least forcible argument was the fact, as expressed by Dr. J. M. Withrow of the Board of Education of Cincinnati, that we are using our ignorant and unskilled labor to produce and export raw material, such as pig iron, cotton, etc., and then buy it back in the form of fine machinery and manufactured goods. We export raw copper rather than dynamos, steel billets in place of linotype machinery. We are exporting crude materials to be made up into finished products by the better educated laborers of competing countries.

The general opinion prevailed that the psychological age at which the boy should begin his apprenticeship was from fourteen to sixteen, and it is by starting the education at this age that the best results are obtained.

The unions as well as the schools believe that education in the trades should be carried on in conjunction with such schooling as will be of use to the mechanic. The advanced mechanic will in time become the shop superintendent, provided he can acquire the necessary education, and it is by some system in which part time is given to study and an equal time to actual work at the chosen trade. Night schools are not within the reach of all, nor are all physically able to acquire an education at night after a day of toil. Only those who have acquired an education by such means can appreciate the effort required.

Not the least incentive toward higher education is the increase in pay. The life earnings of a trained mechanic are estimated to be about $20,000 greater than those of the trained laborer, and about $10,500 greater than the life earnings of the boy who "picks up" his trade.



LEAVES FROM A STUDENT'S NOTE BOOK—No. 7

By GEO. METSON

HAVING in the two previous articles dealt with retaining walls for earth and for water, the wall that has earth one side and water the other can be gone into. All that is necessary is to combine the resultant of the forces exerted by the earth and wall with the force exerted by the water.

Taking the wall in the illustration, the earth exerts a force of which J K represents the magnitude and the direction. The weight of the wall exerts a force equal to M O to the same force scale; combined resultant is M P. The water exerts a force equal to S T, which represents its magnitude and direction. All so far is easily understood by reference to the two previous articles.

It is now necessary to combine the force S T with the resultant M P. Prolong M P to V, making P V equal in length to M S, then S V equals M P. Complete the parallelogram S T U V; when the diagonal S U represents the magnitude direction of the combined forces exerted by the earth, wall and water. In the example given the final resultant passes outside of the middle third X Z. It is advisable to keep it within it.

THE ROUND WALL OF CONCRETE

By JOHN UPTON

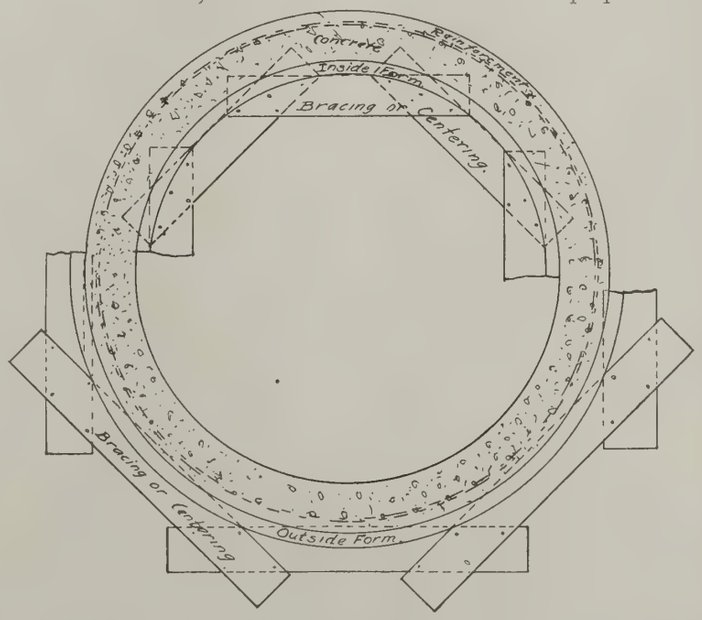
PROGRESSIVE workers are constantly meeting with new problems. One which might be called new is that of constructing forms for a round concrete wall. Such walls are built for water troughs, cisterns, silo foundations and even entire silos, so it is probable that some readers are interested in such work.

The first points are to determine the diameter, and from this, the radius of the circle and where the center of the circle is to be. Drive a stake at the center, using a wire or strip of board the length of the radius; lay out the circle of the ground and excavate for the foundation.

Remember that the foundation of a tub or stave silo should be nearly all built on the outside of the circle representing the inside of the staves and that these silos are measured from outside to outside. If the excavating is carefully done the bank may be used as the form for the outside of the wall as far as the top of the ground.

To make the forms mark the proper size circle on a level spot of ground. Take boards or plank eight to ten feet long and lay them around on this circle using enough of them to go around, and after tacking their ends together draw the circle on them. These boards should be so placed that the circle when drawn does not come closer than four inches to the inside edges of the boards for the inside form, and the same distance from the outside of these, for the outer form.

Allow one or two inches for the thickness of the forms according to the material to be used.



When the boards are cut to the lines drawn upon them you will have two circles, one a little smaller than the inside of the wall, the other a little larger than the outside.

If the wall is to be a low one perhaps you can get along with these, but if it is of considerable height, it will be necessary to cut two more like them so as to have one near the bottom as well as one at the top. If only one circle is used, place it near the top and fasten the forms at the bottom by some other means.

For the forms or lagging, use boards or two by fours, cut the right length and set on end between the two circles. These boards might be placed a few inches apart and the form lined with a strip of galvanized sheet iron.

This iron need not be injured except for a few holes at each end. After the forms are in place they should be securely braced in all directions.

Such a wall as this should have some reinforcement as there will be considerable strain on it. Heavy wire will answer in some cases but in others, bars of iron should be bent to the proper curve

and placed near the middle of the wall, a little closer to the outside.

Such a form made with hoops at the top and bottom may have a device for loosening and tightening it. This may be bolts for the outside forms and wedges for the inside ones. Then the forms can be raised and filled again and the wall built as high as desired.

SECRET ROOMS AND THEIR USES

By L. LAMPREY

UNDER the names of "secret closet," "secret room," "priest's room" or "hidie-hole" secret chambers and staircases exist in so many of the old houses of England that they are far from being a convention of the romance-writers. Less common in America, they yet have existed here in houses of Colonial times and even in some of later building. There is an old house in northern New Hampshire, built in 1818, of timbers more than two feet square, which has a secret room under the stairs, and no one save the present owner and one or two other persons know that it is there at all. This room is entered (when it is entered, which has not been for at least one generation) by taking out the front of one of the steps of the ladder-like front stairs, putting the hand in and opening up another stair, which makes a hole big enough to admit a man. That house was built not so long after the last war with England that it should have seemed impossible that the room might some day be needed. It is, and has always been, a farm-house of the better class, but most of the "hidie-holes" belong to houses, or castles, whose owners were of sufficient political importance to make such a refuge useful when the other party got the upper hand.

The secret room began to be a feature of English architecture when civil wars raged. Before that, the conqueror of a feudal manor simply took possession of the house and all who were in it, and the occupant of any secret room would have starved to death. But when men began to be hunted for their opinions or their deeds, their households not being molested, they could hide in such a secret room till pursuit had ceased or till they could find an opportunity to leave the country.

Most famous of the secret rooms of England is perhaps the one at Boscobel, in which Charles II hid before and after his still more famous hiding in the Boscobel oak. The room which is usually shown as his was occupied by one of his officers; Boscobel has more than one secret room, and the one in which the king lay concealed was under the cheese-room, an important but probably not frequently visited part of the kitchens, on September 6, 1631.

The usual place for the secret closet was somewhere near the chimney which rose like a tower in the midst of the mass of irregular buildings that composed an old-time English manor house. There were several reasons for this; the great chimney-breast would easily conceal such a room, the fire would make it impossible to investigate, and most vital reason of all, the chimney would keep it warm, and not too warm either, as people who have lived in houses which have the old-time chimney-cupboard can testify.

At Broughton Hall in Staffordshire there are rough steps up the chimney in the hall for about eighteen feet, into a good-sized room. It had no window and was probably ventilated somehow from the chimney itself. It now has a separate staircase and is used as a smoke-room.

An old house which affords one of the best examples of secret closets in good preservation is Pitchford Hall in Shrewbury. In a panelled room on the upper floor, a certain panel, the fourth or fifth from the chimney-breast, will slide sidewise if pushed in a particular way. Then one can reach in and withdraw a bolt, and a piece of panelling then springs backward, or downwards, showing a small cupboard or closet. In the floor of this tiny "cubby-hole" is a trap-door leading to a small room below which communicates with a cupboard in the drawing-room. Thus the dweller in the secret place could perhaps hear what was said about him while he lay in hiding, and could conveniently communicate with some member of the family. Pitchford Hall was built in the fifteenth century, and is what is known as a "half-timbered" house.

Gwydyr Castle, near Llanwrst in Wales, once the home of the Wynnes and now the property of Earl Carrington, has a most interesting secret room, as well as wonderful oak carvings and tapestries. There is a Jacob's ladder down to the bottom, and a subterranean passage is said to lead to the park and the river. This would seem to point to an earlier origin than that of most of the secret rooms, since it affords a way for the occupants of the castle, if besieged, to escape even though it was destroyed utterly. A part of the Gwydyr is built up from top to bottom, with no entrance whatever, and no one knows what is inside. A secret room of Glamis Castle in Scotland is said to harbor a spectre or a monster who destroys the peace of house-parties, but if Gwydyr has any such sinister secret in its walls no one can say what it is.

Harvington Hall in Worcestershire affords an example of another kind of secret room, the room under the stairs. The irregular rambling stairways of old houses give opportunity for such chambers, but they were not of course as well heated as the chimney-rooms or as accessible. In this old house three steps are pushed aside at a corner of the stairs, and a hole is revealed which leads into a dark room that could hold a troop of soldiers.

Shipton Hall in Salop has another dark room, between the floors of the house, reached by a ladder put up to a trap door in the ceiling of the kitchen. It may be remarked incidentally that when plaster came in, secret rooms and trap doors generally went out, for a trap door in a plastered ceiling would be all but impossible to conceal.

Compton Wynyates, seat of the Marquis of Northampton, not far from Sulgrave, the ancient home of the Washingtons, has a council chamber which is a vivid epitome of the dangers of its time. It occupies one whole floor of the tower, so that listeners would be absolutely baffled; there is but one stairway to the rooms below, but three to the upper apartments; it has six doors, and in a closet are pulleys and ropes. There is a hidng-hole behind the fireplace, and a "priest's room" above.

Baddesley Clinton, another old manor-house with a "priest's room," bears above its chapel door the significant motto, "The Catholic faith never changes." Handlip Hall has a secret room in which Father Garnet, a superior of the Jesuits, and three other men were hidden for several days. Liquid food was conveyed to them through a hollow reed. There are no less than thirteen hiding-holes in that house. The Jesuit college at Stonyhurst has several secret rooms, and, in fact, the secret room reached its greatest vogue from necessity during the religious wars. The priests, from their distinctive garb and the fact that they were vowed to non-resistance, may have been oftenest forced to use them, but there is no doubt that the same hole was sometimes used by men of both parties alternately as the house changed hands or sides.

The walls of Treago Castle at the four corner towers are six feet thick, and a long-forgotten room was found at the top of one of the towers, with a tiny window, a fireplace and folding desk.

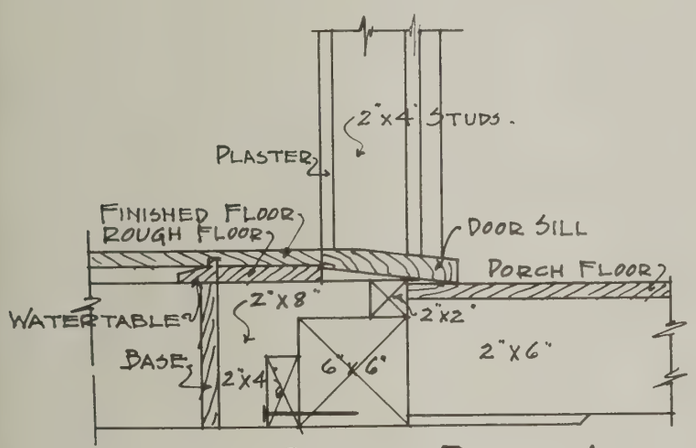
Cheltham Hospital, once the hall of the Lords of Manchester, has several hiding-holes. Half way up its Jacobean staircase there is a wooden panel where once there was a stone that would turn in the wall and disclose a recess into which a man might scramble and find a chamber above and behind the hall fire. In case of pursuit or discovery the occupant of the room could climb further up the chimney and come out on the roof.

There are wierd stories of old houses built with staircases all round inside the walls, but these are rather the work of eccentricity than necessity. The secret chambers of old English houses were built in grim, dead earnest; it was a life and death matter to make them safe, and their existence was seldom known to any save the most responsible members of the family, and perhaps a trusted servant. It was the same way, for the most part, with the first of the colonial houses which had such rooms. They never gained any great vogue in this country for many reasons. First, the conditions have passed which made it necessary for a God-fearing man who had done no wrong to hide from pursuit by officers of the government. Second, the chief enemy whom the early Americans had to fear was that other early American, the Indian, and he seldom stopped to hunt for secret rooms; he burned the house down, room and all.

There was said to be a secret room in the minister's house at Hadly, Mass., where Whalley and Goffe lay hidden; there were secret rooms in some of the other old colonial houses, but more often there were secret passages out of the house. The Carlisle House, sometimes known as the Braddock House, in Alexandria, Va., is an interesting example of this arrangement. The present entrance is where the entrance of a colonial house usually is, at the front, but inside you find windows looking down into a small court yard. From this leads a long subterranean passage, with dungeons on either side for the storage of powder, prisoners or grain, to a small iron door or gate in the bank of the Potomac. Thus the occupants of the house, if besieged, could run along this underground corridor and escape by boat, and it was a not unusual plan for the pioneer colonial house. The last use of the secret room was for the storing of valuables, but this, too, has mainly

gone out, because it is useless in case of fire, and most people find electric lights and burglar alarms easier to manage.

Strangely enough, the last man to use a secret room in this country—perhaps the only one to use such a room in this generation—was Whitelaw Reid, present ambassador to England, and he did so for none of the reasons hertofore mentioned. So well was the secret kept that nobody but himself and an intimate friend or two knew the room existed until the Tribune building was remodeled. Then a little room was found up in the tower, with a desk and some simple bedroom furniture, and it was finally discovered that some years ago Reid used it quite often when kept late at the office. The plan also kept him out of the way of questioners till he had formulated his Tribune policy on any knotty point.



There is an atmosphere about a secret room which nothing can quite equal. The cunning workmanship, the artistic beauty of the carving which often conceals the crack in the wall, the ingenious devices employed to make each room different and difficut of discovery, have, like everything else in old-time architecture, a spirit of intense individuality.

BUILDING A PORCH

By I. P. HICKS

FRAMING solid sills, showing a good and easy method without mortising in the floor joists, also how to figure for porch floor base and watertable so that the porch floor will come tight up under the door sill, and watertable just come on a level with top of porch floor.

The question of framing sills and joists for houses is one of more or less interest to the carpenter for in some cases it means a whole lot of labor, particularly where the joists are to be framed into the sills. In some cities the building laws do not permit anything to be used for a sill smaller than a 6x6 and in this case the floor joists are generally gained into the sill, which makes an unusual amount of labor and is no better than some other method

FRAMING SILLS & PORCH JOISTS SHOWING HOW THE DIFFERENT PARTS MEMBER.

that would take much less time to do the work. For example, take a 2x4 and space the joists the proper distance and notch out 2 inches; this can be done in very little time with a saw and chisel; then spike the 2x4 on to the 6x6 sill just right to receive the joists, as shown in the illustration, and the sill is made, and is every way as strong and good as if it had been gained out, taking three or four times as long. Drive spikes directly under where joists rest to give the greatest strength.

Another important thing to always consider is to figure out just how the base and watertable will work out where they join a porch or come up to the outside doors. This is quite important for it looks much better if these member in some kind of shape that is practical. The watertable ought to either butt against the porch floor or else come just on top of it and butt against the end of door sill. If it comes above or below these two points it always makes more or less bad looking work where it joins porches or comes against door frames. In the case illustrated we have figured it to come with the bottom edge of watertable just on top of porch floor. This is figured 2x8 joists for house and 2x6 joists for porch floor, which is very often used in house construction. It is true that 2x6 joists are high for porch floors, they should be used in short spans not to exceed 10 feet between supports; this can be done by putting on double headers every 8 or 10 feet, as may be required. Constructed in this way it is possible to get a real stiff floor even with 2x6 joists.

It is better construction to use 2x10 joists for house floors and 2x8 joists for porch floors. In this case we would have to figure out a different width of base to make them member properly.

The illustration shows a base 7½ inches wide, which will work out just right where 2x8 and 2x6 joists are used. If you have different size joists, figure it out before you get too far along with your work for it does make a noticeable appearance in the work to have these things come right.

As the cost of doing work is always an interesting part to the carpenter we will tell you how we figure the cost of the work shown or indicated in the sketch.

Base and watertable per lineal foot, 4c.; framing main floor, $1.00 per 100 square feet; laying rough floor, $1.00 per 100 square feet; laying finish floor, 2¼ face, $2.00 per 100 square feet; smoothing, scraping, $1.50 per 100 square feet; framing porch floor, $1.50 per 100 square feet; laying porch floor, 3¼ face, $1.50 per 100 square feet.

WASTING TIME AND MATERIAL

By N. E. DUFFEY

MY occupation in connection with building construction for a number of years has given me many opportunities to think about and consider.

One thing I find that is important and that is the waste of time and material on many jobs that either the contractor and builder, and often the foreman, seems to lose sight of and neglect.

I find, in visiting the various jobs, material of all kinds wasted for the want of someone whose duty it should be to care for and keep it in some place convenient for the mechanics to use when needed. I have been on buildings where every room or apartment was littered with the boards of various lengths, pieces of joists, studding of different sizes, bricks, terra cotta and tile, with a covering sometimes of plaster or cement. Such material the mechanic too often passes over and goes to the pile that is clean and clear of such mixture, and he is not to blame for doing so. All material, lumber, brick, tile or terra cotta, when not used at the place and time, should be taken care of and put in its proper place with the material to which it belongs, and when wanted, could then be found without loss of time or spoiling of new material to make more waste.

The time lost on such jobs, when large, runs into days; the material into dollars. Employers will say, "time is money," and the dealer will say, "material is money," and when time is lost and material wasted, it counts double to the contractor.

Think of a carpenter chasing around to find a piece of 3x4-4 feet long for fifteen minutes, which is probably among the material above described, and after securing the piece wanted, in what condition is it to use a saw in that perhaps has just been filed? So often the same case occurs with a piece of board that must be planed. The length or width is right, but in what condition to use a plane on? Trim of all kinds and sizes is left to travel over, split and edges broken, flooring in the same condition, causing a waste of material to cut out the damaged edges and broken parts, besides the extra time it requires.

Such things I find on jobs where everything is seemingly rush and no one has time to stop or think about anything except the work they are doing just at that time, and from one thing to another, leaving the material with the waste to do the work in haste.

Does it pay?

COPPER ROOFING

By H. M. SANDERS

THE subject of "sheet metal roofs" is one which we have already treated in the past year in the columns of the National Builder in some of its phases, and from the standpoint of the specific use of some of the sheet metals, such as lead, zinc and tin roofs, and to some extent shown their comparative value as used for that purpose.

It is our purpose in this article to take up the subject of still another sheet metal—sheet copper—as one which is of growing importance in this department of our industrial life.

In presenting this phase of the subject of an ideal metal roof, we are aware that it opens up a subject of wide range of thought and experience, upon which all do not think alike. But, notwithstanding this, it is presumed that there are certain points upon which all can agree. First, perhaps, that the aim and purpose of a roof covering is for protection. Protection against unfavorable weather, exposure of climatic or atmospheric conditions, against rains or storms of any kind. All agree that a material used for that purpose should last as long as possible without repairing or having to be renewed. This, of course, brings up the question of its durability, etc.

At this point starts the divergence of opinion as to which of these metals, all things considered, is best calculated to meet these requirements.

Upon the point of the comparative value of sheet metals for roof coverings, the two main sources from which we may obtain information is, first, from a study into the nature and character of the different sheet metals used; and secondly, from practical tests in their use and application. But upon this matter of practical tests, we do not judge all metals alike, for in some the time limit of value is measured by centuries of use; in others, by a few years, more or less.

Living as we do at the present time in an age and under conditions where the time limit of values of material is measured by years and not by centuries of use, it seems hard at times to realize that one or more of the sheet metals has a value as to durability which can be measured by centuries of use. But we know such to be the case with the lead roof, which has lasted on many of the cathedrals of the Old World for upwards of 300 years. This fact alone, however, does not prove that lead is the only sheet metal of centuries of use, for on some of the church spires in England that were covered with copper 150 years ago, they are good today without having been renewed. This rather forces us to the conclusion that had copper as early a start as lead, with the Genii of the twentieth century to mould and shape its destiny, copper might have had as good, if not a better, record than lead, in moulding the requirements of a roof material of the past.

It will be remembered that in the early history of roofs, they were mostly flat roofs, as is the case today in nearly all the Asiatic countries, while now and especially during the past one hundred years there have been great and radical changes in the character and construction of buildings and their roofs.

This has brought with it a new set of conditions bearing upon the relative value of roof material, where durability alone is not the only essential quality or characteristic required.

At first thought, perhaps, the mind reverts to lead as being the best sheet metal for an ideal roof, but we find that sheet lead has its weak points; it has one characteristic that reflects seriously against its use on steep roofs; it has a peculiar creeping tendency which none of the other metals have. Other sheet metals like zinc, tin, copper, etc., have expanding and contracting qualities, but none of them, like lead, have a tendency to creep out of position when placed on a roof in an inclined or vertical position; for it has been known to creep out of position from 15 to 17 inches inside of two years.

Then again, in selecting an ideal roof metal under present day conditions which grow out of our economic use of material, both in the roof covering and in the framing of the roof itself to receive the metal, we find that there are other of the metals that are even better calculated to meet these new conditions and requirements than the lead roof.

As a fact, they all to a certain extent meet these requirements, but by the very nature and character of some of the metals themselves, they are better adapted for the purpose than others. So it would be presumed that the sheet metal that would meet the most, if not all the conditions necessary for a model roof, was the one best fitted for that purpose.

This leads us up to the point of inquiry as to what are the essential qualities of a model roof, and, secondly, which of the sheet metals used for roofing purposes will best supply them?

The following schedule may be considered as combining the essentials in the requirements of a roof covering of modern times:

1st—Durability.
2nd—Lightness.
3rd—Adaptability.
4th—Low expanding and contracting qualities.
5th—Low resisting properties.
6th—Toughness of texture.
7th—Moderate cost.
8th—A good appearance.

Taking the schedule of essential requisites of what is required to secure an ideal metal roof, let us see how far the various sheet metals are able to meet these requirements.

First: We will take the lead roof. We find that it possesses the first requisite, Durability, to a remarkable degree, but it does not meet the requirements of the second, Lightness; the chief objection being its great weight. It seems to possess the third essential, Adaptability, but rather in excess perhaps because of the softness of the metal, together with its great weight, which often causes it to creep out of position, as already spoken of.

In meeting the other five requirements of an ideal roof—from the third to the eighth—it fails largely, though in the seventh requirement, that of Moderate Cost, it compares favorably with sheet copper as to first cost of the metal, but it requires a heavier constructed roof to receive it.

As regards the use of zinc roofs, they seem to compare favorably with lead or copper roofs in none of these eight essentials, except in cost, unless we make exception in favor of its comparative lightness and adaptability under certain conditions. The average length of life of a zinc roof, according to different authorities, varies from twenty to thirty years.

Comparing still further, the comparative values of lead, zinc and copper roofs, let us consider their fire resisting qualities. The melting point of lead is 612° F., zinc 736° F., and copper 1,975° F. Thus is shown the great advantage of the high melting point of copper over the lead or zinc. This, comparatively speaking, would go to show that the copper roof is quite immune from being affected by fires in adjacent buildings, and a source of protection in keeping a fire within the building itself, whereas a lead roof under the same conditions would quickly melt, and a zinc roof would catch fire at a much less heat, and by its very nature as a metal reduced to an oxide under intense heat that will burn forcibly and thus be destroyed.

Now, in regard to tin and galvanized iron roofs, how do they compare with the other sheet metals spoken of in meeting the requirements of an ideal metal roof? This brings us to the consideration of another and somewhat different class of roof metals, for they are a different class by themselves.

We speak of a lead roof because it is a lead roof, and we speak in the same way of a zinc or a copper roof, because they are zinc or copper roofs, but we cannot so speak of a tin or a galvanized iron roof, for they are not tin or iron roofs in the same sense as when speaking of a lead or copper roof.

When we speak of a sheet of copper, we know that not only the surface of the sheet is copper, but the body plate of the metal as well, but when we speak of a sheet of roofing tin, we are speaking of a sheet metal where the surface only is of tin and the body plate of the metal is of a baser metal.

Hence, we speak of it as belonging to another and cheaper grade of sheet metals, which, because of this fact, does not stand on the same footing for durability as sheet lead or copper, although under certain conditions in the past history of its introduction and use it has a record of over seventy years' durability.

So the position of tin and galvanized plated metal assume rather of a dual position, combining tin and iron or steel in the one case of sheet tin, and zinc and iron or steel in that of galvanized sheets.

These three metals, tin, iron and zinc, in their crude ore state are practically as pure and durable as lead or copper, but we find

that in the process of working these metals into sheet form to be of general, practical use in the industry, the working out the dual combination changes the character and to a great extent the durability of the product in sheet form.

This grows out of the fact of the nature and character of the tin and zinc or spelter in their pure state as an ore metal. They are of a brittle, crystalline nature and must be alloyed with another softer and tougher metal to be of practical value as a metal in sheet form.

In view of the foregoing and what has already been stated in our former article on Tin Roofs, they cannot fill all the requirements of an essentially "Ideal Roof."

As we review the advantages that sheet copper possesses over all the other sheet metals spoken of as meeting the requirements of an ideal roof, we find that it possesses not only superior fire-resisting qualities, but it is tougher in texture and has lower expanding and contracting properties, and these, together with its lightness, seem to make it the one metal that will best meet all requirements of the ideal roof, especially of our better class of buildings where permanency and durability may be looked for and desired.

It is quite true that on a large class of the cheaper grade of buildings, the cost of a roof often becomes a question of paramount importance to consider.

This, of course, is often a drawback and disparagement to the introduction of a more complete and perfect roof, the first cost of which is more expensive. Even then, this fact alone is no assurance that such a roof would not prove the cheapest roof in the long run, especially so, since so many of the cheaper grades of metal roofs have to be removed so often every few years, besides being constantly repaired at intervals between times. Under such conditons of constant renewals and repairs, the cheap roof would often prove much more expensive than the original cost estimate of even a copper roof.

The idea of such possible conditions existing is rarely thought of or properly considered by those who have such a class of work in charge. It goes without saying that the owner of the building expects and has a right to expect a good and substantial roof. He does not let out the work to the lowest bidder with any other thought than that it shall be well protected with a substantial lasting roof. In ninety-nine cases out of a hundred, if he knew, or was informed of the fact, that the copper roof would outlast several tin roofs and would be the cheapest roof in the long run, although more expensive at the start, he would surely adopt it.

Now, who is to blame that the owner of the building does not know this fact?

Some will say, perhaps, that the architect is to blame for he should have required it in his specifications. The fact that the architect has specified some cheaper grade of roof than the copper shifts the blame from the shoulder of the contractor of the building. But does this leave the blame wholly with the architect? We may allow that he should know better or be better posted as to what is the best roofing material, but his judgment is based largely upon the standard of appreciation within the trade itself of the value of the different metals for roofing purposes. If we want a higher standard of appreciation in the public mind generally, as to what is the best material to use for specific purposes, the trade itself must show it by a higher standard of excellence. For up to its own level and no higher can it be raised. This all being true, we must lay the blame where it belongs, mostly at the threshold of the trade itself.

So we must conclude that all those who are interested in the growth and development of the sheet metal industry, and in its future success as an important branch of our industrial life, realize that we can raise public interest and appreciation of the use of the sheet metals in any direction of its varied application up to the level, and no higher, than that which exists in the general trade itself.

We can only secure a higher and broader appreciation on the basis of a higher standard of excellence, as before stated. To this end, our ideals must ever be moving us onward and upward toward the goal of perfection.

In the foregoing we have set forth some of the main reasons why we believe that the copper roof is to be the "Ideal Metal Roof" of the future. In our next article it will be our aim to show by illustration, Why.

MAGNESIT FIREPROOF BRICKS

By ROBERT GRIMSHAW, PH. D.

IN AN interesting paper in Kalk, Sand und Zement, Paul Schnurpfeil considers the subject of fireproof bricks made with magnesit, particularly those varieties from the county of Gomör in Hungary and the Veitschtal in Steiermark (Styria). They have the advantage over the celebrated material from the Island of Euböa, that at a high temperature they form a cinder without melting.

Before the crude magnesit is burned, it is freed from quartz, lime and dolomite, it is then burned at a high white heat in a shaft-furnace lined with magnesit. When a red heat is reached, the magnesit loses its carbonic acid and becomes anhydrous magnesia, which is slimy but somewhat binding, and can be formed into blocks under high pressure.

In the burning process the loss by shrinkage is considerable; being about 50%. For this reason it can be used for fireproof bricks only when thoroughly burned. In this operation the specific gravity rises from 3.0 to 3.8; the magnesit becomes very free from pores, is hard and unaffected by water or carbonic acid, and can stand the pressure of quartz in the fire without combining therewith.

In order that it may form a good clinker, it is desirable that it contains 2 to 4% of iron sesquioxide ($Fe_2 O_3$). The presence of this material seems to have a similar action to that of a similar amount of argillaceous earth sesquioxide of aluminum ($Mn_2 O_3$) in garzite.

From the fully-burned magnesit the limey impurities are separated and it is then stored in a dry room with a sloping floor, at the lower end of which there is a ball mill which in 10 hours can grind five tons to No. 60 size; the product falls into cars for transport. The mill takes 12 H. P.

The ground magnesit is mixed with about 1% of water by spreading a thin layer on the floors, sprinkling it, and shoveling well together. The mixture is stored for a few days and then sieved. It is best to have all storage room and other floors in the plant made of cement.

If the magnesit is well burned there will be less water absorbed than if the burning be imperfect. For this reason it is important to ascertain by test the requisite amount of water to be added. The mixture should ball up easily in the hand, but fall apart readily to the touch.

Next comes molding in hydraulic presses. Enough for one block is weighed off by hand and the form filled; the rotating press table being so placed that the mold comes exactly under the ram; a second workman starts the latter. The table is turned further and the molded block is forced out automatically; the now empty form is wiped out and the block set on edge on an iron slab. The blocks are then taken to the drying room; they must be handled very carefully, else they will slump down. Three men tend the press and bear off.

A fresh pressed block 230 x 118 x 63 mm. = 9 x 4.65 x 2.54 inches weighs 4.6 kg = 10 1-3 lbs.; when dry, 4.35 kg = 7⅞ lbs.; when burned, 4.2 kg = 7¼ lbs.

It is best to dry these blocks in the air, in well-closeted but well ventilated rooms, on iron slabs. During the cooler months this room is warmed by exhaust steam; the blocks are laid on cars which run slowly down the tracks in the dry-kiln and carry the blocks from them to the kilns for burning.

The blocks, which at first were very unstable, get harder and tougher in drying; and when ready for burning may be stacked, like other fire-proof bricks, in the kilns.

Magnesit blocks can be burned at the same time as the Dinas bricks; some kinds, with a greater percentage of iron, are burned like tiles in the upper part of the kilns at a temperature corresponding the Segels' cones No. 11 or 12. The bricks must be so set in the kiln that they do not come in direct contact with the flame; it is therefore advisable to protect them by a row of other bricks.

Burned magnesit bricks are solid and strong, and ring well. When slowly warmed they do not spring. When exposed to the higher temperatures, there is no fear of either swelling or shrinkage, for which reason they are well adapted for high basic furnaces.

ROOFING WITH THE STEEL SQUARE
THE MANSARD ROOF

By J. H. B.

THE mansard, Dutch, or double-pitched roof is one which might well be used to a much greater extent than it is, being as easy to put on as any other roof, using very little more timber, and allowing of far more room inside than the ordinary span roof. It consists of two distinct roofs, the lower one of which is very acute in pitch. This should be so arranged in height as to allow the ceiling joists to lay on the top of it, thus forming a series of tie beams to take the thrust of the upper portion.

As a rule, the bottom part of the roof is formed with upright gables, so as to give the full length of the building for the room inside, and the upper part being hipped, does all that is required in the way of strength. Such a roof as this is shown in elevation in Fig. 87, in plan in Fig. 88, and in sectional elevation in Fig. 89. In the latter drawing, A represents the floor joists, and the dotted lines B the upright studding which will form the side walls of the room.

The roof shown is of the flush eaves style. Thus there are no projecting feet to the rafters; therefore, the best method is to mortise the plates, and to stub-tenon the rafters into them, so that they finish level on the outside.

The upper plates must be halved or mortised together so as to form a rectangular frame to take the rafters of the upper part of the roof, and the lower rafters should tenon into the plates, so that they come level with the latter at the upper side; thus, when ready for fitting in, the rafters will be as Fig. 90. For the sake

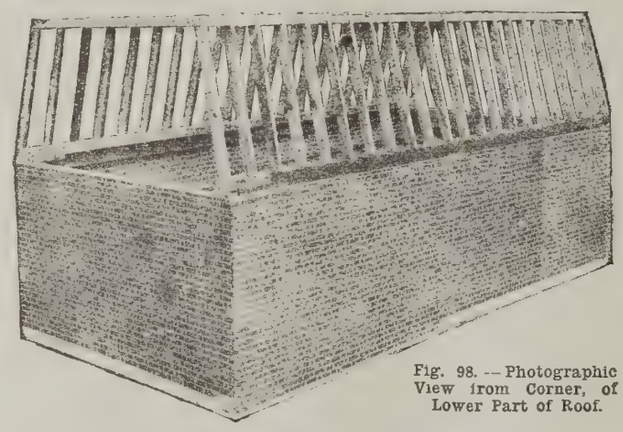


Fig. 98.—Photographic View from Corner, of Lower Part of Roof.

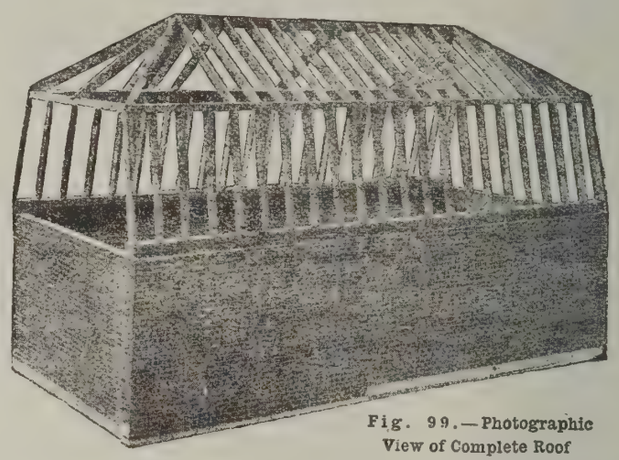
of stability while the roof is being erected, it is as well to allow several of the tenons to go through the upper plates, and to pin them; this is simply a safeguard for the time being. When the roof is once fixed, it will be perfectly safe with the stub tenons only.

In the drawings the pitch of the lower part of the roof is 15°, and the method of getting length and bevels of the rafters is shown in Fig. 91; thus the square placed to the 16-in. and 8½-in. marks, and passed along six times, will bring it to 8-ft. rise, which, allowing for 7-in. floor joists, boards, and plaster, will allow of a room of 7-ft. 3-in. pitch.



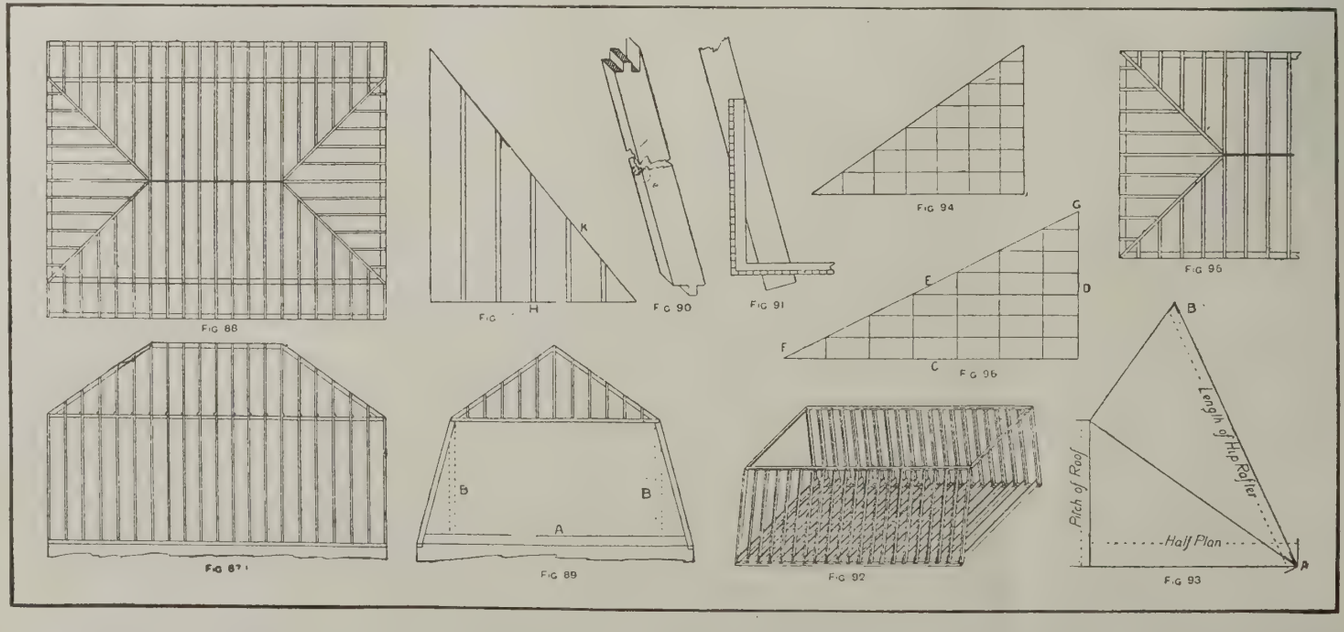


Fig. 99.—Photographic View of Complete Roof

The angle of the shoulders at top and bottom will be the same, and the projecting lip at the top end will be at right angles to the shoulders, dying out to a feather edge at the upper side of the plate.

Fig. 92 shows the lower part of the roof erected as it should be before the upper part is begun. The erection is easy if set about in the right way. The rafters should first be fixed in position, and the upper side plates put on and pinned (if prepared for this), propping them up temporarily. The end plates can then be put on and fixed, the props removed, and the floor joists fixed to plates and rafters as shown, adjusting the former as required before the joists are fixed.

The ceiling joists should be fixed before the upper rafters are put on; they will then keep the plates in position, otherwise they might be thrust outwards during the fixing of the rafters.

The upper roof, as shown in Figs. 87 and 98, is framed in the ordinary way, and may be raised the same as other roofs. Fig. 93, shows a method of obtaining length and bevels for hips. Fig. 94, shows the manner of getting length and cuts for common rafters. Fig. 95, exhibits a plan of the upper portion of roof. Fig. 96 is a method of getting length and bevels with the steel square. Fig. 97 gives a method of getting lengths and bevels for jack rafters or cripples.

HOW TO TELL POOR PAINT By A. ASHMUN KELLY

THE surest test of an exterior paint is its wearing on the surface to which it has been applied. But this is like planting a Grimes' Golden apple tree and waiting ten years to know whether it is such or merely a Ben Davis or other inferior fruit. While it is beyond the power of the chemist to determine whether the young tree will bear a certain kind of apple or not, it is quite easy for him to analyze paint and tell its true character. But it is not convenient to run to him with the pot of paint and have it analyzed, as it takes time and is costly. And we might give here formulas for physical tests of paint that the contractor might use for determining the true character of the paint he has in hand. This plan would involve time and considerable apparatus. It is very doubtful if one contractor in one thousand would care to do this. No master painter does it. How then shall he tell when a paint is poor? We must suggest a very easy and practical way. Well, there is the ready mixed paint bearing a label which is the trade mark of a well known and reliable paint manufacturer. That is a very good indication of a good paint. But, the paint maker puts out more than one brand. Then get his first grade. Paint makers are trying to get out a paint that will give perfect satisfaction in every way. It is a mistake to suppose that their firs aim is to turn out a paint that will produce the most profit. The matter of profit is important, but success depends upon giving satisfaction, and this a poor paint will never do.

An expert painter can tell a paint by very simple physical tests. The odor is one test. That will tell him what it has been thinned with. An outside paint should have only pure raw linseed oil as a thinner, the quantity of driers not being sufficient to influence its odor. The oil and pigment together form a distinct odor that is unmistakable to a painter. Then the fineness of the paint is another index. A paint whose base is white lead or zinc white, or a mixture of both, will be perfectly free from grit or sandiness. It ought to be as smooth as butter. If coloring has been added to it, it should still be smooth, for any staining pigment should be ground butter-fine. If a mixed paint looks very glossy in the can, and works under the brush rather soapy, it is poor. While a good paint will work smooth and easy under the brush, at the same time it will not have that soapy feel that an emulsion or rosin oil paint will have. This is difficult to describe, but the experienced painter knows it very well. The paint that works "short," that does not flow out well under the brush is a poor paint. It contains benzine. The paint that thickens up when left standing for some hours is a poor paint; it contains rosin oil.

The requirements of an exterior paint, for we will not consider interior paint now, although much that pertains to the one is a requisite of the other, are that it shall be durable, both as to body and color. That it shall be free from grit and adulteration in body or base and thinners. Perhaps the word durable will cover the whole case, for if durable, then that is all we can require. That will mean a paint fast to the light and weather as concerns its color, as far as possible. For all colors will fade, even white lead fading out whiter; or, rather, it is the oil in it that whitens or bleaches.

The kind of lumber and the degree of dryness of the lumber influences the wearing of paint. Hence we must not condemn the paint when it goes wrong on wrong lumber. To elucidate this point would require another chapter. But speaking in a general way, a paint should be reasonably weather proof, it should be able to resist water and sun, injurious gases, salt water, or the air from salt water, etc. It should have good covering power, for the paint that will not cover up well is a poor paint, lacking in the proper paint material. White lead paint, properly mixed, will cover perfectly. True, it will not cover say a black mark, with one coat, nor a surface badly discolored, one coat, but a case of this kind is remedied by adding a little coloring to the paint. A little trick well known to expert painters. A good paint is the opposite of the poor paint, hence by ascertaining what a good paint is shows us what a poor paint is. A very poor paint may show unusual gloss, looking even better in this respect than the best lead and oil paint, but time will show that it is a fraudulent paint. Its gloss will soon dim and at last perish utterly, and the base with it. Rosin oil paint is of this sort, and of all poor paints this is about the limit. In course of time it will "alligator" where the sun and weather gets at it, and it will remain soft and sticky where it is protected. The trouble of removing this paint is worse than the loss of money involved in its purchase and application.

To contractors who do the painting I would suggest a plan used by some large master painters, namely, get the paint made by some reputable paint maker, have your own formula, and get the paint in paste form, so that it may be thinned on the job.

White lead is a natural dryer, and so also is raw linseed oil. Hence little driers are needed. Too much will injure a good paint. To grind white lead and oil to a paste requires, for old Dutch process lead, 92¼ lbs. lead and 7¾ lbs. oil. Or practically a gallon of oil to 100 lbs. lead. Such a paste lead should be mixed with from two to three gallons of oil to the 50 lbs. of lead. This will give a good gloss paint for exterior use. Thinned to the ordinary painting consistency, the paint will cover about 500 square feet one coat, to the gallon. The mixed paint that will not come up to this standard of efficiency is a poor paint.

SOME ROOF FRAMING By A. A. STAFFORD

So many times in the twentieth century, has the NATIONAL BUILDER had drawings and explanations of roof framing, it seems almost needless to say anything more about it. But, I see in every issue where some "Chip" asks about roof framing, and mostly hips, valleys and jacks, it seems a problem a little beyond the ordinary carpenter to figure out, as many, like myself, have not had book learning enough. Now I wish to say for the benefit of those who wish to profit by it, there is another way. Seeing things where there is nothing, and by illustrations, a carpenter, to be a keen mechanic, must be able to see clearly a full detail of his work by looking into space. When he can do that he knows just what he is doing all the way through.

At this time, I will try to illustrate a plain corner section of hip roof, one side of hip backed where the roof board carries on to it the proper height of common rafter. Now to get this, observe that this method is the quickest and simplest by which these backing lines were ever obtained on a hip rafter. See Fig. 1, take a piece of hip rafter stuff, saw the seat (or bottom), cut it clear to a point, place it on your square with the point to the corner just like it would set on the corner of the plate. Just where the edges of square and sides of stick crosses is gauge lines and a center line on top will be where to cut for a perfect fit if nicely done, works on any pitch. Now to get the hip to set just high enough. After finding the distance from the corner of the piece to the gauge line, take a hip stick and gauge it, from gauge line measure down hip plumb line for seat cut, plumb measure must be same as it is on common rafter at this point. See AA, Fig. 2. The thickness at this point must be made to suit job where it is built. These drawings are not to scale, merely show position of rafters.

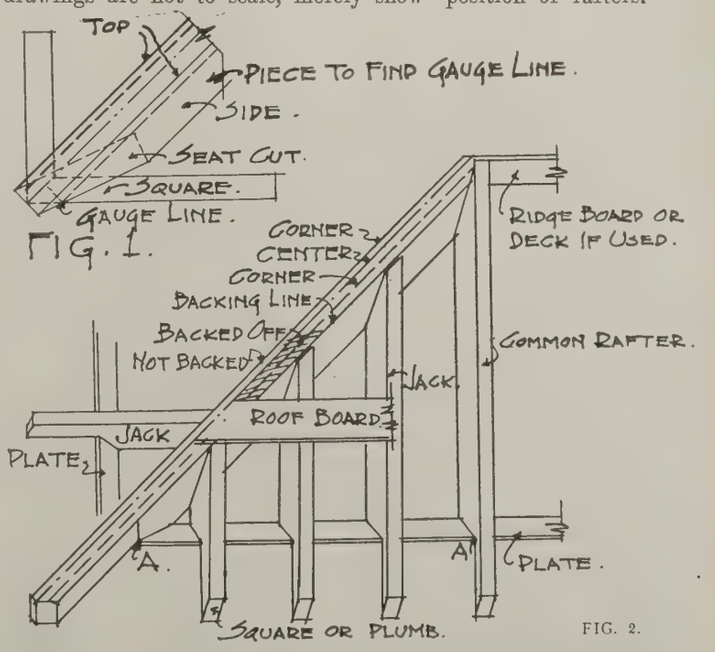

FIG. 2.

STRUCTURES SUBJECT TO MECHANIC'S LIENS

By W. J. STANTON

UPON the same lot or tract of land may be two or more structures, each of such a character that if it were there alone, a separate claim of lien might be enforced against it. Where such is the case, may a claimant proceed against one or all of the structures, or, if his right to proceed against all or more than one can be affirmed, does he lose his right to proceed against that one because he has not sought to subject the other or others to his claim? The word "structure" is used here to denote any thing or piece of property against which a lien can be claimed and enforced for work done or materials furnished upon or about it.

Several buildings may be disconnected and intended for separate occupation, and yet they may have been constructed for one owner and under a single contract in or by which no duty was imposed of keeping a separate account of the work done or materials furnished upon either. Where such is the case, a person furnishing materials or performing labor upon all the buildings may, in a majority of the states, include all in a single claim of lien and in a single suit for its enforcement. On the other hand, if the contract shows the amount of work to be performed or materials to be furnished upon each building, each must be treated separately in the claim for a lien, and a claim of lien upon all the buildings cannot be sustained.

In some of the states, however, the statutes controlling this subject have seemed to treat each building as distinct, and hence have been construed as not warranting any claim of lien extending to two or more distinct buildings. Thus, in Connecticut, it was said that the statute of that state "creates a lien upon every building in the construction and repair of which, or in any of its appurtenances, the claim arose. It provides that such claim shall be a lien upon the land on which the building may stand, the building and its appurtenances. It follows, therefore, that in order to be entitled to claim a lien pursuant to the statute on any building for work done upon any other building, the latter must either be an appurtenance of the former or land upon which it stands, as these terms are construed. And the same principle must apply when a lien is claimed upon several buildings for work done generally upon all."

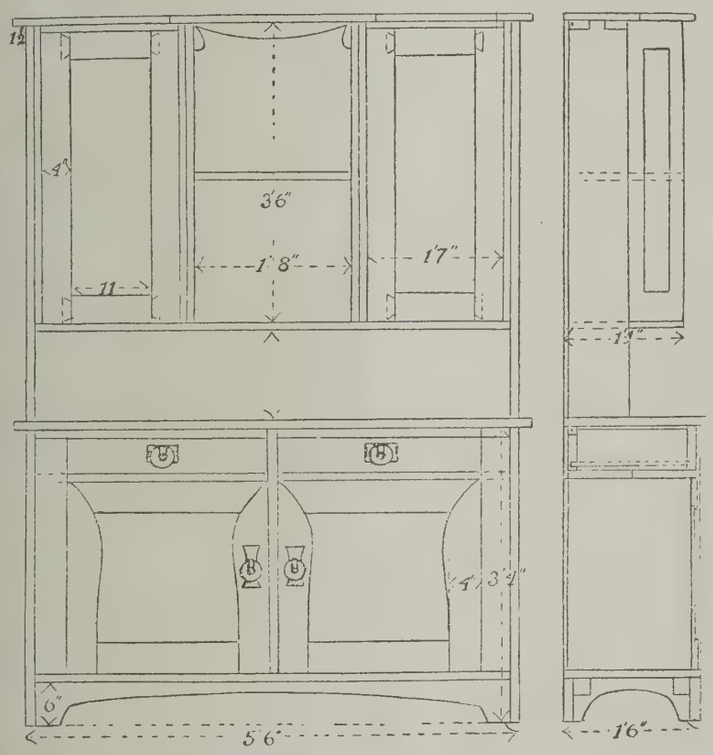
The cases to which we have just referred involved claims of liens upon two or more structures upon all of which the claimant had performed labor or furnished materials. Where, however, he has not done any work or furnished any material for some of the buildings or structures, it would seem clear that his claim must be restricted to the building or structure upon which he did work or furnished material, except where several buildings or structures constitute a single plant, each being, irrespective of the date of its construction, a part of the common whole. In some of the states, however, the statute seems to attach the lien to a lot of land, and hence it has been held to include buildings thereon to which the claimant did not contribute either labor or material.

Thus, in Massachusetts, the owner of a lot upon which four buildings were already erected and a stable intended for the use of such of the tenants as would pay the best rental therefor, contracted for the erection of two additional buildings without making any subdivision of his lot, and the contractor was held to have a lien upon the lot, including as part thereof, the four buildings in the erection of which he had no part. This rule and holding is contrary to the general rule applicable to the subject. The statutes of Iowa provide that a mechanic or materialman who furnishes labor or material for any building or other improvement upon lands, by virtue of a contract with the owner or his agent, shall have a lien upon such building or improvement, or upon the lands belonging to such owner upon which the same is situated, and that the entire land upon which such building or improvement is situated, including the portion of the same not covered therewith, shall be subject to the lien. A building was erected upon a lot upon part of which another building already stood, the lot never having been divided, and the question then arose whether the materialman or mechanic had a lien upon the house to the construction of which he had furnished nothing. The court held that the "statute should be construed as to give a lien only upon the building for the erection of which the material was furnished or the labor done and upon the land upon which it actually rests, and, in addition thereto, upon the other land properly appurtenant to the building. Hence in this case appellants would have no lien upon the other house or upon the grounds occupied by it, not being properly appurtenant to the building for which the materials were furnished. Here material was furnished for a new house, an independent structure. Upon the same lot there is another structure. The two buildings are not so situated as to be used by the same persons or as one dwelling house, but they are separate and distinct; and a certain portion of the lot must, of necessity, or by reason of convenience, be used in connection with each house. In other words, in such a case the lien extends to the particular improvement and the land upon which it is erected and to such land surrounding the improvement as is properly appurtenant thereto."

Where work is done or material furnished in the construction or repair of a portion of a building, the lien extends to the whole thereof, though the work consists in adding thereto a new apartment, as a kitchen or a new wing, and doubtless the claim of lien cannot, at the option of the claimant be restricted to the new apartment or addition, where to so restrict it would prejudice the owner of the property by separating it into distinct fragments in the event of a sale to enforce the lien. The physical connection of its several parts is not necessary to constitute a single structure. If the apartments in a dwelling were separated by unenclosed and uncovered passageways, it might still be regarded as a unit, and a lien claimed and enforced accordingly. This is more commonly true of the buildings or structures forming part of a plant designed or used for the purpose of manufacturing or carrying on some other business in which it is found desirable, convenient or prudent to employ disconnected buildings instead of confining the operations within a single structure.

Where several structures erected on a tract of land or lot are designed for a united enjoyment, the law treats them as a unit in relation to the liens which it gives. They are to be considered constituent parts of a whole, incapable of separation without injury. An owner may see fit not to have his kitchen attached to his residence although adjacent and upon the same tract. In such case it would be unreasonable to contend that the mechanic could have a lien only upon the latter for his labor in constructing it. The kitchen alone would be valueless. In the case in which this statement was made, the plaintiff sought to foreclose a lien on the property of a smelting and refining company for work done and labor performed in furnishing, constructing and erecting buildings and machinery for the use of a plant consisting of several buildings not under the same roof nor physically attached to one another, and it was claimed that a single lien could not be asserted against the whole, but that each building or structure should have been the subject of a separate claim of lien. The court further said: "In the case at bar, the object was to erect a plant consisting of buildings and machinery necessary for the smelting of ores. Either from choice or necessity, or both, some of the structures were physically separate, but all were component parts of the whole. The building in which was contained the principal machinery was useless and valueless without the pumphouse, and so with the office and tramway. Each was necessary to the accomplishment of the object sought by the improvements and in the purview of the statute, did not become separate and distinct buildings simply because they were not physically attached, and because it was seen fit to designate the several component parts by distinct names."

The same principles were applied to another case involving a claim of lien against the property of a smelting company for furnishing material and constructing the smelter, scales, assay office, bins, boarding houses and other appurtenances.



Winter or summer the bedroom windows should never be closed except on such occasions as blowing rainstorms. Sleeping in cold air is all right if heavy enough clothes are used and the head is properly protected by a nightcap, or woolen hood or whatnot to suit the season. Dangerous to sleep in an overheated bedroom where the heat dies down seriously before morning. Risky leaving a hot sitting room and going into cold bedroom and cold sheets. Lots of folk believe that a big bedroom does away with the need of open windows. Nothing to it. Many people cannot breathe foul air without at once getting a heavy, sleepy, stupid headache, a sneezy, running nasal catarrh or a dry sore throat. Such natural warnings should be heeded and not defied.

A DINING ROOM SIDEBOARD

By GEO. F. RHEAD

THE dining-room sideboard, illustrated in Fig. 1, and in front and side elevations, Figs. 2 and 3, presents no difficulty in construction, and is in size to suit the average room. If mahogany is considered a too expensive material, pine or cherry could be employed, and the latter, if desired, stained to exactly imitate the more expensive wood. Walnut would look well; indeed, some of the old walnut furniture rivals on all points that of the more popular woods of the present time.

The article may, of course, be any size, the measurements being readjusted to suit requirements. The carcase of the lower part is the first thing to be considered, and is illustrated in Fig. 4. The sides of this measure 1 ft. 5 in. by 5 ft. 5 in. (including tenons); rails, 5 ft. 5 in. by 4 in.—these latter being dovetailed into the top of the sides as shown in Fig. 4. The center partitions, measuring 1 ft. 5 in. by 3 ft. 3 in., is tenoned or screwed into these and the base. The two drawers supports are sub-tenoned into the sides and the center division, with an intervening space for the drawer from the top of 5 in. Four drawer-runners extending from

FIGS. 2 AND 3. FRONT AND SIDE ELEVATION OF SIDEBOARD.

the inner of the drawer supports are screwed to the sides and center divisions. The top measures 1 ft. 7 in. by 5 ft. 8 in., and should be a nicely marked piece of material, and, if possible, got out of one piece of wood; but if a difficulty is experienced in obtaining a board of sufficient width, the expedient of "matching" together two narrow boards must be made use of. The boards may, if preferred, be dowelled together. The top is screwed to the lower carcase with screws from the underneath side of the top rails of same before they are fixed. The boards to which the doors are hinged are fixed by screws from underneath the bottom and through the top rail. They measure 2 ft. 8 in. by 4 in. In the construction of the doors the frame is curved on the inner side to introduce a more decorative and uncommon effect. The doors should be roughed out full size on paper before cutting. The framework is 4½ in. wide in its greatest width, and ¾ in. thick. The framework will be most easily joined together by means of the tongued mitre joint, this being illustrated in Fig. 5. Mark and saw out the groove shown in the sketch, making it a third the width of the material. Saw down and chisel out. It is necessary that the grain of the slip of wood employed for the tongue be at right angles to the grain of the frame material. Glue up, and when dry cut away that part of the tongue which comes outside the joint.

We now proceed with the upper part of the sideboard. The measurements and form of the top board are shown in the plan, Fig. 6. The material for this should be 1 in. thick. The top overhangs the sides and front by 1 in., and the edges in our diagram are left plain; but they may be moulded if desired. The sides measure 4 ft. 6 in., and are sub-tenoned into the top, the joint being made further secure by means of blocks of wood glued underneath as shown in the side elevation, Fig. 3, the lower shelf

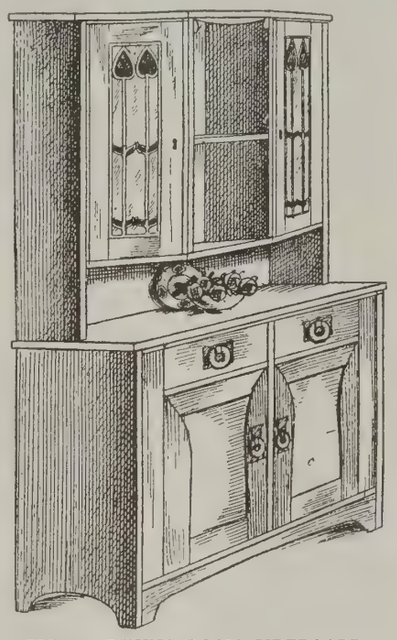


FIG. 1. DINING ROOM SIDEBOARD.

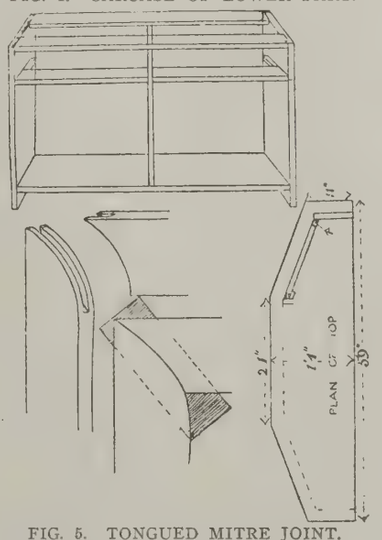
being fixed into the sides in the same manner, but with the exception of the blocks. The size of the lower shelf is indicated by the dotted line in Fig. 6.

The doors are hung on hardwood slips, one of which is shown by A in the plan, Fig. 6, and these need very careful planing to fit. Narrow slips are also glued in position for the doors to close against. The framing of these doors may be tenoned or dovetailed, two pieces 2 ft. 5½ in. by 4 in., and 2 ft. 1 in. by 4 in., including tenons, being required for making each. The back edges are rebated to receive the panel, which may be of leaded or plain glass,

FIG. 4. CARCASE OF LOWER PART.



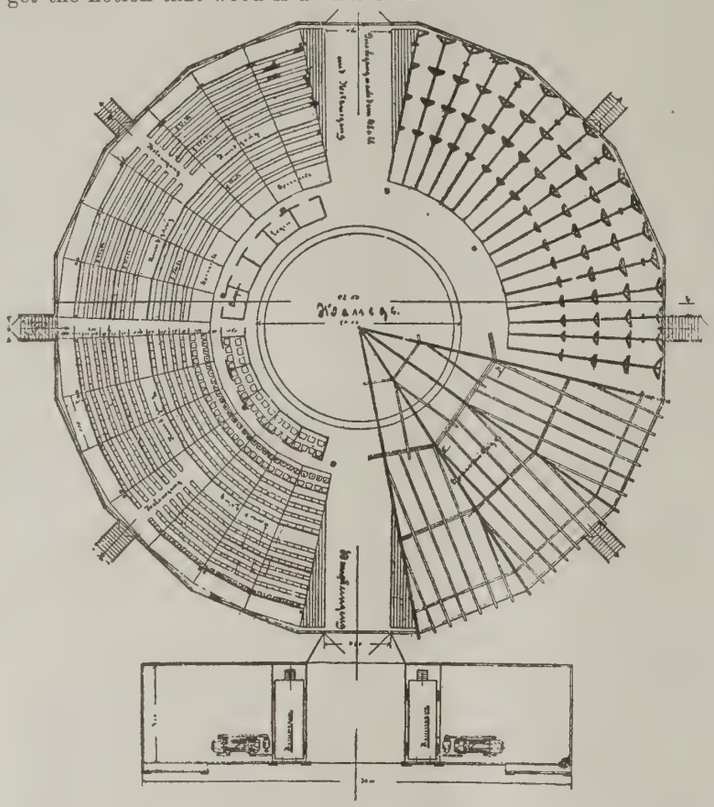


FIG. 5. TONGUED MITRE JOINT.

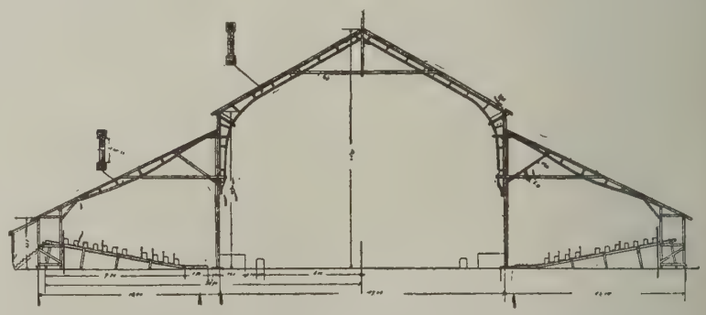
or wood—preferably the former, as it gives a pleasing ornamental appearance to the object.

The two separate parts of the article are kept in place by dowels, but not glued, the detachability being found a great convenience for moving. Before finally fixing together, the back edges of the whole carcase must be rebated to receive the back covering.—English Mechanic.

IMPORTANT CONSTRUCTION IN WOOD

FOR all that wood has been pushed to the rear by iron and steel, brick and cement, there comes forward at times an instance of the adaptability to construction, which is the more important, as these instances are on lines usually supposed to be monopolized by some one or other of the rival materials named. Considering the many districts where wood for building is still plentiful and where iron is not yet cheap, it may be well not to get the notion that wood is a "has been."



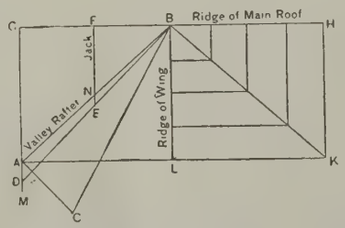
A very good example of the resurrection of wood as a building material is shown in the transportable building of the Sarrasani Circus (called Sarrasani because the name of the owner, Stosch, is not sufficiently romantic). It was built in Cassel very largely according to the ideas of Herr Stosch, and among its special features are that it must be transportable, firm, weather tight, capable of being steam-heated, and have a good appearance. The builder was Emil Herhardt. The entire circus takes up about 5,000 sq. meters, which, being transposed into our measures, means about 5,380 sq. ft. The exhibition tent is sixteen sided, with a diameter of 42 meters, or 138.3 ft., has a facade of 30x7 meters, or 98.4x27 ft., and has in connection with it five similar "tents," each of 22x10 meters (=72x32.8 ft.), for stabling, kitchens, dining-rooms, wardrobe, etc.

The construction of this building delights the eye of the previsional builder, and attracts also the layman. The sixteen-sided exhibition tent or auditorium consists of an eight-sided middle building with eight supporting pillars, having about 19 meters (=62.3 ft.) spans each, and at total height of 16 meters (=52.5 ft.). Each of these eight pillars is composed of four separate timbers, bolted together for the purpose of securing extra elasticity and also great firmness, as the four timbers interlock. Around this eight-sided building there is a sixteen-sided annex carried to a height at the outside of 3½ to 4 meters (= 11 ft. 3½ in. to 13 ft. 1½ in.), by a system of columns. The secondary members are constructed, with special regard to the necessity of frequent transportation, of light, air-dried spruce, without the use of glue—a glycerine and lime compound being used instead, this latter having been used in building for the last 1,000 years.

By this method of construction all warping and splitting is avoided. The roof is of cloth just as in the ordinary summer circus tent. But in order to keep the building as warm as possible, inside, there is within the outer weather and storm-proof covering, which is fastened to the timbering with leather straps and with ropes, a second inner roof below the timbering, so that there is between the two cloths an air chamber over the entire building. The side walls, which are in all other circus buildings made of sailcloth, are here of woodwork, in order to obtain an absolutely tight room, which may be easily made warm and kept warm; these side walls consist of a double layer of tongued and grooved boards with felt paper between them.

In order to facilitate rapid taking down and erecting, the sections of the wall are so arranged that they consist of light panels, each with tongued and grooved joints, and readily attached to the timber frame of the work by screws or hooks. This makes the wall stiff enough to enhance the rigidity of the uprights.

The seats, for about 4,000 people, are arranged very practically. There are four wooden frames so arranged that they resemble triangles and which may be laid inside each other and thus may be transported without taking up too much room. These frames are so constructed that they permit the attachment of cross-pieces, with notches above and below, and in these cross-beams there are inserted bench-legs, which fit the notches and thus bind the whole together. The bench legs have sinkings, in which the seats are inserted, and thus the whole forms a series arising in steps in the usual manner. Every bench leg will fit every cross-piece, so that in setting together there is no necessity of bringing specially-numbered pieces together, the result being that the seats can be put together in five hours. The cross-pieces are put on the supports, and all through the construction every piece will fit just as well on one side of the building or in the same row as anywhere else. No tools are necessary to put the whole together; the entire



seating capacity for 6,000 people, together with the flooring, takes up only one ten-ton wagon, which is an advantage only spruce could confer; iron would be much heavier.

It must not be imagined that safety from fire has been lost sight of. Entrance to the building is, under normal circumstances, through the main entrance, the gallery being reached through the two middle entrances. But in case of panic four further emergency exits can be opened; further, there is a wide exit towards the stables.

JOINING WING ROOF TO MAIN ROOF

The illustration shows a plan of construction in joining the roof of a wing to that of the main building. In the sketch G H represents the ridge of the main roof. B L represents the roof of the wing. B A and B K are the valleys. For the true length of the valley rafter from A, erect A C perpendicular to B A, making A C equal to the rise of the roof. Connect B and C. Then B C is the length of the valley rafter and the angle at C is the bevel of the same. Draw the line B D in length equal to B C, in such a manner that the point D, corresponding to C, shall fall in the line G M. Extend the jack-rafter F N until it meets the line B D

in the point E. Then E F is the length of the jack, and the angle at E is the top bevel of the same. The bevel will be the same as the main rafter.

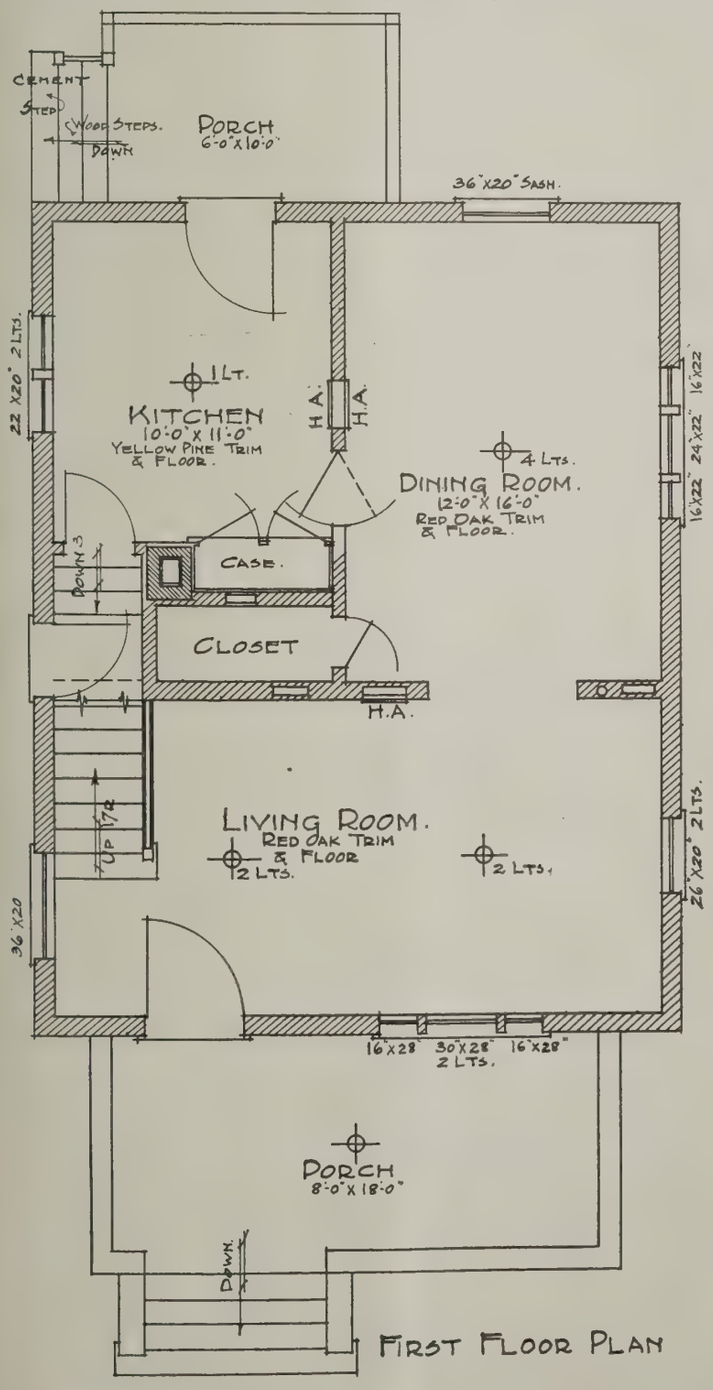
AN INEXPENSIVE COTTAGE

All over the land, but especially in the smaller cities and near manufacturing plants, there is a constant demand for the small inexpensive cottage, suitable for the mechanic or clerk ambitious to own his own home with a little plot of ground.

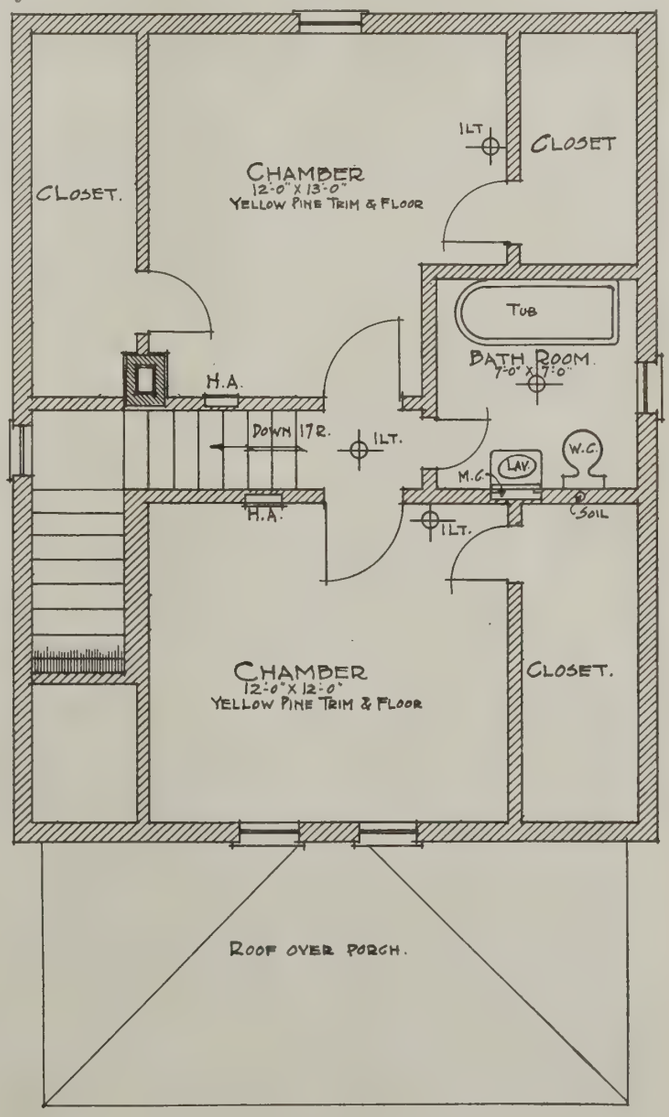
Such a house, having all the comforts of the more elaborate buildings, can be built for less than two thousand dollars. The illustrations show the floor plans and photograph of the completed house as designed and built by W. L. De Long at Waterloo, Iowa. It will be seen that there is no waste room on either floor. The space for closets on the second floor is about five feet high at the door and slopes down to about three feet at the outside wall, making considerable storage space without resorting to the third floor or attic.

Being rectangular on the ground, there is no extra expense for internal angles or bay windows, and still the building is excellently planned. It will be noted that by the arrangement of the stairs from the kitchen to the basement going down three steps to a landing opening to the outside, the awkward and inconvenient "outside cellarway" is entirely avoided and access to the basement is as easy in winter as in summer.

It is to be noted that the living room and dining room are finished in red oak, which makes a particularly durable finish and



H. F. DeLong, Builder. Waterloo, Iowa.



lends itself to a great variety of color schemes. In fact, with the possible exception of birch, no wood is so popular on this account.

A great many houses of this character have been erected through the building and loan associations throughout the country. As generally conducted, this means a payment of $20.00 or less a month for about ten years, which is practically what one would pay for rent for a house of this character.

Owning their own homes greatly increases the standing and credit of the owner, and in times of adversity he has far more sympathy and support than those who are free to come and go as they wish.

FIRST FLOOR PLAN

SECOND FLOOR PLAN.

A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.

PLATE XXIV. LEFT SIDE ELEVATION.

IT is an easy matter for the student to finish this elevation since he has completed the others. Notice that the right and left side elevations face the opposite ways on the paper. The front elevation should still be used to project the dimensions over.

PLATE XXV. REAR ELEVATION.

This elevation presents no new problems, but it illustrates a method often used, of breaking a railing to show some part of the main building, in this case the rear door.

This plate finishes up the plans and elevations of a building. They are always accompanied by details, which we will take up with Plate XXVI.

Never use a scale for a ruler.

Draw all horizontal lines with the T-square and all vertical lines with the triangles, then they will be at right angles to each other.

Do not fill the pen too full of ink. The pen of medium size should carry about ¼ inch.

A careful draftsman leaves his drawing in such condition that anyone could easily proceed with the work where he left off.

Pencils should be sharp and lines light. The draftsman should not bear down on his pencil so as to leave a ridge in the paper.

Care should be taken with dimensioning. Never use a slanting line for a fraction or it may be misunderstood. For example 1 and 5/16 may be taken for 15/16.

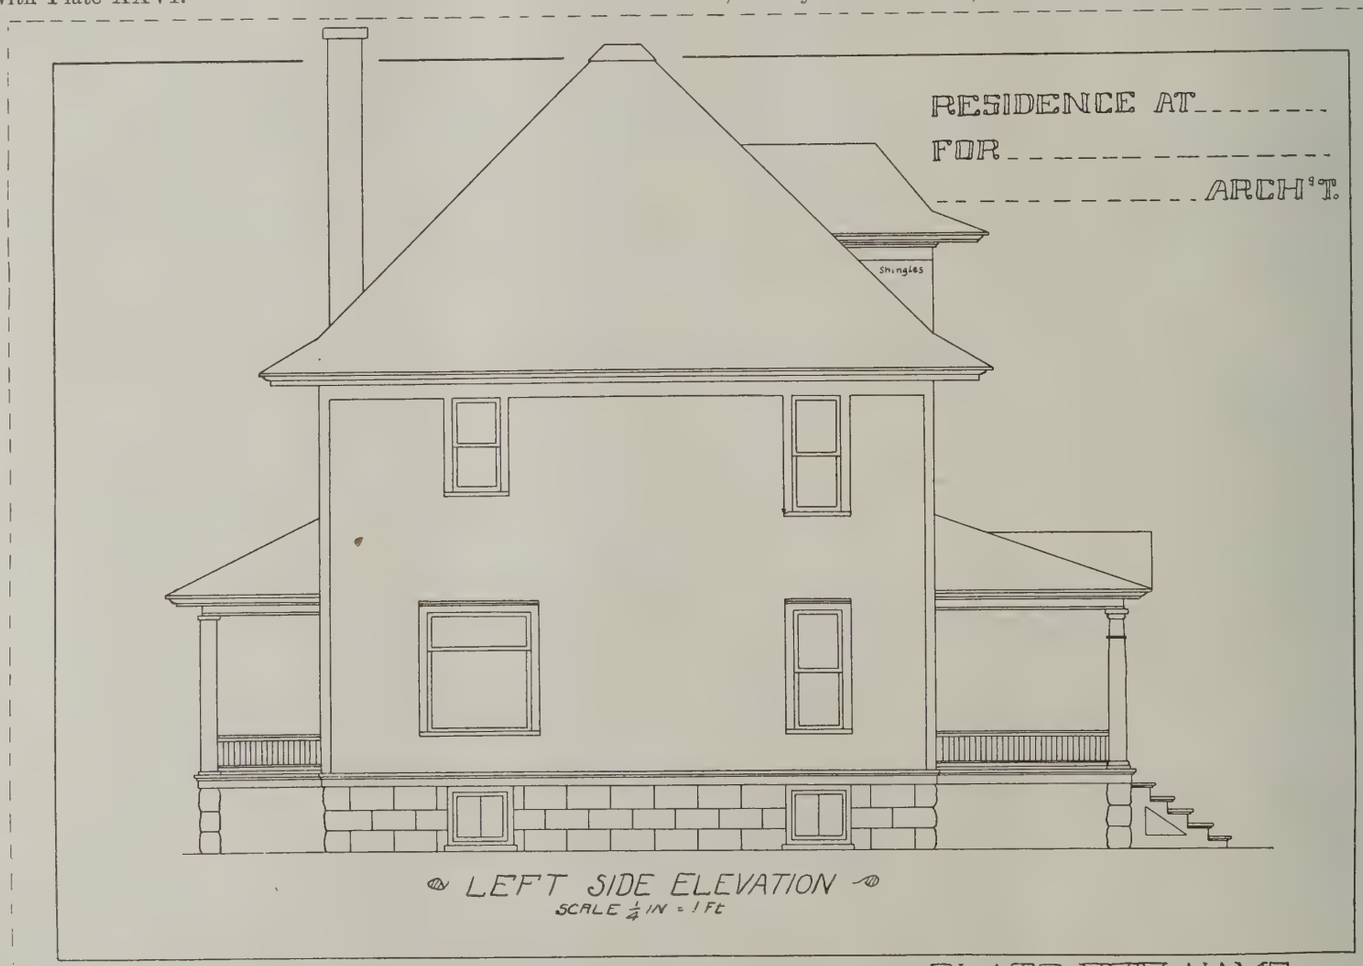


PLATE XXIV. NAME.

DRAFTING KINKS.

It has occurred to the writer that it would be useful for the young draftsman to know a few of the things that are in the daily practice of professional draftsmen, time-savers and money-savers that they have heard of or worked out for themselves. A few of these things have been mentioned before, but they are now repeated to emphasize their practical worth.

Do not run inked lines past their destination, though it is a good plan to do this in penciling.

If a short inked line is to be taken from a drawing and it is not to be gone over again with ink, a sharp knife blade is the best instrument to use. But if it is to be inked over it should be erased and re-glazed with soapstone or by rubbing a blunt instrument of ivory or celluloid over the spot.

Thumbtacks should not be withdrawn with the fingers. Use a knife.

Pens should not be filled over a drawing.

Ink should never be left in pens, as it corrodes them.

Horizontal lines should be inked from the left to the right. Vertical from the bottom up.

Dimensions should be pricked off from the scale with the dividers. Very fine depressions are all that are needed.

Circles and curves should be inked in first, before straight lines. First ink the smallest and afterward the largest circles or arcs.

The erasers should be kept clean. This can be accomplished by rubbing them over fine sandpaper where they have become soiled.

After filling the ruling pen nearly close the nibs and try the line on a piece of waste paper.

Blue prints that are wrinkled after drying may be flattened by rubbing them with a hot iron.

To indicate the position of a center that is to be used again, lightly pencil a circle around it; never enlarge the hole.

If a mistake has been made in scaling, do not attempt to cover it by putting in the right dimension, but erase it and do it right the next time.

The needle points of the compasses should be a little longer than the pen or pencil points.

Never ink in a portion of a drawing until it is entirely penciled.

Never trace a set of working drawings until the last one is finished, as they may need revising as the work proceeds.

Some draftsmen make their original drawing on tough tracing paper, ink it in, and thus save a little on the cost of tracing cloth. This practice is not to be recommended.

The draftsman should keep all of the original data given him on a job, so that if an argument occurs, the blame may be put upon whom it belongs.

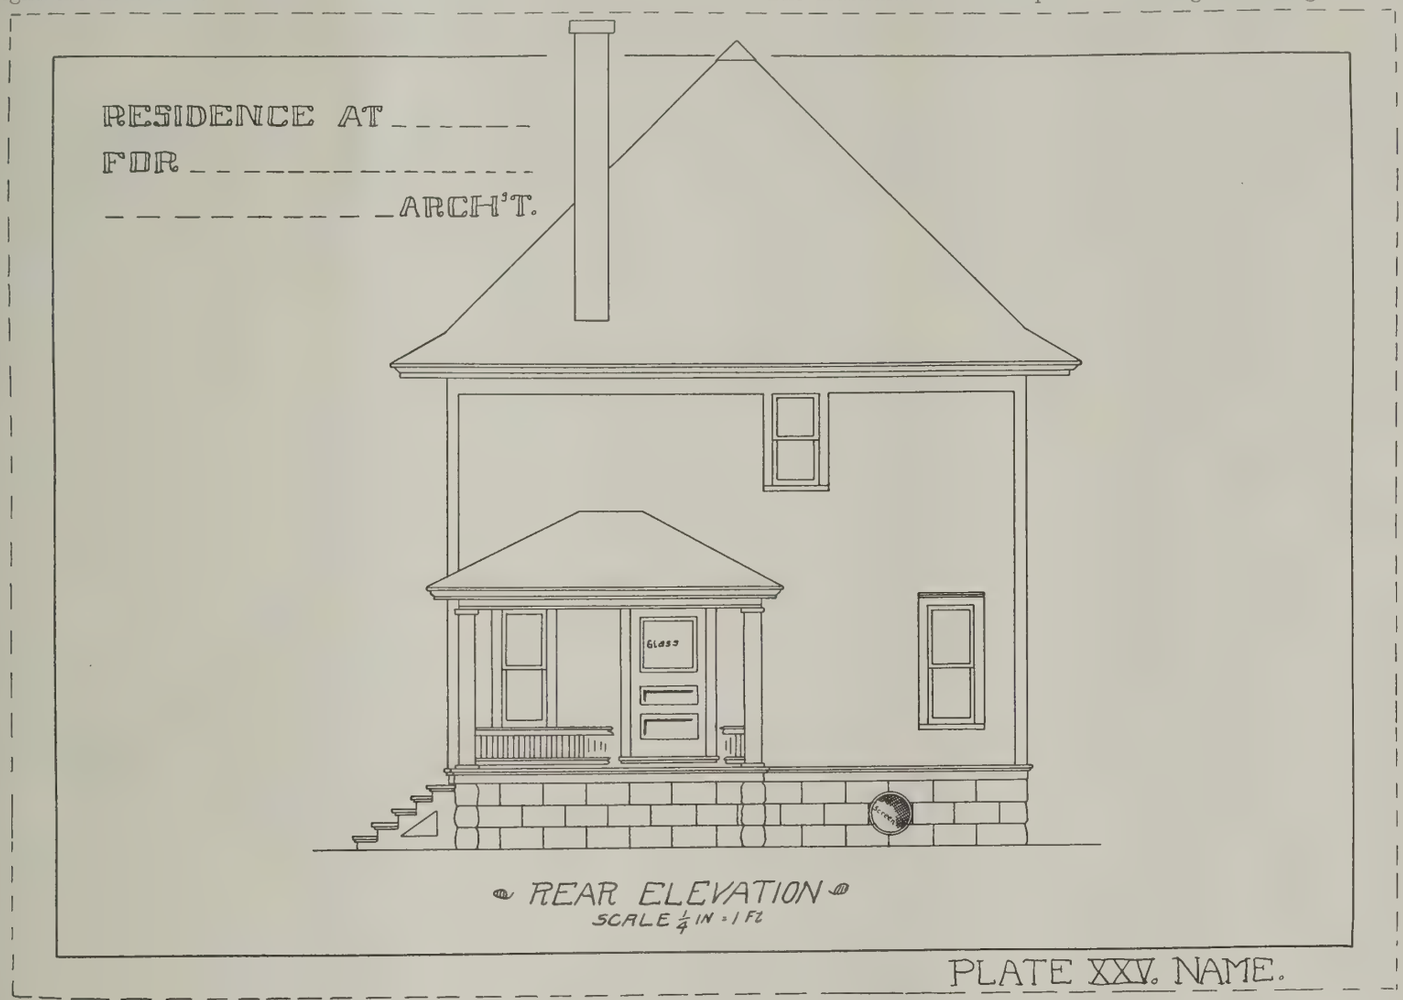

PLATE XXV. NAME.

Avoid fingering the drawing sheet as much as possible; in pointing to any part use the pencil and not the finger.

Never use the upper edge of the T-square as a cutting edge, as a slight nick will cause inaccurate work as long as it is used thereafter.

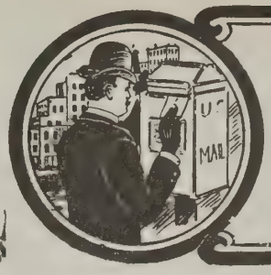
Great care should be taken to keep the drawing boards away from heat and damp, as these will cause the wood to warp and they are liable to open the glue joints.

Section lines should be inked in last and it is not necessary that they be penciled in before hand.

A substitute for a printing frame may be found by using a thick pad placed upon a flat surface upon which is placed the tracing and the printing paper. Good contact is secured by means of a piece of plate glass, which, being heavy, forces the tracing and the paper firmly between it and the pad.

Keep your instruments clean and sharp. Sharpen your ruling pens on a fine knife stone when they become dull.

(To be continued.)



A FLOORING NAILER NEEDED

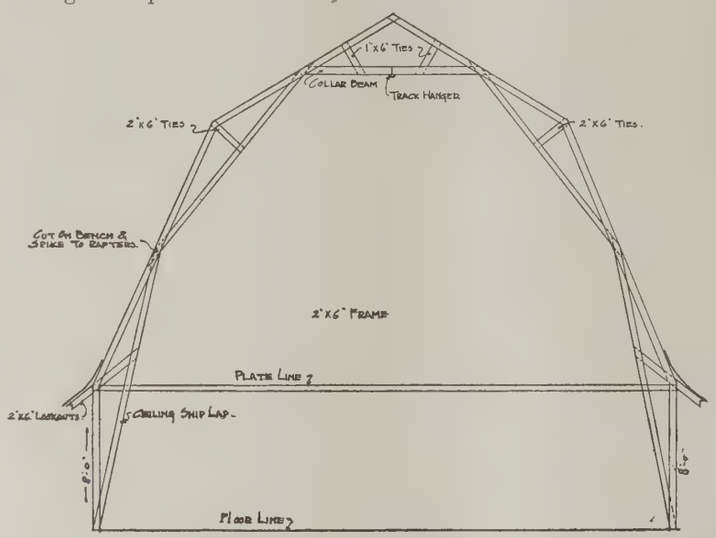
By J. CROW TAYLOR

We have nailing machines for making boxes and doing cleating and quite a wide range of shop and factory nailing and also some special machines for driving shingle nails, but a thing that seems to be needed now is a floor nailing machine, a machine with which one can nail hardwood flooring, using a finish or casing nail. This complicates the problem of making a nailing machine, because the majority of nailing machines separate the nails and handle them by the head and it would take pretty close manipulation to handle finish nails or casing nails in this way. On the other hand, the nail with a head on it is not good for blind nailing in hardwood flooring.

One strong reason for the need of just such an invention is in the fact that one of the greatest impediments to the progress of hardwood flooring is the tedium of nailing it. We are getting to the point where in some sections of the country oak flooring in common stock and thick strips can be had for the same price as pine. It makes such an infinitely better flooring, both in the appearance and durability that where the favors are even it should always have the preference. That it has not already made much more progress is due to the fact that it is difficult and tedious to nail it. Hard dry oak is pretty hard stuff to drive a nail through and the nails have to be driven home with a set and as a consequence the average carpenter doesn't like the job.

It is time to come to it though and really the carpenter shouldn't be fighting shy of it, because it means more work for him. Yet, there is no gainsaying the fact that the carpenters stand in the way of progress of common stock in hardwood flooring and the thing it will take to get him out of the way is the invention of some machine or appliance for nailing hardwood flooring that will render this work easy, light, and rapid. That is one of the things the trade needs badly right now, is a floor nailing machine.

OUR READERS' PAGES



[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. These columns are open to our readers at all times without cnarge, and any questions or experiences will be given proper space.—Editor.]

CURB ROOF.

From "R. E. P.," Ellsworth, Kans.

Here is a style gambrel roof that has given more than satisfaction. You will find less timber and as I consider more of, and a better brace from the fact of going below the plate line for a seat and each brace meeting the main rafter in or near center, making a complete set of braces from one side to the other. Furthermore, the tie or collar beam serves as tie, also for hanging track to. The feature of this is the taking weight from plate line. Ceil brace rafter from side wall to first rafter. Shiplap makes good material for same. The cornice is open, using flooring from lookout to 18 inches above plate line and end cornice same. Cut all brace rafters on bevel and spike to main rafters.

Hope this will meet with the approval of your correspondent or any one wishing a gambrel roof that will not spread the frame of building.

CEMENT FLOORS IN DWELLING HOMES.

From "Witts," Philadelphia, Pa.:

W. H. C., Des Moines, Iowa, can make first class cement floors by using expanded metal as a reinforcing medium on which to lay his cement. Joists may be placed three or four feet apart, then boarded over with rough stuff, or lined with corrugated metal and the expanded metal lathing laid on this with joints on joists, then cement with good stuff made of one part cement and two parts clean white sand. This can be polished as smooth as glass.

ESTIMATING FLOORING.

From Carpenter, Chicago.

I offer the following in answer to question as to the amount of flooring it requires to cover 100 square feet of surface of the various widths. It must be remembered that there is just as much loss in matching on a narrow board as a wide one; therefore, where the loss is 30% on flooring 1¾-inch face, below is given the amount of D. & M stuff required, to cover a space of 100 square feet; under 1 inch thick is figured as inch thick:

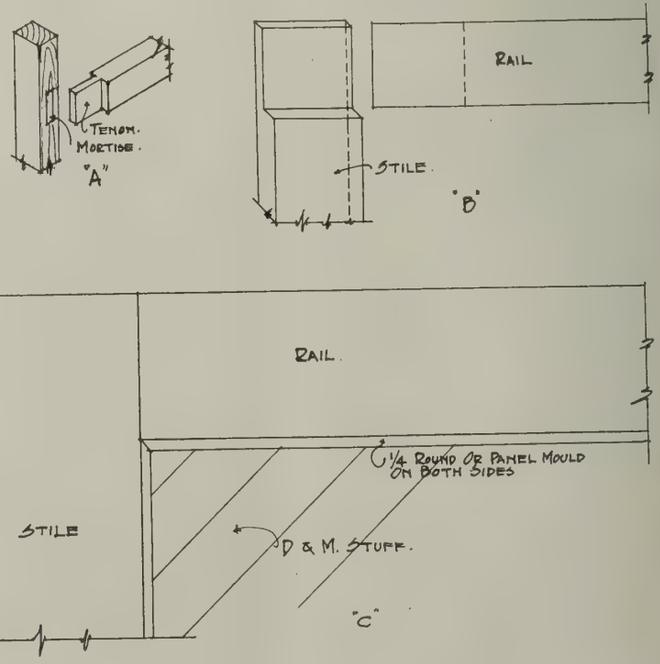
Face width.	1 in. and under.	1¼ in.	1½ in.
1¾ inch	143 ft. B. M.	179 ft. B. M.	215 ft. B. M.
2 inch	137½ ft. B. M.	172 ft. B. M.	206 ft. B. M.
2¼ inch	133 ft. B. M.	167 ft. B. M	200 ft. B. M.
2½ inch	130 ft. B. M.	162 ft. B. M.	195 ft. B. M.
3¼ inch	124 ft. B. M.	155 ft. B. M.	186 ft. B. M.
5½ inch	114 ft. B. M.	143 ft. B. M.	171 ft. B. M.

Note—5% to 10% should be added for waste, according to conditions.

HINGING DOORS.

From "Worker," Rochester, N. Y.:

In reply to the query of "Frank C. N.," Ponoka, Canada, it is safe to say there is no stringent rule on the matter as so much depends on the doors, the positions in which they are hung and the kind of hinges used. The top hinge is nearly always placed its whole length below the top-rail of the door, and the lower hinge is generally placed an inch or two above the bottom rail. This gives the screws a solid setting in the stile. If a third hinge is used, as in heavy outside doors, it may be placed to advantage about six inches below the center of length of door. The way I lay out my Eyebrow windows is about as follows: I cover the whole roof with roofing boards, than lay out the window on the boards, in such curve as may be decided upon, and cover and shingle this over in the usual way. The frame and sash are set up first of all, and give the lines for a final finish. After this is done, the back of the window is cut out, rafters and all, if so desired. It is a very simple method, and after the first job of the kind the workman will find the whole process as easy as "falling off a log."

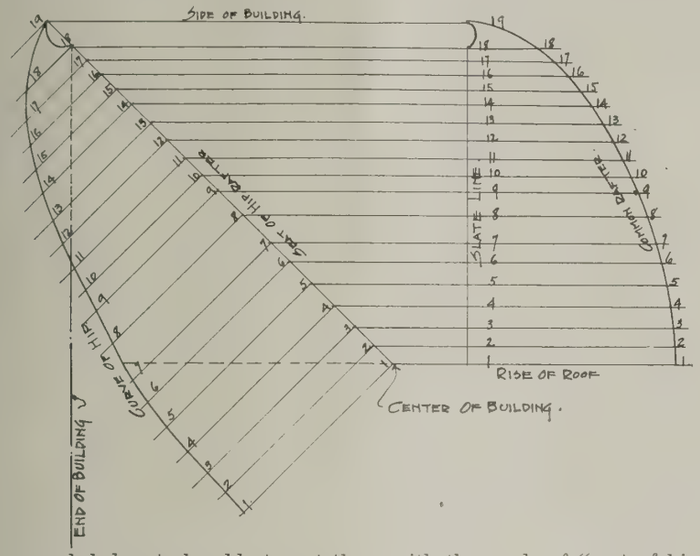


MORTISE AND TENON JOISTS.

From Contractor, Chicago.

To answer this question would require quite a good sized volume. I would suggest that the reader get a copy of Hodgsons' Light and Heavy Timber Framing.

I will, however, try to offer one or two hints. The proportion of a mortise and tenon should be from 1/3 to 2/5 the thickness of the material used, illustration (A) shows a mortise and tenon to 1/3 proportions.



With reference to the large barn doors, the writer makes a frame of 2½ inches thick stuff, the stiles about 5½ inches wide, bottom rail 10 inches to 12 inches wide, center rail about 8 inches wide, top rail same as stiles; this can be either mortised and tenoned together as at (A) or halved together as at (B) with the D. & M. panels stuck in with a ¼ rd. or suitable panel mould on both sides as shown at (C). I trust this may be of some service to my brother reader.

CURVED HIP RAFTER.

From J. Wm. H., Niagara Falls, N. Y.

Having been an interested reader for some time, I have been waiting to see an answer to C. J. H.'s inquiry, as to how to proceed to lay out a hip rafter for plan. Now as the brother does not say, I take it for granted he is referring to a square or right angled building. At any rate, the principle will apply to any angle as long as the proper angle of the seat of hip is given. First, lay out common rafter, whatever curve it may be, then draw parallel with the rise of rafter lines dividing same into any number of spaces, the more, the more exact will be the result. Extend far

enough below to be able to cut them with the angle of "seat of hip and side of building," then with dividers take each one separately and transfer height of same from where the line cuts the angle of hip line, and at right angles to it, erect a corresponding line to the original height (see cut), trace through these points and trouble is over.

I hope that the brother will be able to grasp the principle, for it will help him in a great many cases, but if more extensive explanations are needed I will gladly and cheerfully give them, if he will let me know through these columns.

This is not the exact curve the brother gives, but just an example of how to lay it out. I think it is plain enough.

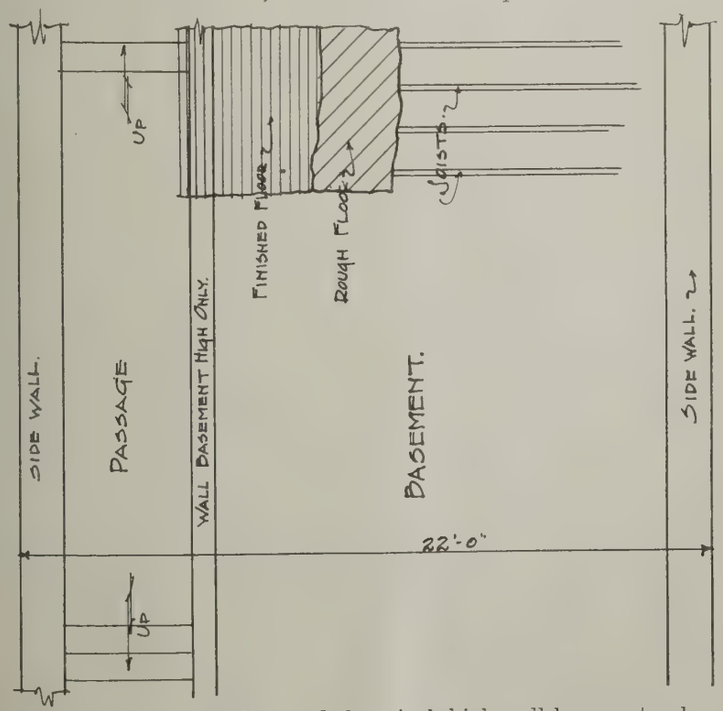
DUTCH CURB ROOF.

From "H. F. G.," Grabill, Ind.

In regard to the question of A. O. R. of Eastwood, Minn. I have never built a barn like this but I have seen several. There is one in our town and I saw one in Beaverton, Mich. It did not have the brace from the studding to the rafter, but that will better it.

You can tell the boy who asked about hand saws that I have Disston's, Bishop's, McIntosh's and Atkins', and am well satisfied. Be your own chooser and your own loser or gainer. Make them guarantee them.

HOME MADE REFRIGERATOR.



From Old Hand, St. Louis.—If E. G. M. has more time than he knows what to do with and can get his ice cheap in the summer, it is all right for him to make a home-made refrigerator. If he were asking how to build an icehouse to hold the summer's supply, we might help him out, but for a small family refrigerator, he doesn't say about how large, it will be a whole lot cheaper and better to buy from the well known manufacturers of those goods. They have been at the business for years and have the materials, and know how. However, I don't want to discourage him. If he will dig up his May number of THE NATIONAL BUILDER, he will find how to build the walls of his refrigerator, and he is probably ingenious enough to make the doors so there is no chance for the air to leak out when the door is closed. A small box should be lined with galvanized iron to keep the wood dry, and provision must be made for the water to run off. This must be in the form of a trap, so that air won't run out at the same time. Remember to keep in cold air, the box must be as tight as to hold water. Use plenty of the paper made for refrigerators, and if you can't get cork boards, that is cork shavings pressed into sheets, use dry sawdust and tamp it in well.

I think the best shape for a home-made box is like a chest, for then the cold air stays in—it is heavier than warm air, and not so much ice is melted when the box is opened.

QUESTIONS

From Reader, Chicago.

Being a reader of your paper, I desire to ask through its columns for some advice, the sketch shows the position of the two

outside walls of a building and the 8-inch high wall basement only forming the side of side passageway, which goes down four steps to the basement floor level.

My trouble is, the floors above this 8-inch wall are raised about 1 inch above the level at the outside walls. There is a common floor stripped with 1x2 inch strips and then a 7/8-inch hardwood floor on them.

What I would like to know is what is the cause? And how it can be remedied? The building is about six years old and shows no sign of cracks in the walls anywhere. I shall feel grateful for some expert's opinion on it.

From D. H. B., Alice, Texas:

I wish to make a wooden cistern 10 feet in diameter and 8 feet high. I am going to use five hoops, which I think will be enough. I want to know all points about it—how to obtain the bevel for the staves; how to obtain the length of the hoops; also in ripping the staves I wish to know how much to take off, so that when put up it will taper as usual. Kindly give me all the information necessary to build a wooden cistern.

From Nixon, Quincy, Ill.:

What are the proper dimensions for a concrete mixing box and how is it made and used?

HIP AND VALLEY RAFTERS.

From N. W. I., Coatsville, Pa.:

How will I proceed to get the bevels at foot of valley rafter for a roof having a front gable? Also how will I get the depth of valley rafter at seat, so that the front gable rafters will strike the center of the valley rafter?

From C. F. K., Cincinnati, Ohio.

I want to build a press brick mantel in the corner of a room. Would like very much if some one would give me a suitable design with plan and details, or tell me where I can get an assortment of designs. Any information will be greatly appreciated.

Please publish the above in the next issue of THE NATIONAL BUILDER.

GILDING ON MARBLE.

From A. L. C., Smith Falls, Ont., Can.

I would like to know through the columns of THE NATIONAL BUILDER the best materials to use to letter with gold on marble.

TILES AND TILING.

From "Country Plasterer," Quacknic, N. J.:

I wish some one who knows would tell in these columns how to lay floor tiles, and how to hang them on bath room walls, and for facing chimney breasts for mantels and other work. I have had several little jobs of tiling to do this last summer, and could not get a man to do the work properly, so had to send to Newark for an expert and this ate up all the profits on the work, and more too. I take it that many small towns and villages all over the country are situated as we are here, and when a job of tiling has to be done, a man from the nearest ctiy must be sent for to do the work. It also happens often that builders will persuade the owners of buildings not to use tiles because of the extra cost, which is always magnified by the contractor, in order to discourage their use. I have discouraged owners more than once because of the reasons I have mentioned. If a better knowledge of the methods of laying and hanging tiles was more diffused among workmen, I am sure the use of these beautiful productions would soon be doubled, and many of our cheaper buildings would be made much prettier and more artistic in their interiors.

A GRANDFATHER'S CLOCK.

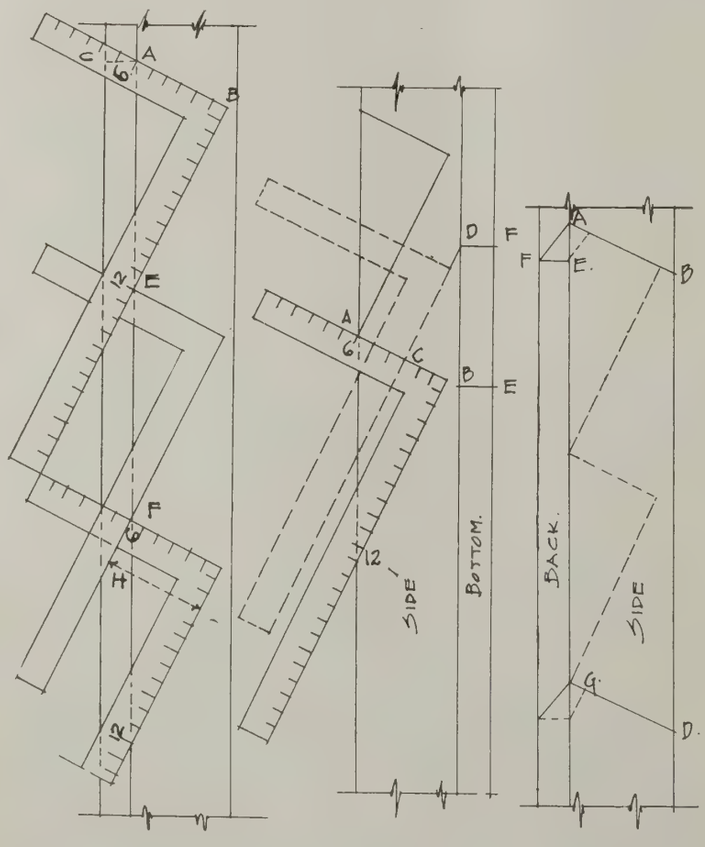
From "A Learner," Erie, Pa.:

I am going to try my hand at making a case for a clock, that will be a veritable grandfather's clock, when completed. I have an old clock that has hung on the wall of my father's house ever since I can remember. It is an excellent time keeper, and on its face is engraved: "1764, Dublin," Thatcher, maker; and the face is somewhat quaint, is of metal, and seems to have been plated over at some time or another. The face is about ten inches wide and a little more in length. There is a pendulum, weights and chains, and it will run nine or ten days after once being wound up. What I want to make is a simple plain case, something similar to mission furniture, only I want it made of oak and finished in the natural wood. I hope some of my fellow readers will help me out, as I intend making the case this winter is possible. I have made quite a number of pieces of furniture and other useful articles, designs of which I have taken from the good old NATIONAL BUILDER, to which I have been a subscriber for more than eighteen years.

STAIRS AND BRICKS.

From "Contractor," Green Bay, Wis.:

I submit two questions to which I would like answers from a number of my fellow readers, viz.: Is it necessary that bricks be made wet before laying in a wall, when the temperature is near the freezing point? Is a six inch rise and a twelve inch tread the best proportion for an easy going stair step?



SOME RAFTER PROBLEMS—By JAMES BARRY

LAYING OUT COMMON RAFTER.

Place square on stick at AB, as shown in sketch No. 1, 6-inch and 12-inch, the pitch of roof being 6-inch rise to 12-inch run.

Cut to CAB. To get the length of the rafter, place the steel square diagonally on the rafter with 6 inches on the tongue and 12 inches on the stock as shown, A to E, and then move it along top edge of the rafter as many times as there are feet in half the width of roof as shown at AEF.

Move square along diagonal at 6-inch and 12-inch top corner

of stick. If there should be a fractional part of a foot, such as 3 inches, in one-half the width, place square the same as before and set off the distance required on the blade. Mark as before down the bevel HG. Don't forget to allow for ridge pole, one-half the width of which can be taken from amount of the half shown, or taken off at G when laying out the rafter.

LAYING OUT THE SEAT OF COMMON RAFTER.

Set off from top of stick on down bevel the height top of rafter stands above plate, from A to C. Move square along on (3 inches in this case) side of stick until the edge of tongue comes to C, as shown by dotted lines. Mark along the blade of square the seat of rafter GD. (See Fig. 2.)

Now square across bottom of rafter from B to E and from D to F and your troubles are all over. Now cut to EBC, which is your cut for outside of plate. FDC is your level cut for top of plate. The projecting ends can be cut to length after being placed.

LAYING OUT JACK RAFTERS.

The bottom end of jacks are laid out same as common rafter, as shown in Fig. 2. The down bevel is also the same as shown at AB. (Fig. 2.)

In order to mark side bevel, find exact thickness of stick and set off distance on side.

Now square across back at EF, and mark diagonal AF, which is the correct bevel to fit against side of hip.

Cut to FAB. Select straight stuff for pattern.

With accurate pattern made and cut fit jacks in pairs and mark on both sides of stick.

BEVELS

The subject of splayed work, says C. Cloukey, in the *Wood-Worker*, as occurring in the construction of pedestals, hoppers, bins, tanks, etc., is one of much interest and usefulness to the mill man, who often has such work to lay out. Nearly every treatise on carpentry and joining has the subject well illustrated, and the figures given here are not all new ones; in fact, being so old as to have lost their origin. However, it is but seldom that the directions and descriptions are sufficiently lucid and explicit to enable the novice to get certain results from the book. For instance, he may work out the drawing and get the bevels right, but be uncertain whether to apply the marks on the face or on the edge. If on the face, the description of the figure does not tell him that he must apply it on both sides of the piece and saw to both marks, and does not tell him how to get the starting points on the other side.

It is evident that if the outside dimensions of the hopper are given, it will be possible to lay off the face cuts for the outside without making a drawing at all, except to get the width of the side of the hopper, as in Fig. 194. We will take for example, a hopper 2 feet deep, 4 feet square at top, and 2 feet square at bottom, the splay or slant of which would be 1 foot. We will assume a thickness of 1¾ inches for convenience, which will give say, 2 inches across the bevel, making a difference of 4 inches in outside and inside dimensions of hopper, and have top and bottom edges beveled to horizontals and the corners joined by a butt joint. The bevels for edges may be taken from Fig. 194, and if so desired, the whole layout may be made on the square-edge piece, as set forth in Fig. 195, which shows a transparency of a board from which one side

of the hopper is to be cut. It is shown somewhat in the perspective, in order to better illustrate the horizontal bevels *a a*, which should be laid off on the ends of the piece from the angle obtained from Fig. 194, and gauge the lines *e b* to mark the limit of the bevels.

If the outside dimensions are given square a line across the middle of the outside, as shown at *c d*, always keeping in mind that in this figure the inside of the board is next to the eye. This line should be squared clear around the board as it will be needed on both sides. Now, from the center line each way lay off 10

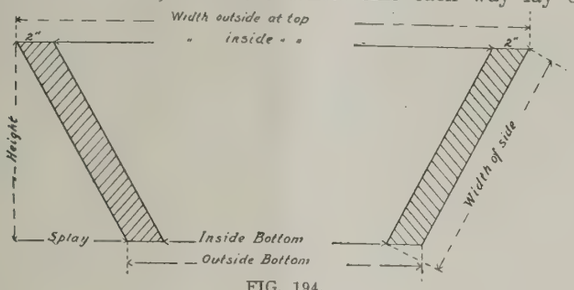


FIG. 194.

inches on the line *b* and 1 foot 10 inches on the line *f*, and when the points opposite, above and below, are connected by straight lines, you have the layout for the outside of the hopper. Repeat the above measurements on the inside of the board, and you will be surprised to find the inside wider than the outside; but this is correct and necessary, as a glance at the Fig. 194 will show that the sides of the hopper splay evenly, and it therefore follows that as the side of the hopper in question tilts back or outward, the outside must be cut away from the square sufficiently to allow the side to fall into place. When the outside measurement is given, we cut the inside wider, but when the inside dimensions are given, we cut the outside narrower.

The lines for the face cuts should be extended to the edges of the board, so as to give connection with the lines on the opposite side of the board, as shown at *i*, Fig. 195, and in case the top edge

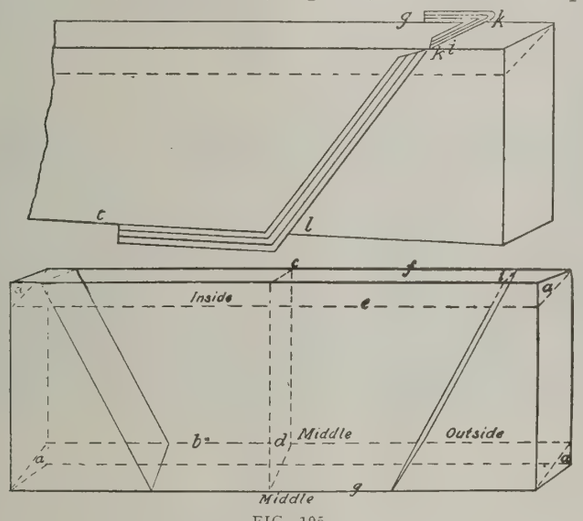

FIG. 195.

is left square with the side, it will give the proper angle across the edge.

Of course, the workman will understand that for a butt joint only two sides of the hopper need be worked as described, the two remaining sides simply being nailed or joined to the two already prepared and the waste ends sawed off flush; or in case the butt end is gained into the adjacent side, more or less should be left on the piece for a chime, as it always does in the case of tanks.

Figure 196 shows a graphical method of finding the bevel for a hopper having a miterd corner. It will be noticed that the section shown at *x* is similar to those in Fig. 194 and shows the splay of the sides. To proceed with the drawing, lay off the line *ab*, and from this erect the section *x*, representing a side of the hopper just as it would stand when fastened into the finished work. Now drop the three perpendiculars from *cd* and *m*, then draw the horizontals on *pz* and *l*. It is now plain that we have a picture of one corner of the hopper, looking down from above, and that the next line drawn from *l* to *n* represents the miter cuts when the sides are together, but cannot be taken off on the bevel square from the paper, as the line *ln* shows a compound slant. To obtain the angle to put on the square, extend the line *pz* to *k* and from *k* draw a line to *l*. The angle formed by the lines *kl* and *kg* is the proper set for the square, or it may be set on the angle *tlk* if preferred, and the board laid off from the bottom edge.

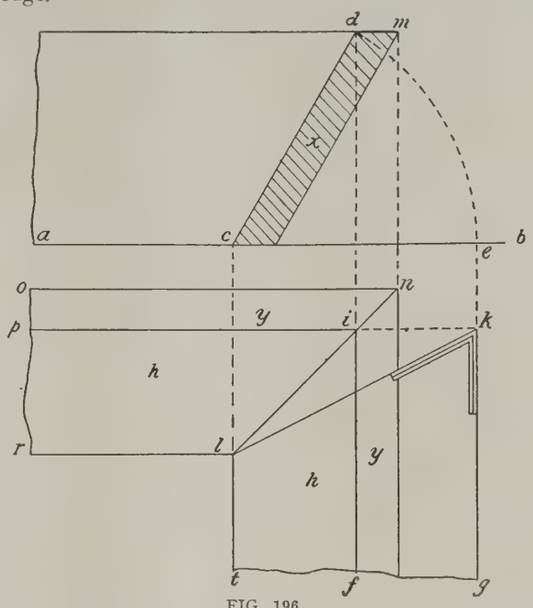

FIG. 196.

Now, whether the dimensions are given for the outside or for the inside, begin at the middle of the side, as directed in the previous example, measure out half the distance required, and from these points lay off the face marks. The workman should understand that in case the example calls for a hopper 6 feet square at the outside of the top, 2 feet deep, it will not be necessary for him to figure out how large the hopper would be at the bottom, for he will have the slant of the sides on his bevel square from the angle obtained, like that at *lkg* in Fig. 196. The method of applying the bevels is shown in Fig. 197.

If the piece is beveled off to the level on top before laying off the face cut, the workman may get his dimension marks on the edge of the top, outside or inside as the case may be, and from these points lay off the regular 45 degree miter cuts on the level edge of the board. The mechanic will understand that the surfaces represented by *yy*, Fig. 196, are the same as the top of a regular square box, and as they are horizontal or level surfaces, the miter will be regular across the corners; but if he would lay the miters cut before the tops are beveled, he must use the angle *lkg*, Fig. 196. If he lays out the corners with

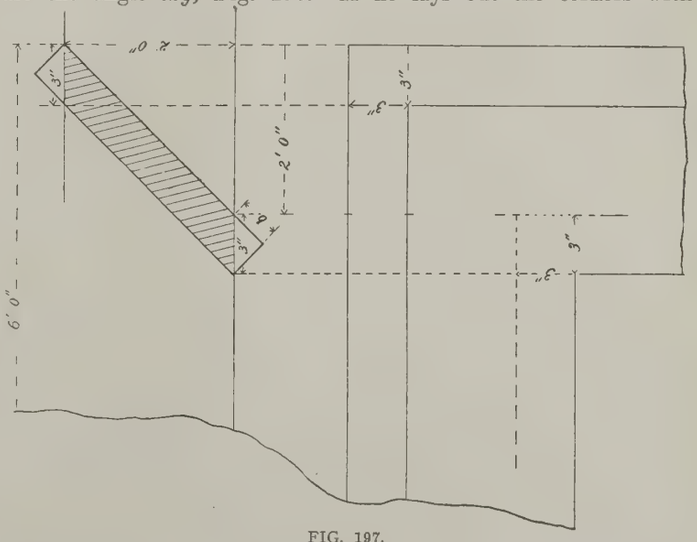

FIG. 197.

the miter square, he may then make all his face marks with the bevel square set at the angles shown in Fig. 196.

In Fig. 198 is shown a method of laying out a splayed hopper with mitered corners, wherein no diagram is made to find the miters for the corners, but the simple plan shown which is similar to Fig. 196, and is designed to show the width of the side, the bevel of the top and bottom edges, and also how much larger the hopper is outside than inside.

OUTDOOR STORAGE CELLARS

ON every farm in any locality there is need of a good outside cellar. In cold climates they afford the best and cheapest winter storage for fruit, vegetables and bees. They are just as valuable in summer for keeping berries, milk and butter. In the southwest such cellars offer the only means of safety during cyclones. Because they can do all the work themselves, farmers everywhere are building their cellars of concrete.

BUILDING THE WALLS AND FLOOR.

The most popular size for the average farm is a cellar 10 by 14 feet, inside measurements, with a self-supporting arched roof 5 feet above the floor at the sides and 7 feet 8 inches in the center. All of the side walls are 8 inches thick, therefore dig the hole 11 feet 4 inches by 15 feet 4 inches and to the depth desired, usually 5 feet. At one end cut out the earth to a width of 4 feet 4 inches and slope it upward for seven concrete steps with a rise of 8 inches

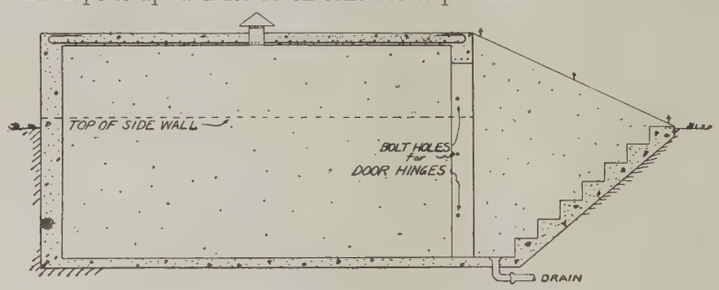

FIG. 1. LONGITUDINAL SECTION.

and a tread of 10 inches and for a thickness of 4 inches of concrete back of the steps proper. Arrange for an 18-inch landing at the bottom of the stair.

Make the side-wall forms of 1-inch siding on 2 by 4-inch uprights spaced 2 feet. As the concrete floor will be 4 inches thick, set up the forms on 4-inch concrete bricks. Above ground level use outside forms similar to the inside. To curve the end wall forms, lay them out with a 6-foot string in the same way as described below for arch rings. At the entrance end, to provide for a doorway, set between the forms a frame of 2 by 8-inch stuff 3 by 7 feet in the clear. Mix the concrete 1 part Portland cement to 4 parts bank-run gravel, or 1 part cement to 2 parts sand to 4 parts crushed rock. A sack of cement equals 1 cubic foot. With

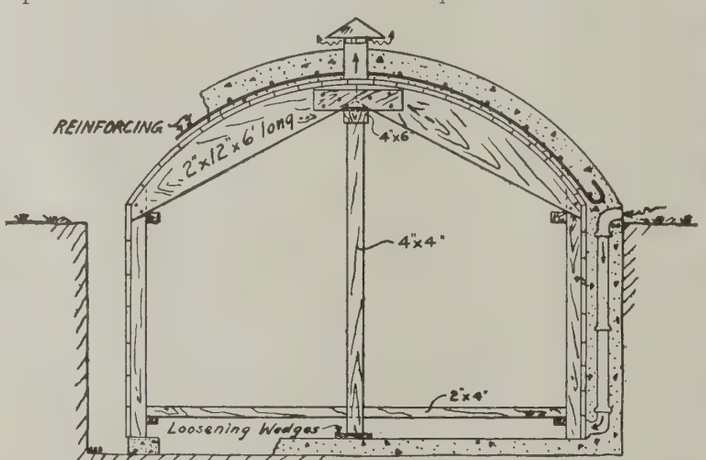

FIG. 2. CROSS SECTION.

the forms in place, lay the 4-inch floor the same as a sidewalk, but without joints. Fill the wall forms in 8-inch layers with mushy wet concrete, and 6 inches from the top of the side walls and 1 inch from the outside, place two ⅜-inch steel rods the full length of the cellar. In the concrete two inches above the door frame, lay three four-foot lengths of ⅜-inch rods. Roughen the top of the walls so as to insure a good bond with the roof. Build the stairway with a 4-inch thickness of concrete behind the steps proper. Each step has a tread of 10 inches and a rise of 8 inches. The side walls of the cellar hatchway extend above the door opening of the cellar proper, so that outside sloping doors may be added. In the top of the hatchway walls, while the concrete is soft, bolts are set heads down for holding the wooden sill to which the strap hinges are later attached.

THE SELF-SUPPORTING ROOF.

When the side walls are one week old, begin on the roof. To give the roof a rise of 2 feet 8 inches, arch rings are needed. For laying out the rings, choose a floor or a bit of level ground. To one end of a strong string fasten a pencil and tie the other end to a nail driven firmly in the floor with exactly 5 feet 11 inches of string between the pencil point and nail. Mark out half a circle. Across the circle lay a board exactly 10 feet long so that its ends just touch the mark. The part of the circle above the board represents the arched inside of the roof. Place boards for the arch rings over the mark on the floor and nail them together. Mark the curve upon them and cut them to the mark. Brace the arch well as shown in the drawing. Spacing the rings two feet apart, six will be needed. Fasten them securely in place to 2 by 6-inch liners spiked to the side wall forms. Cover the rings tightly with

With the roof form ready, place the reinforcement upon it. Use ⅜-rods 14 feet long. Space them 6 inches apart crosswise and 12 inches the long way of the cellar. Wire the rods together where they cross. The roof must be 5 inches thick. Carefully work exactly 1 inch of concrete between the rods and the sheathing. Tamp the concrete until the liquid cement flushes to the top and then finish the surface smooth by means of a wooden float and steel trowel. Do not stop for anything until the roof is finished. In two to three weeks the concrete roof will be strong enough to support itself; then the forms may be removed.

Ventilation is necessary for most cellars. While building the wall make one or more air-shafts (similar to a chimney-flue) of 3-inch tile, by imbedding them in the concrete wall, with an opening inside at floor level and another outside well above ground line. By this arrangement fresh air is admitted. Place a tile chimney

FIG. 3. THE COMPLETE CELLAR.

in the concrete roof and cover it with a galvanized iron hood for removing the foul air. If built late in the fall, protect the fresh concrete from freezng by covering it with clean straw or with old carpet so suspended as to leave a dead air space between the concrete and the covering.

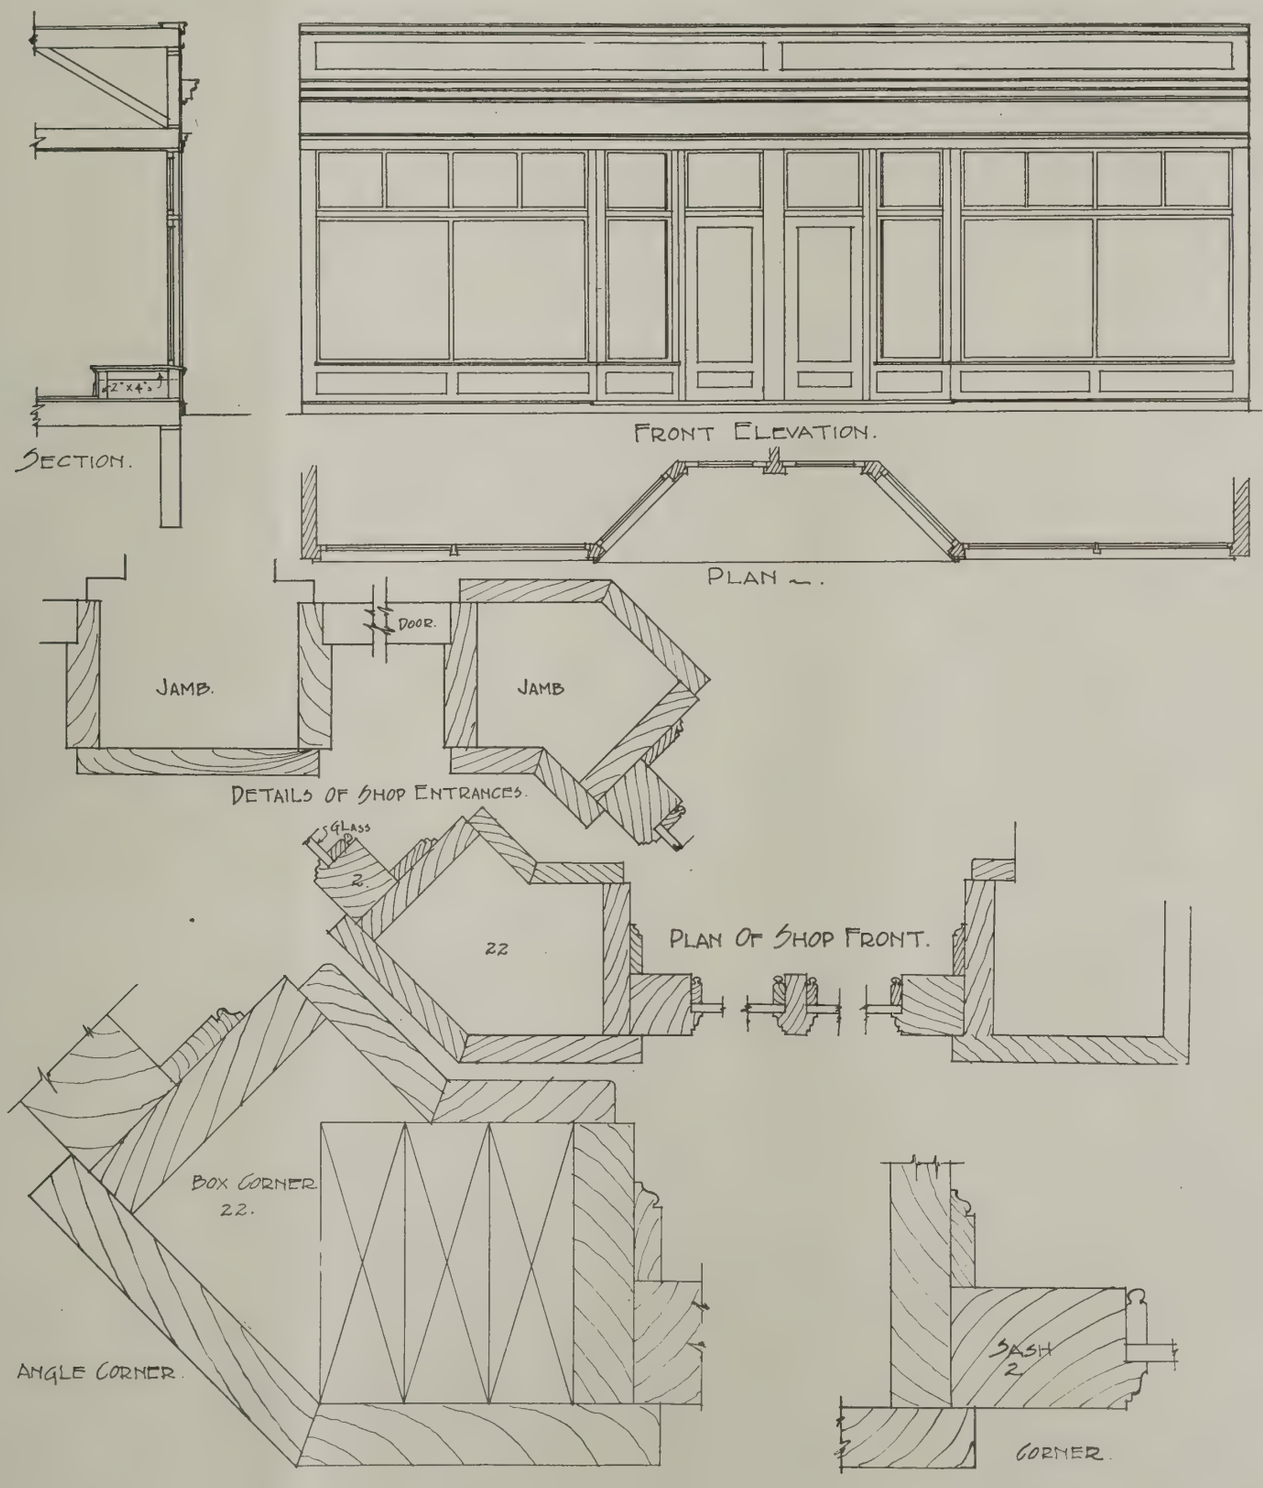
Below is given a list of the materials required. The prices are higher than in most localities. If good screened pit gravel is used, no sand will be needed.

BILL OF MATERIALS.*

Crushed Rock, 13 cu. yds. at $1.10	$14.30
Sand, 6½ cu. yds. at $1.00	6.50
Portland Cement, 22 bbls. at $2.50	55.00
Rods, 40 Pieces, ⅜ in. x 14 ft., 206 lbs. at $0.02¼	4.65
Total	$80.45

*Consult local dealer for prices.

The cellar shown in the photograph is 18 by 18 feet by 8 feet deep. It is located on an apple farm. The owner finds it a profitable investment as he has his own storage and keeps his apples until the market is no longer glutted with "wind-falls" and "seconds."



BUILDING BUSINESS ROOMS

DWIGHT L. STODDARD

IT OFTEN happens, not only in small towns, but in large towns as well, that business rooms are wanted, yet they do not go to the bother of getting a real architect to draw the plans, but leave it entirely in the hands of the carpenter to plan and build it. It is true it is very simple, as it is only a room enclosed, covered likely with a tar and gravel roof; yet as simple as it is, many carpenters find it difficult to arrange the main thing, which is the entrance.

I enclose drawings I have just finished for a building with two store rooms that is to do business on our street.

Note the elevation and construction, then notice the detail of the front. After studying the plan and smaller drawing, see the larger drawing of the sash, and then the general construction of the studding, jambs and casings. Note that three, two by six can be nailed together to form support for the front and then additional pieces can be nailed to them to form good nailing for the finish. Now, this way, a good support can be had for the front, something that is often neglected; the entrance can be built similarly, which makes a good support for the door jamb, and makes a good door, as, unless properly supported, the jamb springs and makes the door too loose or to tight, as the case may be.

BUILDING TRADES INTERESTS IN THE COURTS.

Where, in an action for breach of a contract to construct a building for plaintiff according to a specific pattern, the uncontradicted evidence showed that the house constructed was not a substantial performance of the contract, it was the court's duty to grant a peremptory instruction for plaintiff.—Nance v. Patterson Bldg. Co., 131 S. W. (Ky.) 484.

Where defendant undertook to build a house for plaintiff which should be a duplicate of another at a specified price, plaintiff was under no obligation to bear the consequences of a misadventure in the work, such as defect of concrete work due to its being put down in frosty weather.—Nance v. Patterson Bldg. Co., 121 S. W. (Ky.) 484.

Where defendant contracted to built a house for plaintiff according to a sample, plaintiff was not required to accept a house which was not like the sample, though equivalent in value or utility, but was entitled to refuse performance if the structure tendered was different from that required, allowing only for immaterial deviations involving neither change of plan, material, nor general character of workmanship. —Nance v. Patterson Bldg. Co., 131 S. W. (Ky.) 484.

Where defendant failed to perform a contract to construct a house for plaintiff, and, after the house constructed had been refused, sold the same for $50 more than plaintiff had agreed to pay for the house contracted for, defendant, in an action for breach of contract, in which plaintiff sued for the earnest money and for the difference between the market value of the property if completed according to the contract and the contract price, was estopped to claim that the house would not have been worth at least $50 more than the contract price.—Nance v. Patterson Bldg. Co., 131 S. W. (Ky.) 484.

Defendant contracted to construct a house for plaintiff complete to duplicate another house, named in the contract. The house was not completed on the date specified, and it was undisputed that the foundation was different from the one taken as a pattern. The arrangement of the openings, doors, and windows was different, and the cement construction of the cellar was inferior to that of the pattern house, nor was the new house provided with suitable sewer or drainage pipe so as to carry off the waste water. There was a sink hole in the back yard which overflowed and foul water found its way into the cellar running a more or less constant stream through the same. It also appeared that some of the concrete work in the cellar and the tunnel to the street was cracked because of faulty workmanship and material. The stairway in the front hall was also 5½ inches narrower than in the pattern house. Held, as a matter of law, that there was no substantial performance by defendant, and that plaintiff was justified in refusing a tender of the house and could recover the money paid and the difference between the contract price and the market value of the property if the house had been completed as required by contract.—Nance v. Patterson, 131 S. W. (Ky.) 484.

That a contractor may recover for repairs to a building, he must show a substantial compliance with the terms of his contract, or that he did work upon or furnished materials for the building which were of substantial benefit thereto.—Keys v. Garben, 128 N. W. (Iowa) 337.

Where, in a contractor's suit to foreclose a mechanic's lien for repairs on a building, the evidence showed that he did his work in an imperfect and negligent manner, and conferred no real benefit on the property, which was not in as good condition as when he commenced work, there was no substantial compliance with the terms of the contract, and he was not entitled to recover.—Keys v. Garben, 128 N. W. (Iowa) 337.

Where certain mechanics and material men, constructing a building for a bankrupt, had claims for which they were entitled to liens, such liens were not canceled, either in whole or in part, by several book accounts for supplies furnished by the bankrupt to the lien claimants; the right of set-off being permissive, and not obligatory.—In re Kyte, 182 F. (U. S.) 166.

Where, in an action on a building contractor's bond, conditioned for the erection of a building and delivery of the same free from claims to plaintiff, the obligee in the bond, who had contracted with the owner to erect the building, the evidence showed that it was the custom of plaintiff to receive payments in acceptances, and that the contractor knew of the custom, and that before an acceptance was received by plaintiff and charged against the contractor the latter was informed that the same was for lumber furnished to him for the building, and that the contractor checked over the lumber bill which the acceptance was to pay, and acceptance was properly received in evidence, though on its face it showed no connection with the building in question.—Caldwell v. Concho Building & Loan Ass'n, 131 S. W. (Tex.) 625.

A contractor for a building, who let the contract to a third person, who gave a bond conditioned for the erection of the building and the delivery of it to the contractor free from claims, need not see to it that payments made by him to the third person on account of the building are actually so applied by the third person, and the surety on the bond may not escape liability by merely showing that the third person did not apply payments received from the contractor to materials acquired for the building.—Caldwell v. Concho Building & Loan Ass'n, 131 S. W. (Tex.) 625.

BOOK NOTICES

In reviewing "The Library of Work and Play Books," last month, we stated the works could be purchased singly. The publishers, Messrs. Doubleday, Page & Co., of Garden City, New York, inform us the work can only be obtained in sets of ten volumes, the price of which is $17.50. We make this correction so that readers about to send for single volumes may know the conditions.

When your work is a pleasure it is a success. Pleasure comes from Perfect Satisfaction. Why not be a success in your profession and be happy by using Simonds Hand Saws? They prove the Best by Test.

A stranger seeing a carpenter at work on a building noticed that he was using a No. 7½, 26-inch Simonds Hand Saw.

"I see you are using a Simonds Saw," said the stranger.

"Yes."

"How do you like it?"

"Well, I'll tell you. I have been carpentering twenty years and bought that saw four years ago and haven't set it since I had it. It is ground thin on the back and don't need setting, which saves half the labor in sharpening it; and it beats anything I ever saw to hold an edge"

Glidden

to the

Better Builders

THE BETTER BUILDERS know that in the art and science of building there are no details unworthy of their most exacting and minute attention—no paltry things of little value or of little importance—but that, "from turret to foundation stone," ***all*** is of importance. Wherefore, in their most exacting avocation an aptitude and capacity for taking infinite pains is, of necessity, the rule, where in other fields of endeavor it is too often the exception.

Knowing this, we have prepared for the use of the better builders, Glidden's Green Label Varnishes, Endurance Wood Stains and Specialties. They are being specified by architects and the better builders for the finishing of the finest interior trim in private residences, banks, office buildings, etc.

We will gladly send you, free of charge, a beautiful panel frame showing our Endurance Wood Stains in fourteen different color effects, and the same stains finished with our best interior varnishes. We maintain a special department devoted exclusively to reproducing any color scheme you may care to suggest, and you are welcome to avail yourself of the services of this department ***without cost.***

Glidden's Endurance Wood Stains are the finest in the World—the ultimate wood stains—the stains you will always specify and always use, once you know them. Those who have used them declare that they are so far superior to any other stains that there is no comparison. They enhance the natural beauty of all woods. They penetrate ***without raising the grain,*** and all the colors are permanent.

IF you sublet the varnishing on your jobs, see that the painters use M. P. Durable Interior (the best varnish for interior trim), M. P. Durable Floor (the strongest floor varnish made), Glidden's Velvet White Enamel (the ideal egg shell finish), and Glidden's Superior White Enamel (the perfect gloss white).

When you have to guarantee work make sure that the best material is used.

Write us for free panel frames and literature. Use the attached coupon.

SARGENT'S HARDWARE.

Hardware is the most important part of a house, for it is the part that gives the house life. It is to the house what muscles and joints are to a man; it is the part that enables it to be useful in the world. It is very important, therefore, that hardware should be chosen with unusual care and now that the manufacture of hardware has reached its present standard of excellence and manufacturers are co-operating so closely with the builder, there is no excuse for having anything second class about that part of the equipment.

The name of Sargent is known to every one who has sought out the best in hardware and tools and this name for the best part of a century has been closely associated with the development and perfection of many devices for both constructing and equipping buildings that are now recognized as standard the world over.

The choice of hardware which bears the Sargent trade-mark always reflects credit on a builder and if an owner ever desires to sell he can use as a most effective talking point the fact that the hardware is standard. A still greater satisfaction to an owner is the daily use of high-class hardware such as Sargent's; the smooth slipping in of a key, the perfect working of the bolt, the mechanical excellence of the latch as shown by the very "feel' of the hand of the knob and its almost noiseless action when the door is closed all show that the hardware is made by artisans who do not do things poorly. Think how many times in a day or in a year or in ten years the doors of a house are opened and closed and then consider if it is not worth while to pay close attention to the locks, the butts and the checks that will make the operation frictionless and easy.

There have always been locks and hinges of some kind, but the door check is distinctly the product of modern civilization and it has only been within the past few years that they have been in extensive use in residences. There is good evidence, however, that they will be in general use very soon, for those who have ever used them always want them, and the builder who induces his client to let the door checks go in comes in for especial thanks. Sargent's door checks will be found equal to the rest of the line in smooth working efficiency and durability. They are easy to attach and adjust, from the fact that they work either left or right handed without having to change the parts, and the patent adjustable feet is an exclusive feature that also greatly simplifies attachment. The company issues a special booklet on the subject of door checks which it will pay any builder to get.

By the way, why not take advantage of the long years of study and experimenting which the Sargent company have given to hardware problems? It has cost them a great deal of money, but will cost you nothing. If you will write Sargent & Co., 53 Leonard street, New York, mentioning about the kind and cost of house you are planning you will be sure to get literature that will be helpful and instructive.

THE HUMMER GRINDER.

The man who makes two blades of grass grow where one grew before has little or nothing on the man who can decrease by one-half or more the time or effort it takes to do necessary work. Where would we be without the many time and labor-saving devices, such as steam engines, sewing machines, etc.?

In the building trades there has been a constant endeavor to cheapen construction by various means—labor-saving machinery cuts up the lumber formerly hewn out by hand, pneumatic tools take the place of sledge and hammer. But there is still a great deal of hand work necessary. Tools must be replaced and sharpened and one of the greatest improvements has been along the line of shortening the time necessary to repair, replace, sharpen, etc.

The Luther Grinder Manufacturing Company, 219 Madison street, Milwaukee, have for several years had their grinding machines on the market. A recent improvement consists in the grinding agent, which they call Dimo Grit from its consisting of microscopic diamonds. This gives a peculiar fast cutting quality not obtained by other materials and many times faster than the old-fashioned grindstone. Not the least qualification claimed for Dimo Grit for fine works is the fact that the grinding will not injure the temper of the finest edged tools.

The Luther Grinder Manufacturing Company have recently sent out a large catalogue showing the manufacture of Dimo Grit in the terrific heat of the electric furnaces at Niagara Falls. The catalogue also gives much detailed information regarding sharpening tools and should be in the hands of every mechanic. Send for catalogue showing cut-off, rip and jig-saw attachments for small shops.

ISOMETRIC PERSPECTIVE OR PROJECTION.

There are frequent occasions when a perspective drawing of an object will convey a much clearer conception than any number of plans, elevations, sections, etc. The perspective stands out as the true appearance of the object and it is possible to show the object as it will look completed from any angle or point of view.

Few mechanics and not all draughtsmen, possess the faculty of making proper perspectives. The laws governing them are rather complicated and call for some study and practice to become proficient.

Isometric drawing, while the name is formidable, is really a simple method of showing an object so that its principal dimensions, lengths, breadth and height are shown in their true length. To some extent it resembles perspective work, but lacks the diminishing effect of distance and entirely eliminates the horizon line, vanishing point and station point. In effect it takes the place of both plan and elevation as the lines which are ordinarily shown are the true length and can be measured or dimensioned with accuracy.

The Norman W. Henley Publishing Company, 132 Nassau street, New York City, have prepared ruled paper by which this class of drawing is greatly simplified. It is only necessary to trace over the lines to get a representation of any object and with the outline given it is a simple matter to complete intricate drawings.

We understand that the Henley Publishing Company will send further information and sample sheets to those who mention the NATIONAL BUILDER.

Look for the "Big Chuck" when you buy a brace

THEN look for "The MARK of the MAKER" and you can be sure it's a

P.S.&W. "SAMSON"

YOU can't mistake the Samson Ball-bearing Chuck. It fits the hand comfortably and the weakest wrist can release it instantly, or get a tighter grip than you can get with any other brace by using a vise.

The Samson is the top notcher in the most complete brace line on the market.

Don't forget to look for the trade-mark. It stands for 92 years of experience, ability and progress in tool-making and is put on every item in our line of Guaranteed Tools for Carpenters.

P. S. & W. Guaranteed Chisels

THIS is another of our guaranteed lines that you ought to know. It leads in the big things—variety, completeness, quality, design, workmanship; and it leads in every little detail—finish, temper, perfect fit of handle and shank, blade ground to a sharp edge, etc.

Write today for our Free "Mechanics' Handy List," a 170-page book containing 35 pages of valuable information and a complete catalog of over 200 tools for Carpenters, Machinists, Electricians and Tinsmiths.

TREATISE on the PRACTICAL USES of the STEEL SQUARE
By FRED T. HODGSON, Architect

Two Vols., Cloth Binding.....$2.00
Two Vols., Half Leather Binding.. 3.00
Single Vols., Part I, Cloth..... 1.00
Single Vols., Part I, Half Leather $1.50
Single Vols., Part II, Cloth..... 1.00
Single Vols., Part II, Half Leather 1.50

NEW and up-to-date. Do not mistake this edition for the one published over twenty years ago. This is the latest practical work on the Steel Square and its uses published. It is thorough, accurate, clear and easily understood. Confounding terms and phrases have been religiously avoided where possible, and everything in the book has been made so plain that a boy twelve years of age, possessing ordinary intelligence, can understand it from beginning to end. It is an exhaustive work, including some very ingenious devices for laying out bevels for rafters, braces and other inclined work, also chapters on the Square as a calculating machine, showing how to measure Solids, Surfaces and Distances—very useful to builders and estimators.

Sent postpaid on receipt of price by
HODGSON BOOK COMPANY, 542 South Dearborn Street, CHICAGO

THE PERRY RECKONER

is a tabulation of all the commercial sizes of lumber and shows the number of feet, board measures, in any number o pieces from one to a hundred.

The book is so indexed that you can instantly find the proper table and as surely know you are right.

One mistake in figuring the old way costs you many times the price of this book.

NIAGARA BRICK BONDS.

The use of face brick is made practical only by a means for tying the face brick to the common brick backing, for the common brick is, as a rule, considerably larger than the face brick. Where a thin putty joint is used, as in the better class of work, the disparity in size is even more noticeable. In some sections of the country an attempt is made to bond the face brick in by headers whenever the courses come together, but this takes additional brick, and the headers do not improve the appearance of the front of the wall. Sometimes the face brick have the inside corners clipped to allow a common brick to toe-in to the facing. Many face brick are broken in this manner, and the resulting job is not as strong as a wall in which the brick are all properly bonded.

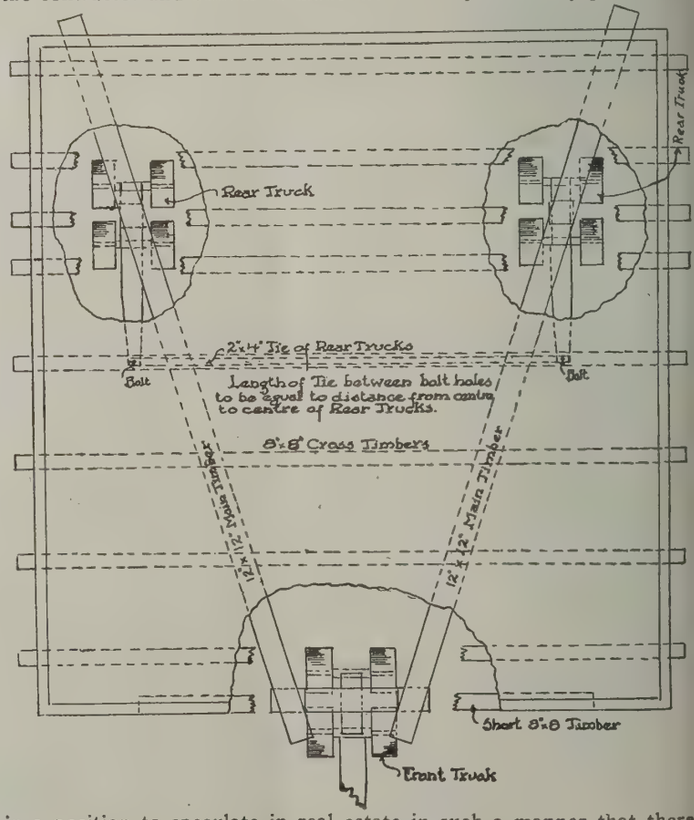
To accomplish ideal results, the use of metal wall ties are indispensable. While these are made in several designs, the one shown

NIAGARA BRICK BOND FOR BRICK WALLS.

herewith, as made by the Niagara Falls Metal Stamping Works, have several features of interest. It will be seen that the shape is such that considerable effort will be required to affect them when built in the wall. The makers claim that a single tie will stand a breaking strain of 1,000 pounds, so that it will be seen that the face brick can be firmly held in place.

For brick veneer buildings a somewhat different tie is required, as shown in the lower cut. This permits a firm nailing against the

BONDS FOR VENEER ON WOOD FRAME.



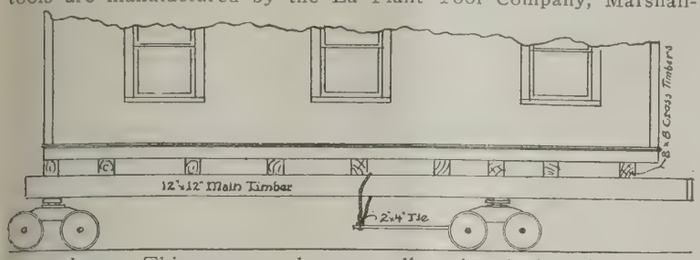
sheathing, while the peculiar shape of the tie prevents its slipping out.

The Niagara Falls Metal Stamping Works, Niagara Falls, N. Y., has just issued a pamphlet describing these ties, as well as some of the other goods they manufacture, and will, we understand it, send this free to anyone asking for Pamphlet 57B. Every builder and mason should be posted on these goods, as there are frequent occasions when they can and should be used.

HEAVY HOUSE-MOVING MACHINERY.

The easiest way to meet the high cost of living and have the luxuries for yourself and family is to earn more money. The contractor who uses his gray matter nearly always succeeds, while the man who plods along with his eyes shut to the many opportunities for making money right near home continues to throw out remarks about the high cost of everything.

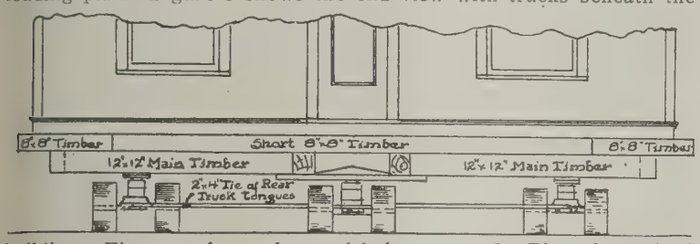
The illustrations shown with this article suggest a new way for the contractor and builder to make more money. It really places him



in a position to speculate in real estate in such a manner that there is not one chance in a hundred for him to lose out.

Suppose the contractor has a job which necessitates the removal or wrecking of an old residence. It takes time to wreck a building, to divide up the lath, the flooring, the siding, timbers, etc., pile them up around the building, and then cart them away for storage. Even if the contractor can use some of these materials on another job, or can sell them at a fairly good profit, there is not the money in it for him that he can get for the whole building. Suppose instead of wrecking the old building he can place it on three sets of trucks or

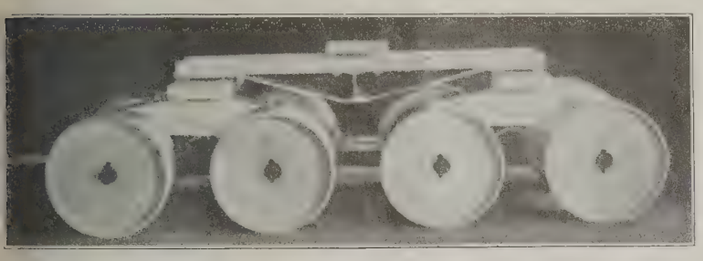
PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.



wheels, move it a mile away to some other lot, and then, after fixing it up a little, sell the house and lot at a good profit.

The old way of moving a building is a hard and unsatisfactory job, but modern methods have made it possible to move large, heavy residences and other buildings a considerable distance in a very short time. The best up-to-date, heavy house-moving machinery and tools are manufactured by the La Plant Tool Company, Marshall-

town, Iowa. This company have a well equipped plant for making heavy house-wrecking steel trucks which have proved a wonderful success for contractors and builders.



The illustrations shown in this article will give a pretty good idea of the whole system of moving heavy buildings quickly from place to place. Figure 1, for instance, shows the method of loading the building on timbers and trucks. Figure 2 shows a side view of the loading plan. Figure 3 shows the end view with trucks beneath the

building. Figure 4 shows the steel bolster on a La Plant four-wheel truck.

Figure 5 shows a large frame building being moved away from a lot where a new building is to go up and being taken up to another place.

A La Plant outfit generally consists of three trucks of two, four

or eight-wheel type, which are capable of moving a large sized building. The rear trucks have a short tongue five feet long and are kept together with 2 x 6 cross-ties to keep the trucks in line with each other and in proper relation to the front truck. Each rear tongue is hung to timbers above with chain or rope. The trucks are built on scientific lines that are both practical and mechanical. They are constructed on an interchangeable system whereby they may be worked singly, in pairs or in fours, to meet the requirements of the job.

The contractors and builders who are now using the La Plant Tool Company's outfits are very enthusiastic over them. Reading matter, showing many illustrations of houses being moved and views of these steel wheel trucks, can be had at once by writing the manufacturers.

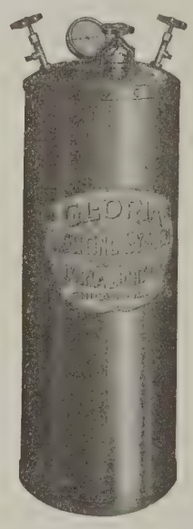
GOOD ADVICE FOR COLD WEATHER.

The Chicago Portland Cement Co. are sending this bulletin to contractors.

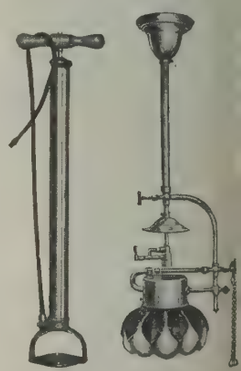


Don't let the weather deceive you—the days are warm, but the nights and mornings are cold. Cold weather is not conducive to quick setting, and long time sets mean slow hardening, thus reducing the strength of the concrete for a considerable period.

Mr. Contractor, as a precaution, watch the weather—give your work ample protection, and most important of all—heat the materials and the water. This will insure satisfactory work.

IMPROVED LIGHTING SYSTEMS.

Did you ever stop to consider that the main advantage of day over night was the matter of light? This one quality alone describes all the physical conditions—the only conditions we can perceive with our senses. The only way we can turn night into day is by a flood of light.



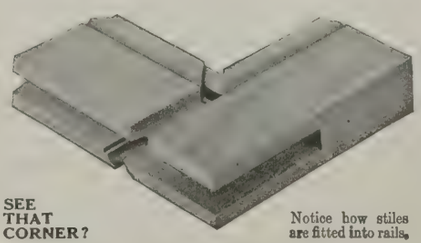
For ages man depended on sunlight for all of his hours of labor and business. To be seen about at night was tantamount to being on an evil errand and this same rule holds true to this day in many plases where modern lighting methods have not been installed.

From a business standpoint, plenty of light is indispensible. There is no better advertising medium, and it brings the largest returns for the money invested. The most prosperous stores are those that are best lighted. A poorly lighted store does not attract trade, as its gloom lacks invitation and conveys no suggestion of the good things which are displayed on the counter. Personally, now, would you enter a poorly lighted store in which you could scarcely find your way about, or a brilliantly lighted store, where every detail stands out plainly, and the goods are presented as well as in daylight?

A great many stores depend on the gas and electric light companies. Where the service is good, the results are good, but often costly. In the smaller towns and cities, the electric light companies have a custom of shutting down sometimes at 11 p. m., sometimes at midnight, and not running at all during the day.

It is for places such as these, requiring good lighting at a reasonable cost, that the Gloria Light is designed. In principle it consists of a tank, placed where convenient, in a shed or room outside the buildings entirely, from which tubing extends to the lighting fixtures or lamps. A few strokes on the pump is sufficient to keep the system in operation for several days, and the light is available at any time, day or night. These systems can be easily installed after the building has been erected and is in use. By the use of these lights, both the interior and exterior of the store or residence may be brilliantly lighted at a minimum of cost.

Each lamp is independent of all the others, so one or more can be turned out without affecting the others. It is also to be noted that there is nothing to wear out or be replaced except the mantels, which are the same as used in ordinary gas lighting.



The Gloria Light Co., 1265 Washington boulevard, Chicago, Ill., claims that this system is ideal for the small store, whether in city or country, and for residences, whether within the limits of commercial gas or not. The information which they are sending out to interested parties is interesting and instructive, and we urge everyone to take advantage of their liberal offer.

Misuse of Tools

There was a fellow in our shop,
His work was at the bench,
And every time he struck a blow
He used the monkey-wrench.

And when he found his wrench was gone,
With all his might and main,
He went and got his neighbor's wrench
And commenced to strike again.

Be the Man Who Superintends
Be the Man Who GIVES Orders

The man who superintends now was once the man who was given orders. Special training has raised him in salary and position.

You who hold minor positions now have the same opportunity for quick advancement that thousands of our graduates have had.

The "hard-working, oldest employees" advance very slowly nowadays. It is the man with individual training who jumps over their heads.

That is the reason why you see men of 25 and 30 years superintending men of 40 and 50 years.

Our special training in

Architectural and Mechanical Drafting

Estimating, Plan Reading

BY MAIL

will increase your salary

You know the advantages of being able to read plans and estimates, and the opportunities for promotion and prosperity that come to those with that ability. We can positively teach you, with our simply written, practical lessons. Hundreds of plans of buildings, in course of construction in Chicago, are studied from.

As a practical man you can see the advantage of studying blue print plans, specifications, and estimates for buildings *now being built* or recently completed. You do not receive a lot of books to read *about* some building which exists only on a printed page, as your problem. To *learn* a thing you must *do* it—reading about it is not sufficient.

If you are a bricklayer, mason, carpenter or builder, you need this course—it will bring you higher wages.

If you are a foreman or superintendent, you need this course—it will enable you to become a successful contractor.

If you are a contractor you need this course—it will help you to figure closer. It will eliminate mistakes—increase your profits.

The lessons are approved by well-known Chicago architects and engineers. We have partial courses to fit your individual need, if you have had previous experience.

Start now on your journey to success. Don't say you can't do it—you can; don't say you haven't time—take it; don't say you haven't the money—earn it as you study.

Determine now whether you will advance in salary and position or let other men go ahead of you.
Send for free folder, now.

METAL TILE ROOFING.

In the erection of our houses we have a double duty to perform. We must make the building satisfactory to the owner to live in, and we must also make the outside appearance such that there is no reason for unfavorable criticism. Too often we seem to work with a total disregard for our neighbor's artistic feelings, and frequently say the law gives us the right to make our buildings as ugly as we wish. It is only too true that there is no law to compel one to be artistic, but we sometimes wish there were. When we see a barn-like structure disfiguring a fine residence district, or a three or four-story tenement perched on a narrow lot beside some beautiful lake where land is plenty, we wish there were an art censor.

Why should not the exterior be as pleasing as the interior? Why should we buy cut glass for the sideboard and the poorest quality for our front windows? Why should it be "nothing too good for the parlor; nothing too cheap for the roof"?

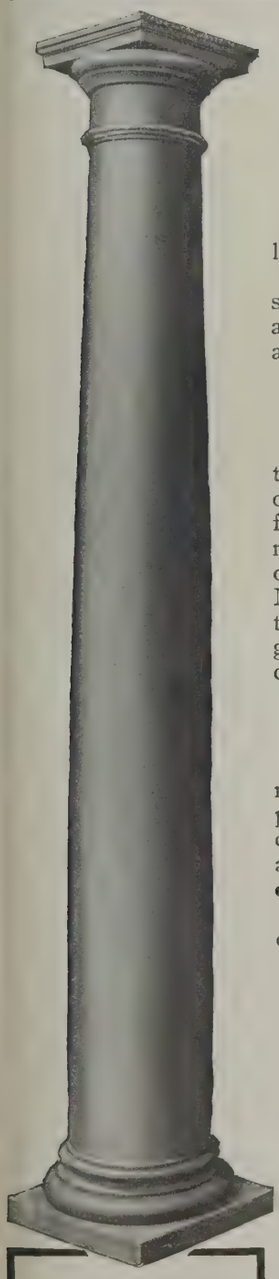
We frequently hear of leaky roofs. Oh, yes, some people expect a roof to leak! Do we ever hear of a basement wall being faulty? Sometimes, and then the builder catches it from all sides. But why spend money for an elaborate cut stone foundation and watertable, and cover the roof with the cheapest grade of shingles and know, yes, know, that in a few years you will see water stains on the ceilings and find the things in the attic all soaked and winter almost on you. The first time this happened, the was possibly a little excuse for it, for no one knew any better, but in the light of present day knowledge, one is going right against the recognized principles of construction when anything but the best is put on the roof. Submit it to an expert and see what you hear.

For many years the value of sheet metal for roofing has been generally recognized. As a protection from weather it is rain, snow and wind proof. As a protection against fire, it will hold out until the framing is burned from beneath it, and has even been known to hold in and practically check a fire by settling down like a blanket. Thus, for utility, metal excels, and as for appearances, one can get the same detail as in stone or any other material, as well as some designs which belong entirely to metal.

METAL TILE WITH RIDGE AND HIP FINISH.

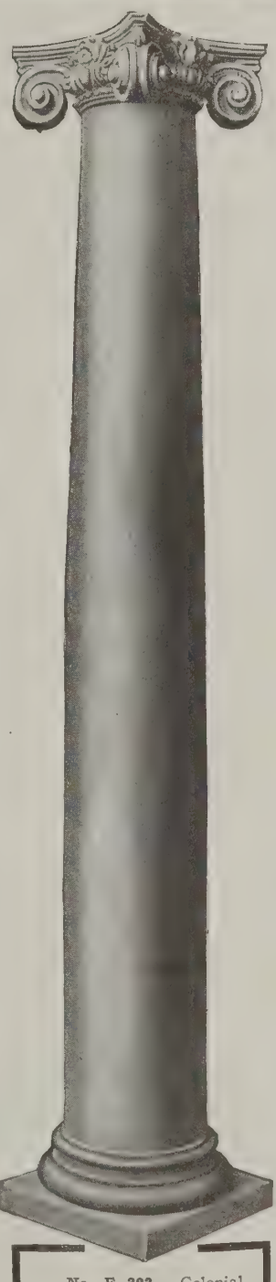
As to the form of roofing, there is a wide choice. It may be in large sheets, as corrugated iron, used on factories, sheds, etc.; in flat sheets for flat roofs of apartment houses, stores, etc.; or it may be in highly ornamental stamped plates or tiles.

While resembling in finish the clay tiles used both here and abroad, they have none of the disadvantages of the clay product. Being stamped in the same press, they are all exactly the same size, not subject to shrinkage in burning, and the edges are so thin and flexible that they can interlock, making a perfectly tight roof. It is generally said that a clay tile roof is as tight as the tarred felt put on under the tile, but with metal tiles there are no open joints for the snow and rain to blow in.



Among the manufacturers of metal tiles and roofing, the Kanneberg Roofing and Ceiling Co., Canton, Ohio, are prominent. With an experience of twenty-five years in the sheet metal line, they are fully competent to understand the most exacting requirements in the roofing line. Their catalogue "E" showing several styles of tiles, as well as the various other shapes necessary to go with them, is being sent out to interested carpenters and contractors. If you are not on their list, write them at once. We understand that if THE NATIONAL BUILDER is mentioned they will place your name on file; not only for catalogue "E" but for future information as it comes from the press.

"DURABILT"



"Durabilt" is the trade mark for Harris & Cole Bros.' red gum and oak trim and moldings and red gum and oak finishing lumber. It is a well known fact that when a manufacturer places a trade mark on his goods everyone has more faith in it. The architect, contractor and builder know where to go and go quickly if anything is wrong in regard to quality and manufacture.

The Harris & Cole Bros. are the first in the building field to trade mark trim, moldings and finishing lumber. It is their intention to specialize on fine red gum and oak. The accompanying illustration shows a piece of quarter-sawed red gum taken from stock. The upper end of this piece shows a small strip of sap red gum and shows the beautiful richness and coloring of this wood. It is enough to convince the most skeptical that a residence finished in Red Gum would be something that everyone would admire and want.

Where the Big Bargains Come From

Out from these great concrete warehouses come the greatest millwork and lumber bargains that the American market affords.

Our whole business revolves around the bargain idea. The present building season finds us better equipped than ever before to save money for contractors and builders. You will be amazed to see the big reductions on staple millwork and lumber of highest guaranteed quality.

New Bargain Catalog Ready

This catalog is in itself an immense exhibit of the finest building material on the market. It offers an almost unlimited variety of the latest styles in millwork of every description. Doors in all regular sizes and in scores of new and beautiful patterns and in various woods—veneered doors in Colonial, Mission, Craftsman and other popular styles—art glass doors in exquisite designs and colors—doors for every purpose. Windows to correspond with every style of door. Mouldings, inside finish, flooring, mantels, stair and porch material—everything that goes into any home, down to the very last detail. A bargain price and a guarantee of quality, safe delivery and satisfaction on every item. Send for the catalog and see for yourself.

New Plan Books—Sent FREE

The new Gordon-Van Tine Book of Plans, prepared at a cost of over $5,000, is now ready for free distribution to carpenters and contractors. A complete and practical work that gives 32 designs for city, suburban and country residences, cottages and bungalows costing from $600 to $6,000. Also 12 plans for barn, dairy and cattle barns and other outbuildings. **This book keeps cost within original estimates,** for every plan has been proved again and again by actual construction.

The Plan Book will be mailed free on receipt of 10 cents in stamps or a dime to cover cost of packing and mailing.

You Are Invited to Visit Our Vast New Millwork and Lumber Plant

Although we conduct our business entirely by mail, we like to have carpenters and contractors visit our plant. Hundreds of them do this every year. Our warehouse is the busiest place in Iowa. Come and see us loading 22 cars at a time from our loading platforms, extending the entire length of the plant. Meet personally the men who stand behind this gigantic enterprise. The latch-string is always out.

We Can Save You Hundreds of Dollars This Season

THE ORIGIN OF PORTLAND CEMENT

"What's this?" asked the City Editor, glaring at the reporter. "Here you have in your story 'The wall was built of Portland cement.' After this, cut out the word 'Portland.' We don't want to advertise any particular brand of cement."

"I thought it meant Portland, Me., where it's made."

"It is none of your business to think anything. You are wrong, besides. It means Portland, Ore., and the West must pay for all its advertising in this sheet, or I'll know the reason why."

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

Harris & Cole Bros. have a large, well equipped factory at Cedar Falls, Iowa, and have been favorably known to the lumber industry for many years. Architects and contractors who are laying out their work for next year would do well to specify "Durabilt" Red Gum or Oak trim, molding and finishing.

To give our readers an idea of the beauty of red gum manufactured by this company, Mr. Harris states that while visiting the plant of a large automobile company a short time ago and during a conversation with the officers, he pulled out of one of his pockets a piece of Red Gum Casing, No. 8309, finished with just one coat of white shellac on both sides, both edges and at the ends. He asked the officers of the automobile company and some of the workmen what kind of wood the piece was. They all replied, "Circassian Walnut." Then they stepped over to their finished cars and put Mr. Harris' piece of Red Gum Casing beside their material and remarked that they used nothing but Circassian Walnut in certain parts of their automobile, and called attention to the fact that both were the same woods. The Red Gum sample resembled Circassian Walnut so closely that even the most expert workers and handlers of fine interior woods could not tell the difference.

Red Gum is daily gaining many enthusiastic friends. The one thing necessary to do in specifying and using Red Gum is to take a few precautions in manufacturing and placing it in the building. It is well for the architect, contractor and property owner to be sure that the mill in which the job for the interior finish is to be done, is

PANEL OF "DURABILT" RED GUM.

a well equipped plant and one that can properly handle Red Gum to get the finest effects. In that case, there is one chance in a thousand which might occur where the wood is not understood.

Harris & Cole Bros. in placing the "Durabilt" trade mark on their materials are really giving a guarantee as to quality and workmanship. A building finished in "Durabilt" Red Gum would pass for Circassian Walnut. If the property owner did not care for that finish, he could have Red Gum finished to resemble the finest mahogany. Of course, the difference in cost between Circassian Walnut, Mahogany and Red Gum would be well worth considering.

The sample of red gum shown in above cut was furnished by the Waterloo Varnish Co., Waterloo, Ia.

"Durabilt" stands for quality, fine workmanship and beautifully grained Red Gum and Oak.

HAND SAWS—*Their Use and Abuse*
By Fred T. Hodgson, F. R. I. C. A.
LARGE 12MO., CLOTH—300 PAGES FULLY ILLUSTRATED—PRICE $1.00
THE latest Hodgson book is an up-to-date treatise on small saws of all kinds, cross cuts, rib saws, back saws, tenon saws, hand saws, scroll saws, frame saws, hack saws and small saws of every kind, with directions for buying, filing, setting and straightening, with hints, suggestions, kinks and advice regarding the proper use and care of small saws, files and other equipment.
This is a larger and very much superior work to the one prepared by Mr. Hodgson some thirty years or more ago, and which had such an immense sale among woodworkers, and while it embodies within its limits all that is now of value in the initial work, it has added to it much that is new and up-to-date regarding the qualities and makes of saws, methods of using and sawing and filing equipments.

JACKSONVILLE ILLINOIS

WISCONSIN BIRCH FLOORING.

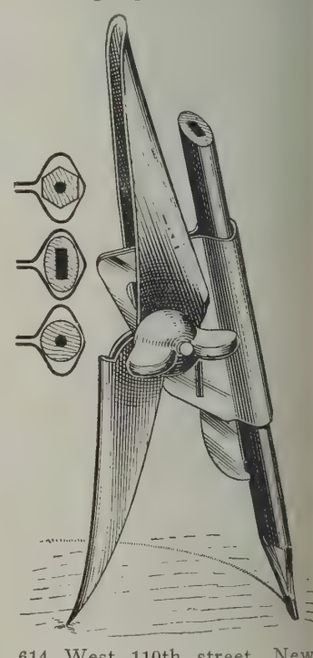
While maple flooring is well liked, and specified by many architects, contractors and property owners, yet for those who want a high class wood flooring at a lower price, Wisconsin birch will fill the bill, besides having a number of other good qualities not found in maple.

For instance, birch makes a rich-colored, handsome grained floor—that stays in place as well as maple. Property owners sometimes object to hardwood flooring on account of the danger of the rugs slipping. This objection is done away with where birch is used, for rugs do not slide on it as on maple or other woods. Birch is not slippery and is, therefore, easy to walk on. Besides, it is practically noiseless. Well seasoned birch flooring will last as long as the building and wear as smooth and as long as maple.

The Osgood & Blodgett Manufacturing Company, Twenty-seventh and Duluth streets, St. Paul, Minn., with an experience covering more than thirty years continuous hardwood production state that a whole house can be floored with their birch cheaper than with knotty first fencing.

Their X L C R, 3/8-inch birch flooring, having extra strong tongue and groove as shown in the accompanying illustration is well liked by not only architects and contractors but also by the carpenters, who find it very easy to lay. While it may be true X L C R hardwood flooring is better known in the northwest than in some of the neighboring states, yet its high class grades and fine appearance when laid and long wearing qualities are gaining many new customers for it.

A sample of X L C R birch flooring will be sent postpaid to readers of THE NATIONAL BUILDER and those interested in a mighty good low cost flooring.



Many lumber dealers are carrying X L C R flooring. The Osgood & Blodgett Company also manufacture a very fine Michigan rock maple, oak, black walnut and cherry flooring; all under their own trade mark.

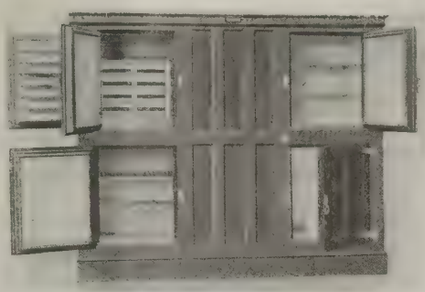
POTTER BROS. SPECIALTIES.

How many times we try to do our work with improper tools, and how much needless work we do to get our work right, when the whole trouble is our lack of proper equipment. Suppose we set out to make some nice dowelled joints. The holes should all be exactly the same depth, but how many of them are? We fuss and worry at the job for a while, and then perhaps fit a block to stop our bit at the right place. There is a little tool made to help right at this place. The Peerless Flexible Bit Gauge is readily attached to the shank of the bit, and indicates exactly when the right depth is reached. As the indicator is flexible there is no danger of marring the face of the work or catching and throwing the bit off when boring a shallow hole.

Another tool of great utility is the Peerless Scriber, also shown on this page. How often it is necessary to draw a circle on a rough board, and how hard it is to do it without the proper tools. A scriber of this character is free from many of the inconveniences of the old fashioned compass, for it is strongly made and will accommodate any kind of a pencil or the ordinary scratch awl without adjustment. The manufacturers of these two articles, Messrs. Potter Bros., 614 West 110th street, New York City, advise us that they have had a wonderful sale for them—orders for 300 dozen frequently coming in from the large hardware concerns. So general are the sales that it is probable your local hardware dealer can supply you. If not, write direct to Potter Bros., 614 W. 110th st., New York City.

Every carpenter should have these two handy tools in his kit. The first man to use them on a job will find them the handiest in his entire collection.

A girl's heart is naturally light when she strikes a match.



Leading a woman to the altar is usually man's last act of leadership.

ART of PRACTICAL WOOD CARVING

By Fred T. Hodgson

PRICE: 12MO, CLOTH $1.50—HALF LEATHER $2.00

THE lessions given in this new book lead the young workman by easy steps until he is able to turn out work of a creditable character. The use and care of carvers' tools are given and explained and the tools described and shown by illustrations, with methods of sharpening and honing the tools. All kinds of appliances are shown, described, and illustrated, for holding the work, and for preparing the tools and finishing up the carvings. The various styles of carving are fully described, such as Flat Carving, Chip Carving, Incised Carving, Scratch Carving, Figure Carving, Carving in Relief, Round Carving and Jewelry Carving.

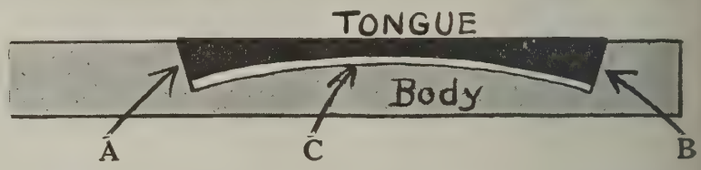
How to Take Care of a Chamois Skin

Mostly they are not real chamois skins at all, but simply washleather, the product of a young goat or kid. Never leave the skin in water after using. Wring it out dry and spread out carefully, then hang it up to dry. Never put it in hot water, for that will make it tough and harsh. An old skin is better than a new one, if taken care of, for then it has no lint, as a new one has. When dirty wash out with clean water and white soap, and leave some of the soap in the skin when wrung out to dry. This will keep it soft.—Master Painter.

WATERPROOF CEMENT STAINS.



The two conspicuous defects of cement as a building material are its porous nature and its cold and cheerless monotony of color. From a structural point of view, the former is the more disastrous, as buildings of cement or plaster, unless waterproofed, are apt to be damp, the decorations will be discolored and metal lath or reinforcing bars rusted so as to be useless.

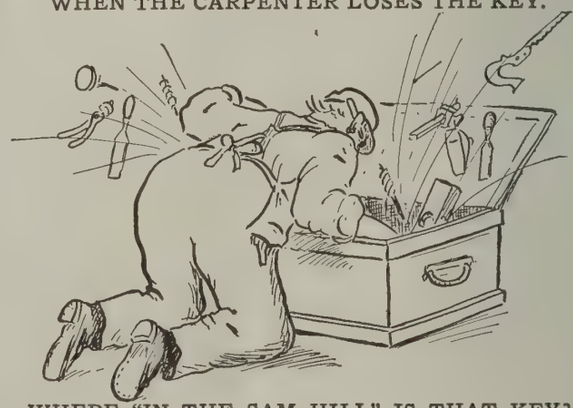
The importance of coloring the surface of the structure has been recognized since the earliest times. It is generally conceded that the ancient Greek and Roman buildings, though of marble, were painted and decorated. Even Solomon's Temple was overlaid with gold, showing that even in those remote times the value of color was important. At the present time one of the reasons why frame houses keep their hold on the people is their adaptability, not only to various forms of decoration, but to the variety of colors in which they may be finished.

The Samuel Cabot, Inc., Company, of Boston, Mass., have long been known as manufacturers of high-grade shingle stains, but not so generally for their cement, plaster and brick waterproof stains and preservatives. They have recently sent out a beautifully illustrated catalogue, describing these products and showing the great variety of buildings in and on which these materials have been used.

The catalogue contains color cards, showing the possible shades obtainable, and a great deal of very useful information for the contractor and builder. We understand that the mention of THE NATIONAL BUILDER will get your name on their mailing lists for this and future literature of similar value.

NICHOLLS TAKE-DOWN SQUARES.

This cut illustrates how the joint of their TAKE-DOWN SQUARES are machined. These joints, "A" and "B," are machined perfectly square with edge of tongue and body. The tongue of square does not touch the body at point "C" and only rests on the beveled portion of the body indicated by point "A" and "B." These bevels are so straight that it answers the same purpose as a straight shoulder and they will not slip. The clearance at point "C" allows the tongue to settle down as the bearings wear in taking square apart and putting together, thereby producing constant accuracy.

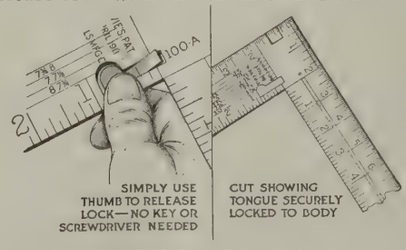


The end of tongue springs down under the button, as you will see in cut "2," and is held down at the other edge of body by a very rigid spring.

Rust-proof canvas case with each square.

If your dealer does not handle their squares and will not order one for you, write them. They have a special inducement to those who order first square in every town.

WHEN IS A TAKE-DOWN SQUARE NOT A TAKE-DOWN SQUARE?

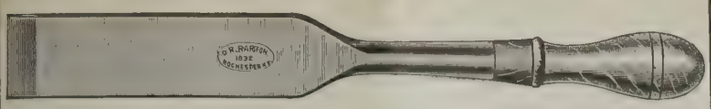


WHEN THE CARPENTER LOSES THE KEY.

WHERE "IN THE SAM HILL" IS THAT KEY?

He has not only lost the key, but he has lost his temper, and lost all respect for the English language.

Not so when he has a Nicholls Take-Down Square. No key to lose, simply release lock with the thumb. His thumb is his key.



This is the only TAKE-DOWN SQUARE on the market containing this kind of a Locking Device.

GUARANTEED ACCURATE AND TO REMAIN SO.

The main feature of their new TAKE-DOWN SQUARE is that it will always stay true. It is so constructed that the tongue is held down into beveled bearings by a spring, and these bearings are made so as to take up the constant wear which comes in taking square apart and putting it together, thereby producing constant accuracy.

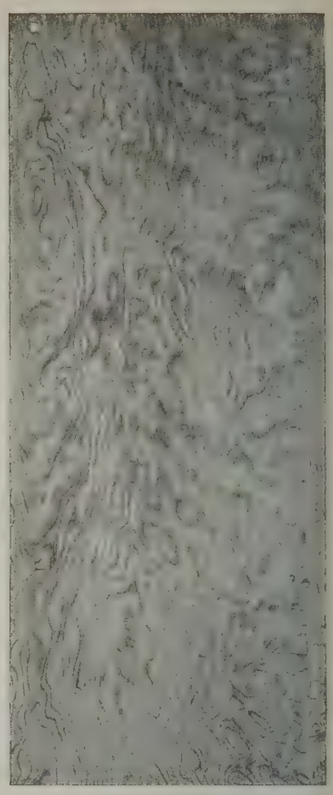
Primeval man, we believe, was thoroughly satisfied to close the entrance of his cave with a bear skin, but through the ages there has been a considerable advance in the methods of protection against the weather, wild animals and other enemies. It would be interesting to trace the door forms through the various phases of development. Many materials have been used for doors. Sometimes of stone, heavy and cumbersome and again of delicate screen of fretwork, depending on the degree of protection it was to afford. Metal and asbestos doors offered protection from fire, felt-covered doors deaden sounds, and glass doors are fair substitutes for windows.



But the main material for doors is wood, and to certain degrees different varieties offer widely varying amounts of protection and efficiency. Heavy oak doors, iron bound, protected the medieval castle and today oak doors, of lighter construction, protect our homes; other woods, birch, pine, cypress, mahogany, etc., are used when their particular grain or figure add to the color scheme or design.

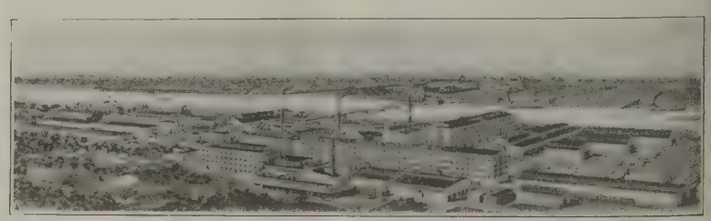
The advance in construction ideas has for some years been along the line of adapting various woods to decorative and constructive purposes. The improvement in the dry-kiln and methods of seasoning have produced lumber far more dependable in quality than formerly and methods of sawing and cutting veneers gives us the most beautiful figures and patterns at a minimum of labor and cost.

No item has contributed more to modern construction of doors than the methods of building a door by facing a light pine core with a veneer of harder, heavier and more expensive wood. The use of a light center decreases the weight appreciably, meaning less labor to swing them, with a saving in hinges and locking devices. Using only a thin veneer of expensive wood enables us all to enjoy the appearance of the finest woods, formerly only in houses of the wealthy, while the method of building up the core and applying the veneer insures the door against warping, twisting, sagging, etc., so common in doors of less careful manufacture.

In the manufacture of veneered doors the Paine Lumber Co., of Oshkosh, Wisconsin, use methods peculiar to their plant. The cores of all thin doors are not only built up of a number of narrow strips, but each strip is locked into the adjoining strips in such a manner that it is impossible to pull the core apart, even if no glue were used. THE KORELOCK core is plainly shown in the section of a door at the head of this page. It will be noticed that the tendency to warp is entirely overcome by the crossing of the grain of the wood in the core, as well as by the possibility of thoroughly drying the material. Any kind of wood can be used for the veneer, although the tendency at present is to use birch or oak. The former possesses a beautiful grain and figure, as may be seen in the door

panels shown here, and it can be finished in many styles or to match mahogany or other expensive woods. Oak, always the symbol of strength, makes an extremely durable and satisfying door in any of the standard finishes. It is to be hoped that on account of the thin veneer the best cuts can be used and a quarter-sawn veneer costs but little more than the plain. There is, therefore, every reason why a veneered door is preferable to the solid door and it is only occasionally that we see a solid door of the more expensive woods. Indeed we have seen a veneered door of clear white pine where it was especially desired to avoid warping, etc.

The standard oak or birch door is veneered with hard wood about one-eighth of an inch thick. In the fancy and figured woods, such as mahogany, rosewood, circassian walnut, etc., a thinner veneer is used, as it is not practicable to get the veneer in the standard thickness.



While some profess to not understand the recent interest in a better class of doors, we believe that it is perfectly reasonable in the light of progress made along all lines. The wood finishers, varnish makers, etc., have shown us the possibilities in hard wood. Prospective home-builders, searching for new ideas, have visited homes where hardwood has been used and nicely finished and insist on the same work in their more modest dwellings. Compared to a painted door, there is always a quick decision in favor of the veneered even at a slight advance in price.

For a time the carpenters objected somewhat to the veneered door, as they thought it required more work to hang them than fit them. This idea has largely disappeared on longer acquaintance with modern methods and tools; one style of door can be hung about as quickly as the other. A point sometimes lost sight of is the fact that veneered doors are almost always finished in natural colors, or to bring out the grain and figure, while with a painted door many defects in natural and workmanship can be covered up by unscrupulous manufacturers only to appear again after some time.

The PAINE LUMBER COMPANY are naturally gratified at the favorable impression their **Korelock** doors have been and are receiving and are making every effort to raise the standard of manufacture even above its present efficiency. In their catalogue "C," which is sent free on mention of the NATIONAL BUILDER, are shown many styles of veneered doors, forms of which we show on this page. Possibilities in the way of finishing color, etc., are also shown.

The PAINE LUMBER COMPANY also make the complete trim for buildings of all descriptions and of the finest workmanship and quality, and should be consulted when in need of any materials of this description.

Amatite ROOFING

Why the Buyer of Amatite Never Complains

WHEN a man buys ordinary ready roofing he usually neglects to paint it and after three or four years he comes back to the dealer with a protest. It is human nature to neglect painting roofs.

When a man buys Amatite Roofing he lays it on his building and in three or four years it is still as good as new and does not need any paint. He forgets he has such a roof but no harm is done by that.

There is nothing to neglect in the case of Amatite. Amatite has a peculiar surface—a sort of plastic concrete made of pitch and mineral matter.

This surface is plastic enough so that the material can be rolled up into handy rolls in the usual manner and handled just like any other ready roofing. When unrolled on the roof and nailed down it presents to the weather a continuous surface of mineral matter and pitch. On this surface wind, rain, storm, heat and cold have little effect. Year after year it looks up to the sky undisturbed and unaffected. It costs nothing to maintain and relieves the owner from all responsibility.

Dealers can improve their business by selling Amatite and buyers make a good bargain when they buy it. The price of Amatite is less than that of most painted roofings of less weight and durability.

Sample and further information on request.

New Books for Building Mechanics

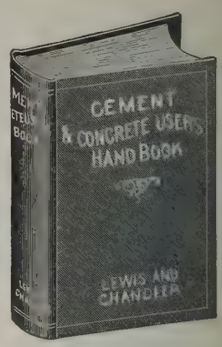
MODERN PLUMBING ILLUSTRATED. By R. M. Starbuck.

This book represents the highest standard of plumbing work. It has been adopted and used as a reference book by the United States Government, in its sanitary work in Cuba, Porto Rico and tne Philippines, and by the principal Boards of Health of the United States and Canada.
It gives connections, sizes and working data for all fixtures and groups of fixtures. It is helpful in demonstrating and in figuring work. It gives the mechanic quick and easy access to the best modern plumbing practice. Suggestions for estimating plumbing construction are contained in its pages. This book represents, in a word, the latest and best up-to-date practice, and should be in the hands of every architect, sanitary engineer and plumber who wishes to keep himself up to the minute on this important feature of construction. 400 octavo pages, fully illustrated by 55 full page engravings. Price.....**$4.00**

STANDARD PRACTICAL PLUMBING. By R. M. Starbuck.

A complete practical treatise of 450 pages covering the subject of Modern Plumbing in all its Branches, a large amount of space being devoted to a very complete and practical treatment of the subject of Hot Water Supply and Circulation and Range Boiler Work. Its thirty chapters include about every phase of the subject one can think of, making it an indispensable work. Fully illustrated by 347 engravings. Price.....**$3.00**

PRACTICAL STEAM, HOT-WATER HEATING AND VENTILATION. By A. G. King.



This book is the standard and latest work published on the subject and has been prepared for the use of all engaged in the business of steam, hot water heating, and ventilation. It is an original and exhaustive work. Tells how to get heating contracts, how to install heating and ventilating apparatus, the best business methods to be used, with "Tricks of the Trade" for shop use. Rules and data for estimating radiation and cost and such tables and information as make it an indispensable work for everyone interested in steam, hot water heating and ventilation. It describes all the principal systems of steam, hot water, vacuum, vapor, and vacuum-vapor heating, together with the new accelerated systems of hot water circulation, including chapters on up-to-date methods of ventilation and the fan or blower system of heating and ventilation. 367 pages. 300 detailed engravings. Price.....**$3.00**

CONCRETE CHIMNEYS, SLATE AND ROOF TILES. By A. A. Houghton

The manufacture of all types of concrete slate and roof tile is fully treated. Valuable data on all forms of reinforced concrete roofs are contained within its pages. The construction of concrete chimneys by block or monolithic systems of is fully illustrated and described. A number of ornamental designs of chimney construction with molds are shown in this valuable treatise.....**50 Cents**

POPULAR HANDBOOK FOR CEMENT and CONCRETE USERS. By Myron H. Lewis

This is a concise treatise of the principles and methods employed in the manufacture and use of cement in all classes of modern works. The author has brought together in this work, all the salient matter of interest to the user of concrete and its many diversified products. The matter is presented in logical and systematic order, clearly written, fully illustrated and and free from involved mathematics. Everything of value to the concrete user is given, including kinds of cement employed in construction, concrete architecture, inspection and testing, waterproofing, coloring and painting, rules, tables, working and cost data. Price.....**$2.50**

ORNAMENTAL CONCRETE WITHOUT MOLDS. By A. A. Houghton.

The process for making ornamental concrete without molds, has long been held as a secret and now, for the first time, this process is given to the public. The book reveals the secret and is the only book published which explains a simple, practical method whereby the concrete worker is enabled by employing wood and metal templates of different designs, to mold or model in concrete any Cornice, Archivolt, Column, Pedestal, Base Cap, Urn or Pier in a monolithic form—right upon the job. These may be molded in units or blocks, and then built up to suit the specifications demanded. This work is fully illustrated with detailed engravings Price.....**$2.00**

CONCRETE FROM SAND MOLDS. By A. A. Houghton.

A practical work treating on a process, which has heretofore been held as a trade secret by the few who possessed it, and which will successfully mold every and any class of ornamental concrete work. The process of molding concrete with sand molds is of the utmost practical value, possessing the manifold advantages of a low cost of molds, the ease and rapidity of operation, perfect details to all ornamental designs, density and increased strength of the concrete, perfect curing of the work without attention and the easy removal of the molds, regardless of any undercutting the design may have. 192 pages. Fully illustrated. Price.....**$2.00**

CONCRETE WALL FORMS. By A. A. Houghton.

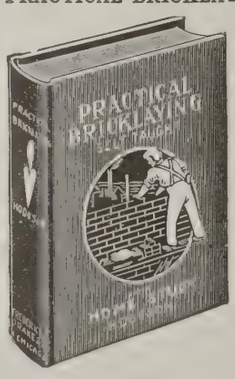
A new automatic wall clamp is illustrated with working drawings. Other types of wall forms, clamps, separators, etc., are also illustrated and explained.....**50 Cents**

CONCRETE FLOORS AND SIDEWALKS. By A. A. Houghton.

The molds for molding squares, hexagonal and many other styles of mosaic floor and sidewalk blocks, are fully illustrated and explained.....**50 Cents**

CONCRETE SILOS. By A. A Houghton.

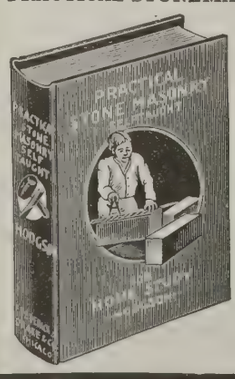
Complete working drawings and specifications are given for several styles of concrete silos, with illustrations for molds for monolithic and block silos. The tables, data and information presented in this book are of the utmost value in planning and constructing all forms of concrete silos....**50 Cents**



MOLDING AND CURING ORNAMENTAL CONCRETE. By A. A. Houghton.

The proper proportions of cement and aggregates for various finishes, also the methods of thoroughly mixing and placing in the molds, are fully treated. An exhaustive treatise on this subject that every concrete worker will find of daily use and value.....**50 Cents**

Any of these books sent prepaid on receipt of the price. Address **NATIONAL BUILDER, Pontiac Building, CHICAGO, ILLINOIS**

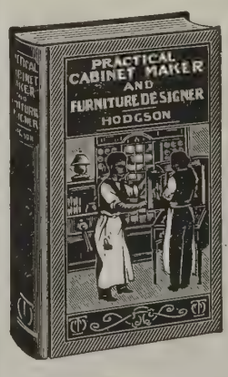


TWO PRACTICAL BOOKS

PRACTICAL BRICKLAYING—SELF-TAUGHT. BY Fred T. Hodgson, F. A. I. C. 277 Pages, 300 Illustrations, 12 mo, Cloth Binding. Price.....$1.00

Bricklaying is becoming quite an art, and the "bricklayer" is becoming of as much importance today as he was in the 16th and 17th centuries. It is absolutely necessary now-a-days that, in order to take his proper place among the arts and crafts, he become familiar with all the minutiae of the trades. As much art can be displayed in brickwork as in any other of the trades, and it is up to the working bricklayer to get all the knowledge possible regarding his calling, so as to enable him to execute any kind of work relating to his trade. This book is designed to help him out in this matter, and discusses the various kinds of bond, ornamental brickwork, damp courses, quality of brickwork, forming of pilasters, quoins, skew arches, splay work, brick joints, chimneys, fireplaces, flues, brick-pavings, and many other classes of brickwork. The work contains 300 fine illustrations.

PRACTICAL STONEMASONRY—SELF TAUGHT. By Fred T. Hodgson, F. A. I. C. 300 Pages, 500 Illustrations, 12mo, Cloth Binding. Price.....$1.00



This book deals with stone cutting and mason's work, methods of building walls in rustic rubble, ashler square, uncoursed, random coursed, irregular corners, snecked and square rubble polygonal ragwork, and other styles of masonry and stone cutting are explained and illustrated. Finished stones, such as window sills, window heads, coping, arch stones, key stones, and similar dressings are described and illustrated. Stone arches and joints are described and illustrated, with ample instructions for working them.

The book contains hundreds of illustrations and diagrams, and is a complete cyclopedia of practical instructions in masonry and must prove of inestimable value to the operative mason.

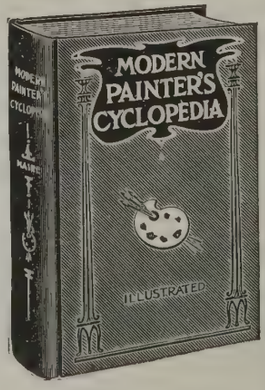
JUST FROM THE PRESS

The Practical Cabinet Maker and Furniture Designer



By FRED T. HODGSON, F. A. I. C.

Large 12 mo, Cloth Binding. Price.....$2.00

An entirely new book on cabinetmaking in all its phases and is intended to aid young workmen in making all kinds of furniture from the simplest mission to the most elaborate styles. It contains lessons of the framing and joining of woodwork, glueing and the using of glues generally, veneering, doweling, gilding and completing fine cabinet work. It describes the various woods suitable for cabinet work and the best methods of working them. Various styles of work are shown, French, German, Queen Anne, Chippendale, Shereton, Hepplewhite, Colonial, Adams, Louis XVI, Louis XVII, Louis Seize, Boule work, and other styles, thus enabling the student to recognize the style of a piece of furniture on sight.

The book is well illustrated with several hundred illustrations.

The Modern Painter's Cyclopedia By F. Maire, Head Instructor of the Chicago School of Painting. Decorating and Paperhanging
Illustrated, Cloth.....$1.50

It is an entirely new book on painting. It is not a revised edition of an older book of nearly the same title. It treats its subject matter in an up-to-date way, discarding the old methods where the new are better. The headings of the subject matter are the only remains of the older book.

The manner of writing up the subject matter, while it may not be new in some other publications devoted to the study of manual trades, is certainly new as applied to any heretofore published which treats upon paints and painting.

As much as possible many tedious repetitions have been saved by having arranged all details throughout the book in numbered paragraphs so that, whenever it is needed, reference is made to such or such numbered paragraphs, which give the additional information.

At the end of every subject-head will be found "Questions," each of which are numbered and which appertain to a similarly numbered paragraph of text, where the answer to the question asked will be found. It is hoped this will be of great help to apprentices or students who are endeavoring to obtain a better understanding of the painting trade, as it will enable them to search out the answers, and better still, to review what they have just read and to give the answers from memory, as it will help to fix the information gained more permanently.

The above books sent postpaid on receipt of price

CORTRIGHT METAL SHINGLES
ARE STORM PROOF

That's one of the best arguments you Contractors and Builders can offer to your clients.

CORTRIGHT Roofs are also fireproof, last as long as the building, and never need repairs.

These facts have been shown so clearly to the consumer that the demand for the CORTRIGHT METAL SHINGLES has grown to tremendous proportions, and is ever increasing, and the contractors and builders who are handling them are reaping the benefit.

If you have not received our special proposition to Contractors and Builders, send for it now before you forget it.

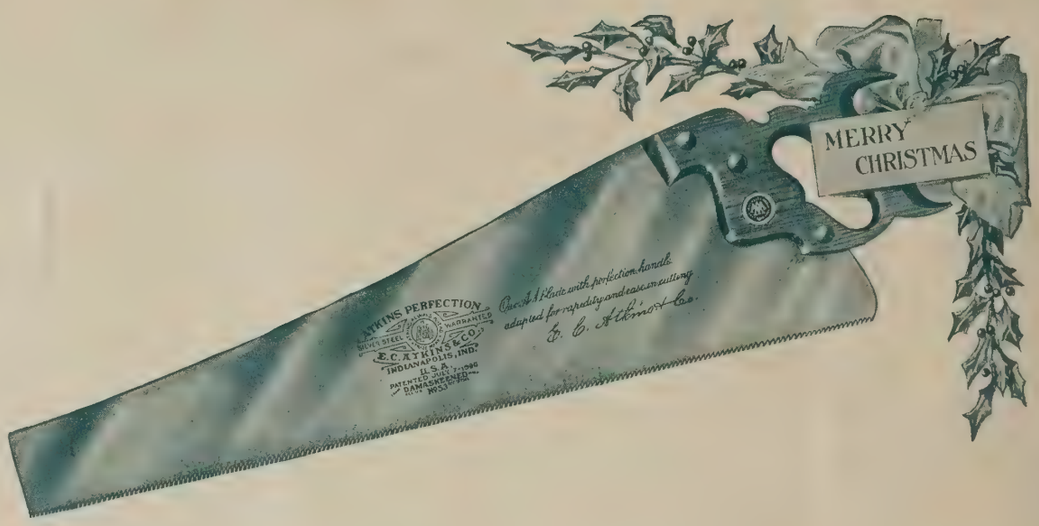
SARGENT

Hardware

is used throughout many of the most notable public buildings in this country.

Experienced architects and owners know its solid worth. They appreciate the beauty and distinction of Sargent designs. They realize that Sargent quality means long, satisfactory wear and the saving of repair bills.



Whether you propose building a great office structure, a magnificent residence or a modest cottage, it is well worth while to understand the advantages of Sargent Hardware. Sargent designs include styles to harmonize truly with every period and school of architecture. Let us send you a complimentary copy of the

Sargent Book of Designs

It contains illustrations and descriptions of a great variety of patterns, also much other information that is valuable to anyone who builds. Our Colonial Book will be included if you mention an interest in that period.

ATKINS Silver Steel SAW

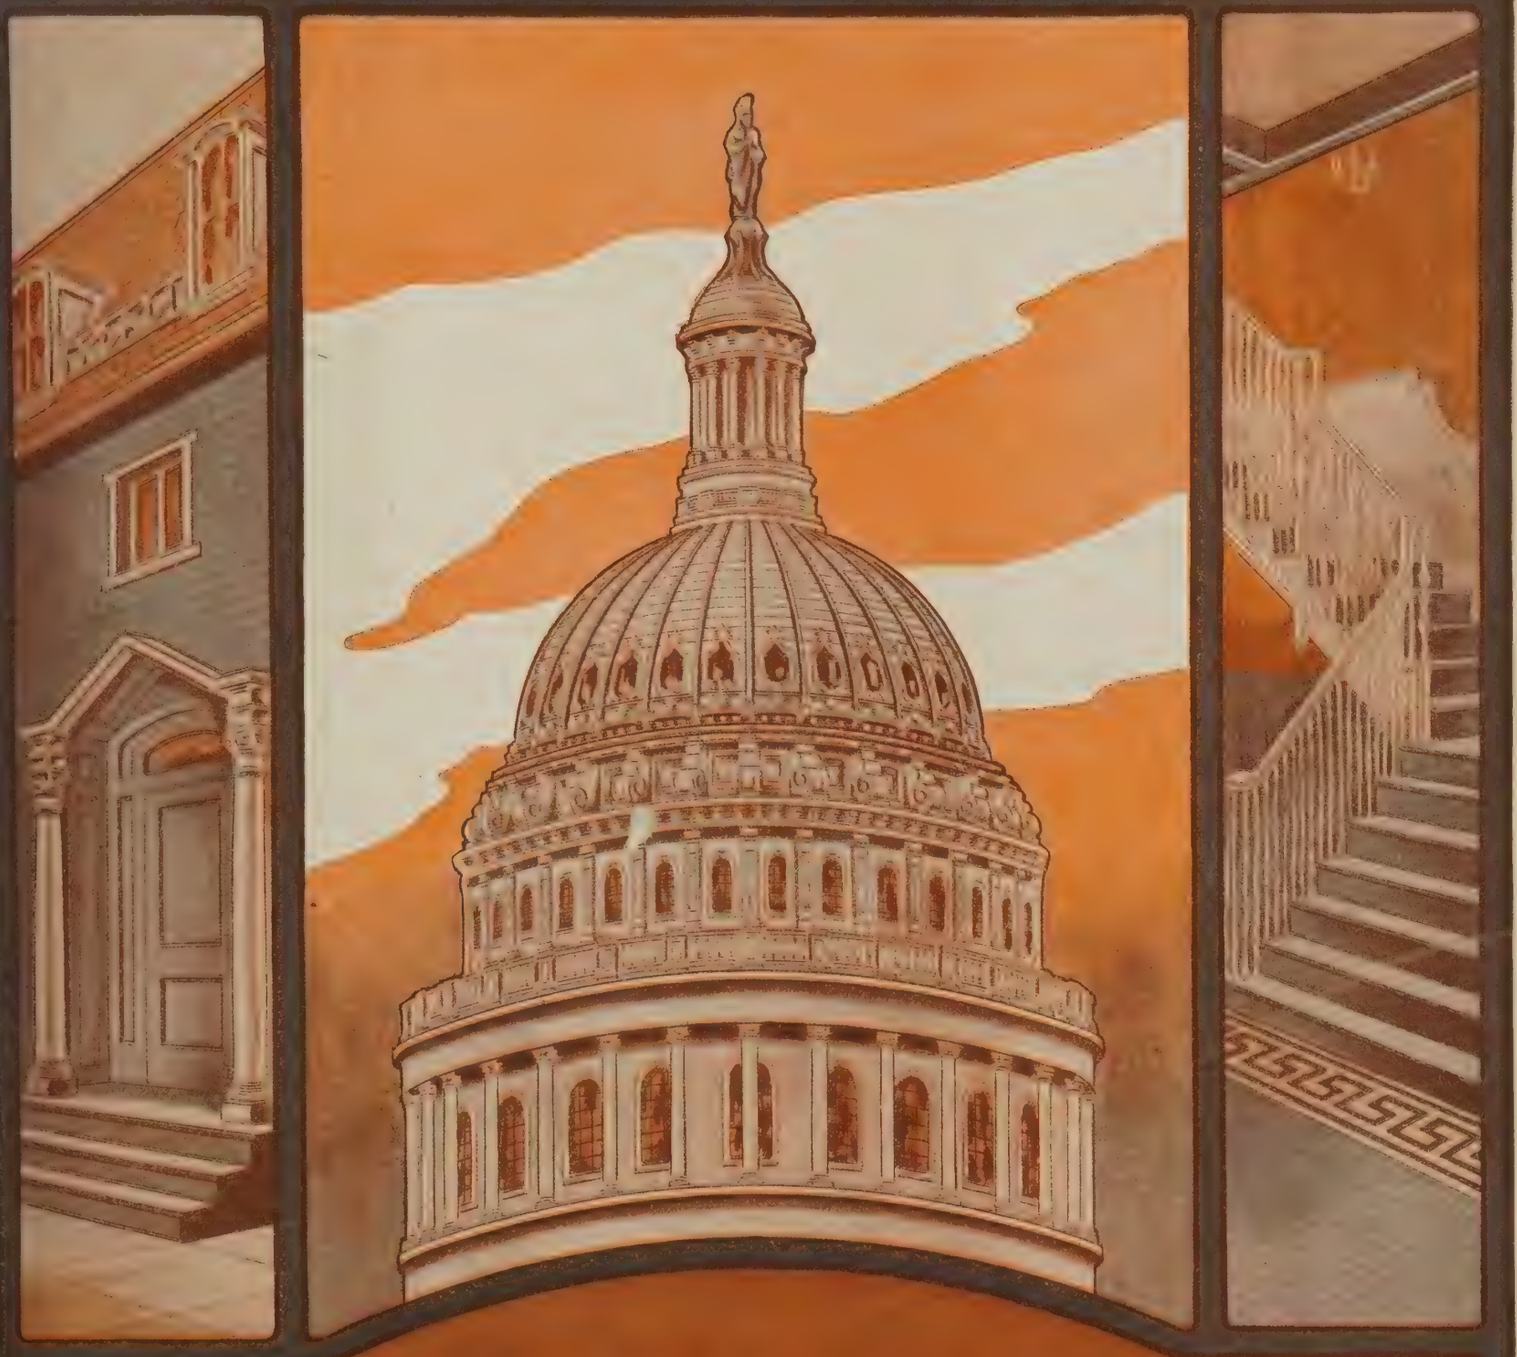
If you are married—why not suggest to your wife a Genuine SILVER STEEL SAW? Is there anything that you actually need more?

If you are not married—then the sister or best girl would surely rather give you something that is going to save your time, your strength—your very lifeblood—than a gewgaw that you do not want and that will soon be forgotten.

If you are one of those crusty old bachelors, why not make yourself a present that will be a source of gratification for years to come?

IT'S ALL UP TO YOU

Why not work your plans to get what you want most—a really fine new saw that you will be proud of?



OUR GUARANTEE

And remember that if your ATKINS SILVER STEEL SAW is not the very best saw you ever used, take it back to your Dealer and get your money back. This is the only real guarantee that protects you. We are not afraid to stand behind our Saws.

Better Than Plastering! Costs Only Half!

Applying Wall Board to Studding

Applying Wall Board to Ceiling

Applying Bishopric Sheathing

Send for Free Illustrated Book and Big Free Sample of Bishopric Wall Board

CONTRACTORS AND BUILDERS—This famous Wall Board and sheathing will run your busy season right through the winter. There are buildings in every community which could be remodeled **at once** if you only showed the owners how well and how low priced it can be done with Bishopric Wall Board. Look for these jobs. You don't have to wait for building weather. This is the Bishopric Wall Board weather—and remember—your Bishopric jobs will look just as handsome and last longer than the best lath and plaster ever put up. 12,685,500 square feet of Bishopric Wall Board and Sheathing sold in one year. This is going to be a greater year for these products than ever. "There's a reason."

CONTRACTORS' AND BUILDERS' COUPON

The Mastic Wall Board and Roofing Mfg. Co.
314 Este Ave., CINCINNATI, OHIO

Please send me your Wall Board and Sheathing Book—and big Sample of Bishopric Wall Board. Also your special proposition to Contractors and Builders.

Name .....

Address.....

City..... State.....

BISHOPRIC WALL BOARD AND SHEATHING

Made With Tough, Fire Resisting and Everlasting Asphalt-Mastic

This is asphalt toughened by a patented process and *it won't burn.* In hot Asphalt-Mastic kiln-dried dressed laths are imbedded at a pressure of 500 pounds to the square inch. The other side of the Asphalt-Mastic is surfaced with heavy, sized cardboard.

The non-burning Asphalt-Mastic protects the lath. Buildings have been saved because of this wall board.

Bishopric Wall Board comes in sheets 4x4 feet, ready to go on. It goes on *dry.* You don't have to wait for setting or drying as you do with plaster. Bishopric Wall Board does not freeze—has none of plaster's troubles—you can finish a building in the dead of winter and *save a month's time.* Use it for remodeling. Close up the attic and make a comfortable room with it. Make new partitions with Bishopric Wall Board. Finish the porch—ceil and wall the cellar with it.

Laths Keep This Wall Board Flat Forever

Bishopric Wall Board is the only wall board made with laths. Laths are positively necessary to back up a wall board—to make it rigid and substantial—and to keep a perfectly flat surface.

Without lath, wall board swells, warps, cracks, and pulls away from the joints.

Bishopric Wall Board never warps—never cracks—never pulls away from the joints. It keeps its flatness as long as your building lasts. It is sold to you on our binding, money-back guaranty that it will make good on every claim.

Save 75 Per Cent by Using Bishopric Sheathing

Bishopric Sheathing is made of precisely the same materials as Bishopric Wall Board, but finished surface is not so smooth. It saves, by actual figures, 75 per cent of the cost of applying lumber and building paper. It is far better. Binds cement or stucco to building as nothing else can. Proof against cold, heat, dampness and vermin. The family can move right into a comfortable building the day it is finished with Bishopric Wall Board and Sheathing.

Make Air-Tight, Rat-Proof Farm Buildings

Where it is not necessary to make a finely finished job, Bishopric Sheathing is used instead of wall board.

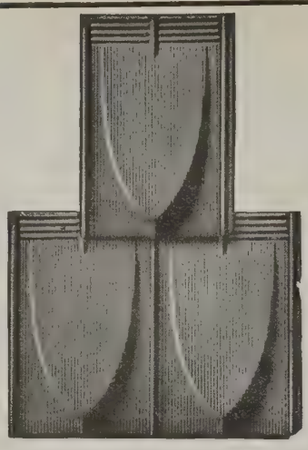
Use the Bishopric Wall Board and Sheathing in stores, garages, churches, schools, mills, warehouses, stations, moving picture houses, booths, lodge halls, city buildings, farm buildings.

Price of Bishopric Wall Board

Each crate contains sixteen sheets, 4x4 feet, making a total of 256 square feet. Price, $6.40 per crate of 256 square feet, or $2.50 per square of 100 square feet, f. o. b. Cincinnati.

Price of Bishopric Sheathing

Each crate contains sixteen sheets, 4x4 feet, making a total of 256 square feet. Price, $6.00 per crate of 256 square feet, or $2.35 per square of 100 square feet, f. o. b. Cincinnati.



Get Our Special Proposition

We have a special and very attractive proposition for contractors and builders. Fill out the coupon in this advertisement, or drop us a letter or a postal today. You put yourself under no obligation to us whatever. All we want is an opportunity to show you how you can make Bishopric Wall Board and Bishopric Sheathing a big paying part of your business—a business that goes right on through your slack season as well as your busy season.

This is our great 1912 offer—specially made to meet building conditions for the coming year. There will be a big response. Don't be the last to get your inquiry in. Address

Don't Miss This Opportunity

We Want One Carpenter or Builder in Every Community to Demonstrate, Take Orders for and Apply Our EDWARDS METAL SPANISH TILE ROOFING on a Liberal Commission.

Here is a chance to build up an independent, profitable business for yourself right at home. Many carpenters are now devoting their entire time to selling our metal roofing Others have made big profits **simply devoting part of their time to selling and laying our Metal Spanish Tile.**

Edwards Metal Spanish Tile

Is being advertised in the leading magazines and is now known to thousands of home builders and owners everywhere. Wherever it has been used it has made a decided "hit" because it shows off to good advantage on the roof and has numerous points of superiority over any other style of roofing.

Architects are specifying Edwards Metal Spanish Tile, for they know it will do away with roofing "troubles." Builders like it because of the finished appearance it gives any house on which it is used.

Our Metal Tile are stamped out of the highest quality Worcester terne plate in exact imitation of the most expensive Terra Cotta Spanish Tile. They come either "dip" painted or heavily galvanized, size 10 x 14 inches. Our patented interlocking side lock makes it possible to make a perfectly moisture-proof roof without soldering. Edwards Metal Spanish Tile afford the fireproof advantages of Terra Cotta Tile, but are much lighter in weight, cost but a trifle more than ordinary roofing and will last a lifetime.

WRITE US TO-DAY ABOUT YOUR TERRITORY. Our business is growing so rapidly that it is necessary to have an agent in every community. The territory is going fast. One day's delay may mean that someone else will be given your territory. DON'T DELAY. WRITE TO-DAY FOR OUR SPECIAL AGENTS' PROPOSITION.

Note the construction of patented interlocking device, protecting nail heads from weather and providing perfectly for expansion and contraction of the metal.

MF

32 POUNDS COATING

ROOFING TIN

"The Terne which turns the elements"

MF ROOFING TIN in the hands of a practical roofer assures both builder and property owner a roof that is light, clean, fireproof, lasting, and thoroughly satisfactory. MF is the original Old Style, and is the most popular terne plate manufactured. Each plate is stamped with the weight of coating —32 pounds, which is an assurance to the purchaser that he is getting exactly what he is paying for. This is important—insist upon your plates being stamped with the weight of coating. You hear complaints that Tin Roofs do not last as long as they did formerly. Why is it? Simply because there has been a tendency to buy cheap plates and then put them on the roof as cheaply as possible. You can buy as good or better plates to-day than ever before, one reason being that they are more uniformly coated. MF plates if properly applied will last a lifetime, and are the cheapest in the long run Write us for a free sample of MF, and note the softness, pliability and even coating. We also manufacture other brands of redipped plates carrying from 20 to 40 pounds of coating.

A Few Helpful Facts About Pipe and Boiler Insulation

As you of course know, insulation is based on the fact that heat cannot pass through dead or motionless air. Therefore, the more dead air a pipe covering confines, the greater its efficiency.

Now, J-M Asbestocel Pipe Covering is the only low-pressure covering we know of which confines air—and lots of it—in an absolutely *dead* state—the only one which permits no circulation whatever.

In other coverings the air channels run from end to end and the air is, of course, continually traveling back and forth.

But the air cells run *around* the pipe—each cell entirely separate in

J-M Asbestocel Pipe Covering

Thus the spaces are so small that the air has no chance to circulate.

Also, because of this arrangement of the air cells, J-M Asbestocel Pipe Covering is built on the arch principle and is therefore far *stronger* than other low-pressure coverings—doesn't crush down under weight—*lasts longer* than any other kind of low-pressure covering.

If you will investigate, we believe you will find that your client's interests will be best served by the installation of J-M Asbestocel.

Write our nearest branch for booklet giving the results of an engineering test (made by disinterested investigators) showing how much more coal J-M Asbestocel Pipe Covering saves as against ordinary coverings.

The Advantages of a Portable Woodworker

Especially the "FAMOUS"

YOU WANT THE BEST

Several Woodworking Machines Combined in one

The machines embraced in the FAMOUS Portable Woodworker are:

- 8″ Jointer
- 20″ Band Saw
- Saw Table (carrying a 12″ saw blade) with raising and lowering arbor.
- Mitering Attachment
- Cut-off and Ripping Gauge
- Disc Sander
- Emery Grinder

3 H. P. Gasoline Engine, Batteries

All Necessary Belting

Stop hauling your millwork to the machine-shop—and hauling it back. Bring your machine-shop to your millwork! It's cheaper—and the saving goes into **your** pocket.

The FAMOUS Portable Woodworker is really a movable machine shop. When you've completed your contract on one job, move the machine to the next. Seven useful woodworking machines—practically all that a contractor requires—are combined into one. And a gasoline engine, complete with belting, is included in the outfit.

A Remarkable Machine

Combining all the remarkable features of the FAMOUS Universal Woodworker—over eight hundred, of which are in use—our Portable Woodworker is a real boon to contractors everywhere. Surfacing and edging, boring, band-saw work, ripping and cutting-off, sanding—all these, and more can be done on this machine **right at the place where your work is!** No planing-mill delays and **no unnecessary expense.**

The FAMOUS Portable Woodworker is mounted on skids and can be moved around without any trouble. A wheeled truck can also be furnished. The engine is three horse power, and batteries and belting come with it. This is by far the best proposition today in woodworking machinery. Write for full details.

THE DOUBLE CLAW HAMMER

BETTER HANDLE, BETTER STEEL, BETTER FINISH
and we find the
BETTER MECHANIC USES IT FIRST
FREE DELIVERY TO YOUR ADDRESS ON RECEIPT OF $1.50

¶ Pulls the nail out straight without a block. ¶ Relieves the strain on your arm when doing scaffolding, siding and ceiling work. ¶ You hold on with your left hand while pulling with your right—this gives you more power and the nail is not rolled into a fish-hook as with the old hammer. ¶ You drive the nail right in again. For "finishing work" the Double Claw Hammer is a great aid, as 10% to 15% of all finishing nails start wrong and must be withdrawn.

Under strong competition you pay 75c for a good hammer. The high nailing feature of the Double Claw Hammer is worth 75c many times over. The straight and easy drawing of nails is worth another 75c. The ease and pleasure in using a tool like this cannot be measured by the slight additional cost.

The Double Claw has all the good features of the old hammer, and a lot more besides.

SAP GUM

The success of ***RED GUM*** in New York building operations—both large and small—has been most pronounced.

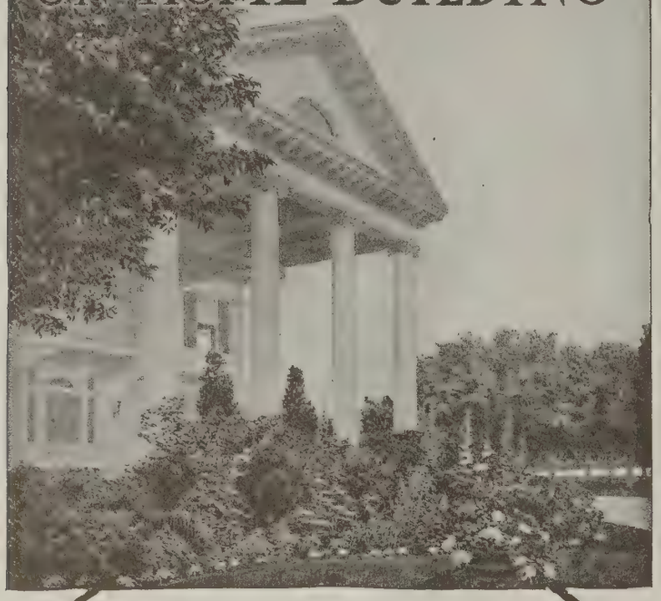
Any builder who wants to be up-to-date may find several hundred high class apartment buildings and residences in which ***RED GUM*** has been selected for the interior trim because of its beauty and value.

SAP GUM

(which comes from the same tree) is not yet so generally known, perhaps because it lacks the superb grain and color of ***RED GUM*** and because it is usually used where it does not show. (***SAP GUM*** is the ONE BEST WOOD known for WHITE ENAMEL TRIM, for instance.)

Builders who don't yet know about ***SAP GUM*** will find it is thoroughly reliable when properly manufactured, and will find, furthermore, that ***SAP GUM*** has all the good qualities of many of the woods hitherto used merely through force of habit.

Get any responsible trim manufacturer to make you a quotation on good ***SAP GUM*** in places where you would otherwise use other woods, and you will be glad to find



YOU WILL SAVE SOME MONEY

without any loss of value whatever, and with an increase of prestige.

The Builders' and Contractors' Guide to Correct Measurements

By Fred T. Hodgson and W. M. Brown, C. E.

261 PAGES, 45 ILLUSTRATIONS, 12MO, CLOTH BINDING. PRICE, $1.50

THIS book is intended to instruct builders and quantity surveyors to obtain correct measurements of areas, solids and lengths and breadths of work wrought, or work to be wrought, for purposes of estimating, or for artisan's pricing in order that the latter may get a just rendering of his claims, or the dealer get an exact statement of any materials he may be called upon to furnish. The question of measurements is a very important one, and it is essential the measurements should be correct and in accordance with the rules laid down by some standard authority, as costly disputes are often incurred because of incorrect or careless measurements. The present volume is intended in some measure to supply a set of standard rules for taking dimensions, the results of which will be reliable and which all parties concerned can accept without any misgivings

FOR SALE BY

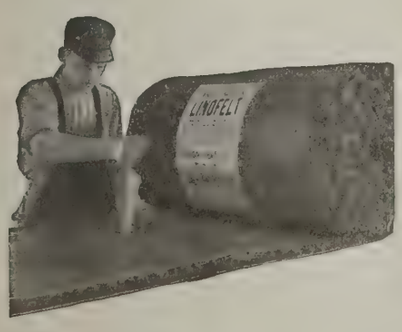
LINOFELT=Weatherproof

Linen-Felt made from Flax Fibre

LINOFELT
Linen-Felt made from Flax Fibre

for



1912

". . . . . I feel that the company that produces an article like Linofelt owes it to the citizenship of our country to tell them what the conditions in their houses really are and how they can be remedied."

—Extract from recent letter from leading material man in Duluth.

The conviction expressed above heads our good resolutions for the New Year. In discharging this, our debt to the citizenship of our country, we ***must*** have ***your*** aid—to ***your great profit.*** Write us today.

UNION FIBRE COMPANY

ABOUT the most puzzling problem you have with residences is that of ***weatherproofing*** the walls and roofs. You know that building-paper is nothing more than a wind-break at the best, that tarred felts and such add expense to little or no effect

What you want is **SOMETHING** that will keep heat and cold each on their own side of the wall, just as any opaque substance separates light and darkness. But perhaps you have never heard of any such material.

That's our fault—but it won't continue to be. In 1912 we're going to tell the public—***your*** public—***all*** about Linofelt. And if satisfied customers—walking, ***strutting*** advertisements—mean anything to ***you***, we're going to put big round dollars into your pockets as was never done before.

Sure, there's such a material. By hundreds of ***actual*** and ***laboratory*** tests **LINOFELT**—

—stops the passage of heat and cold more effectively than ***40*** thicknesses of standard building-paper.

—cuts ***one-third*** off ***your*** customer's fuel bill ***every*** winter.

—keeps his house ***cooler in summer*** than you or he ever dreamed possible.

—deadens sound from ***200*** feet through wood to ***2*** feet through Linofelt ***and***

—adds no more than one per cent to cost of building at most.

Linofelt is made from flax fibres, specially treated and steam-cooked in chemicals. After drying it is made into batts a quarter-inch thick and quilted between 2 sheets of rosin-sized building-paper on the largest sewing-machine in the world.

Linofelt is used just like building-papers. It comes in 18 different styles to meet any particular use or problem which may arise.

Remember that only separated dead air-cells stop heat and cold. Live air is the best transmitter known—and that's what your so-called "dead" air space is. Linofelt contains ***more*** separated ***dead*** air cells than any other substance capable of use in building.

Write us ***today*** for our booklet and all the information you want. Send us the wall and roof dimensions of any residence you have in work and let us estimate it for Linofelt. There's no "corner-coupon" here; we want you to write us a ***personal*** letter.

There is money in it for both of us—write us ***now.***

U. S. GOVERNMENT REPORT

(Dept. of Agriculture, Forest Service, Bulletin 95,)
issued June 30, 1911, says of

CYPRESS:

"AS SIDING IT PRACTICALLY WEARS OUT BEFORE IT DECAYS"

(FROM PAGE 44, U. S. GOVERNMENT BULLETIN 95.)

Same report says "CYPRESS shows paint well and holds it for many years, but lasts a long time without it."

(You know the conservatism of Government Reports)

Heres a photograph (straight from the wood) of a piece of *Cypress Siding* taken from St. Charles College, La., duly attested in writing by the president, Father Maring. Built 1819—torn down 1910. *NOT A TRACE OF ROT.* Note that the lower or exposed edge, originally the thicker, has become the thinner by the simple erosion of nearly a century of rains.

CYPRESS SIDING SOUND AS A DOLLAR after withstanding the tempests of a century and willing to start again! *91 YEARS "ON THE JOB," WITHOUT EVEN PAINTING,* on a church in use till the day it was razed to make room for a larger building, and the *CYPRESS LUMBER COMPOSING IT THEN USED AT ONCE* to erect a new gymnasium!

THERE'S INVESTMENT VALUE WORTH WHILE!

WRITE TODAY for VOLUME ONE of the CYPRESS POCKET LIBRARY, with Full Text of OFFICIAL GOVT. REPORT as quoted above. (Sent FREE PROMPTLY on request.)

"WOOD THAT WILL STAND THE GREENHOUSE TEST WILL STAND ANYTHING." *ASK FOR VOL. THREE—ALSO FULL OF VITAL FACTS.*

When planning new improvements or repairs to old ones, just remember—"*With CYPRESS you BUILD BUT ONCE.*"

Let our "BUILDERS' HELP DEPARTMENT" help YOU. Our entire resources are at your services with Reliable Counsel.

COPYRIGHT, 1909, BY THE STANLEY RULE AND LEVEL COMPANY

Stanley Tools

The "BAILEY" Iron Plane has been the standard for over forty years and during that period has always maintained the leading position.

From time to time other Iron Planes made in imitation of this celebrated Plane have appeared upon the market.

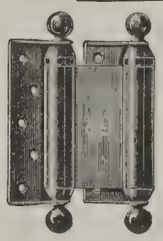
These imitation Planes are often put up with numbers and labels designed to make the consumer think that he is obtaining the "BAILEY" Plane.

We are the sole manufacturers of the "BAILEY" Plane. Every Plane has the name "BAILEY" and the number cast in the bottom, and the name "STANLEY" is stamped on each cutter.

Always insist that your order be filled with Planes made by the Stanley Rule & Level Co., which carry with them a guarantee backed by a Company that has been manufacturing Carpenters' and Mechanics' tools for over half a century.

STANDARD THE WORLD OVER

Stanley Rule & Level Co.
NEW BRITAIN, CONN. U.S.A.



EVERY TOOL GUARANTEED

DUMB WAITERS

The best is the best and the cheapest is not always the cheapest. Builders who have used the most dumb waiters and hand power elevators agree that those made by the Sedgwick Machine Works are the best and if results are considered, that they are the most profitable to handle. Some builders buy the Sedgwick Machines only and build the balance of the outfit themselves. Others find that it is more convenient to let the Sedgwick Machine Works supply the complete outfit, as it is manifestly impossible to make one dumb waiter as cheaply as they can be made a hundred or a thousand at a time.

Send at once to the Sedgwick Machine Works, 130 Liberty Street, New York, for their Catalogue "K" which will be mailed you free, and you will then have for reference a catalogue from which you can select just what will best suit your requirements.

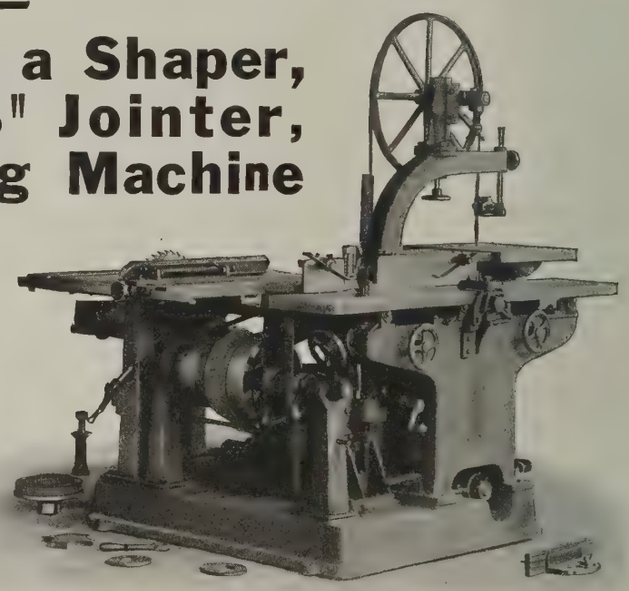
Place Yourself On an Equal Basis With the Planing Mills

BY MANUFACTURING YOUR OWN MILLWORK



WITH A No. 51 CRESCENT UNIVERSAL WOODWORKER

Keep the Millman's Profit for Your Own

Equip your shop **now** with this No. 51 Crescent Universal Woodworker. It can be instantly available and operated at a very small cost.

This Outfit Combines a Shaper, a 26" Band Saw, an 8" Jointer, Saw Table and Boring Machine

The Special Equipment

consists of Re-Saw Attachment, Tenoning Attachment, Panel Raiser, Pole Rounder, Hollow Chisel Mortising Attachment, Disk Grinder, Knife Grinder and Emery Grinder.

If You are Rushed On the Job

you can operate the band saw, the jointer, saw table and borer all at one time. This means that four men can work on a No. 51 at one time without interfering with one another. Each machine can be operated independently of the other. It is not necessary to stop all the machines when you want to stop one.

The No. 51 Crescent Universal Woodworker is a Portable Machine

instantly adaptable for being moved from place to place without the aid of crowbars or rollers.

Let Us Get Together Now—You Will Find This Outfit the Easiest Operated and the Most Economical

We build besides this machine, an elegant line of Band Saws, Saw Tables, Jointers, Shapers, Planers and Matchers, Disk Grinders, Swing Saws and Borers. Our catalogue will tell you all about No. 51 and these separate machines.

"AMERICAN" CONTRACTORS' PORTABLE SAW BENCH

If it pays to use machine tools and methods in the mill, certainly you can expect equal savings when you use a machine tool right on the job, replacing hand labor.

With an "American" Bench, you have a miniature planing mill right at your work, capable of doing the work of a rip, cut-off, and mitre saw; dado, rabbeting, gaining and grooving machine; matcher, moulder and jointer; and a boring machine.

But be sure that your bench is an "American." For that name "American" stands for the best manufacturing methods, the highest quality, and the maximum earning power for you.

The name "American" is a guarantee of maximum satisfaction

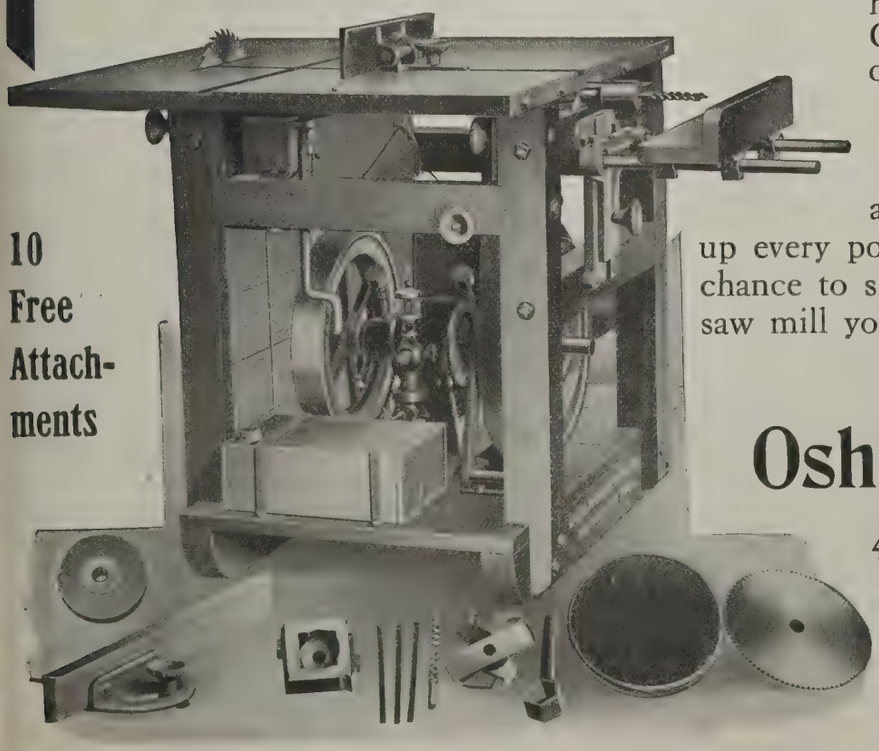
Everybody Satisfied

Not a saw rig back, nor one unsatisfied user since the first one put out! That's because the Oshkosh is made on the correct principle, and saves the contractor big money on every job—from a five-room dwelling to a public school. If this were not a fact, we could not guarantee it for life.

TRADE OSHKOSH MARK *Eveready*

SAW RIG

Guaranteed for Life



No matter how long you use the Oshkosh, if any part proves defective in material or workmanship, we will replace it free of charge.

Now don't think the Oshkosh is just for the "big contracts." You can use it on ***any*** job. It's on skids and can be easily pulled anywhere. It saws and rips not only straight lumber but also does a lot of so-called "hand-work," such as cutting stair joists, etc. Besides that, you can do innumerable other jobs with these **free attachments: 12" Jig Saw, Boring Device, 10" Pat. Sanding Disc, 2½" Pat. Jointer, 6½" Dado Head, 6" Emery Wheel, Mitre Device, and Pat. Rip and Bevel Gauge**—ten in all, with one rip and one cross-cut saw.

The Oshkosh is furnished with the best engine we could buy. It requires no experience to operate it and a gallon of gasoline will last **many** hours. The power is ample for any sawing purpose—in fact, it's a sturdy power plant you can't afford not to own.

If Not Satisfactory Return It at Our Expense

We mean exactly what we say. Any responsible contractor can send for this saw rig and try it out on his hardest contract. If it is not **just as we represent it**, he can return it at our expense. Can you possibly think of a fairer offer?

10 Free Attachments

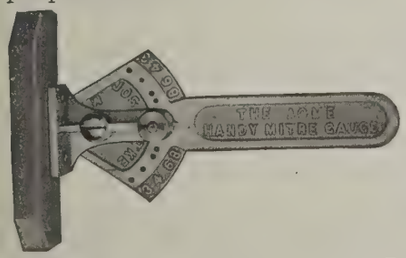
OVER $100,000.00



Has been SAVED by USERS of the

Acme Floor Scraping Outfit

during the past five years. Thousands of machines are now in daily operation, and every mail brings letters from users commenting upon the satisfactory work their outfits are doing and the vast amounts of labor expense they are saving.

Now, Mr. Contractor, you do not have to rely upon what I say regarding the merits of my machines, but I want you to let me send an outfit to you on **one week's free trial,** and you can then let the machines demonstrate on your own work just what they can do. If, after working with the equipment for one week, you are not convinced that the same will save you many dollars, and do your floor scraping better than it was ever done before, just pack up the machines, return them to me, and you will owe me nothing.

Write to-day for booklet and full details of my proposition.

The Acme Handy Mitre Gauge

is another labor saving tool. It is absolutely accurate, can be set at any angle and fits in the pocket where it is always ready for instant use. If your dealer does not carry them in stock, then write to me for circular describing this wonderful little tool.

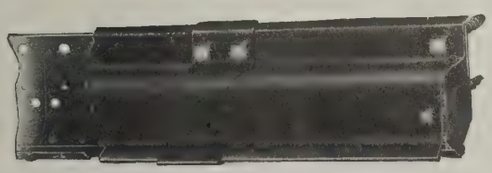
STORM-PROOF Hanger and Rail

No. "77" STORM-PROOF HANGER

Here is a new combination and one that will please you.

Easy-running, anti-friction roller bearings.



A rigid and flexible hanger in one.

Frictionless contact with rail.

One pair in a box with bolts for hanger, and lag-screws, end-stops and cover-splice for rail. Illustrated directions with each pair.

STORM-PROOF RAIL

Tite-Fit

A new departure in barn-door rail.

Requires no brackets.

Forms a continuous bracket in itself.

Requires no housing, as it fits close against the building.

Perfect tread for hanger wheels.

Bird- and Storm-proof.

Made in 4, 6, 8 and 10 foot lengths, two pieces of a length in a bundle.

Send for descriptive circular "A" and give dealer's name.

National Mfg. Co.

Sterling, Ill.

Go to the bottom of the roofing question—if you want to save money on your roof.

Don't be caught by mere looks and mysterious terms. Find out what the roofing is made of.

And the time to find out is before you buy—it is often costly to find out afterward.

Genasco

the Trinidad-Lake-Asphalt Roofing

is made of *natural* asphalt.

The difference between natural asphalt and manufactured or artificial "asphalts" is great. Natural Trinidad Lake asphalt contains natural oils which give it lasting life. They are sealed in Genasco and stay there to defend it permanently against rain, sun, wind, heat, and cold.

Artificial asphalts are residual products. Same way with coal tar. They are mixed with oils which make them pliable for a while, but the oils evaporate quickly when exposed to sun and air; they leave the roofing lifeless, and it cracks and leaks.

When you get Genasco you can be sure of roofing that lasts. And roofing that lasts is the only kind worth having.

The Kant-leak Kleet is the lasting waterproof fastening for seams—prevents nail-leaks, and does away with unsightly cement.

Ask your dealer for either Genasco mineral or smooth surface roofings with Kant-leak Kleets packed in the roll. Fully guaranteed. Write for The Good Roof Guide Book and samples.

Do You Want This Job?

It Pays This Building Foreman $250 a Month

There are thousands of just such jobs awaiting the trained man. In every section, in every state, and in every city there are factories to be superintended; machinery to be repaired; railroads to be built and maintained; residences and business blocks to be erected; canals, cuts, and tunnels to be dug; or dams and power plants to be constructed.

Who should be in charge of this work? YOU.

Who should receive the high salaries paid for such work? YOU.

Who should qualify to successfully handle this work? YOU.

The progress of this age is not going to stop, and some one must do this work. Will it be you or the other fellow? One thing is certain: it will be the man best qualified for the job.

Thousands of I. C. S. students are today heads of the largest manufacturing, inventive, constructive, and business enterprises. And for 20 years it has been the business of the I. C. S. to prepare men for such positions. But today there are more businesses than ever, more opportunities than ever, and there must be more trained men than ever to fill the many positions.

Let us help you to qualify for a bigger job. What we have done for tens of thousands of others we can do for you.

You need only mark and mail the attached coupon and you will receive, without obligation or cost, full information about any position in which you may be interested.

Mark and Mail the Coupon TODAY

International Correspondence Schools
Box 1332, SCRANTON, PA.

Please explain, without further obligation on my part, how I can qualify for a higher salary and advancement to the position, trade, or profession before which I have marked X.

LINOFELT

Linen Felt made from Flax Fibre

The Weatherproof House is a Linofelted House—This Month, Next Month, the Year Around, and in Any Climate.

Architects and contractors who know LINOFELT specify it regularly. Those who do not know LINOFELT are missing their best opportunity to win an extra degree of enthusiastic gratitude from their clients and customers. And this "extra degree" is what puts the money in your pockets. Turn to page 11 for further details and jot this down in your memory now:

1—LINOFELT cuts 40% off the coal bill every year.

2—LINOFELT keeps a house cool through the hottest summer.

3—LINOFELT is the most efficient sound-deadener available.
and
4—LINOFELT will never add more than one per cent to the cost of building and need add nothing.

Incidentals, 5%	219.41
Total estimate	$4,607.75

The approximate number of cubic feet in this building is 28,240, making the cost of construction just a fraction over sixteen and one-half cents per cubic foot.

EDITORIAL NOTES AND COMMENTS

AND NOW WE WRITE IT 1912.

Let us hope all our readers made good resolutions on the first of the year, and that they will not fail to live up to their resolutions. So mote it be!

Noise proves nothing. Often a hen who has merely laid an egg cackles as if she had laid a star of the first magnitude. Silence, it is said, is golden, simply, we believe, because it gives opportunity for thought and meditation. Nothing of consequence ever was, or ever will be, achieved without forethought and brainy preparation.

Modesty is one of the sweetest and most desirable of qualities and yet too much modesty hinders advancement. When this quality is over-developed it antagonizes aggressiveness, without which no great success can be attained. Habit is habit, and not to be flung out of the window by any man, but coaxed downstairs a step at a time.

The limbs and lives of workmen are worth as much to the owners and their families as are the limbs and lives of the soldier to himself and his wife and family. The one builds and improves his country, the other, at times, and often unnecessarily, pulls down and destroys. Yet the destroyer secures a lifelong pension for himself and often for others, but the poor fellow who falls from a scaffold or gets ground to mincemeat while in the performance of his duty, in assisting in the making of the country, gets but little sympathy and less substantial aid. His wife and family are left to battle with all kinds of adverse circumstances, without help or aid from any source but their own efforts. It may well be asked why such conditions exist. Of late a more humane wave of thought —after much fighting—seems to be taking the place of the old order of things on questions of this kind. The insurance act recently passed by the British House of Commons is a far reaching one in the direction of making some fair arrangement towards providing for disabled, or sick workmen, and will lead up to even better conditions in favor of compensation to the injured.

President Taft recognizes the necessity of doing something for the worker in the way of providing some sort of compensation for those who become injured or disabled by accident or otherwise, and indeed the whole country is awakening to the fact that something ought to be done on the lines foreshadowed in the recent message of the president. The following, which is taken from "The Chicago Tribune," indicates the hold the question is taking among the employers of labor, as well as other thinking people. The big business interests of the country have accepted the inevitable and voluntarily shouldered the burden of general liability insurance, according to G. A. Ranney of the International Harvester Company, who appeared some days ago as representative of the National Civic Federation and before the Congressional Committee on Employers' Liability and Workmen's Compensation.

The commission seemed particularly interested in Mr. Ranney's testimony owing to the fact that he told of the actual operations of the system inaugurated several years ago by the Harvester Company.

Mr. Ranney, who is a Chicago man, said the year before the system went into effect the company paid out $20,000 on account of damages for injuries to employees and the litigation connected therewith. The next year, which was just two years ago, the company paid out $60,000 merely for administration expenses of the liability system, the total cost of which was $125,000.

"Do you mean to say," asked Representative Brantley of Georgia, "that you put in a $60,000 administration system to take care of a condition that the year before had cost you only $25,000?"

"Yes," Mr. Ranney replied. "But we didn't do it just to meet that condition. We saw the handwriting on the wall. We believed legislation on the subject would soon be enacted, and we also believed the voluntary adoption of this workman's compensation plan was the best for our employees and the best for ourselves."

Living conditions in Germany, as in the world generally, are seriously affected by the continued rise of food-products, many having advanced far above all previous records. The imperial and state government, as well as municipalities, chambers of commerce, and workmen's associations, have been actively discussing means to alleviate the distressing conditions. But wherever such conditions become galling they mean war against all artificial forms of dearness, and the German people resent the fact that so far the Imperial Government has not granted the petition to reduce the customs' tariff on bread, cereals, potatoes, etc., to open the frontiers more widely for the importation of foreign meat; and to restrict the large exports of German grain. Several of the States having no say with regard to customs duties have taken what measure they could to alleviate the situation. The Bundesrath, or Federal Council, is now discussing remedial measures to be proposed to the Imperial Government. What they can be short of a reduction of imposts on foodstuffs and of bonuses on exported foodstuffs it is not easy to see. The situation is a grave one, and requires prompt and generous handling, apart from the fact that the elections are near.

THE INFLUENCE OF MATERIALS ON DESIGN IN WOODWORK

MR. F. W. TROUP, F. R. I. B. A., delivered an interesting lecture at Carpenters' Hall on February 10 on the above subject. After lucidly describing timber houses—those in our own country in what is called "half timber" construction, those in Norway, Switzerland, and other northern countries in pine and, of course, usually "whole timber," i. e., built of solid logs—the lecturer went on to say that when in doubt the designer cannot do better than refer to the old examples in our museums and unrestored buildings, and if you are wise you will take the craftsman into your confidence and you may be able to learn something of him, and at the least you will know what he is equal to, and perhaps find it advisable to modify the designs to suit his capabilities, or, better still, leave something for him to modify as the work proceeds. Young architects are told to get to the bench and work with their hands. Now it may seem to them impossible and impracticable to give up the time to acquire even a smattering of half the crafts that go to house-building, but if the young architect does but learn the rudiments of one craft or trade he will find that it gives him an unexpected insight, a kind of instructive knowledge of the others, that will surprise him and reward him for his labor. In designing, above all things avoid being clever merely for the sake of effect. Cleverness is not an art—more often it is mere license and a want of restraint. Be certain of this, that your best work is not that part in it which you most admire yourself, and you will be safe ruthlessly to cut out that part from the design. Choose to be what critics call commonplace, rather than attempt the clever, the smart, the up-to-date. As a last resource, if in doubt, do what you believe to be right, constructively right and true to the nature of your material, and the result will look right, or at any rate it will be the best that you are capable of.

In conclusion, the lecturer said the design is so completely governed by the material that it is really little more than the resultant of two main forces, the inert material with all its possibilities on the one hand, and on the other the aggressive tools of the craftsman with his infinite capabilities for good or evil—these two forces, the one passive, the other active, brought together by the craftsman and guided partly by his knowledge and experience of what is possible and what is best, and partly by his skill and practice in the use of the tools themselves. These produce the main lines, they affect the assembly or bringing together, the building-up of the whole. That which remains for fancy and imagination to play with is comparatively unimportant. There is indeed a right and a wrong way of letting loose the fancy in carving, painting, or whatever form of gaiety the craftsman allows himself to indulge in, and the right way is always subservient. As soon as indulgence in the fantastic, the tour-de-force or attempt to imitate other materials, begin to get the upper hand, so surely does "debased art" become the true and only description of the work. The theatrical, the inessential, the superficial, rules and leads on to the same end that has been described by a great writer as the vile torrent of the Renaissance.

THE CONTRACTOR AND THE AUTO By STUART STEVENS SCOTT

THE question whether the auto truck is a paying proposition has always, and always will be, paramount among those who consider utilizing the power wagon instead of the horse-drawn vehicle.

Labor and transportation are commodities and a saving in either means dollars and cents in the pocket. It is true of a motor car none the less of a horse that to get fair returns upon the investment one must have work to be performed. The first cost of a motor car exceeds the cost of two span of the most expensive draught horses and wagons, yet, not only must the animals be fed all the time but they have their limits, physically. In winter one must double the team to overcome the icy pavements, or the muddy roads. In summer the animals must be carefully driven lest they be killed by the fierce heat.

On the other hand the motor truck knows neither heat nor cold, it stops not at the steepest hill, be it dry or wet, and as long as it is supplied with oil it will run. Its physical endurance may be said to be that of its driver. It not only does this, but at the same time it will carry three to four times the weight that two span of horses can draw.

The ills of a motor depend largely upon the man who drives it, and just as an experienced horseman can get better results with equines so can an experienced man get better results with a motor. Many owners of motor trucks make the mistake of employing inexperienced men because they can be hired cheap. It is a mistake, the greatness of which can better be shown on the cost card at the end of the year.

The most important question, after all, is that of service, of amount of delivery you have to do, the distance you have to haul and the number of teams you use. It has been contended, as I will endeavor to show, that the motor truck is best for long hauls and short stops. By users of machines in several lines of business it has been found that the machine can cover a far greater distance in a day and can deliver three to six times the quantity of material but to get the maximum results with a minimum of expenditure all of the hauls must be lengthy.

That this is so is all the greater reason why the motor truck should be welcomed, particularly by contractors. It gives to them the advantage of entering into districts which were previously barred on account of cost of transportation by horse-drawn vehicles. When distance is eliminated one has accomplished a great deal. For instance, a constractor might be barred from competing in another town, say 15 or 20 miles away, because the man on the ground would be able to deliver more cheaply. With a motor truck 15 or 20 miles is nothing.

To illustrate this more forcibly, take the National Building & Supply Company, as an example. This concern employs three motor trucks, two of them of 5 tons and one of 4 tons capacity. These machines have been in service long enough to enable Mr. Harry P. Boyd, the secretary and treasurer, to get a good "line" on them. He says that for long hauls and short stops they are far less expensive per mile than horse vehicles. On occasions he makes deliveries at places 20 miles from the city. With a truck he can make four round trips a day, delivering 20 tons. It would require six teams to perform this same service within the same time.

Mr. Boyd has kept a most accurate cost card on his company's machines and is therefore able to give a most intelligent report as to expense for mileage. In the first place each driver is supplied with a printed card prepared to bring out minute data. At the end of the month it is only necessary to refer to these cards, to make the additions and the result is at hand.

Taking a month at random Mr. Boyd's results read:
Material delivered, 650 tons.

Days, 27; mileage, average, 42½; total, 1,140 miles.

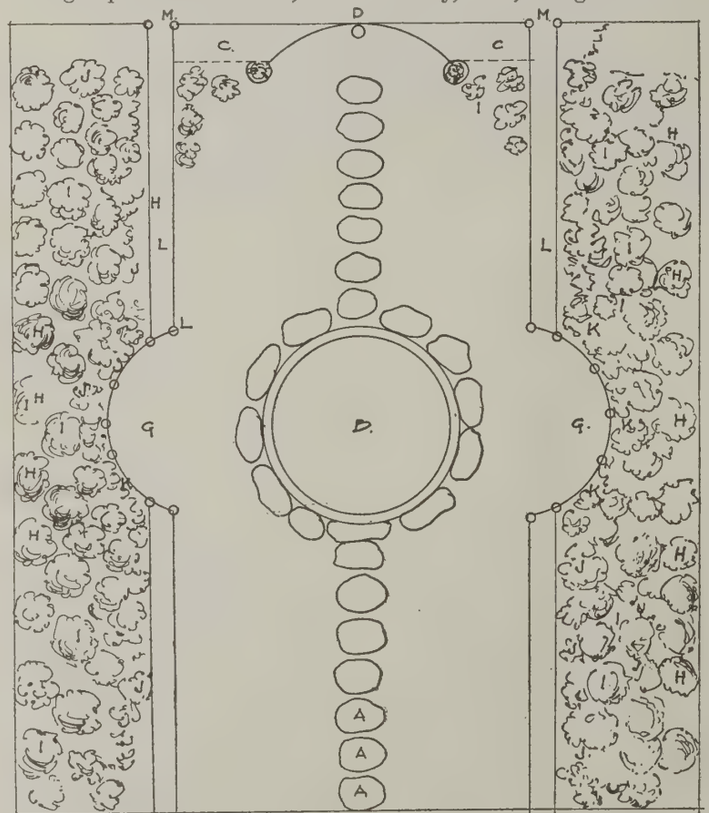
Oil, repairs and wages of driver and helper	$157.64
Wear on tires, 6c per mile	68.40
Depreciation on $4,000 investment at 20 per cent	67.50
Insurance against accident, fire, etc	20.25
Total	$313.79

From these figures it will be seen that there is something convincive about them, but there is one feature in Mr. Boyd's handling that does not appear on the surface and that is his method of operating his machines. Each of the machines is what is known as the dump type, the dumper being a great time saver. For instance, a load of cement, lime or other bagged material, if handled piece by piece, would require two men at least 30 minutes to unload 100 sacks. By dumping the 100 sacks can be deposited in 3½ to 4 minutes and, as the men are familiar with that method, none of the sacks are injured. At the warehouse, in anticipation of the arrival of the trucks, all of the material to be hauled is arranged as closely as possible and the minute the trucks are in position the entire force of the company is put to work. In this manner the trucks are loaded in about 10 minutes.

"The saving of time is most important," said Mr. Boyd to the writer. "I estimate that it costs about $1.50 an hour to operate a truck, and this is about 2½ cents a minute. If, therefore, I can save, in loading and unloading, 45 minutes on each load I have made $1.12, an item that will make itself felt at the end of a year."

There is one thing certain and that is that if this concern can use a motor truck in its business, machines may be used anywhere for the steep hills, cobble-paved streets and wretched suburban roads on which it operates offers to the work an example of how power may overcome even the worst topographical disadvantages.

SOME WELL-DESIGNED FLOWER GARDENS



By IDA D. BENNETT

THERE is no better foundation for a successful flower garden than a well thought out and executed plan. Given a definite plot of ground in a favorable situation, preferably at the side or rear of the house, but where an unrestricted view may be had of its extent from one or more of the living rooms of the house, and it only remains to select a design which will be in harmony with the shape and extent of the plot and not incongruous to the surroundings.

A well laid out garden, with its well constructed walks and orderly beds, protecting walls and other accessories has a certain beauty independent of its enrichment of flowers. The garden constructed without any definite plan—a bed here, another there, a mass of foliage or vines in out-of-the-way corners used to mask an unsightly object or view is a very different affair from the garden which is laid out with a definite purpose and made to conform strictly to a carefully thought out plan.

The accompanying plans are especially suited for development along with or following the construction of the residence itself, and its architectural features should, as far as possible, conform to those of the house. For illustration: a brick house should have for its garden, walks and walls of brick, while cement construction would naturally follow the house of stucco or concrete. A frame house will be more in harmony with ornamental board fences, timber pergolas and seats and tables of wood, painted to harmonize with the color or trim of the house, though there is nothing so attractive in a garden as white.

In the accompanying diagram "A" a long, narrow garden, suitable for the rear of a village or suburban lot, or for the side of a larger place is indicated, the shrubbery, here, being massed at

L
H
H
H

to be avoided. It is even better to dispense with walks altogether, than to mar a small lawn by them.

Plan "B" features another oblong garden in which some charming effects of broken vistas are achieved by bringing the side border of shrubbery to a point midway of the length of the garden. In achieving this effect a half circle of turf half the diameter of the yard is outlined directly in the rear of the house. This is surrounded with a brick, gravel or cement walk and two rods of broken ground planted to shrubbery and perennial intervenes between this and the main lawn, the shrubbery nearly meeting at its intersection with the central walk of the garden. The shrubbery should be rather tall and heavy in the rear of this point, growing gradually lower and less dense as it recedes towards the house and towards the rear of the lot.

The rear of the lot is confined by a high wall of stone, or brick, or wood in front of which a rockery of large boulders is constructed as a background for a lily pool of cement bordered with rough stones. If sufficient effective, large stones are available to raise the rockery to a sufficient height just back of the pool it will add much to its beauty to pipe water to the topmost point and let it fall in a feathery cascade from rock to rock into the pool below. One or two stones hollowed out into shallow receptacles will furnish bathing places for birds too small or timid to venture into the pool itself, and the rocks, near the water, may be planted with moisture loving ferns and plants, those requiring less humidity being relegated to the dryer portions.

In selecting shrubbery for the borders it is best to use a number of plants of the same kind rather than a great variety of single plants; also, it is well to plan to have something in bloom all the time. Commencing with the various Deutzias, which commence to bloom in May and continue well into June, one may plant the new hydrangea arborescense, which blooms from June to August; Hydrangea Panniculata, from mid-August to September; Cochorus, which blooms all summer; Altheas, from August last through September; the new Wiegelia Eva Rathke, practically an all summer bloomer, and the Tamarix, some variety of which is in bloom from early May to September. And, of course, one will plant liberally of the flowering trees as, although these bloom at practically the same season, they make an excellent background for the shrubs when these are in bloom.

In front of the shrubbery one should grow such effective perennials as foxgloves, sweet Williams, shasta daisies, hibiscus, delphiniums, larkspurs, aquilegias and the like, and interspersed among these should be lilies and lilies and lilies, and as an edging, tulips and hyacinths galore. Star the lawn with crocus against the coming of the March winds and the blue bird's note, and make it bright with the gold of daffodills and white of narcissus, and your garden will be a thing of beauty from frost to frost.

BINDING EFFECT OF ARCHITECTS' CERTIFICATES

By W. J. STANTON

IT HAS been generally held that an agreement in a building contract that there shall be no liability to pay for the work done, except upon an architect's certificate, is valid, and when such a certificate is inserted in the contract, the certificate must be substantially such as the contract calls for, or it will not authorize a recovery.

When provision is made in a building contract for the payment of the price, or a portion or portions of such price, upon the certificate of the architect in charge of the construction of such building, the obtaining certificate is a condition precedent to the right to require payment, and such condition must be strictly complied with or a good and sufficient excuse shown. No action can be maintained upon the contract in the absence of such certificate, unless it has been demanded of the architect and fraudulently or arbitrarily withheld, or has been withheld by a clear mistake.

If, after the work has been substantially completed, the architect refuses to give a certificate, and such refusal is based on unreasonable requirements, the failure to obtain the certificate does not bar a recovery by the contractor, although its procurement by the contractor is made a condition to recovery. If the contract between the parties for the erection of a building provides that payment is to be made upon the presentation of a certificate signed by the architect, his arbitrary refusal to act upon matters left to his decision under the contract dispenses with the necessity for procuring a certificate before an action is brought to recover payment.

If the certificate required is arbitrarily and dishonestly withheld, the builder may recover on showing this fact, and that he has performed the contract according to its terms. If a party contracts to furnish stone to erect a building, with reference to stone from a particular quarry to be used and the superintendent selected by the parties, and upon whose certificate payment is to be made, recommends it, and the contractor uses it, and receives certificates after using it on part of the building, such superintendent cannot, by fraudulently refusing to furnish the contractor with a certificate that he has completed his contract, on the pretext that the stone used is not the proper kind, deprive the contractor of the price he was to receive for furnishing the stone.

Where the contract provides that payments shall be made only upon certificates of the architect that the work has been done in a good and workmanlike manner, the fact that payments have been made from time to time, without requiring strict performance of such condition, is not a waiver thereof. If there remains any material part of the work which can be reasonably done in accordance with the contract, the architect may rightly withhold his certificate until the contractor has completed such work, and, so long as he can rightfully withhold his certificate, there can be no recovery.

If the contract stipulates for payment by the owner, in consideration of performance by the contractor, in installments, provided that in each case an architect's certificate shall be obtained that the respective payments have been reached and that the work has been done, such certificate is not requisite to entitle a subcontractor to enforce a mechanic's lien for material furnished for the building, in a case where the owner has completed the work, according to the contract, upon the contractor's failure to perform.

An architect is liable in damages for negligent and erroneous statements to his employer as to the value of the work done by the builder under which the latter is overpaid, if such statements are independent of the certificate called for by the contract between the employer and the builder.

A provision in a construction contract that the engineer or architect of the owner shall finally determine, as between the contractor and the owner, what work has been done, and the amount to be paid for it, it is valid and will be enforced in the absence of mistake or fraud. A provision in a construction contract that, when the work is completed there shall be a final estimate made by the engineer of the quantity, quality and value of the work, and the balance after deducting monthly payments, and on the contractor's giving a release, shall be paid in full, is not an agreement that the engineer's estimate shall be conclusive.

If the facts and circumstances surrounding the case and directly proved are such as would lead a reasonable man to the conclusion that fraud in fact existed, that is all the proof the law requires.

A NEW AND IMPROVED WOOD SCREW

EVERY carpenter knows how difficult it is at times to find the slit in a screw head, if there is not plenty of light at hand to enable the workmen to see the slit. To overcome this difficulty, Mr. Reuben Houghton has invented and patented an improved screw.

The improvement consists in forming the heads of wood screws so that they slope inwardly towards the saw cut 1/16 inch to 1/32 inch (see illustration) for the purpose of guiding the screwdriver into the slot. If the point of the screwdriver is across the slot, a slight turn enables it to slip into place easily.

The advantages will be further demonstrated where a worker is in simi-darkness. It should prove a boon to users of small screws and to electricians.

COPPER ROOFING

By H. M. SANDERS

IN the preceding chapter we have shown the nature, general character and texture of sheet copper as compared with the other sheet metals used for roofing purposes, and presented the reasons why we believe it supersedes all other sheet metals in meeting fully the requirements of an ideal metal roof for the future.

In this chapter it will be our object to speak of and illustrate what has proved to be some of the best methods of constructing a roof of this character.

But before entering directly upon this branch of our subject, of how it shall be applied and constructed, let us first consider some of the essential points as a preparatory step in securing an ideal

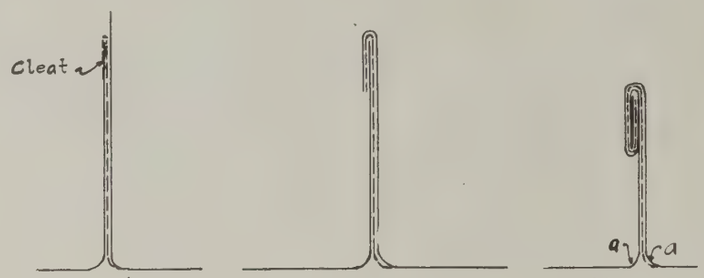

Fig. 1. Fig. 2. Fig. 3.

roof of so durable a sheet metal as copper. For besides its lasting qualities as a sheet metal, its final assurance as a success as a roof covering, much depends upon its method of construction, the workmanship and the character of the surface of the roof on which it rests. For in securing a good, serviceable metal roof, of whatever nature and character of the metal, it must have a smooth roof to lay on. The boards should be laid lengthwise with the pitch of the roof, and not crosswise of the roof from side to side, with the seams all smooth and evenly jointed. Over this should be laid a felt covering. While this felt covering may not be absolutely essential in prolonging the life of a copper roof, it is claimed to be of great benefit in keeping living rooms directly under the roof warm in winter and cool in summer. It also prevents the heat of the metal on a hot day from penetrating through and warping the boards. Then, again, a layer of felt covering on the roof boards before laying the metal roof, in case of a heavy rain or hail storm on the roof, deadens the sound. Annoyances of this kind will often occur if the felt covering is omitted. The annoyance has proved so great in some cases that the roofs had to be taken off and relaid

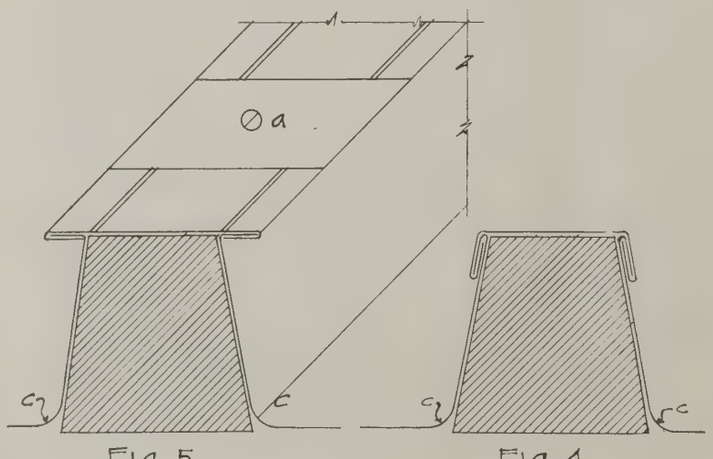

Fig. 5 Fig. 4.

with the felt covering put under it, which proved effectual in removing the annoyance.

It is generally conceded, we believe, that in the construction of the copper roof, it should be so constructed as to require the use of as little solder as possible. Of course, where there are openings in the roof to be flashed, and angles against chimneys and walls, there will be more or less solder required to make the roof tight. But on the body of the roof, practically speaking, no solder should appear. This would mean as few seams in the roof as possible to be soldered, and this requires the sheets of copper to be as large as possible to secure the best and most reliable roof covering. In no other way can the expanding and contracting nature and character of the sheet metal be properly met and cared for. The laying of a copper roof in small sheets for flat roofs, with flat soldered seams, does not seem conceivable to this writer's mind as the ideal of perfection in a copper roof, however necessary they may seem at times owing to conditions and environment.

This inconceivability is based on the fact that the best roofs are those which have the fewest soldered seams to give out and leak, which are sure to be more or less affected by the expansion and contraction of the metal under atmospheric conditions and pressure.

We have in the following illustrations given the methods of copper roof construction, which, it is believed, makes the best and most secure roof covering. Neither of these roof constructions are new ideas. One or two of them, at least, have been in use in the old country for many years.

They are of two classes; one for flat and the other for steep roofs. Both require practically the use of no solder; both have the fewest seams in their construction of almost any other form of construction, as both require the largest sheets of copper in commercial use for its purpose.

The sheets of copper used for the flat roofs require to be the smooth flat sheets, bent up at intervals to form a finish on the roof. Those used for the steep or inclined roofs are corrugated lengthwise over its whole surface.

In Figs. 1, 2 and 3, we have shown the old English method of making the seam for a copper roof. This is called the "stand up welt system," which is practically the same in method as the one we use in our standing seam tin roofs in this country today, and

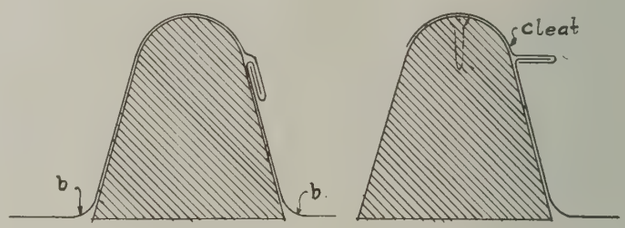

Fig. 6. Fig. 7

also from which the idea of making the vertical or standing seam in our tin roofs originated, with this difference: Under the old English method the vertical seam when finished, as shown in Fig. 3, was 1½ inches high from the roof, while the finished standing seam of our tin roof is only ¾ inches high, or one-half the height of the English roof.

This method, we understand, has been the longest in use, but of late years it has been superseded to some extent by a newer method, using the wood roll or rib. The objection to the former, it is claimed, that, although a cheaper construction, there is not sufficient allowance made for expansion and contraction on account of which there is a tendency on the part of the copper to tear away from the cleat which holds it to the roof.

While we are inclined to the belief that such a result is apt to follow with too sharp bends at the point at the angle of the upturn where it joins the level part of the roof, we are inclined to question our English cousins who have been disposed to discard this stand up welt seam, because of these sharp corners and have tried the process of relieving the strain occasioned at this point by introducing the curved surface, as we have shown at points *aa* in Fig. 3, *bb* in Fig. 6, and *cc* in Figs. 4 and 5. Such curved surfaces in metals of all kinds, under such conditions of strain and tension, become a source of relief.

Without considering this point further we will take up the wood roll method or system, as shown in Fig. 4. This, as will be observed, is a wood roll with tapering sides, measuring 1¾ inches across its base 1⅛ inches across the top, and 1¾ inches high, covered with copper as shown, with cap double-seamed to the upturn of the sides of the roof sheets.

These wood rolls, of course, run lengthwise with the pitch of

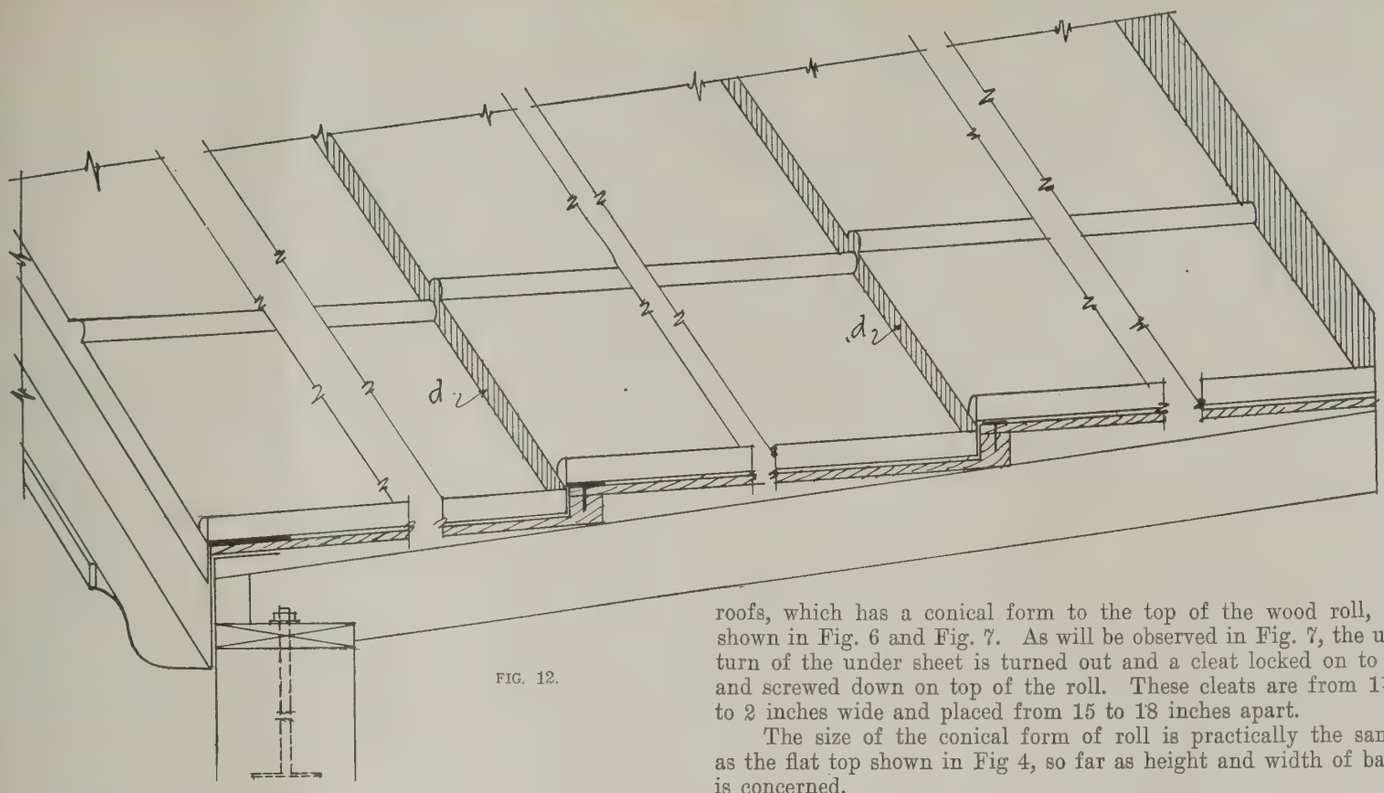

FIG. 12.

the roof, and are placed distances apart on centers to suit the requirements of the width of the copper used for the roof.

For copper 24 inches wide, it would require the wood rolls set 20¼ inches on centers, or 3¾ inches less than the width of copper used.

This kind of roof is held down on these wood rolls, as shown in Fig. 5, by means of cleats locked on to the side upturn of the roof sheets, and screwed down to the top of the roll at point *a*, before the top or covering is placed in position, and the edges turned down to a finish on each side of the roll, as shown in Fig 4.

There is still another method of constructing these ribbed roofs, which has a conical form to the top of the wood roll, as shown in Fig. 6 and Fig. 7. As will be observed in Fig. 7, the upturn of the under sheet is turned out and a cleat locked on to it and screwed down on top of the roll. These cleats are from 1½ to 2 inches wide and placed from 15 to 18 inches apart.

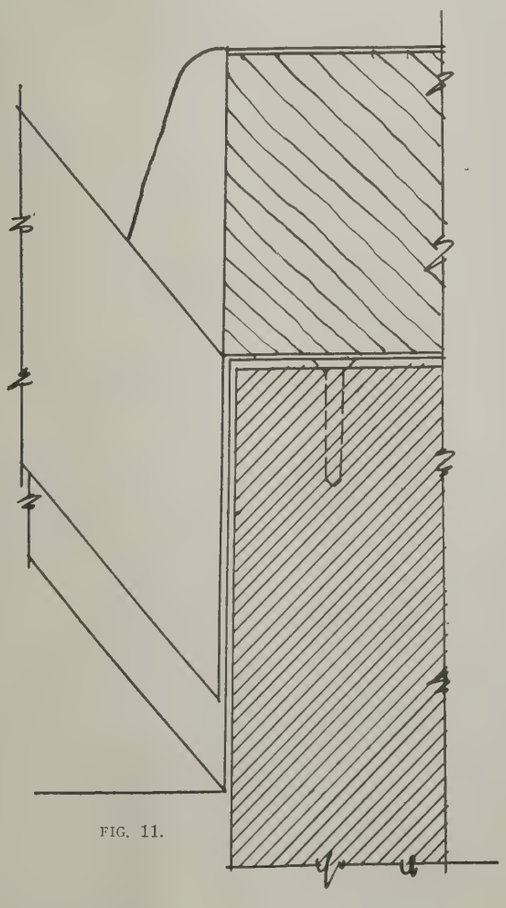

FIG. 11.

The size of the conical form of roll is practically the same as the flat top shown in Fig 4, so far as height and width of base is concerned.

All three of these systems of roof construction have their valuable points in securing practically a seamless, solderless roof. By eliminating the sharp angle at the intersection point between the upturn and the main roof, and by using the round corner as we have shown at those points, we have a roof construction as nearly complete and perfect as possible.

As to the comparative cost of these three methods for a roof covering, there is claimed to be but little difference, with a slight advantage in favor of the stand up welt system, which, requiring no wood roll, takes a little less copper than the flat-top wood roll and a little more copper than the conical shape top.

While these three systems are especially adapted for very flat roofs, they all require what is termed the roof-drip, as shown on roof plan, Fig. 12, and as also shown in full size section in Fig. 11. These roof-drips run crossways of the pitch of the roof from top to bottom a sufficient distance apart to meet the requirements of the length of the sheets of copper used for that purpose, which will vary in length from 8 to 10 feet, making the distance between the drips six inches less than the sheet itself, in order to make proper connections at each end with the adjoining roof sheets, so that if the sheet of copper used is 10 feet long, the distance between drips would be 9 feet, 6 inches.

These methods of construction of the metal roof are not confined to flat surface roofs, but apply equally as well to an inclined or pitched roof, and where the roof has an incline of more than three inches to the foot they may be safely applied without the use of the roof-drips, by having the roof one continuous level surface, joining the ends of the two connecting sheets with a cross seam one inch wide.

Corrugated roofing is a form of metal roof covering that may be safely applied on all roofs when the pitch of the roof is more than 3 inches to one foot. In some respects this kind of metal roof in corrugated form is better adapted for mills, foundry, pier sheets, etc., where the roof construction is all iron, and where no wood-sheeting is required on the roof as a support for the sheet metal.

Such a metal roof is more easily applied and less expensive, as no sheathing is required—the deep and continuous corrugates in the sheet making it strong and stiff enough to hold it firmly in position upon the purlins, which are usually placed from 3½ to 4 feet apart.

Where the sheets are riveted together at the sides and end of the sheets, they should be riveted through the top curve of the corrugation of the sheet. Also, all cleats that are used as clamps to hold the roof to the iron frame should always be riveted to the top curve of the corrugation in like manner, and never on the lower or bottom curve.

OUR JANUARY COMPETITION

In our November number appeared a small notice offering a prize of ten dollars for the best article on either of the following subjects:

1. Brick Veneer Houses. Their advantages and disadvantages from a construction standpoint.

2. The Personal Appearance of the Small Contractor.

From the many answers it would appear that the latter was the more important question, for that subject was taken by twice the number who looked on the construction problems.

From the many excellent articles we have selected the one written by Aug. C. Schnake as being the very best of all submitted, and have sent a check for $10 to Mr. Schnake.

We also print several others presenting other points not mentioned in the prize articles. Several others are so good that they will appear from time to time.

THE PERSONAL APPEARANCE OF THE SMALL CONTRACTOR

By AUGUST C. SCHNAKE

The term, "Small Contractor," as I understand it, in this instance, is applied to the contractor who superintends his own work, irrespective of size or number of men employed. Should he go well dressed? He should! For various reasons. "Clothes make people," is the old saw, or in other words, people are judged by their dress. The neat-appearing, well-dressed man is always estimated many per cent above the person dressed in a slovenly, "I don't care" fashion. Of course, "well-dressed" doesn't necessarily mean an expensive, tailor-made outfit, but should be clean, neat and tidy, indicating the person to be careful and painstaking.

The contractor should present, as well as be, the boss. The word "boss" indicates an article a trifle better than the average and people seem to be imbued with the idea that a "boss" can be recognized by his appearance. Take it on the job: A spectator or salesman desiring to see the boss will accost the best-dressed man in the bunch, then when he is pointed out to them, seeing he is dressed like the others, they are disappointed and put him down as a second-rate article. People in general, and those building or contemplating to build in special, nearly always desire to put up a stiff front or keep up appearance, and other things being equal, will prefer the best dressed man.

While at times, in the course of his duties in superintending his work, it may become necessary for the small contractor to don the overalls, he should discard them when he leaves the job, or when not necessary to wear them, as his own employes will respect and honor him more if he presents the boss, than if he wears the same garb with them. They will be willing to do more work and do it better, and consequently not only increase his profits, but improve upon his reputation, which means an increased business. As a rule, when people try to borrow money, or buy on credit, they wear their finest togs and try to look their best. Why? They try to inspire confidence; they know their personal appearance influences the party approached more or less. The same rule applies to the small contractor. He will find it a great deal easier to establish a credit in the commercial work, if he keeps up a nice front, than if he looks the slouchy and unreliable.

Look around in other lines of business—the merchant, the banker, the lawyer, the doctor, yes, even the preacher, if he is successful in his line, you will find him a person who lays great stress upon his personal appearance. What is true in these lines certainly applies to the small contractor. While it doesn't necessarily follow that because a person wears good clothes he possesses all the good qualities that are desirable in a successful contractor, yet, the opposite is certainly the case of the untidy and careless looking individual.

When the well-dressed contractor goes along the street, people say: "He seems to be doing well; looks successful; guess I'll have to see him about that job of mine." When they see the unkempt, slovenly-looking contractor, they say: "He appears to be down and out. Nothing doing."

We find it to be a fact that even intelligent and experienced business men will give a half hour of their time to a well-dressed person, whom they would not give five minutes if he were wearing workingmen's clothes; which goes to show that the well-dressed contractor can reach business where the other fellow could not get a look in.

Numerous other reasons could be argued, but the above are amply sufficient to prove that where ability is not lacking, the neat and well-dressed small contractor is a great success over the careless and slovenly fellow, and every small contractor should make it a point to always look his best, and with the necessary push and perseverance, he may some day be a large contractor, which he can never be if he doesn't take a sufficient amount of personal pride in his personal appearance.

Here is to the well-dressed "Small Contractor!" He will prosper.

BRICK VENEER HOUSES AND THEIR CONSTRUCTION

By P. K. RAMSEY

There are several reasons why we should build veneer houses. The first one is, I think they are the most enconomical houses to build and while we find the first cost to build a little more than a wood house throughout, we find in a few years that we have more than saved the difference in paint bills, and at the same time the repairs are reduced. The veneer house can be built to suit any climate if properly constructed. In the first place, we should have a good stone foundation not less than 18 inches thick to accommodate frame wall and the 4-inch brick wall. There should also be a one-inch air space left between the two walls. This will allow the brick work to be built plumb and true, and also acts as a dead air space, which no dampness is likely to pass. I would recommend all framing to be seasoned and walls to be built plumb and true, and storm sided with 7/8 T. &. G. or shiplap stock, and walls to be covered with a good grade of builders' paper. All brick work in veneered walls should be laid in good strong mortar, well tempered with Portland cement. There should also be galvanized iron wall tile used on about every six courses of brick, well nailed to sheathing. We should provide stone sills for all doors and windows and I think we will get a nicer job if we use cut stone lintels, as they will prove a more artistic effect than angle irons or arches. Another reason why we should build veneer houses is that it affords greater protection from fire if we use metal roofs and decreasing insurance rates so far as the exterior is concerned. I find in my experience that a veneer house affords greater comfort than most any other kind of construction, being cooler in summer and warmer in winter.

The most important thing about house construction is the heating and ventilation. All windows should be of the proper size and placed where they will give the best ventilation. I think the hot water system is the best heating system for residences, if properly installed. All chimneys and flues should have terra cotta flue linings, built in them, and should extend to top of flue. The most disadvantage I find here of veneer houses is the first cost which I think will not exceed 10 per cent over wooden construction.

For artistic beauty and economy the brick veneer house excels them all.

THE PERSONAL APPEARANCE OF THE SMALL CONTRACTOR

By CHARLES E. KNEEN

This is a question which no doubt is a very interesting one to the small contractor who is just embarking into the contracting business, and also to the average person who is looking ahead into the future.

Of course, he has in mind his idea of doing a day's work with the rest of the men, at first, but then there arises so many little things which have to be given attention and looked after, such as the laying out of the work, visiting the mill and lumber people with regard to material and going to the bank, etc., at least once a week.

These, of course, take up a good part of the day sometimes and brings the small contractor in touch with people he would not otherwise meet while working at the trade.

So it appears to me that the small contractor should make some sort of a distinction to the average working man and dress a little better. His work as a rule, is new, clean work; then, again, he has the privilege of selecting his particular work even with the use of overalls.

It has been said that "Clothes make the man." While this is not exactly true, it is like looking at a frame house freshly painted and one in need of it.

Things that look good sometimes make a better impression.

PAINTING ON METALS By A. ASHMUN KELLY

THE metals commonly in use for structural purposes, and requiring to be protected with paint, are iron or steel, tin roofing, galvanized iron, and copper. Structural iron framing requires an enormous amount of paint, and demands a paint that will protect it from the action of those agencies that cause rust, dampness being the worst.

Where structural work is to be covered completely with cement or concrete, as it usually is, the paint must be proof against both moisture and alkali. The alkali of the cement will do no harm as long as moisture is absent, but the combination of the two would seem capable of causing the disintegration of any ordinary oil paint. Happily, moisture is not likely to occur once the concrete is dry. Where old structural iron work has been uncovered, after the lapse of some time, as in case of a fire, the protective coating of paint has been found intact. It is probable that the cement prevents access of air to the metal, and so prevents rust. If so, one might ask why paint it at all?

It is generally conceded by experts in painting that red lead is the best coating for iron work, for the first coat at least, after which any desired paint of good character may be applied. Some believe that a good form of graphite paint is better still than red lead, and a great deal of steel or iron structural work is coated with this material, mixed with boiled linseed oil. For exposed work, as on railway bridges, oxide of iron paint is often added to the graphite, forming a more pleasing color than the graphite alone. So, too, lampblack is added to red lead for a finishing coat, to form a more agreeable looking coating for the finish.

The preparation of iron work for painting is an important factor in the durability of the paint. The iron should be freed from any grease and dirt, scale, etc. The sand blast is useful on bridge work, to free the metal from all foreign matter and make the surface clean and smooth for the reception of the paint. This is very important, for deterioration of paint on such work is sure to occur from want of careful preparation. Railroads recognize this fact, and their painters are doing better work than once obtained in this direction.

In mixing red lead and lampblack paint the following proportions may be observed for bridge work: To 100 lbs. dry red lead, add 3 lbs. 6 oz. lampblack ground in oil, 8 1-3 gals. boiled linseed oil, 6 2-3 pints japan driers, and 5½ pints of turpentine.

The lampblack serves as a coloring agent only, when used in this proportion, 1-16 of an ounce of the black being capable of making one pound of red lead a chocolate color. This is indeed the formula used by one railroad company for its bridges. This makes a very agreeable color, not inferior to that of a fine oxide of iron paint. And where lampblack is so used the proportion of oil is to be greater than where all red lead is used, as the black takes up much more oil than lead. The following table will be found useful in this connection:

Formula: Twenty lbs. red lead, 5½ lbs. raw linseed oil, 1¼ oz. lampblack, making 1 gallon of paint, that will cover 1,200 square feet. The proportion of lampblack in this formula is 1-16 oz. to 1 lb. red lead.

Formula: Fourteen lbs. red lead, 6 lbs. raw linseed oil, and 7 ozs. lampblack, making 1 gallon of paint, that will cover 1,200 square feet. Proportion of lampblack is 1½ ozs. to 1 lb. of red lead.

Formula: Ten lbs. red lead, 6¼ lbs. raw linseed oil, and 10 ozs. lampblack. Proportion of lampblack is 1 oz. to 1 lb. red lead.

Now, as red lead and lampblack both dry rather slowly in raw oil, the use of japan drier is necessary, and even in the case of boiled oil it will be found well to add some japan. The black being the slower drier of the two, the more lampblack the more oil, is the rule. Another important feature of the boiled oil is that it helps keep the red lead and lampblack from separating from each other, the lead being very heavy and the black very light. The oil serves as a binder. In the proportions given in the above table the paint should dry in from 16 to 24 hours, according to the amount of lampblack in the paint. Where japan is added the drying may occur in about 8 hours, while without the japan, but with boiled oil, it will dry in about 12 hours.

Where it is desired to mix dry red lead and dry lampblack together the two may be placed in a barrel, which should then be headed up, and the barrel rolled around a few times, which will cause a thorough admixture of the two pigments. Then it may be used as needed by mixing with oil, etc.

On no account should oxide of iron be used in connection with red lead as a paint; the same holds good with white lead and zinc oxide. Any pigment with an iron base will, when mixed with lead or zinc paint, cause a mottling of the paint, making a very unsightly surface. Never use any but the pure linseed oil.

Galvanized Iron: Ignorance of the proper way to paint on new galvanized iron sheeting or other galvanized objects results in considerable trouble and expense, and yet it is easily avoided. If the metal is allowed to stand to the weather for several months, preferably a year, the surface will be in a condition to take paint and hold it. But if the paint is applied as soon as the metal is in position, or if done within a few weeks of that time, the paint will in time scale off in small flakes. Then the trouble is to correct the evil. It may be scraped off with wire brushes, but should not be re-painted until every particle of the original paint has come off, for otherwise it would scale beneath the new paint, and thus take all off. The better way is to treat the new galvanizing with this wash, which has been in use for many years, and with the surest results.

Take two ounces each of copper chloride, copper nitrate, and sal ammoniac, dissolving same in one gallon of soft water, then add two ounces of muriatic acid. This mixture must be made in a glass or earthen vessel. With a broad bristle brush apply a coat of this to the galvanized iron, and let it stand until perfectly dry, when it will be ready for paint. At first the color of the coating is black, but this soon changes to gray. Upon this coating paint or varnish will adhere perfectly, and there will be no scaling. A gallon of this coating will cover about 25 or 30 squares of 100 feet each. It is inexpensive and easily made and applied. The ingredients may be bought from any large dealer in drugs and chemicals.

Painting on Zinc: Paint acts the same on new zinc as on galvanized iron, the metals being identical. Zinc and galvanized iron have what is called a greasy surface, to which paint adheres only imperfectly. Exposed to the weather for some time the surface oxidizes and then takes paint well enough. New zinc should be treated with the wash indicated for galvanized iron, if it is to be painted.

Painting on Lead: Sheet or other form of lead is very difficult to paint as far as durability is concerned, and some paints that take to tin and lead do not take so well to zinc. As a general thing, the iron oxide paints take to these metals better than talc, ochre, or other earthy pigment. Lead water pipes, when full of cold water, will not take paint, owing to moisture, but if the water is left out of them and a coat of shellac applied, followed by any desired shade of paint, it will last well. Warm water lead pipes may be painted or varnished or bronzed at any time. The bronzing on hot water pipes will remain bright, while on cold water pipes it will soon become dull, and continue thus.

Painting Tin: The metal tin does not rust, and if it were alone used for roofing there would be no need for paint. As it is, the paint cannot be applied too soon after the tin is laid. The main trouble with tin roofs is that the sheet plate under the tin coating (this coating consisting of a combination of lead and tin, the cheaper sorts containing very little tin, if any), is made so that it is impossible for it to do otherwise than rust. And no paint will prevent this rusting, for it will go on under the tin or spelter coating and paint just the same. But some paints are better than some other paints for tin roofs. Thus, it is certain that a good oxide of iron paint, properly prepared, will protect the roofing well, if the coating is renewed at intervals of a few years. Then the paint must be properly applied, and the roof be in the proper condition for receiving paint. It is necessary also to coat the under side of the roofing, and thus protect it against possible dampness or moisture arising from the interior of the building. Also, never place tarred paper under tin roofing, for it will surely rot it. Plain sheathing or building paper is all right, or just the plain boards.

In repainting a tin roof, all old paint that is not fast, or that is too thick on the seams, should be removed. It has been suggested that breaks in the tin might be patched with muslin and pasted down with thick paint, but the oil in paint will rot muslin, hence it is better to use linen, which is not affected by the linseed oil. Gutters and flashings around chimneys and adjoining roofs may be painted with a special mixture of paint, or with the regular roofing paint. Gutters and valleys should be kept well painted,

particularly where soft coal is used, and more particularly where locomotives burning soft coal, and running near by, spit forth sulphur and vapor to eat out the life of tin roofing. Paint the valleys and gutters once a year, and the roof once every three to five years.

On new or old tin roofing one coat of iron paint will be found sufficient, it being better to apply a coat when first laid, and another a year following, then not for two or more years, according to circumstances. Properly cared for, no other form of roofing will outlast tin, in case the tin is of the best quality. And such a roof, though costly to begin with, will prove economical in the long run. But, of course, it all depends; if one is not interested in its wearing well, not expecting to retain ownership long—then that is something else.

UNIFORM MILL-WORK LISTS

By CHARLES CLOUKEY

THE above caption is intended to refer to the uniform listing of mill-work from sets of plans as furnished by architects, and not to uniform details of different jobs.

One might think it an easy matter for any number of mills to make lists just alike from the same plans and specifications, and considering the high class of workmanship employed in listing and estimating, it would seem that if the estimators are not able to get the same items, on their respective lists, there must be something the matter with the work of the architect.

A long experience with the work of architects in different parts of the country leads me to believe that a good share of the uncertainties encountered in making lists result from a peculiar attitude of the architect toward the work to be done by the contractor and his subs. We find in many cases the architect is indifferent about certain details and materials, and will not go to the trouble of minute specification. For instance, he may say that certain parts are to be made of pine and does not specify the quality, and perhaps the only clue to it may be found in the specification for painting and finishing which says that certain rooms are to be painted, certain rooms stained and certain others to be finished in the natural wood. One mill may figure a No. 1 common finish for the paint, clear sap for the stained work and clear for the oil, and then for fear he should be forced to furnish better stuff for the paint, he adds a small per cent in the way of insurance.

It is a common specification with an architect to say that "all materials must be the best of their respective kinds." Now, if the finish for paint had been specified No. 1 common, or D stock, every estimator and mill foreman would be free from doubt as to just what was wanted.

It is a common occurrence to find that the thickness of doors is not mentioned in a set of plans and specifications, and this leaves the estimator in much uncertainty; perhaps he will list all the outside doors 1¾ and all the inside doors 1⅜; perhaps another mill will call all of the inside doors 3 feet wide and over 1¾. In case an architect specifies doors of 2 inches in thickness, one mill may list them as 1¾, while another will list them 2 inches and price them as 2¼ thick.

Now, it is not expedient to multiply the record of a thousand and one instances where the estimators and listers come to a parting of the ways, for we who are interested in this matter know pretty well what they are. To place the responsibility for the trouble is another thing, and to bring about its practical abolition is decidedly still another.

It is a fact that the mill men are not always blameless in the matter of modified lists, for some of them have been known to bill short in order to make a cheaper total and then agree to furnish only the stuff they had listed. This is a very old trick, and has been practiced by retail lumbermen and mill-work men to such an extent that the live contractors now ask only for blanket bids, according to the plans and specifications.

It has been suggested that the architect furnish a complete list of mill work with his set of plans and specifications, and so eliminate part of the expense of estimating. If it is a fact that 5 per cent of the cost of mill work is represented in the making of estimates, it would cut it down considerably if the work of listing could be side stepped. Then, again, if the list furnished could be considered as absolutely reliable, the items added for uncertain "miscellaneous" which sometimes are as high as 5 per cent, could be eliminated entirely.

The logical inference is that this would be a material saving for the builder, as the competition among mills would keep the price down in relation to cost. But let us see how it would work out in practice. In the first place, the architect would not do the extra work without an extra charge, and this would consume at least a part of the saving contemplated, if the professional services of the architect did not take it all up. Also, it is not reasonable to suppose that any assistant in the architect's office would be more liable to make a list of mill work free from error than would an estimator in the factory office. And while such errors would not necessarily cost the mill man anything, they would cost the contractor or owner something unless the loss could be recovered from the architect. In case the architect was held for the mistakes in listing, he would add a percentage to his charges to cover the same just as the mill man does. If the contractor had to stand the loss of error he would also figure higher, and if the owner had to supply the shortages and make the changes, why it would cost him as much as it would if one of those already mentioned had included the extra percentage in their charge for material and service.

It stands to reason that if a specification is so lax that a man of experience cannot tell what it means, a mill-work list made by the same office would be liable to lack in particulars of quality and detail even if it was absolutely correct in sizes and quantity. This would mean delay or adding the extra per cent to cover a possible and more expensive interpretation of the items in question.

Considering the fact that mill-work concerns find it necessary to make a charge for error in spite of the fact that they employ the most expert help to be had for the purpose of listing, it is good logic to presume that no other branch of the building business can do better. And arguing further from the fact that every party concerned will add a percentage for error where he is held to the correction of mistakes, we are led to believe that the owner is the man who ultimately has to pay for the mistakes of the various individuals who do his work. There are specific instances where gross error falls upon some division of the work in such a manner that it cannot be shifted, but put in the general term of per cent, and the owner is the man who is forced to pay.

Now what do we learn or how can we benefit from the above analysis of this subject? Is there any way by which some of the work of estimating may be eliminated? We can say, yes, to this, but we are not so certain when asked if any of the cost can be cut out.

If the mill work lists were made in the architects' offices and sent out with the plans for blanket bids, the mill would have to verify the list and that would save little if any time. If the list was considered correct and only the details were sent along to enable the mill man to price the articles listed, the responsibility as well as the work would be thrown back on the architect's office, and the only possible question of saving would lie between the architect's charge for this service and risk, and the listing of the material by half a dozen more or less of mill-work estimators.

If the average cost of estimating mill work amounts to 5 per cent of the business secured in that way, it arises from the fact that the mills figure on four or more plans to every contract they land. There seems to be no remedy for this as long as the mills are in open competition, and the only saving to them would be the work of taking off the quantities from the plans.

As far as the contractor is concerned, it is practically useless to expect him to make lists of mill work, and if they all did it, there would be about as much work involved as now, and we are forced back upon the alternative of the mill and the architect. Perhaps some ambitious as well as able architect will set the good example of furnishing complete and guaranteed lists of mill work with his plans, and others thereby forced to do likewise! However, if he ever does put out a list of mill work we will see this note in some conspicuous place on the printed heads: "Any discrepancy occurring between this list and the plans and specifications covering the same, must be reported to the architect for correction before proceeding with the work!" And would a list like that be a help to any party concerned?

Perhaps more can be done in the mill office to cut down the cost of estimating than at any other point, if the architect will but do his part in making his plans, specifications and details of such a character as may be read and interpreted without doubt and delay.

THE SMALL FIRE-PROOF HOME

By H. LEONARD LANE

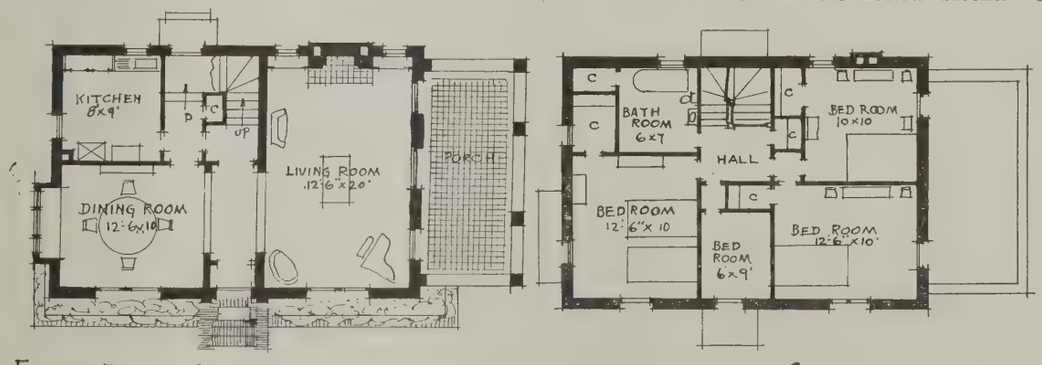
THE architect and builder have solved most of the problems on the subject of fireproofing, but in the matter of the small fireproof home little progress has been made.

The primary difficulty of the small home builder is the problem of making the home both fireproof and inexpensive. The construction of an office building, factory or warehouse has small interest for the man whose personal problem is "How can I build a fireproof house for $5,000 and get an even return for my money?" But experience teaches that any building, whether it be an office building, store, apartment or residence can be built absolutely fireproof at a cost of less than twelve per cent greater than ordinary wooden construction. This additional expense, however, is more than compensated for by the durable, fireproof, sanitary and economical advantages of fireproof construction.

The days have passed when timber and brick were the standard materials for home building, and it is unfortunate that more careful study has not been made of the materials on the market today. The man who builds a fireproof house is safeguarding himself, and is a benefactor in his neighborhood, not only by protecting the adjacent buildings, but by the force of example.

As to the beauty of design of houses built of fireproof materials, little need be said. The recent work of our leading architects demonstrates the fact that no other materials are so well adapted to produce the charm and beauty of the type of homes characteristically American.

The houses shown on these pages should cost, exclusive of heating and plumbing, approximately $4,000, depending on the locality. Much of the first floor has been given over to the large living room, which, with its large open fireplace, and French doors leading to the trellis covered piazza, should be entirely satisfactory. The hall, while small, is conveniently arranged. For lack of space the pantry has been sacrificed. The passage from kitchen to dining room is arranged so that the cooking odor will not pervade the dining room. The flight of stairs leading to the second floor is placed in a way to be used to the best possible advantage, being convenient both from hall and kitchen.



The second floor contains four bedrooms. The bath room is placed over the kitchen in order to concentrate the plumbing.

The construction of this house is of the simplest type. The cellar walls may be of solid concrete or concrete hollow blocks, with a concrete cellar floor. The superstructure walls to the second floor

window sills are built of eight-inch concrete hollow blocks with four-inch brick facing. The walls from second story window sills to the under side of roof are built of eight-inch concrete hollow blocks, with cement finish. The interior partitions are built of four-inch hollow blocks. The facing brick should be of a dull reddish brown, with wide joints of the same color, the cement finish being stained a soft pale brown. The floors and roof are built of four-inch reinforced concrete hollow blocks. The roof covering may be of shingles, slate or tile. Tile or slate would be more expensive, but also an additional protection against fire arising from external sources. The exterior trim should be painted white. The interior trim may be cypress, stained a soft brown. Poplar finished with white enamel would look well, but would not be as cheap. This house to be architecturally successful will depend on its environment. The lot should be large and the house placed well back with an eastern exposure to the dining room.

As stated above, the house should cost approximately $4,000, but the only accurate way of ascertaining the cost of this building is to obtain bids from reliable builders. There should be accurate plans and specifications describing the house, in order that the owner may have a definite basis to work on, and enabling him to make a contract with which to bind the builder to the proper fulfillment of the work.

BUILDERS' REFERENCE TABLES

By J. GRANT ROBINSON, Architect

The tables forming the basis of this work were originally compiled by, and for the use of, the writer only, and during thirty-five years of use have proved of valuable assistance both in the office and in the field.

The tables are revised and up-to-date, and are based on United States tests, when such were obtainable, and on approved modern methods of construction.

The explanation of the tables and formulas are given in plain and simple language, avoiding all technical expressions possible, making the work clear and easily understood.

In this age of sharp competition, the untrained man is at a disadvantage, but by the use of the tables will be able to compete with more highly trained men, and in a very short time become thoroughly familiar with, and able to design, any structure.

Every builder, superintendent, foreman, draughtsman and journeyman mechanic should acquire a full and complete knowledge of construction and be able to design the structures he is called upon to build. It is useless to describe the tables here, as no better explanation can be given than the perusal of the tables themselves, but will give one illustration:

First: The floor of an apartment house is designed to support a total live and dead load of 80 pounds per square foot of floor area, and it is desired to use 2″ spruce joist (beam) spaced 16″ center to center and 22′0″ span in clear; look in Table 4 in Plate 1 in column of length for 22′ 0,″ then to the left along that line to the nearest figure to the known load, which is 85 pounds; look up to the top of the column and you will find 14″—therefore the joist used should be a 2″x14.″ Or if a joist of less depth is desired, choose from one, two or three.

In the same manner, by reference to the proper table, you can find the size of a girder or column, of any kind of wood, a cast iron, steel or stone shoe (base plate); also a concrete footing for any load, on soil bearing from one to four tons per square foot of surface, giving the number and sizes of rods for each footing.

Full details are given of the different parts of the work, including the column caps in cast iron and steel; also steel and cast iron pintles.

The method of computing the footings under walls is set forth in a clear and comprehensive manner.

EXPLANATION OF DEAD AND LIVE LOADS IN CONNECTION WITH THE USE OF THE SEVERAL TABLES.

Dead loads: The dead load consists of walls, floors, roofs, partitions, and any and all parts of material that enter into, and form part of, any building or structure.

Live loads: A live load is all movable or variable load other than a dead load.

Floor loads: The dead and live loads of buildings are considered and estimated at so many pounds per square foot of floor, and this unit is used in designing the strength of the floor joist (beam). The dead load of floor consists of joist, flooring, plaster on ceiling under joist, the partition and plastering on same. The live load consists of people, animals, furniture, portable goods of any kind, machinery and vibration from machinery.

Roof loads: The dead load consists of rafters, roofing material, hanging ceiling under and plastering of same. The live load is for snow and wind of about forty pounds per square foot of roof, if flat, and about seventy-five for pitch of 12″ to the foot.

The following table will give the weights of the different woods per square foot, board measure, commercially dry:

Southern or long leaf yellow pine	4½	pounds
Short leaf and Texas yellow pine	2¾	″
Oregon pine and Norway pine	2¾	″
Spruce and hemlock	2¼	″
Redwood	2	″

Note: Desired the weight of a 2x12 Oregon pine joist per square foot of floor, when said joist is spaced 16″ center. A 2x12 = 2 feet board measure, times 2¾ pounds = 5½ pounds divided by 1⅓ = 4⅛ pounds per square foot of floor. This method applies to any kind of wood.

Lath and plaster: Wood lath and plastering should be estimated at 6 to 8 pounds per square foot of surface; 6 pounds is for two-coat work. Plastering three coats on wire lath should be estimated at 10 to 12 pounds per square foot of surface. Note: Plastered partitions of wood lath run about 17 pounds per square foot of floor in any building used for living purposes or office building.

Note: Where building laws are in force the loads prescribed by such laws should be used.

The following table will give the live load to be used in a given class of buildings, and when taken in connection with the values of safe strength of joist (beams) as given in the tables, will provide absolute safety with proper allowance for economy. The number of pounds per square foot of floor are:

No. 2. For dwellings, sleeping apartments, tenements, apartment houses and lodging houses	40
For school houses	50
For office buildings (upper floors)	60
For office buildings (first floors)	80
For stables and carriage houses	45
For banking houses, churches and theaters	80
For assembly halls, dance halls and corridors of public buildings	120
For drill halls	150
For stores, light storage and light manufacturing	120
For warehouses, mills and heavy manufacturing	250 and up

Note: Desired a spruce joist (beam) 2″ thick, 20′0″ long between supports, to carry a live load of 40 pounds and a dead load of 28 pounds, making a combined load of 68 pounds, we will look down the column of length in Table 4 in Plate 1 until we come to 20, which is the length we require; the nearest we find to 68 pounds is 75 pounds and is in the column of 2″x12,″ which is the proper joist to use. This method applies to any wood given in the tables. Note: The weight of the joist is included in the formula, so it need not be considered in the dead load.

NOTES ON THE USE OF PLATE 1.

These tables are based on full size timbers. If a beam is ¼-inch thinner and ½-inch less in depth than specified, the rating of the next smaller beam should be used. Thus, if a 2-inch by 10-inch measures 1¾ × 9½, it will only carry about two pounds more weight per square foot than a 2 × 9.

The strongest timber for a given amount of material is in the proportion of 6 wide to 10 deep. This proportion should be used wherever possible as the further one gets from it the more lumber is wasted. A beam thinner than this proportion loses on account of the tendency to bend sideways. While one less in depth receives no benefit from the increased width over this proportion.

Suppose we have a span of 16 feet with a load of 16,000 pounds and want to use an Oregon pine beam 12 inches in depth. In table 7, we find that a beam 12 inches deep and 1 inch thick will carry 1,620 (the safe load for 1 inch). We find a 10-inch wide beam is the one to use. This rule applies to all woods and all cases where the load is movable or changing from time to time, but if the beam supports a set load such as a brick wall or heavy running machinery, the upper figure should be used. In this case, we would require 16,000 + 1,188 = 14″, which would make a beam wider than deep. A 14″ deep beam would mean 16,000 + 1,887 = a 9 × 14″ beam.

Tables six, seven and eight are figured for both strength and stiffness. Where two sets of figures are given the top shows the loading for stiffness and the lower for strength. That is, a beam loaded between the two figures would carry the load safely but the deflection would be more than is allowed in the best engineering practice. When the length of a beam is less in feet than the depth in inches, such as 6 × 12, 8 feet long, the beam will not deflect as much as the limitations prescribe, and so should not be figured for stiffness.

The rule for stiffness is: The safe uniform load equals eight times the width multiplied by the product of the cube of the depth and the factor "e" divided by five times the square span in feet. The factor "e" should be taken at 137 for long leaf yellow pine, 110 for short leaf yellow, Oregon and Texas pine, and 100 for spruce.

In the form of a formula this would be $S = \frac{8\,bd^3\,e}{5 \times L}$ in which

S = Safe uniform load.
b = width of beam.
d = depth of beam.
e = factor taken as noted above.
L = span in feet.

(To be Continued.)

Plate №1 - Safe Carrying Capacity in Pounds for Wood Joists or Beams Spaced 16" on Centers, for each Square Foot of Floor

Compiled by J.G. Robinson, Architect.

Explanation of Tables 1 to 5.
To find what Oregon pine joist will carry a total dead and live load of 120 pounds per sq. foot of floor on 20' span.
In table 3 you will find that a 2×14 is the right size.
This applies to all cases.

A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.

PLATE XXVI. EXTERIOR DETAILS.

Details are drawn to supplement the floor plans and elevations, and are made to show any peculiarities of construction or finish which are to go into the make-up of the building planned. They are always made to a larger scale than the plans, and preferably full size. The trim is nearly always drawn full size.

Plate XXVI illustrates a few exterior details of the house given in former lessons. These are merely illustrative of a large number which could have been included, but a brief course of this kind must necessarily give examples and not all of the possible ones which could be shown.

The scale given on this plate and the next is the one for the student to follow and not the scale as here reproduced. The dimensions shown are to help the student get his sizes, and are not necessary when he has drawn them out full size, though they are often given as a help to rapid reading of the drawing.

It will be noticed that full size drawings of the trim are given in section. This is customary practice, as in this way the mill man can get a quicker idea of the shape of the pieces than he could if they were given in plan and elevation, which is a waste of time on this kind of work.

It is understood that the young builder knows the correct names and usages for the constructions illustrated, so no time will be wasted in explaining them. But we will call his attention to the porch column and floor construction, and especially to the parts named.

A column of this kind is designed after the Tuscan order of architecture, though it does not follow it out exactly. In a future lesson the orders and their proportions will be made clear, though here it will suffice to call attention to the style used and its parts. The top of the column is called the "abacus." In this case as in most others, it is square. Below comes the "echinus," which our modern builders have changed to "cap," though the cap should include all of the column above the astragal. Further down comes the "astragal," and the space between the astragal and the cap is known as "necking." From the top of the astragal down to the top of the "base" comes the "shaft." The correct Roman name for "base" is "torus," and below it comes the "plinth." These parts should be thoroughly understood and remembered by the student.

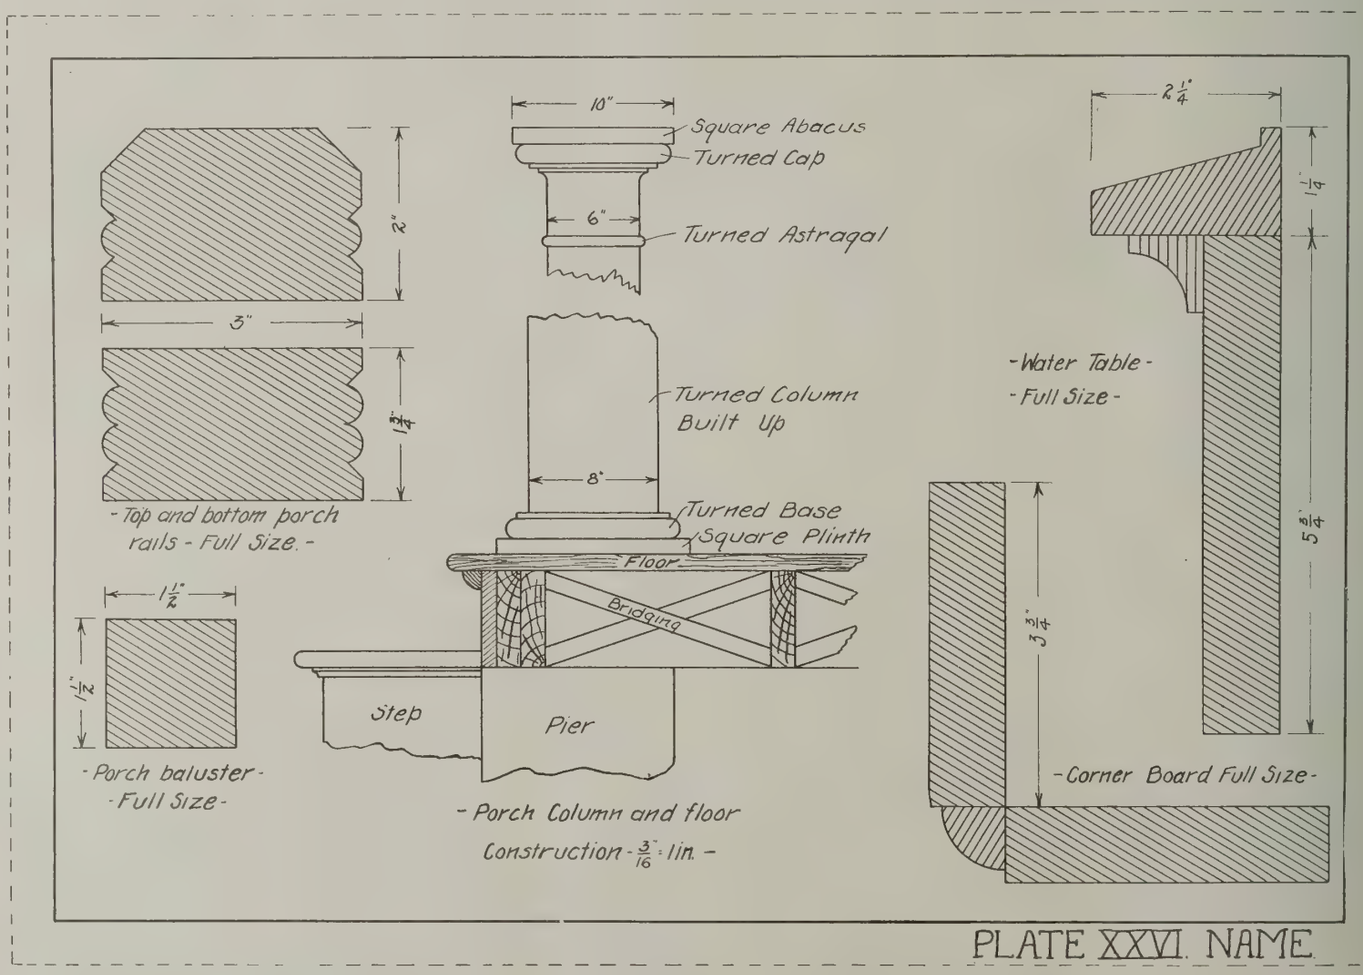

PLATE XXVI. NAME.

The floor construction is self-evident so nothing need be said concerning it.

Different localities have come to adopt different standards for trim, such as water tables, corner boards, etc., and it is advised that the young builder go to a mill and secure short pieces of the different stock materials, if he cares to save money on his mill bills. It is much cheaper to use stock materials than it is to make special designs, and it would be advised for modern buildings to do so, unless the owner cares to pay for something out of the ordinary.

PLATE XXVII. INTERIOR DETAILS.

In general, the interior trim is drawn in the same manner as the exterior, and the same things could be said about it concerning stock sizes. It must be emphasized, though, that different

parts of the interior details must be uniform in style. It will not do to have a very plain mission style mantel, and a stair whose balusters are turned and covered with beads and coves, and whose newels are covered with fancy carvings. And it also does not pay to have the trim too plain. In a modern house the style illustrated on Plate XXVII is much better liked. The pedestal of the arch is paneled after the style of the newel post, and each bears a relation to the other. Other details, such as a mantel, dining buffet, plate rail, etc., should all have some uniformity with the general style carried out.

As has been said before, we must of necessity, leave out a number of details which should be given to make everything clear to the student concerning their possibilities. But if he thoroughly understands the style of drawing and construction of those which are illustrated, he should have little difficulty in working out the rest for himself. A great help would be a scrap book in which to paste clippings from trade journals, papers, etc.; also sketches of details he encounters in his work which appeal to him as being useful. Good practice is obtained by drawing scaled details from these sketches. A number of other methods of self-improvement along this line have been tried by ambitious students, and we leave it to the ingenuity of the reader to devise other means if he really cares to make a success of his studies.

(To be continued.)

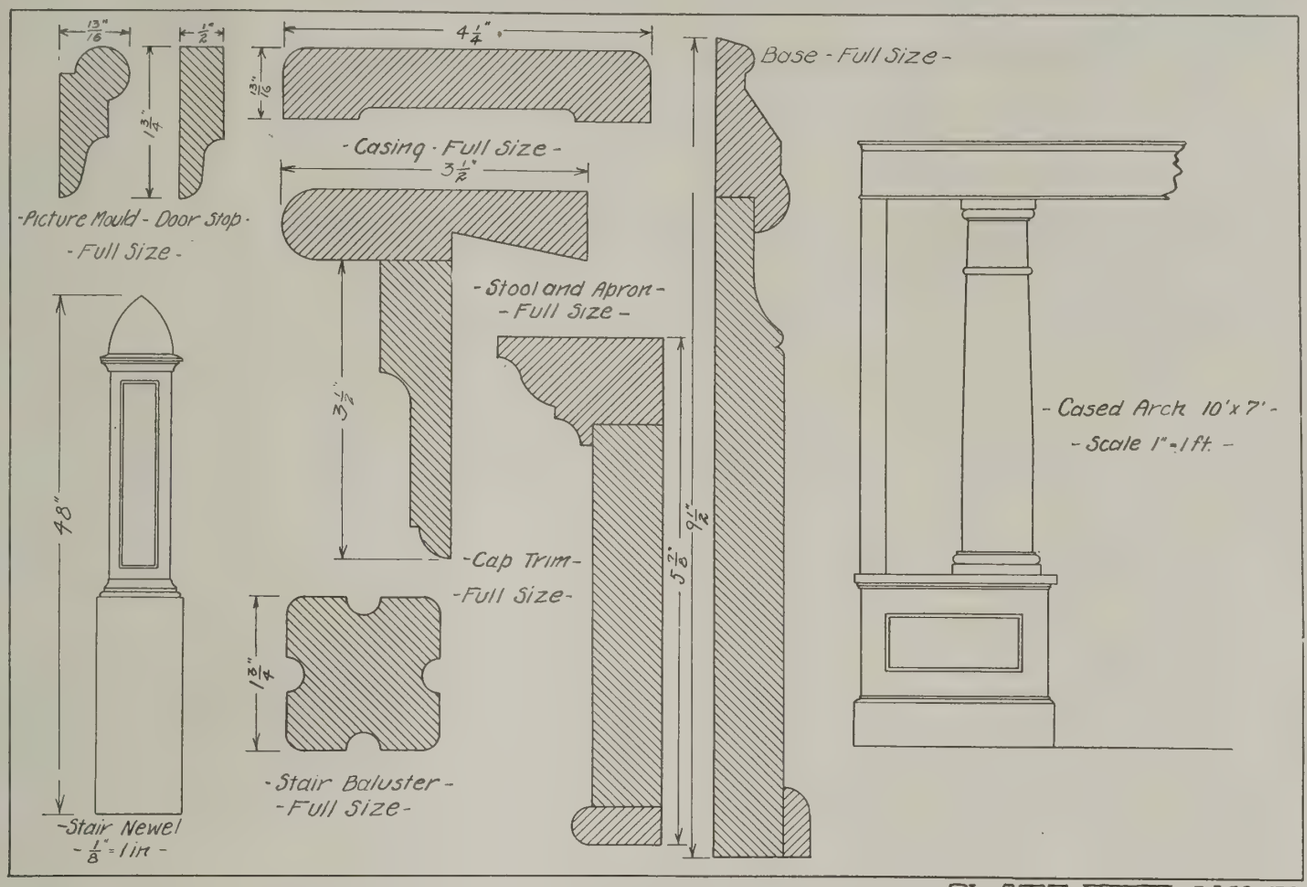

PLATE XXVII. NAME.

FUNGUS IN DAMP DWELLINGS

By ROBERT GRIMSHAW

THERE are districts in which fungus on the walls and ceilings of dwellings is common, and of course detrimental to health and property, as well as unsightly. There are also cases where the climatic conditions are such as to induce the formation of fungi; and where these are introduced in the building material, develop more or less freely according to the local conditions. We are not to understand that the appearance of fungus necessarily implies an undue amount of moisture in the building or on the premises; dry rot once under way continues under conditions which may not by any means be favorable to the starting of visible fungus on the surface of the walls. Whether or not the contractor can be made responsible for dry rot or wet rot caused by negligence, ignorance or bad faith on his part is a legal question; the main thing is to prevent its occurrence—outside of this a guarantee in the building contract that no fungus will appear within a certain time can do any harm.

Dry rot can be caused by several sorts of fungus germs; most of them are to be found in felled or fallen tree trunks which lie on the damp ground where they fell, or are stacked up without anything between them and the ground. When the trunks or logs dry rapidly, they dry without the germs having effected any visible damage; but where they are given time, temperature and moisture to favor their development they can be of incalculable harm.

Wet rot, as shown by fungus on the surface, is mostly caused by only one variety of microscopic being—the merulius lacrimans; and it can pass from house to house through the walls. At first it requires moisture to favor its development; once well started, however, it absorbs from the surrounding air, enough moisture to keep itself in good condition to enable it to propagate, even in what might be called dry buildings.

Dry rot is usually caused by the polyphorus vaporarius.

Prevention against these two evils is a matter for the builder or owner; but once the house is attacked by either the one or the other of these enemies, the house-owner should first learn which one of the two is the cause.

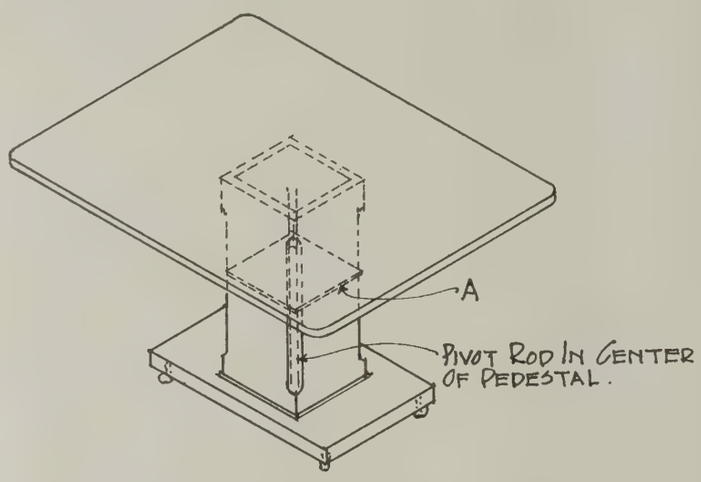
Wood which has started in with dry rot can be made further immune by treatment—dry warmth with plenty of fresh air is a good remedy, and specially attacked places can be treated with a suitable disinfectant. It is sometimes necessary to "iron-clad" them.

Wet rot requires more heroic measures; it is best to remove the infected wood entirely, even although its strength may not seem to be lessened by the disease.

Where the wood is not removed, it must be washed or painted with a disinfectant. When the room is used for living purposes, one must be chosen which is inoffensive to the sense of smell.

OUR READERS' PAGES

[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. These columns are open to our readers at all times without charge, and any questions or experiences will be given proper space.—Editor.]



ANSWERS

REVOLVING TABLE.

From "Old Timer," Niagara Falls, N. Y.

Years ago, I made a revolving table for my own small dining room, with a top measuring 3 ft. 6 in. wide by 4 ft. 6 in. long. A heavy pedestal was made for a central post, over a foot square in section, and a round iron rod 1½ in. in diameter, went down the center of the post and was fastened to the bottom platform which was made of two inch plank about 18 in. wide and 30 in. long, and

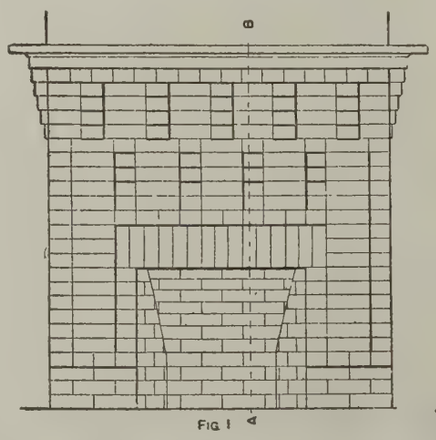
REVOLVING TABLE.

on the four corners of which were fastened suitable castors. The center post was cut off about 13 in. from the top (Marked "A" on cut), and the iron rod ran up into the upper portion of the post which was fitted snugly over the rod, but not so tightly as to prevent the portion of post from revolving easily, carrying the top with it. The rod, of course, is fastened solid and firmly in the lower part of the pedestal, and the upper portion of pedestal with top attached, may be lifted off at any time if so desired. All other details may easily be thought out by any carpenter. If desirable, arrangement can be made at the joint of the pedestal for ball-bearing, but I have never found any trouble in the revolving arrangement of my table, although the whole work is a little crude and not as well finished as it might be.

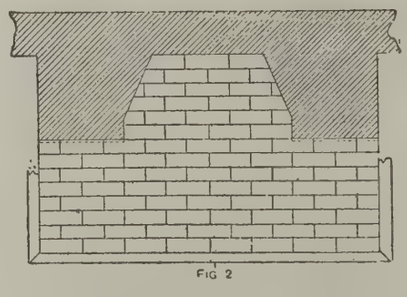
STAIRS AND BRICKS.

From "Builder," Philadelphia, Pa.

To contractor, Green Bay, Wis.—It is always better to have bricks "wetted" before laying, but not a necessity. In cold weather, if the bricks are to be "wetted" the water in which they are dipped should be made hot before dipping, and the bricks then piled in the hod for distribution while still hot. This answers a double purpose, namely, the bricks will not absorb the water from the mortar so much, and they will be warm enough to prevent freezing before the mortar is set. As to the second query, I may say that the rise and tread of a stair step should never exceed 18 inches, measured together, and 6 in. rise and 12 in. tread comes within that limit; but this arrangement does not make the easiest stair to travel. For outside public buildings and grand entrances, the rise may be as low as 4 in., and the tread as wide as 14 in. This proportion makes a very easy grade. In designing stairs, the designer cannot always make the proportions as he would like, as the run of the stairs and the height of the story have to be provided for.



A BRICK FIREPLACE.



The commodious old-fashioned fireplace is a great favorite with home lovers, and it always will be. If properly constructed it will not only throw out a great deal of heat, but it will at the same time provide natural ventilation. An open fireplace, it is said, will extract about 250 cubic feet of air per minute, which will provide satisfactory ventilation for half a dozen persons. But the main reason for the popularity of the fireplace is based on sentimental grounds. It was in front of a log fire that many of us first heard of the fairies and their wonderful pranks, and it was there that the family gathered in the evening to welcome callers and display their hospitality under the cheering influence of the blazing logs.

We remember these things, the fireplace brings to our minds scenes of the past which makes us younger in the thought of them, and so the fireplace becomes a sort of rejuvenator in the cold winter evenings as we gather around it to discuss the news of the day or indulge in harmless gossip.

The open fireplace is greatly favored in England, where no matter how elaborate the heating system of a house may be, provision is always made for at least one large fireplace, where the lord of the manor may enjoy a quiet smoke and a nap, or may gather with his friends and neighbors to watch the snapping flames of the cheerful fire in the good old cheerful way.

In this country it has become the fashion, especially in the larger residences, to provide a fireplace in the living room, independently of other heating facilities. Those who gather around

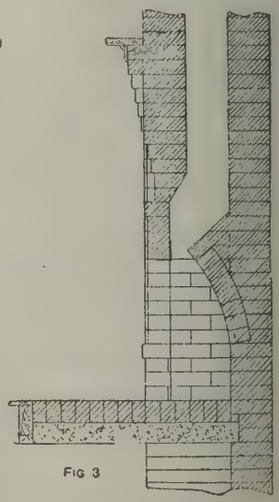


Fig 1.—Front Elevation.
Fig 2.—Plan
Fig 3.—Section on Line A B (Fig. 1)

these hearthstones assert that they make wonderfully for cheerfulness and family fellowship.

With the coming of the winter the fireplace will assume its rightful prerogatives and thousands will see pictures in the blazing logs and live again the days of their youth, inspired by the crackling wood or coal, as it vanishecs to ashes in the ruddy glare.

In this illustration we show the essential points in fireplace construction. While shown for burning wood, it is only necessary to place a fire basket in the opening in order to burn coal. It is to be noted that the back of the fire chamber curves to throw the heat down and out into the room. Above in the chimney is an inclined shelf, which serves to lead the flames back into the chimney and also to check and deflect any tendency to a down draft.

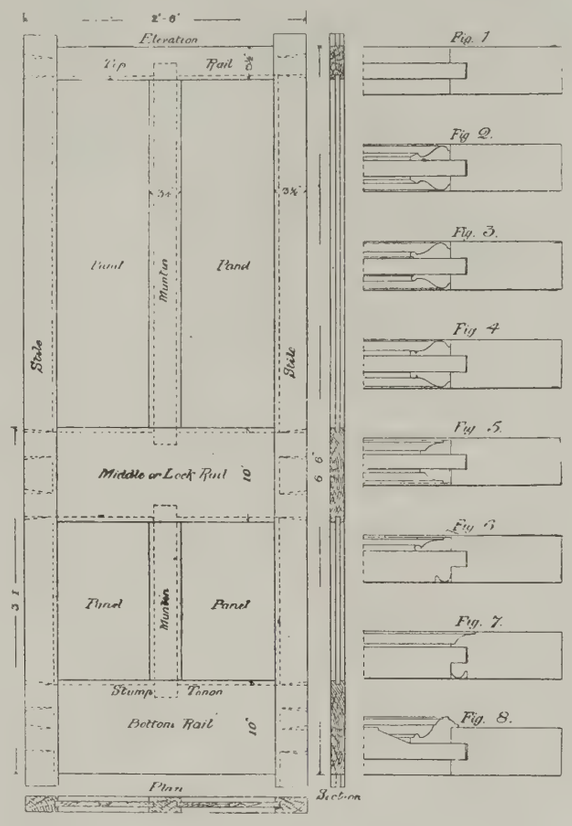
Brick in any of its many styles makes an excellent front for a mantel, and a wide choice is offered from plain common brick to a high-grade enameled brick in colors. Good red pressed brick, carefully selected for color, size, and perfect arrises, make an ideal front if laid up with one-fourth-inch black mortar joints, struck flush. The arch head may be laid square without cutting or grinding the brick, if supported by an angle iron, as shown, otherwise it will be necessary to cut the sides of the brick on radial lines. The facing brick should be well tied in by clipping off the back corners and inserting blind headers, or metal ties may be used. The expansion due to the fire is considerable and unless the brickwork is well executed, some of the brick will work loose.

BRICK MANTEL.

From "Bricklayer," Chicago, Ill.

As a reply to C. F. K., Cincinnati, Ohio, I would suggest that he write to any pressed brick manufacturing company, and ask for an illustrated catalogue and he will no doubt find in it what he wants, or get suggestions enough to suit his purposes. A single design would not likely be of any service to him. If he wants plain or tapestry brick in his mantel, it might be well to write "The Fiske" Tapestry Brick Co., Flat Iron building, Broadway, New York City, and ask for catalogue, or other trade literature.

CONCRETE MIXING BOX.



Answer for concrete mixing box.—A box that you would measure the stuff in would be very unhandy to mix in, as a large platform without any sides to bother is the best arrangement to mix by hand on. I have found the best way to measure is to take a 7 in. board and nail together a frame 4x6 ft. inside measure, no bottom. Lay this frame on your platform and fill it up level full and you have just 14 cu. ft. of stuff—very nearly a half yard—which is enough to make a nice sized batch to mix handily. The amount of cement to use to each batch will depend on the preparation desired, but all that is required to be done is to put the same quantity in each batch as desired. When the frame is filled, lift it off and you have no side of a box to bother.

FLOORING TROUBLES.

In answer to question by "Reader" in the December number, I think I can explain the cause of his trouble and the remedy. First, the trouble is caused by two reasons. As you state the 8 in. wall is only basement high and the joists run over this wall into the main outside wall. Now, it is easily understood that the outside wall will settle more from the natural shrinkage of the mortar joints than the 8 in. basement wall, because it is the full height of building and is thicker, which gives it so much more additional weight, while the 8 in. basement wall is only basement high and has nothing to carry but its own weight. This in itself might cause the floor to raise 1 in. over the remainder of the floor. Another very likely cause would be, when the joists are laid over the 8 in. wall, they would be beam filled with brick to the top of joists. Bricklayers usually fill up flush with the top of joists; if not with brick, with mortar. The joists are invariably green or wet and when they become seasoned, will shrink from a ¼ in. to ½ in. The brick and mortar does not, hence it pushes the floor up from the joist just that much when both ends of joist are pulled down with the natural settlement of the outside walls. This could be remedied without going to a very great expense. As "Reader" states the building has been up six years and has shown no signs of cracked walls; it has evidently settled all it ever will. Now, what the writer would do is take up, say, about 3 ft. in width of the top floor, where it is raised over the 8 in. wall, and reduce the 1x2 in. as required; as the raise is about 1 in. at the highest place they would be eliminated entirely there and the finished floor relaid would lay snug onto the rough floor at this point. When done, you would never know that there had been a bulge. I trust this will help out my fellow readers who encounter like troubles.

SOMETHING ON DOORS.

A "Subscriber" writes us from Peoria, Ill., and asks for some information pertaining to joints, mortising and tenoning, in woodwork, particularly as relates to the framing of doors and similar work. There is no fixed rule for the dimensions of mortises or tenons, as conditions and requirements generally govern the matter. Usually tenons are made a trifle less in thickness than one-third the thickness of the material employed for rails and stiles,

thus: Stuff 1½ in. thick will have tenons half an inch thick. Mortises, of course, are made to suit. This rule, however, is not like the laws of the Medes and Persians, it is often changed to meet various conditions and situations.

We show in the illustration—plan and elevation—the complete skeleton of a four-paneled framed door, with section, figured sizes, tenons, muntins, and panels; also sections of finish and

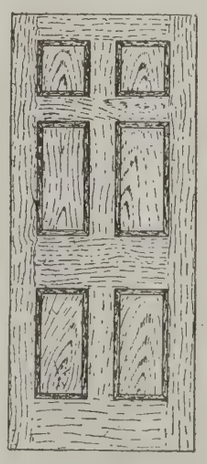


FIG. 9.

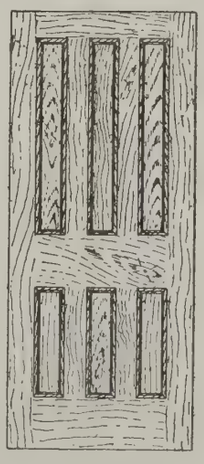

FIG. 10.

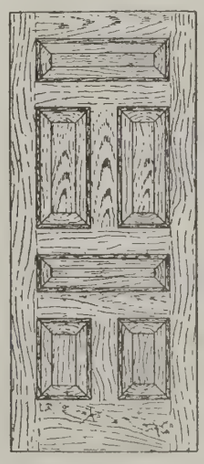

FIG. 11.

mouldings in eight different styles. The door is of standard size, being of a height of 6 ft. 6 in., and in width 2 ft. 6 in.; other sizes range upwards, increasing by inches in both dimensions, so that a door 6 ft. 9 in. high would be 2 ft. 9 in. wide, and one 7 ft. high would be 3 ft. wide.

The position of the middle rail is governed largely by aesthetic principles, but mainly for the purpose of fixing the lock. A convenient position for handling may be considered as 2 ft. 8 in.

from floor line to knob line; this may also be taken as the height of the center of the middle rail. It has been recommended that the height of the top line of the middle rail should be at a distance of 3 ft. 1 in. from the floor line, but this rule alters the height of the center of the middle rail as its width increases or diminishes.

The elevation given is that of a four-paneled door, with the position of tenons and panels dotted in. The different methods of finishing are shown at Figs. 1 to 8. Fig. 1 is a section through what is known as a square framed door with flat panels.

Fig. 2 represents a similar door, with drop or sunk mouldings of the quirked and filleted ogee type.

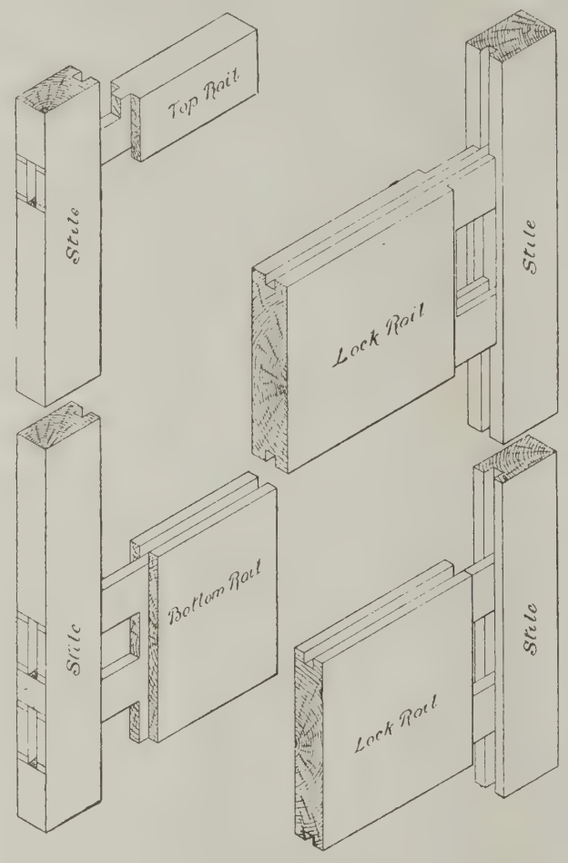

FIG. 12. Details.

Fig. 3 is a similar section, having a beaded and quirked ogee moulding, another form of which is shown in Fig. 4.

The section shown at Fig. 5 has a filleted ovolo moulding.

Fig. 6 shows a section through the stile of a square framed door, with flat panel and sunk moulding on one side, and flush panel on the other.

In the section at Fig. 7 both moulding and bead have been worked upon the framing, the external appearance being somewhat similar to the above.

Fig. 8 is a section through the stile of a square framed door, with flat panel on one side, and a raised or "fielded" panel upon the other, the latter being provided with bolection mouldings. Mouldings projecting beyond the face of the work, and being rebated over the framing, are termed "bolection mouldings." An elevation of two raised or fielded panels provided with bolection mouldings is shown.

Doors vary in size according to their position and use. External doors are generally 2 in. to 2½ in. thick. Doors for reception rooms are from 2 in. to 2¼ in. thick; while for bedroom doors 1½ in. is often considered to be thick enough. A well-proportioned door is considered to be one in which the height exceeds the width by 4 ft., except in the case of tall doors, when this rule is obviously impossible. The lock-rail is usually so placed that its center is about 3 ft. from the ground, or its lower edge about 2 ft. 4 in. from the same place; the idea being that this allows of the handles being fixed at a height convenient to most persons.

When pine is used in the construction of doors, the surface is protected either by sizing and varnishing or by painting, graining being most commonly employed in dwelling houses, as the surface so treated wears better; but, from an artistic point of view, plain tints give the best results. Doors of hardwood are most often polished; the design in this case being greatly enriched by the figure and color of the natural wood.

Various arrangements of the panels are made in order to show how a door can be altered to suit various purposes and designs without calling for the addition of any work beyond that of straight and square framing. Of the many ways in which doors can be made ornamental, the chief are (1) by the introduction of different sections of mouldings, such as mouldings worked on the solid, mouldings planted in the framing, and bolection mouldings; (2), by the use of framing having the object of splitting up the surface into a number of panels, either square, or shaped by the use of rails having curved outlines; (3), by the adoption of panels not only of different shapes but of different sections, such as squares, raised, flush, etc.

The doors shown at Figs. 9, 10, and 11, are all six-paneled, and in various styles, some showing raised panels and others with soffit panels. Indeed, there seems to be no limit to the changes that are adopted in the distribution of the panels, fashion here, as in many other cases, generally governs the number and distribution—and style—of the panels.

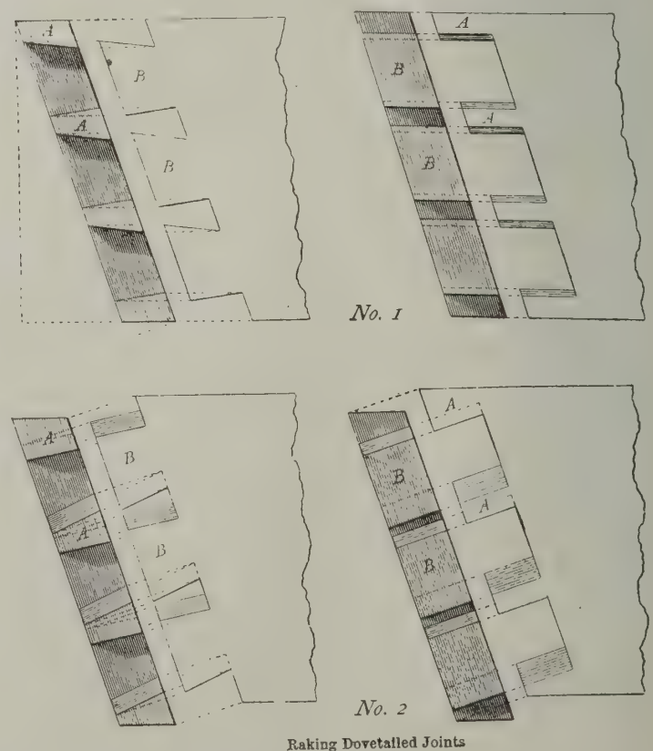

Fig. 12 exhibits the manner of mortising and tenoning rails and stiles, one lock-rail shows a double tenon, a method sometimes used in making heavy doors.

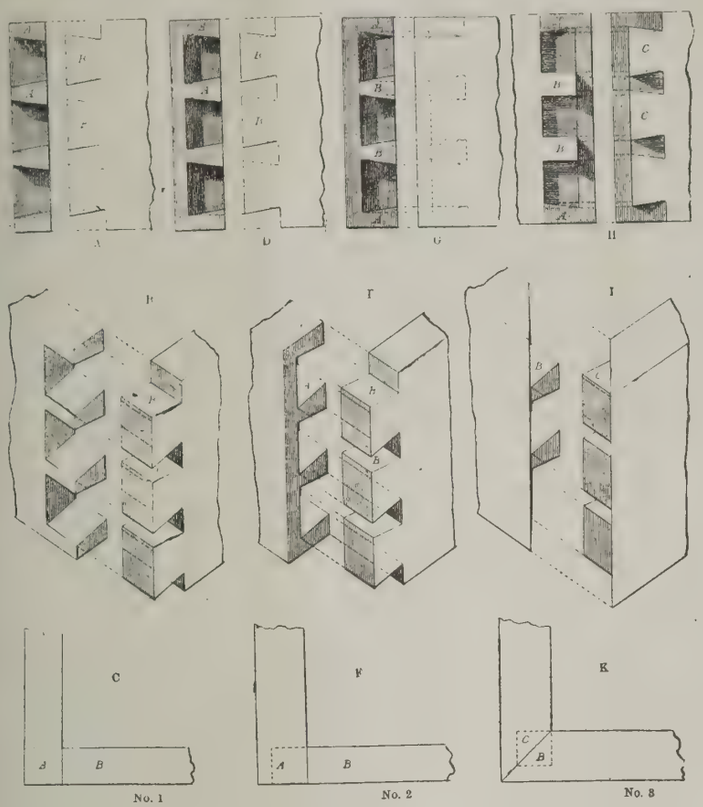
DOVETAILING.

From "T. W. Mc.," Buffalo, N. Y.

Replying to S. J. C., Brooklyn, N. Y., I submit the following which is taken from "Newhall's Universal Carpenter and Joiner," one of the best books ever published. This covers the question of dovetailing pretty thoroughly, and the examples given are quite simple and self explanatory: There are three varieties of dovetailing (see Fig. 1).

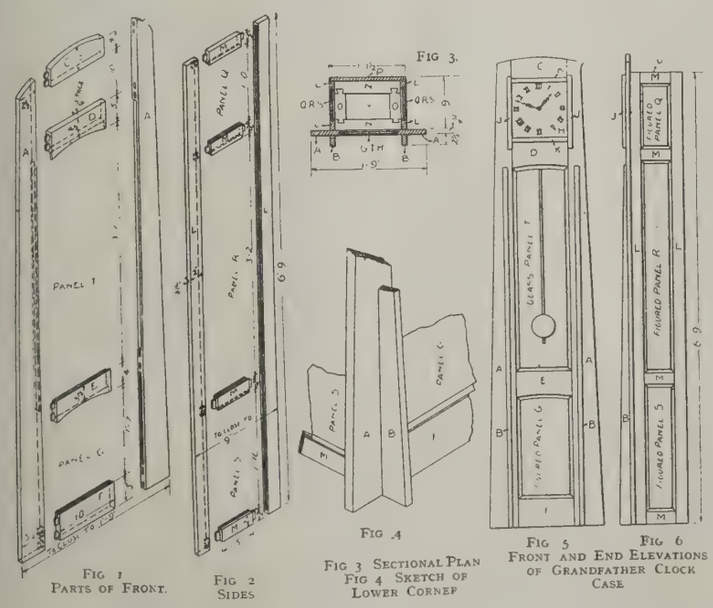


First, the common dovetail (No. 1), where the dovetails are seen one each side of the angle alternately; second, the lapped dovetail (No. 2), in which the dovetails are seen only on one

Raking Dovetailed Joints

side of the angle; and third, the lapped and mitred dovetail (No. 3), in which the joint appears externally as a common mitre joint. The lapped and mitred joint is useful in salient angles, in finished work, but is not so strong as the common dovetail, and therefore in all re-entrant angles the latter should be used. In No. 1, A is an elevation of the common dovetail joint; B, a perspective representation; and C, a plan of the same. The pins or dovetails of the one side are marked A, those of the other side

are marked B. No. 2, D, E, F,—in these the lapped dovetail is represented in plan, elevations, and perspective projection. No. 3, G, H, I, K,—in these figures the mitred dovetail is represented in plan, elevations, and perspective projection. The dovetail of



the adjoining sides are marked respectively B and C in all the figures.

Nos. 1 and 2, Fig. 2, show the modes of dovetailing an angle when the sides are inclined to the horizon, as in a hopper. The pins of the one side are marked A, and those of the other side B.

A GRANDFATHER'S CLOCK.

From "Horology," Cornell, N. Y.

I submit the following for the benefit of "A Learner," Erie, Pa., and think it will meet his needs. It is taken from an ama-

teur journal, and I can vouch for its correctness, having just finished a clock case after the directions given: The carcase in this case is made dust-tight, and is constructed of ⅞ in. plain oak, finished to ¾ in., the panels being ½ in. figured oak, finished as shown in section plan, Fig. 3.

The various drawings taken with the list of parts explain themselves. The parts marked B are cut from A; that is, a piece of oak 7 feet long was dressed on both edges straight and parallel, being 5½ ins. wide. It was then cut diagonally from end to end, making A 5½ ins. wide at one end, and 2½ ins. wide at the other. B was 3 ins. wide at one end, down to nothing at the other; but when cut short as shown was about ½ in. wide.

The sides, Fig. 2, were tenoned together, with the panels let into ¼ in. rebates, being afterwards dressed on both edges to 9 in. wide. The front, shown in Fig. 1, was also tenoned together, with the lower panel let into rebates. The glass panel, however, was not fitted in till the whole case was finished.

The cross frames were dovetailed as at Fig. 3, and fixed to sides at the centers of cross pieces, M, leaving room at the top and bottom for pieces of 3-ply wood, U and V. The front was next fixed to the sides by screws on the line of the front pieces, B. Those pieces (B) were afterwards fixed to the front by dowels.

The face, H, was made of figured oak with oxidized brass letters and hands, with a square-edged moulding, J, K, to cover the joint. The back, which was checked into the sides (see Fig. 3), was made of hazel in three pieces, the joints coming on the cross frames, N, O.

SIZES OF PARTS.

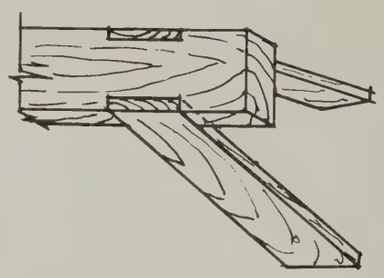
Front:		
	Pieces	
A	2	7 ft. 0 in. by 5½ in. by ¾ in.
B	2	(To be cut from piece A).
C	4	12 in. by 5 in. by ¾ in.
H	1	10 in. by 10 in. by ½ in. (Figured).
G	1	1 ft. 9 in. by 11 in. by ½ in. (Figured).
J	2	1 ft. 2 in. by ¾ in. by ½ in.
K	2	10 in. by ¾ in. by ½ in.
T	1	3 ft. 2 in. by 10½ in. by ¼ in. (Plate Glass).
Sides:		
L	4	7 ft. 0 in. by 2 in. by ¾ in.
M	8	7 in. by 2 in. by ¾ in.
S	2	1 ft. 11½ in. by 5½ in. by ½ in. (Figured).
R	3	ft. 2½ in. by 5½ in. by ½ in. (Figured).
G	2	12½ in. by 5½ in. by ½ in. (Figured).
Frames:		
N	8	12 in. by 1½ in. by ¾ in.
O	8	7 in. by 1½ in. by ¾ in.
Top:		
U	1	12 in. by 9 in. by ¼ in. (Three Ply).
Bottom:		
V	1	12 in. by 9 in. by ¼ in. (Three Ply).
Back:		
P	1	7 ft. 0 in. by 1 ft. 1 in. by ½ in. (Pine).

The lengths given above include tenons.

In this, you will notice the dial or face is provided, but in your case you seem to have the clock all complete, which will make the moderating lap difficult.

WOODEN CISTERN.

From "Wm. B.," Augusta, Maine, replying to "D. H. B.," Alice, Texas:



You will, of course, make your tank slightly taper, say 10 ft. 6 in. at the bottom, and 9 ft. 6 in. at the top, or thereabouts. This will hold near the same quantity as though it was 10 feet diameter at both ends. In order to do this, your staves will be a little narrower at the top end than at the bottom. This difference you can readily find by setting off on a board eight feet long a line parallel with one edge, then measuring square across the board, six inches from the edge, and making another line from the six-inch mark to the edge of the board at the other end. Or in other words, the line will be six inches from the edge at the top and close to the edge at the bottom. This last line will represent the incline of the side of the tank when standing in position. Now take the width of the stave, whatever that may be, and mark that width down from the top on the edge of your board, then square over at this point, and the distance of the point on the slanting line to the edge of the board will be the width of the stave at the top. If your staves are four inches wide, there will be very little difference between the widths at top and bottom. Edges of staves must be straight and should be so jointed that the inner edges touch and the outer edges slightly open, as the hooping up will tighten the inner joints and tend to make a water-tight joint. Staves should be all the same width or thereabouts. If there is a difference in width, the edge bevel will vary a trifle. The bevel for the edge may be found by strik-

ing an arc of a circle that will have ten feet diameter. The arc need not be more than 10 or 12 inches on the curve, then draw a radial line through the center of the circle to the arc or circumference line. Lay out the width of a stave on the arc line and join the two points on the arc line, and the true bevel for the joint will then be the two lines made by the line of the stave and the radial line. I think the five hoops should be plenty if they are wide and thick and well joined. Any good blacksmith will lend you his "traveler," which is a small wheel that must be moved around the tank where the hoop goes, to get the exact length. A tape line can be used, but it is not reliable. I hope I have made this plain as far as it goes. If not, "D. H. B." can inform me through this column and I will explain further.

QUESTIONS

A SAW-HORSE OR TRESTLE.

From "T. T. D.," Wichita, Kansas. I would like very much if some reader would explain how to get the bevels for making a

saw-horse as shown in the rough sketch (Fig. 1), by using the figures on the steel square.

ROOF TRUSSES.

From A. B. C., Marcus, Wash.

Marcus is a small town experiencing its first building boom and the carpenters have to do all the planning and designing of structures in progress, so I would like a little information through your journal.

I am going to build a 40 ft. x 90 ft. two-story concrete block store building soon, for a client here and I am at a loss how to build the trusses that will support the flat roof that spans the width of the building. No supports will be permitted as the second floor will be used for a society hall. Can you help me out with a drawing of a sufficient truss for this roof sloping from front to rear. The roof will be covered with 2-ply roofing.

METAL TRIM.

From J. H., Denver, Colo.

As I have been a reader of your very valuable paper for several years, I take the liberty of asking you to publish some pointers on the erection of metal trim. In what shape does it come to the job, and what are the necessary tools a carpenter requires to have to put it up? It is beginning to be used so extensively in the large cities that many of your readers would very much appreciate any information along this line, as the majority of carpenters are wholly unprepared to take a job on this work and may be called upon to do so at any time.

HANDY TOOL BOX.

From S. D. G., Calgary, Alta.

I would like to have a good plan of a tool box that would be easy to get anything out of without upsetting all the other tools, a box that would take a medium kit. Any suggestions would be very useful.

BALL ROOM FLOORS.

From H. G., Ottawa, Ont.

I would be very much obliged if you would advise me of the latest method of laying a ball-room spring floor. I have a number of books, but fail to get any advice through them.

HEAVY TIMBER FRAMING.

From Carpenter, Wausau, Wis.

I would like to know how to erect a frame for a heavy timbered house in which the posts and girts are framed together. Any information will be gratefully accepted.

BROKEN PLASTER CEILING.

From "General Reader," Middletown, N. Y.

I would like to ask a few questions regarding compo-board, which are prompted by your editorial note last month on this question. The ceilings of my dining room, living room, and parlor are badly cracked, and in some places seem to be broken away from the lath and hang like the sword of Damocles, as though they would fall at any moment. The plastering was done more than 50 years ago, and people tell me it is "rotten" and liable to drop on our heads at any time. Some years ago, the ceilings were papered with a good, heavy ceiling paper, and this seemed to hold them together all right for a while; but, of late, paper and plaster are broken worse than ever. Which will be the better way—to ceil with half-inch lumber or with Compo-board? Can Compo-board be well and securely fastened to the joists, and hold the plaster up safely? Any information on these subjects from my brother readers will be greatly appreciated.

STEP SCROLL.

From "Student."

Please publish a method of getting the line for a scroll, for a bottom step or a handrail, and oblige a young reader.

BIG BARN.

From "Country Builder," Montana.

I am often called upon to build barns of various sizes, and have nothing to guide me in the construction and design, but the figures of the length, width and height, and I make this appeal to readers who have had experience in barn building, to publish a few rough designs of convenient barns of any size or shape. For such designs, no matter how crude they may be, I should feel quite grateful.

CASEMENT WINDOWS

By J. CROW TAYLOR

There ought to be some good work for the carpenter and builder in casement windows, especially for enclosing sleeping porches and also verandas. This is a work that the winter time should bring a quantity of and thus help fill up the dull period by developing practically a new line of work.

The casement window is quite common in the old countries and in France the majority of windows are of the casement variety, many of them extending from the floor up and becoming virtually doors except that it is a sash and not the heavy frame of the regulation sash door.

A few years ago it looked like the casement window was coming into wide favor in this country. Right at the time when divided top sash became popular, but it is always receiving more or less set backs, because of the difficulty of rendering the casement window storm-proof and at the same time hanging it so that it is convenient to screen.

To make a window storm-proof it is almost imperative to hang it outside or else resort to some special means for safeguarding it. To hang it outside interferes with screening it and it is generally better if it can be hung inside, provided sufficient protection can be secured to keep the rain from beating in through the joints.

There is to be had some patent hardware for hanging that makes it convenient to hang inside and also makes it pretty safe. Anyway, in the enclosing of sleeping porches and verandas it is not so important to have a window storm-proof as it is when the window is part of the main house itself. The enclosing of porches is an idea that needs developing. It adds to the usefulness of the porch by making it possible to get service out of it in the winter time and by virtue of doing this it also protects the house both against cold and against exposure to the elements.

So, try cultivating this casement window idea. Make a study of it and see how much can be developed in connection with porches and balconies and afterwards you will be inclined to feature it in connection with house building, especially in kitchens, dining rooms, and places where you want to secure the maximum of air during the summer months.

When your work is a pleasure it is a success. Pleasure comes from Perfect Satisfaction. Why not be a success in your profession and be happy by using Simonds Hand Saws? They prove the Best by Test.

A stranger seeing a carpenter at work on a building noticed that he was using a No. 7½, 26-inch Simonds Hand Saw.

"I see you are using a Simonds Saw," said the stranger.

"Yes."

"How do you like it?"

"Well, I'll tell you. I have been carpentering twenty years and bought that saw four years ago and haven't set it since I had it. It is ground thin on the back and don't need setting, which saves half the labor in sharpening it; and it beats anything I ever saw to hold an edge"

BOOK NOTICES

Notice.—All books noticed in these columns may be obtained from this office at Publisher's prices. All postage or express prepaid. Money and address must accompany all orders.)

PRACTICAL CEMENT WORK.—By B. Henry. Published by the Concrete Age Publishing Company, Atlanta, Ga. Cloth, limp binding. Price 50 cents, prepaid.

This is a very handy and concise little work, and is well suited to the requirements of practical workmen, as it contains full directions for mixing all kinds of concretes, cements and stucco, with rules for the proper proportioning of sand, cement and aggregates, stating the different kinds of sands to be used for different purposes; also methods of mixing and the various appliances used in mixing, and tools required for the purpose of laying concrete and cement. The book is handy for the pocket and contains—for its limits—100 pages—a very large amount of the best up-to-date information on the subject of concretes and cements. The book may be obtained from the office of publication, Atlanta, Ga., or from this office, on receipt of price.

WOODWORKING SAFEGUARDS—For the Prevention of Accidents in Lumbering and Woodworking Industries.—By David Van Schaack, Director Bureau of Inspection and Accident Prevention. Published by Aetna Life Insurance Company, Hartford, Conn., Accident and Liability Department. Heavy, limp cover binding, and containing over 300 clear illustrations of methods and appliances made use of for the prevention of accidents; over 200 pages, printed on fine, heavy paper; sent to any address in the United States, postpaid on the receipt of the price, one dollar, which may be sent to the above address, or to this office.

This is a work that should be in the hands of every person who works about machines of any kind intended for woodworking or other purposes, as it contains so many simple devices and rules—plainly set forth—for the prevention of accidents of every possible kind. Many a man who now labors under the disadvantage of having lost one or more of his fingers—or a thumb, perhaps—or injured by flying splinters or boards, or caught by belts, might have been spared the pain and loss from these and other misadventures had he possessed a book similar to this—and made use of it—a matter of considerable importance to the workmen himself, his employer and the country. The book is not costly, and we would suggest that every mill owner in the country purchase two or three copies and loan them to their workmen, in rotation, and thus spread a knowledge of self-protection, which appears to be quite limited, or certainly there would be fewer accidents attributable to the useful but feelingless woodworking machine.

HINTS FOR PAINTERS, DECORATORS AND PAPER HANGERS.—Containing instructions and suggestions for House Painting, Stenciling, Gilding, Graining, Paper-Hanging, etc. Prepared with special reference to the wants of amateurs. By C. Godfrey, author of "How to Mix Paints," Etc. Published by the Industrial Book Company, Fulton street, New York. Cloth binding, illustrated, 122 pages, printed on fine paper and very neatly gotten up. Price, postpaid, 50 cents.

This is quite a handy little work, and contains most fo the necessary rules that a practical painter must know, if he has any aspirations to become thoroughly conversant with his trade. While the author states in his title that the work "has been prepared with special reference to the wants of amateurs," we feel that it will be equally useful to the general workman, and that even the expert may find within its covers many things he may have forgotten or overlooked in the stress of business, and that he may want in some unexpected emergency.

The little work is quite a creditable production, from a publisher's point of view, and ought to have a fairly good sale.

PATENTS.

The following list of recent patents and trademarks relating to building interests is especially reported for THE NATIONAL BUILDER by Wm. G. Henderson, solicitor of American and foreign patents and trademarks, Norris building, 501 F street, Washington, D. C. A copy of any of the United States patents will be furnished by him for 25 cents.

BUILDING TRADES INTERESTS IN THE COURTS

By GEORGE H. MURDOCH

The word "specification," when used in a building contract, means a detailed statement of each particular part of the work to be done, usually prepared by the architect, to amplify the details of the plans.—Fowler vs. Bushby, 125 N. Y. S., 890.

A surety on a building contractor's bond for the construction of a five-story building was discharged by changes in the plans involving the addition of another story where he did not consent thereto.—Barrett-Hicks Co. vs. Glas, 111 P. (Cal.), 760.

That a subcontractor furnishing materials and labor in the construction of a building did not personally bestow labor or services on the building would not preclude him from obtaining a mechanic's lien therefor.—Barrett-Hicks Co. vs. Glas, 111 P. (Cal.), 760.

The office of the statute in requiring the conditions and terms of the contract for materials to be set forth correctly in the notice of mechanic's lien is to inform the owner as to the extent and nature of a lienor's claim so as to facilitate investigation as to its merits.—Barrett-Hicks Co. vs. Glas, 111 P. (Cal.), 760.

Where the word "specification" was stricken out in two of the four places in which it was used in a building contract, thereby making it ambiguous, any contemporaneous document, such as a duplicate of the contract, could be examined to ascertain the intention of the parties.—Fowler vs. Bushby, 125 N. Y. S., 890.

A provision in a building contract that the second payment should be made when dismissal is secured upon the certificate of the tenement house department did not bind the contractor to do work not included in the contract, in order to secure a dismissal by the tenement house department.—Fowler vs. Bushby, 125 N. Y. S., 890.

A check given in settlement of work done under a building contract, indorsed by the owner as "in full settlement of contract of December 3, 1909," only covered work included in the contract, and was not in settlement of extra work not included therein.—Fowler vs. Bushby, 125 N. Y. S., 890.

Where, after defendant claimed that certain lumber furnished him by plaintiffs was defective, it was agreed that the matter be arbitrated, and on the arbitration defendant was allowed $17 with which he was credited on his account, such award precluded him from thereafter setting up defects in the material as a counterclaim in a suit for the balance of the price.—Barry vs. Congleton Bros., 131 S. W. (Ky.), 1014.

Where plaintiffs contracted in writing to do all the work and furnish all the materials for the construction of a building and covered passageway to connect with an old building for defendant on the place to be designated by the latter and according to the plans and specifications, and defendant changed the location of the building so as to require a longer passageway, plaintiffs could not after proceeding with the work without objecting claim additional compensation.—Rebekah Assembly I. O. U. F. of Indiana vs. Pulse, 92 N. E. (Ind.), 1045.

That one who furnished materials for the construction of a building, who was also a surety on the contractor's bond, took from such contractor an assignment of all money due and to grow due on the contractor's contract merely as indemnity against his loss as a surety and to insure proper application of the money would not render such surety liable under the building contract to the owner or laborers, mechanics, and materialmen, nor preclude him from obtaining a lien for materials furnished by him.—Barrett-Hicks Co. vs. Glas, 111 P. (Cal.), 760.

While under Sess. Laws 1909, c. 45, declaring that every person furnishing materials shall "at the time" they are delivered to a contractor, deliver or mail to the owner of the property on which the materials are to be used, a duplicate statement of all such materials, a reasonable time might be taken, it cannot, in the absence of a positive showing, be said that a few weeks or a month's delay would be excused, so as to entitle the materialman to a lien; the purpose of the statute being to protect property owners against dishonest contractors.—Finley vs. Tagholm, 111 P. (Wash.), 782.

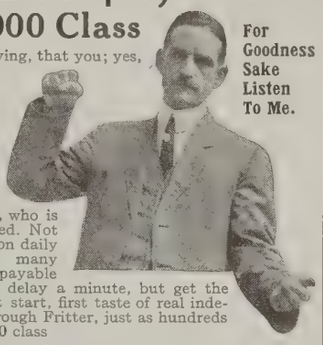
A building contract provided that the architect's decision as to the meaning of the drawings should be final. In a letter the architect stated that when the contractor figured on the house he estimated on the plans before they were presented to the tenement house department, and it was necessary to specify in the plans filed with it that the floor would be waterproof, and several other orders were received from the department on which the contractor did not figure, and as to which he had been put to some expense, and that the contract required the approval of such department, and the owner was not bound to pay the contractor extra for such work. **Held,** that the architect's decision was that the waterproofing of the floor was not covered by the contract; the remainder of his letter dealing with the construction of the contract which he was not authorized to construe, so that his statement that the owner was not bound to pay for the extra work was not binding on the parties.—Fowler vs. Bushby, 125 N. Y. S., 890.

Where a subcontract for the construction of the carpenter work of a building provided that, if the subcontractor neglected to supply sufficient workmen, the contractor on three days' notice might terminate the contract and complete the building, and the contractor thereafter, because of delay which resulted from the contractor's failure to furnish materials as he had agreed to do, terminated the contract and completed the building, the subcontractor was entitled to recover a proportionate part of the price for the work done by him, and also such profits as he would have realized if he had been permitted to complete the work.—Standard Const. Co. vs. Jeunesse, 131 S. W. (Ky.), 1028.

Be the man who gives orders

If you aspire to be one of the men who do things, to rise above the poorly paid class, and to be independent, you must have special training. You have the ability, but it is latent, it needs developing. By our practical and complete correspondence courses we can positively teach you to become proficient in DRAFTING—

Estimating, Plan Reading, etc., by Mail



in full or partial courses to fit your individual need. The courses cover every conceivable branch of the building trades. Conducted by a large and successful firm of Chicago architects—your lessons are supervised by them. Blue prints of buildings actually being erected in Chicago to study from. Courses are especially prepared for contractors, bricklayers, carpenters and all men in construction work. Low tuition, easy terms. No text books to buy. Send for instructive folder.

CHICAGO TECHNICAL COLLEGE, 655 Athenaeum Building, Chicago, Illinois

We also teach these same courses, including architectural, mechanical and structural drafting, at our Chicago School. Day and evening classes. If interested in the resident course ask for Catalog Y.

Any Man Can Get $1,000.00

Who Joins Fritter's $1,000 Class

For Goodness Sake Listen To Me.

Reader, I, Fritter, am talking to YOU!—Am saying, that you; yes, you, can get $1,000; but be warned—only 5,000 can be accepted. So get mighty busy—write Fritter today. It costs nothing to investigate this remarkable $1,000 class.

5,000 Men Will Get $1,000 Each

You, by acting **now—today**—can get the thousand allowed to your section. This money—$1,000 or more per man—goes to **mechanics, clerks, farmers, preachers, doctors lawyers, teachers**—people from all walks of life—**any man, anywhere**—up to 5,000, who is willing to join Fritter's $1,000 class. Nobody barred. Not a fairy tale, fake or humbug; for listen—it's going on daily—hundreds have received their thousand—some many thousands. If you can use $1,000—real money—payable $35 to $75 weekly—say so—don't hesitate—don't delay a minute, but get the thousand-dollar hustle—**get your first $1,000**—first start, first taste of real independence—power, influence, luxuries—get these through Fritter, just as hundreds have done. Poor men joining his wonderful $1,000 class

Without Capital—Without Experience

—starting with only their nerve—finishing with thousands; yes, thousands of dollars. You, if willing to join hands with Fritter, can easily enjoy same abundant prosperity. Knowing the reason dispels all doubt—creates confidence—enthusiasm

CLASS GETTING OVER $2,000.00 PER MAN.

Sectional View of "Energizer"

Korstad (Minn. farmer) received **$2,212.13 in 2 weeks;** Zimmerman (Ind. farmer) **$3,856 in 30 days;** Stoneman (Nebr. photographer) **$3,841.68 in 60 days;** Rasp (Kansas agent) **$1,685 in 73 days;** Juell (Canada clerk) **$6,800;** Oviatt (Iowa minister) **$4,000;** Hart (Va. farmer) **$2,000;** Wilson (Ky. cashier) **$3,000 in 30 days;** Beem (Kans.) averaged **$164.25 weekly** for 3 months; Langley (Dak. liveryman) **$115 first day.** No wonder these men bless the day they joined Fritter's $1,000 class. Reads like fiction, yet it's the gospel truth. **Proven by sworn statements—investigation—personal interviews.**

10 MINUTES' WORK $6.50 Cash, Presto!

IT'S SOLVED. The long-desired, much wanted, universal bathroom has come. Requires **no plumbing, no waterworks—no water systems. 10 minutes to install—$6.50 to buy. The equivalent of any $200 bathroom.** Self-heating—hot or cold running water facilities. Cleansing, friction, massage and shower baths in any room. No tubs to clean bowls or buckets to fill. Simple, durable, handsome, sanitary. The dream of millions come true. Modern homes, modern bathing facilities within the easy reach of every man, woman and child in the land. No experiment. **Used by U. S. Government. Over 200,000 delighted customers.** With such an article, with exclusive selling rights, with Fritter's help and your nerve you're bound to make from $1,000 to $5,000 this year. **It's not a question of ability, location or capital** (for we **give credit** to active workers), but **whether you act quick enough to get into Fritter's $1,000 class. Once in you're good for a $1,000 anyhow.** Reese solicited 60 people—sold 55; McDaniels 20—sold 19; Lodewick 41—sold 39; 17 orders in one day; Hart "16 in 3 hours"; Wilson 102 in 14 days.

Address Fritter personally today—make him prove his claims and above all that you too can get $1,000. Don't accept anything without proof. First get Fritter's entire proposition—it's free. Then decide. Just a postal will do.

ALLEN MFG. CO., 3493 Allen Bldg., Toledo, O.

Take a Course in Architectural Perspective

And You will Then be Able to Close Many a Contract that Would Otherwise be Lost

The demand for Architectural Perspective is increasing yearly because those who build are demanding, in addition to the plans, perspective drawings of their buildings. A well made perspective drawing, properly shaded and set off by a little landscape and secondary detail, pleases the eye, and is a valuable adjunct to the regular plans and elevations. Our correspondence course in ARCHITECTURAL PERSPECTIVE and DRAWING of BUILDINGS is complete, practical, and can be learned at home at odd times. Instruction likewise given in twelve separate, complete Art Courses, for pecuniary profit, or pleasure only, as desired. Year Book sent upon request.

A Happy New Year to Everybody

I'm The Bay State Coating Man

My goods are backed by twelve years of practical experience in making a cement coating. They have been tried under all sorts of conditions and met all the requirements.

Years before anyone else had put a coating on the market Bay State Brick and Cement Coating was an established success. It had been used on large and small houses, factory walls and factory floors, on the vats and damp rooms of textile mills and breweries. It is the only coating that I know of that won't burn when subjected to heat. It has a flat finish, doesn't destroy the texture of concrete and saves it from cracking from moisture.

Just write me for our booklet No. 10.

Give our salesman a good hearing when he calls. He's got the goods.

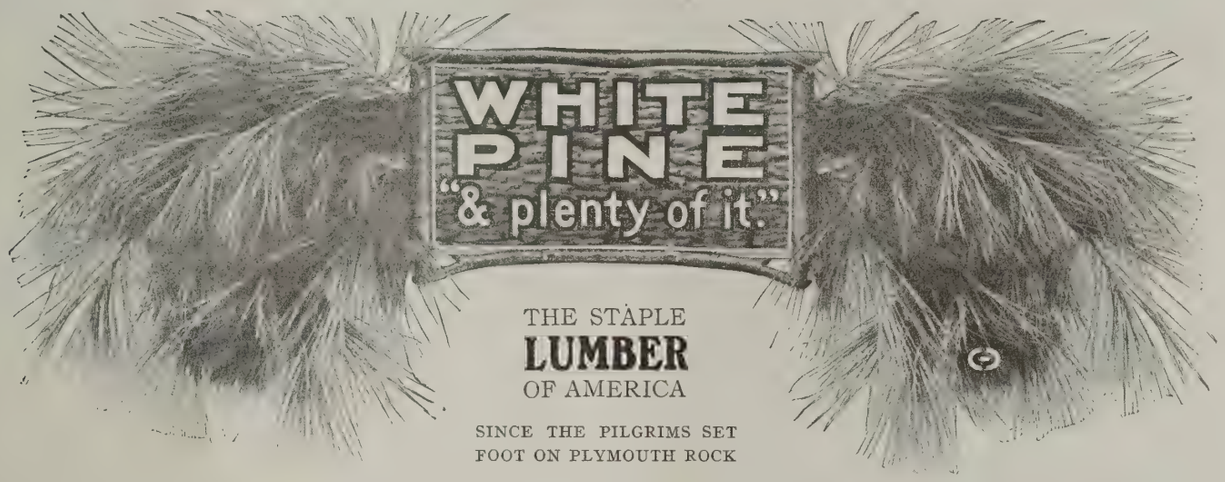
BARN DOOR HANGERS.

We often wonder if too much thought is not spent on the luxuries of life and not enough on the necessities. We are advised that the farm population is decreasing and the city increasing, which may account for a part of the high cost of living. But we also find every incentive to live in the city. The inventions for convenience and comfort nearly all cater to the city man rather than to the farmer.

In the matter of hardware, fine door locks, massive bronze decorations, cylinder locks, etc., are none too good for the city man, but how much thought is expended on the homes of the country man. Frequently the houses and barns are locked with a wood button or



old-fashioned hasp and staple; and a padlock is the regular equipment of even otherwise well built structures.

In the matter of barn door hangers, particular attention should be paid to conditions to secure the best results. Often the door is

GOOD NEWS for Carpenters and Builders

Don't Miss a Word of This

ED. NOTE:—The article below is one of unusual interest to every one concerned in building, either as architect, contractor or owner, and also of the highest educational value in these days of thoughtless and ill-advised use of inferior substitutes for wood. Wood has been well called, "Mankind's instinctive reliance" as a structural material. LUMBER still is the greatest building material in existence—the safest, the most adaptable and most economical. And WHITE PINE and its "half-brother," NORWAY PINE, are by many regarded as the best wood known for most of the uses with which they are historically associated. White and Norway Pine are so essentially "the peoples' lumber" in the diversity of their every-day uses that it is good to learn that the supply is ample and easy to get if demanded.

"The Leader in the Markets for 250 Years" (U. S. Government Report Bulletin 99, October 1911)

When the folks landed from the Mayflower in 1620 they found themselves on the edge of a dense forest of superb WHITE PINE, covering practically the whole countryside, "and then some." Fine, great trees they were—diameters as big as 7 feet, and towering up to 240 feet. (One WHITE PINE monarch that stood on the present site of Dartmouth College was 270 feet high.)

The cutting of WHITE PINE began at once. Within 15 years they were shipping cargoes of White Pine masts to England. Within 30 years they were sending it to Madagascar and trading it for slaves for the Virginia market. White Pine proved so superior a wood that THE REST OF THE WORLD WANTED IT, JUST AS IT DOES TO THIS DAY, and the thrifty colonists' foreign trade in it grew so that

IN 1650 FEARS WERE EXPRESSED THAT THE DRAIN WOULD SOON EXHAUST THE SUPPLY.

(*See Page 37 Govt. Rep't.*)

Many years later the alarm was raised again, but far-sighted

JOSHUA McGEE REASSURED THEM

and told the anxious ones that "cutting a few hundred masts a year would make little inroad on America's forests" which he stated to be "*14 or 15 miles long and 300 to 400 miles broad.*" (He was a true conservative!) And the cutting went right along, yet *HERE WE ARE IN THE YEAR*

1912 AND STILL PLENTY OF WHITE PINE

AS GOOD AS EVER and plenty of NORWAY PINE TOO

(Which for most uses is just as good as White Pine)

And the best of it is that *there is going to keep on being plenty.* After 288 years of White Pine cutting in Massachusetts alone (which by many is supposed to be denuded of timber) there were 238,000,000 feet of White Pine alone cut in 1908 (Government figures). The Forest Service further reported that "it is not improbable that a similar cut can be made every year in the future from the natural growth of White Pine *in that state.*" And Massachusetts is "not much" these days on White Pine production. Minnesota and Wisconsin now produce *THE BEST* as well as the most White Pine. This Government report also says, "*The supply of White Pine lumber need never fail* in this country, provided a moderate area is kept producing." You may rely on us to see that through *WIDE AWAKE RETAILERS EVERYWHERE,* ***YOU*** may secure this "staple American lumber" with the same *certainty* and the *SAME QUALITY ADVANTAGES ENJOYED BY YOUR ANCESTORS.*

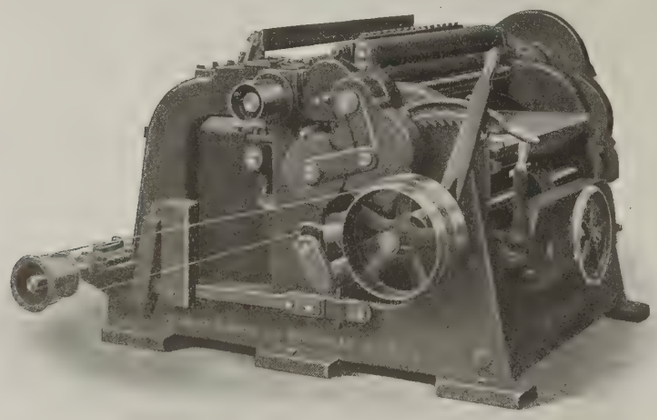
If you ever buy lumber, from a chicken coop to the "trim" of a palace, WRITE US before you do it. Inform yourself—this question of "what wood to use" is deeper than many realize. We will reply PROMPTLY AND CANDIDLY.

SPECIAL NOTE:—Anyhow, drop a card for our little book (you need it for your own sake, not ours.) FREE on your simple request. Don't wait—there's no profit in waiting. Write TODAY.

NORTHERN PINE MANUFACTURERS' ASSOCIATION

1119 LUMBER EXCHANGE MINNEAPOLIS, MINNESOTA

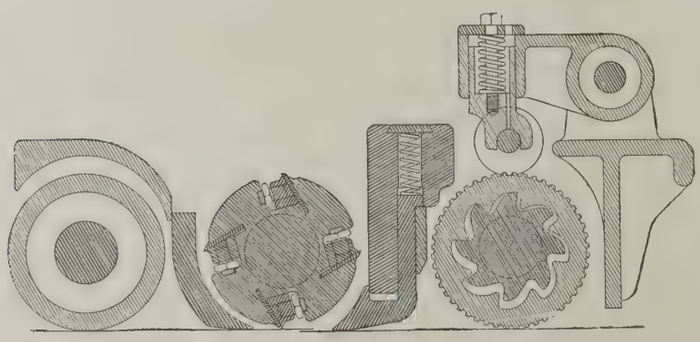
PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.



blocked by snow and ice, jammed by cattle or farm wagons, and, in fact, exposed to the severest service. A hanger which would do well in a mansion would be useless here, for the conditions are far different.

With a view of producing a hanger which would successfully meet all the adverse conditions under which it would be used, the National Manufacturing Co. of Sterling, Ill., have placed on the market their No. 77 Storm-Proof Hanger. They claim it is proof against snow or ice, birds or other sources of trouble. Being self contained, there is no extra work putting up brackets, guides, housing, etc. The hanger wheels run on roller bearings, thus reducing the friction and necessity for oiling.

A special descriptive circular "A" has been prepared by the manufacturers, the National Manufacturing Company, Sterling, Ill., and we are advised that it will be sent on request.



SMITH'S NEW 30-INCH CABINET OR SMOOTHING PLANER.

The Improved Cabinet Surface Planer built by the H. B. Smith Machine Company, of Smithville, N. J., is about the last word in machines for this purpose. As regularly built, the planer is fitted with patent sectional feed rolls, patent sectional chip breakers and new round head with self hardening cutters. The planer is built in three sizes to accommodate material 30, 36 and 42 inches wide by 7 inches thick, and is capable of modification for special work or conditions. As this machine is intended for the very finest work, no attempt has been made to save metal at the cost of freedom from vibration, as is evidenced by the weight varying from 5,480 to 7,000 pounds. This amount of metal allows very rigid crossbracing in the frame and the support of the working parts in the most substantial manner.

RIGHT SIDE FRONT VIEW OF NO. 32-C 30-INCH HEAVY CABINET PLANER.
Showing Patent Gear-Case Coverings; Automobile Chains for Conveying Power to Discharging Feed Rolls; Combination of Weights and Springs to Insure a Positive Feed, and Solid Table Mounted on Incline-Planes.

To raise or lower the bed it is only necessary to throw in a clutch by the hand lever shown on the front left hand side, although the bed can be changed by the hand wheel in front. As the bed works on inclines extending from front to rear, it is very rigid.

Showing Relative Position of the Feed Rolls, Cutter Head, Chip Breaker and Pressure Bar, and Incidentally Showing Construction of New Round Head, Patent Sectional Chip Breakers and Method of Giving Pressure to Patent Sectional Feed Rolls.

A very good idea of the machine can be obtained from the cuts shown in this article, and the method of feed is also shown.

The H. D. Smith Machine Company, Smithville, N. J., will be glad to give further information regarding this and other wood-working machines.

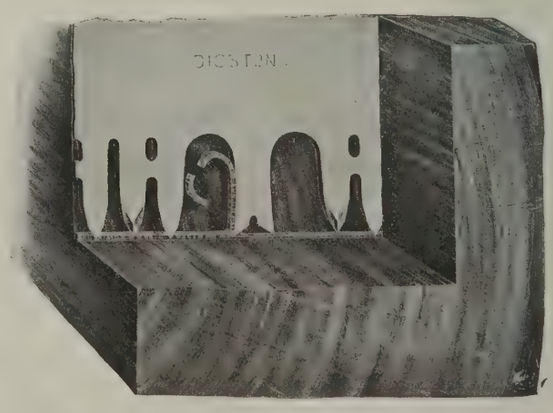
BAY STATE CEMENT COATING.

Man points with pride to the Pyramids and other structures in the old countries as an instance of permanency in works of stone and masonry, and attention is often called to the early decay of modern building materials. To many it would seem that the ancients had secrets which they did not hand down to the present day builders, but is this true? It is well known that practic lly no works in wood remain, and the reason the stone remains intact is due largely, if not entirelv, to the climate of Egypt and other eastern countries, where rain seldom or never falls, and the temperature rarely ever approaches the freezing point. Given similar conditions in this country, the work of the builders would be ideal, but the chances are no one would like the attendant evils of the dry, warm climate.

In many parts of the United States it is necessary to provide for extremes of temperature, often amounting to 150 degrees from July to January, with many heavy rains, and often a succession of days when the thermometer would show alternate thawing and freezing. It is severe conditions, such as these, that play havoc with our pretty ideas and ideals in plaster, stucco and even brick, stone and cement.

How can we combat these conditions? As practically all materials, except the oily asphalts, are more or less porous, it would seem that a heavy coating of black asphalt or similar composition would do the trick. Possibly it would, but would the result be pleasing? The coating would lack the texture of the body material, as well as the colors, but might do for many places where such effects made no difference, such as for underground or engineering work.

Many chemists and paint manufacturers have gone to great expense to find a compound or substance which would be at once available and suitable—among the first firms carrying on such investigations, we find Wadsworth, Howland & Co., Inc., 82-84 Washington street, Boston, Mass. Under the name of Bay State Coating they have for twelve years been marketing a product which they claim meets all the requirements of a perfect coating for all brick, stone, cement, plaster and stucco walls, exposed to moisture. The length of time this coating has been on the market speaks well for its permanency, and the varied conditions under which it has been used indicates its possibilities. Apparently it is an appropriate coating for all sorts of buildings, factory walls and floors, as well as for inside work on tanks, vats, etc. It seems to fill the pores completely and penetrate to an appreciable distance, and still preserves the texture of the surfacer. Being in the nature of a cement held in suspension in a volatile oil, it is not affected by acids, gases, heat or cold. Neither moisture nor fire changes its color, and, in fact, it is so good a fire-retardent as to have the approval of the National Board of Fire Underwriters on every package.



There are so many other uses than the ones we have touched upon that the reader is urged to write Wadsworth, Howland & Co., Inc., 82-84 Washington street, Boston, Mass., and ask for Booklet No. 10, which covers the subject in detail.

DISSTON CROSS-CUT SAWS.

Keeping everlastingly at it is generally considered a requisite of success, and from this standpoint Henry Disston & Sons deserve the high reputation which they have. For seventy-two years they have been making saws, and other tools, too, in such ever-increasing quantities that there must be merit in the goods which creates and satisfies the demand for good tools for such a long period.

From the start in 1840 the Disston plant has steadily grown until it is really a city in itself and would attract considerable attention for that, were it not in such close connection with Philadelphia.

There may be many reasons for the remarkable growth of this plant. Call it business sagacity, supplying a necessity, keeping up with the times, etc., but one fact stands out prominently—Disston made a name for his tools and the tools back up his guarantee. The absolute certainty that a complaint would be investigated and made good has made the sales at the top prices, for the first class mechanic wants and will pay for the best.

With such a past and with such a bright future, there is every reason for continued success and increased business, and there is little doubt but that another seventy-two years will see "Disson" means the highest quality, as it does NOW.

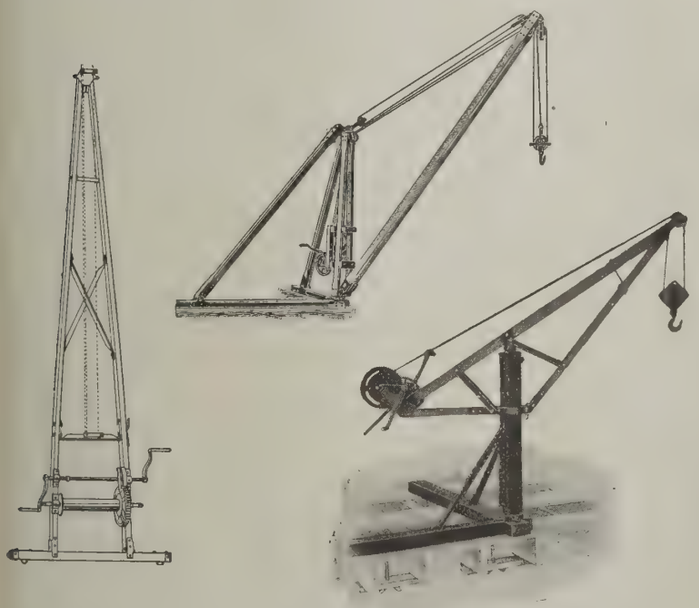
In a recent catalogue one can see some of the technical reasons for the success of their tools. We reproduce one cut showing the action of their cross-cut saws.

The careful manufacturer is here supplemented by instructions to the filer and user. A careful study of this cut will show how the cutting teeth prepare the way for the planing action of the Raker or Cleaner tooth, and the reason for the smooth and fast cutting of a properly made saw.

There are many other excellent points brought out in the catalogue and every saw user should have it.

INVISIBLE JOINT STEEL CEILINGS.

The accompanying illustration shows Invisible Joint Steel Ceilings manufactured by the Milwaukee Artistic Metal Ceiling Company of Milwaukee, Wis., and Kansas City, Mo., used in a very handsome banking room. This particular case serves to emphasize the fact that metal ceilings are becoming from day to day more popular for



use in establishments where high class decoration is desired. The artistic and beautiful effects on the Invisible Joint Metal Ceilings are well known and the manufacturers are ready to supply catalogues and other information which will be of value to those in any way interested in this particular line.

NEW SASGEN DERRICKS.

Sasgen Bros. have a new circular which shows several new derricks that they have added to their well-known line. One is the Sasgen Standard Reinforced Circle Swing Builder's Derrick, especially practical for on high buildings and where large capacity is desired, and which is equipped with a geared winch holding sufficient cable for a twenty-five story building. This derrick is built of selected wood and fitted throughout with malleable and crucible steel fittings, including winch.

Another described in the catalogue is The Sasgen Light, Strong and Portable Stiff Leg Derrick, which can be used by hand or power without altering the derrick and making it especially handy on building. It is built with a split mast and boom and fitted throughout with crucible steel fittings.

The Sasgen Top Point Setter Derrick is also one of their new makes. For setting structural iron, stone, etc., where loads run only to about one and one-half ton, this derrick is recommended very highly, as it is light and handy to get around with, especially where it is used from the floors above.

No building contractor needs to be told the necessity of having a good, serviceable hoisting derrick on the job. The better the derricks, the quicker the contractor can work, and well made derricks are great accident preventers. The Sasgen derricks have been on the building field so long and are so well liked by all who use them that they have practically become standard in their demand.

Those interested in new equipment of this kind should write Sasgen Bros. for full information, addressing them at 2056 Racine avenue, Chicago, or 103 Park avenue, New York.

P. S. & W. TRADE MARK TOOLS GUARANTEED REG U S PAT OFF.

The MARK of the MAKER on this chisel guarantees good service.

THAT means more than quality alone, though the quality is there, just as in every P. S. & W. Hand-Tool.

Not only a special high-carbon tool-steel in the blades; but a temper that gives the sharpest and longest-wearing edge.

Not only straight-grained, seasoned hard-wood in the handle, but handles that are turned to fit smoothly and snugly in the socket.

These are but two of many service qualities that have given P. S. & W. Chisels and Gouges the leading position with expert mechanics.

Guaranteed P. S. & W. Braces

Next time you go to a hardware store—ask to see a P. S. & W. "Samson" Brace. It has the vise-like grip and instant release of the ball-bearing chuck, as well as a steel-clad head with dust-proof ball bearings. It's one of the top notchers in our very complete and extensive line of hand tools for Carpenters.

Write today for our free 170-page, "Mechanics' Handy List." It contains 35 pages of useful information, and a catalog of over 200 tools for Carpenters, Machinists, Electricians and Tinsmiths.

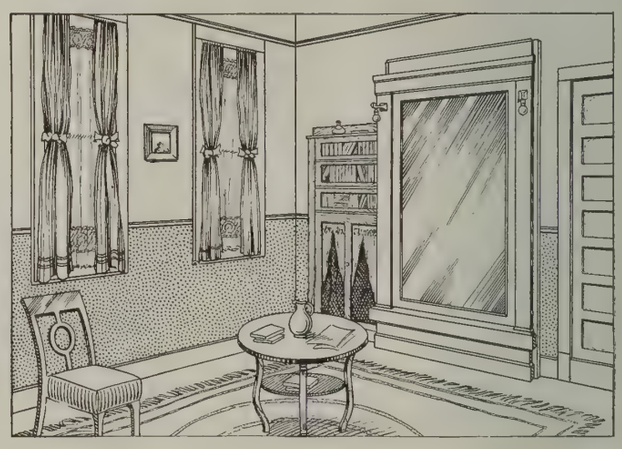
MATHEMATICAL AND DRAWING INSTRUMENTS.

Under the above heading the Keuffel & Esser Company are sending out from their general offices at Hoboken, N. J., a new circular showing a few items from their complete catalogue. We are advised that such of THE NATIONAL BUILDER readers as are interested in Drawing Materials, Drawing and Mathematical Instruments, Surveying Instruments and Measuring Tapes, can obtain their complete catalogue by mentioning THE NATIONAL BUILDER. As the Keuffel & Esser Company carry a very complete stock of the above goods, it is well to have their catalogue on file for ready reference.

The same company is sending out a beautiful celluloid pocket calendar for 1912 which will be useful to everyone. Those on their mailing list will be remembered and others may obtain it by writing for it.

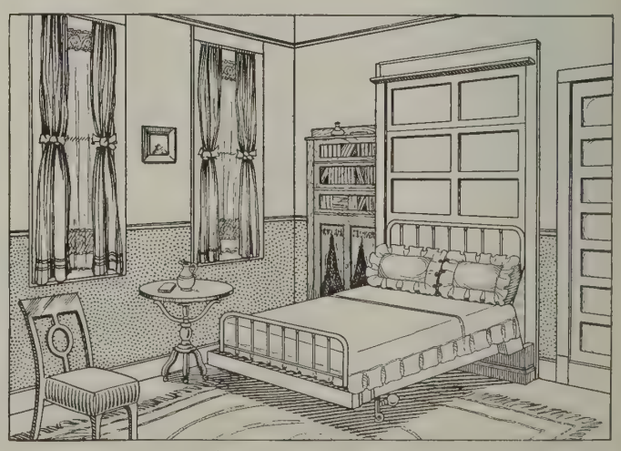


THE I. H. C. ALMANAC AND ENCYCLOPEDIA.

No line of work is more dependent upon the weather than farming, and so we see the farmer eagerly grasping any literature which promises to aid him in forecasting the weather or making suggestions to work in harmony with the weather reasonably certain to come. The International Harvester Co. are sending out from their Chicago office an almanac which, besides being a reference book for astronomical data, tables, useful information, etc., contains articles of an educational character written by recognized authorities.

The book is dedicated to those who are striving to improve American Agricultural Methods, and we understand the remaining copies will be sent free to those who ask for it promptly.

NEW CATALOGUE OF THE NORTHWESTERN GRILLE WORKS.



Catalogue No. 17 of the Northwestern Grille Works is in our hands, and we find it contains a number of novel items of interest to the progressive builder. One of the newest ideas is that of a Combination Wall Bed and Consol, which when closed, has the appearance of a high-class consol, but which can readily be changed

to a full-size bed. This combination can be used to advantage in small bedrooms, and can also be used to supply an extra room. With slight modification, it can be used on a sleeping porch.

The catalogue also shows an excellent line of Consols, Sideboards, Grilles, Columns, Arches, etc.

Careful attention to details, the use of the best materials, and prompt service have given the Northwestern Grille Works a fine

reputation among their customers. With the idea of extending their trade, they are offering to send this catalogue free to contractors, builders and other interested parties. Their offices, showrooms, and works are at 1824 Milwaukee avenue, Chicago.

The Next Time You Buy TOOLS AND SUPPILES

don't scatter the order to all parts of the country. You can save time, trouble and money by purchasing the entire lot from ORR & LOCKETT'S. And when you send that list in to us you can dismiss it from your mind as filled —*we* will see that the goods reach you quickly and as ordered.

In the first place we carry at all times the largest and most complete line of tools and builders' hardware in the West, so we seldom have to hold up an order because something is "out of stock." And this huge assortment (including the well known brands) gives you the greatest possible choice of kinds and prices.

Then everything coming in one lot means a saving in shipping charges and bookkeeper's time, and insures quicker delivery.

Altogether you will find it more convenient, more satisfactory and cheaper to place your entire order with ORR & LOCKETT—"for over forty years the leading hardware dealers of the West."

Asbestos "Century" Shingle Roof—Quintard Estate, Portchester New York. Reroofing Contractor, John Gery, Paterson, N. J.

Asbestos "Century" Shingles

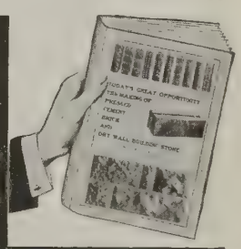
"The Roof that Outlives the Building"

Your clients will pay just about the same for an Asbestos "Century" Shingle roof as for any other roofing that is ordinarily put on first-class buildings.

But consider their durability—their immunity from fire risk—their freedom from repairs and painting—

You find that Asbestos "Century" Shingles are the cheapest roofing known to the building trade.

Two hundred million Asbestos "Century" Shingles were sold last year at a price that enables the architect and builder to specify them in competition with other roofings—and brings us a conservative profit on the cost of making.



You can get Asbestos "Century" Shingles in shapes to suit any architectural scheme—in several sizes—and in **three colors**: Newport Gray (silver gray), Slate (blue black), and Indian Red.

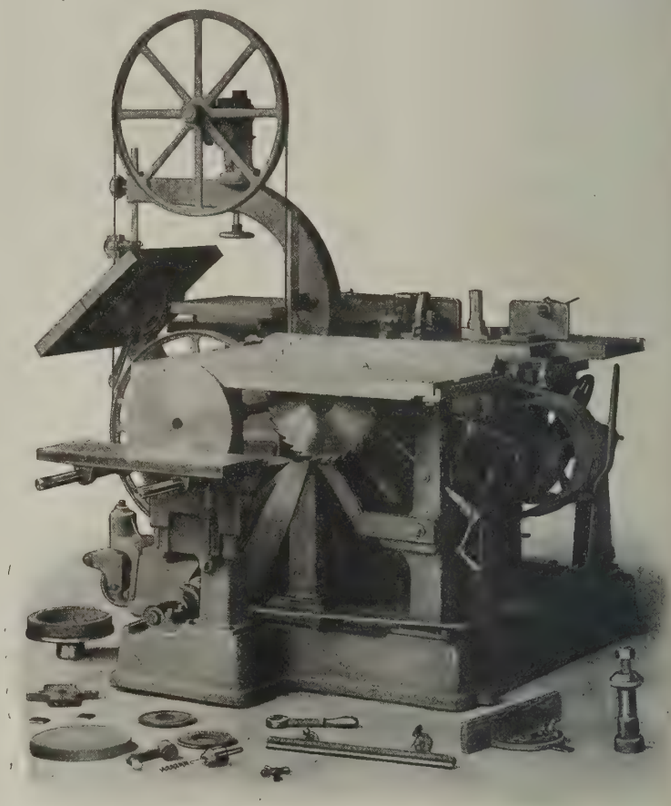
THE WATROUS No. 18 SAFETY SASH HANGER

EASIEST AND QUICKEST TO SET



Won't blow off or be dropped off by children or careless servants. Can't be set wrong. The best of them all. Only sash hanger on the market with gauge lugs which make it impossible to set it in any way but the right way. Nine-tenths of the trouble with sash hangers comes from their being set wrong. The Watrous No. 18 is ALWAYS right. Full directions with each set.

E. L. WATROUS MFG. CO., Des Moines, Iowa

SUBSTANTIAL EQUIPMENT FOR THE SMALL WOOD WORKING SHOP.

Recognizing the urgent need of substantially-built machines for use in the smaller shops, The Crescent Machine Co., 10 Main street, Leetonia, Ohio, have brought out their No. 51 Crescent Universal Wood Worker. In building this machine it has been the aim of the manufacturer to give the small shops the same substantial equipment as is used by the larger planing mills and factories. That their efforts have been successful is proven by the fact that the new machine has the enthusiastic approval of experienced wood workers, who pronounce it the best combination wood-working machine on the market today.

With this machine the small shop is practically converted to an up-to-date planing mill. The machine is portable, being fitted with special devices for making it instantly available for transport-

ing from one place to another. This feature appeals to the small contractor who can take the machine out on a special job and thus save many dollars on the cost of mill work.

The machine combines a band saw, shaper, jointer, saw table, and borer.

The band saw is equipped with re-saw attachment. It has tilting table, and is in every way a substantial machine.

The jointer is the regular pattern 8-inch jointer, made by The Crescent Machine Co., and when desired can be equipped with round safety head. It is in every way a substantial machine, and is provided with tilting gauge, that is adjustable over the full width of the table. Of course, the jointer is equipped with the Crescent jointer guard, which is a part of the regular equipment on all Crescent jointers.

The shaper spindle is conveniently placed and revolving in a vertical position; the machine is admirably adapted for surfacing one side and straightening one edge of a piece at the same time. The shaper spindle is reversible and has a vertical adjustment so it can be lowered below the surface of the table when desired.

The saw table is equipped with a ripping fence that is adjustable to an angle of 45 degrees, and the adjustable cut-off fence is graduated for setting to any angle up to 45 degrees. The saw can be adjusted for cutting through any thickness up to 4 inches.

The borer can be stopped and started at will. It is conveniently placed at the side of the saw table, and operates entirely independent of the saw table. It is provided with adjustable table and has self-centering chuck. It can be quickly converted into a hollow chisel mortiser.

An attachment for grinding planer knives is furnished, as are also a disk grinder attachment and emery wheel, for making the machine available for any kind of work coming within the range of the average shop where wood working is done.

With this machine in his shop the small contractor could save himself many dollars in convenience and actual time saved in getting work from the mills. He can also have his work just when wanted and thus be enabled to finish up many more jobs in a season. The manufacturers will be glad to give you further information upon request.

VANADIUM STEEL.

It is hard to realize the improvements on old methods and materials, for new matters are daily astonishing us. A pamphlet from the American Vanadium Co., Frick Building, Pittsburg, Pa., gives some remarkable facts regarding tools and machinery made of Vanadium Steel. The pamphlet, which is the December issue of American Vanadium Facts, gives statistics of interest to everyone using metal working tools, and we believe a request from any of our readers will secure this and future numbers of the publication.

Dimo-Grit wheels, "the wheels for steel," 25 times faster than grindstone, 10 times more efficient than emery wheels—will not draw temper

Dimo-Grit is the new artificial diamond sharpening substance. It is a product of the same electrical processes by which carborundum is made, but Dimo-Grit is especially adapted for use on steel, leaving the smoothest, keenest edge. No need of water cooling, no danger of drawing temper. Dimo-Grit never glazes—cuts hardest steel as emery does soft copper—just a light touch needed.

Luther "Hummer" Tool Grinder

Engine and foot power—4000 revolutions per minute by foot power. Shaft drive like an automobile—built completely of steel—dust-proof ball bearings—gravity lubrication and runs easy as sewing machine. Tool rests and attachments enable anyone to do difficult grinding as well as an expert mechanic.

A Workshop in itself

Extra attachments convert the Luther "Hummer" tool grinder into jig and circle saw, lathe, force feed drill, etc.—you can completely equip your workshop at very low cost—free book illustrates and describes extra attachments, —16 in all. Write for Free Book today.

Dimo-Grit Sharpening Stones

Ask your dealer for Dimo-Grit sharpening stones—the fastest, smoothest sharpening substance for steel. Look for the name "Dimo-Grit" on the stones.

METAL CEILINGS.

Probably no one item is more before the public today than conservation. Not only must our raw products and mineral resources be used economically, but the vegetable growth, timber, etc., must be preserved from too rapid destruction. No agency is more destructive than fire, and the efforts being made to reduce the fire loss, and the fire risk, are being increased every year.

To prevent the spread of fire inside the building, the use of metal covered walls and ceilings serve the purpose admirably. Good

protection is assured by even very thin sheets of metal, and we are glad to note the increasing use of metal for this purpose.

For external use, a somewhat heavier sheet of metal is generally used, as the material must stand the weather as well as the fire.

The various places in which sheet metal products are used permits the use of tin plate, iron and steel sheets, zinc, galvanized iron and steel, copper, etc. The location and use determines the amount of ornamentation which may or should be used.

There are a number of companies engaged in the manufacture of sheet metal products for building purposes, among them being the Indianapolis Corrugating Company of Indianapolis, Ind. In their catalogue "B," just off the press, we find a number of beautiful designs in ceilings and wall plates, cornices, mouldings, etc., one of which we illustrate. With the proper equipment and experience of twenty years, this company is able to get out the highest class of work. Their catalogue, which is sent free to our readers on request, contains a great deal of useful information regarding metal ceilings, etc. As this material is being used more and more, it is well to have their catalogue on file.

OAK FLOORING GRADES.

The Oak Flooring Bureau announce that owing to the confusion existing relative to the commercial grading of oak flooring, it has been deemed advisable to revise the rules governing the classification and specification. Under the new grading, it is hoped less misunderstanding will occur as regards the quality ordered or delivered. That our readers may be conversant with the grading, we print it in full below.

Oak Flooring Grading Rules Revised.

The grades of oak flooring shall be known as "A" grade, sap clear; "B" grade, common and factory.

Quarter-Sawed: "A" Grade (Clear).—Shall have one face practically free of defects, except 3/8 of an inch of bright sap; the question of color shall not be considered; lengths in this grade to be 2 to 16 feet, not to exceed 10 per cent under 4 feet.

Sap Clear (Sappy Clear).—Shall have one face practically free of defects, but will admit unlimited bright sap. The question of color shall not be considered. Lengths in this grade to be 1 to 16 feet.

Plain Sawed: "A" Grade (Clear).—Shall have one face practically free of defects, except 3/8 of an inch of bright sap; the question of color shall not be considered; lengths in this grade to be 2 to 16 feet, not to exceed 10 per cent under 4 feet.

"B" Grade (Select).—May contain bright sap, and will admit pinworm holes, slight imperfections in dressing; or a small tight knot, not to exceed 1 to every 3 feet in length; lengths to be 1 to 16 feet.

Common (No. 1 Common).—Shall be of such nature as will make and lay a sound floor without cutting. Lengths 1 to 16 feet.

Factory.—May contain every character of defects, but will lay a serviceable floor with some cutting. Lengths 1 to 16 feet.

SAMPSON CORDAGE CALENDAR.

A useful desk calendar is being sent out by the Sampson Cordage Works, Boston, Mass., in which a sample of their celebrated "Spot" cord is artistically used in connection with the calendar.

As practically every reader of the NATIONAL BUILDER is interested in Sash Cord, the calendar will be a constant reminder of its adaptability for its varied uses. A table, on the back, gives the standard sizes in which the cord is made, with other useful information.

We understand that the calendar will be sent to readers of the NATIONAL BUILDER on request.

FIGHTING NATURE WITH NATURE.

In all the processes of modern manufacturing there is probably no more interesting story than that of Trinidad Lake Asphalt. It is not only as fascinating as a novel in itself, but it also has a genuine commercial value to all who have to do with the roofing trade, directly or indirectly, for it instructs as well as interests, gives to every person interested in roofing valuable data which will make him an abler, readier, better-informed judge of roofing values. He could read no more interesting and convincing facts than those of Trinidad Lake Asphalt which is used in the manufacture of the well-known ready roofing called **"Genasco."** It shows how man has seized upon the forces set up by nature herself and has utilized them with enormous success in fighting nature.

Many years ago Charles Kingsley, the great English novelist, described Trinidad Lake on the Island of Trinidad, British West Indies, as "one of the Wonders of the World." Here in a great bowl-shaped depression in the earth, 114 acres in area, there wells up with steady, inexhaustible flow a mighty volume of asphalt. The center of the lake is about three-quarters of a mile from the shores of the Gulf of Paria and about 135 feet above the level of the sea.

Digging Asphalt from Trinidad Lake and transporting it for Genasco Roofing.

Out of this asphalt "lake" no less than 140,000 tons of asphalt are taken every year. But the quantity that remains is always the same, for from the hidden and mysterious well-springs far below there issues forth a fresh supply to fill in the cavities caused by removal. Teams can drive over the surface, except in the softer center portion, but it is necessary for them to keep on the move or they will be slowly swallowed up by the black viscous mass.

The surface of the lake is dotted by a half dozen islands from 50 to 150 feet in diameter. They all have vegetation, with trees 30 to 40 feet high. Imperceptibly, yet almost constantly, these islands shift their positions, another weird feature of this weird, freakish "lake."

The soft, fresh-issuing asphalt slowly bubbling forth raises the center of the lake a foot higher than the edges.

The Barber Asphalt Company, in Philadelphia, recognized in this queer, uncanny lake of asphalt the presence of a natural product of the utmost value to mankind. After a series of tests and a study of the proper process of refinement this concern has built up an enormous industry which supplies Trinidad Lake Ashphalt to many branches of trade, and which has made it famous and invaluable the world over for a great variety of building, paving, and roofing purposes.

The asphalt is dug right out of the surface of the lake by gangs of men wielding pick axes, is shipped to the Gulf of Paria, loaded into vessels, and transported to the Barber refineries located at Maurer, N. J. There it is refined and it is there that the celebrated Genasco Ready Roofings are made.

It can be seen at once why it is valuable to know these facts about the origin of the life-giving asphalt in Genasco Ready Roofings, for they reveal that Trinidad Lake Asphalt is a natural asphalt, that it is nature's own great water-proofer, and that it has withstood the tests of time, of flood, of rain, of wind, of heat, and of the furious elements of nature, for centuries in place from which it was taken.

So to put a stout covering of Genasco—that is, of Trinidad Lake Asphalt—over your roof is to fight nature with her own weapons. And what is more, to fight her with weapons which have been victorious over herself.

But no one is obliged to accept the word of the Barber company that the Genasco Asphalt is a natural product, and being such, is the best water-proofing and all-around weather-proofing there is. To prove the truth of the weird natural origin of the asphalt in Genasco all one has to do is to purchase any one of the scores of imitation ready roofings, made either of chemical substitutes for natural asphalt or

Another portion of Trinidad Lake showing Natives digging Asphalt.

by "secret processes" which are palpably described as secret in order to cloak the worthless nature of the compound.

An asphalt or other substance which is not "made by nature" will dry out, crack, become brittle and break under the relentless onslaughts of sun, wind, rain, cold and snow. It will not stand up under the long strain of the seasons. But **Trinidad Lake Asphalt** has stood up under winds and sun and rains for centuries. On the roof, in Genasco, it will continue to endure.

How the asphalt is made into the famous Genasco Ready Roofing, the different styles which are manufactured by the Barber Company, the ease of its application by persons not skilled in roofing, its permanence and other advantages can all be read in the "Good Roof Guide Book," mailed on request by the Barber Company from their offices in Philadelphia, New York, San Francisco or Chicago.

2155 ELSTON AVENUE - CHICAGO, ILL.

FROM FOUNDATION TO FLAGSTAFF

Don't stick along at an **under** job through all the best years of your life. Don't let the humdrum drudgery of every-day routine CRUSH your ambition. Don't be satisfied with merely pushing a saw and driving nails. Learn to PLAN as well as to work—to use your BRAIN with the **same skill** that you use your hands. Learn to fill a BIG SALARIED job—the kind of a job that hundreds of other men, with no more natural ability than you, are filling with ease and success.

HOW YOU CAN LEARN MORE AND EARN MORE

You can MASTER EVERY DETAIL of your line of work. EVERY BRANCH of building construction, EVERY ANGLE of architecture and carpentry—can do it in your spare moments and at almost no expense at all. You can have the knowledge and experience of over FOUR SCORE EXPERTS at your command ready for instant use whenever you want it—can fit yourself to **fill any first-class position above you that you desire**—simply by allowing us to place in your hands this great ten-volume set, **without your sending us one cent in advance.**

THIS CYCLOPEDIA OF
Architecture, Carpentry and Building

is the most exhaustive, comprehensive and practical work on the building trades that has ever been published. It covers every detail of building construction from foundation to flagstaff, from common carpenter work to reinforced concrete and steel, from masonry to heating and ventilation; from specifications and estimates to building laws and superintendence. It covers all the PRACTICAL things that you WANT TO know, all the things that you've GOT to know if you're going to be a success. It contains over 4,000 drawings, full page plates, diagrams, etc., has 4,760 pages, is bound in handsome half morocco and printed on special paper in large clear type. No CARPENTER, CONTRACTOR or BUILDING OWNER **can afford to be without it a single day.**

Get these books FREE and see for yourself

just what they are before you send us a single cent. Look them over carefully at your leisure, keep them for seven days before you decide whether you want them or not, and then if you don't believe that each volume is actually worth more to you than the price of the **entire set, send them back at our expense and the transaction won't cost you one penny.** If you do decide to keep them, our charge will only be $24.80, spread out thin in easy payments of only $2.00 a month. We don't ask you to buy these books on our description of them. We don't ask you to trust our judgment. We simply ask you to get the books and see for yourself.

Free with every order received before March 1st, 1912

With each set is included a year's Consulting Membership entitling you to the advice of our business and engineering experts free. This will give you practical help in handling working problems which are too specific to be taken up in detail in the cyclopedias. There will be no limit to this service. A single problem solved for you might be worth more than first cost of the books. Order the books now.

THE ROYAL STANDARD UNIVERSAL WOODWORKER.

The No. 10 Royal Standard Universal Woodworker is made from a ton and a quarter of metal, giving it great stability and strength. The tables are 7 feet 2½ inches long from out to out and 23 inches wide, resting on long wedge-shaped slides, erected over and directly above a one-piece column of generous proportions. Outside bearings and cutter heads can be quickly detached. The tables are made

No. 30 ROYAL STANDARD UNIVERSAL WOODWORKER.

to spread and admit all kinds of saws up to 12-inch diameter. The finest kind of dadoing, grooving, rabetting, tenoning, jointing, matching, molding work, etc., can be done easily and without any trouble, or loss in time in making changes from one attachment to another.

The Royal Standard Universal Woodworkers are unusually well designed and made machines. They will do all that is claimed for them, and, as many of their users say, "and then some," meaning that seldom a piece of work is brought into the contractor's shop

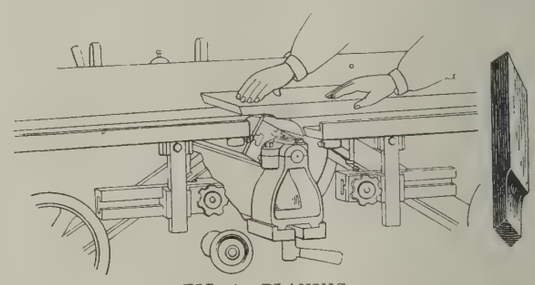

FIG. 1. PLANING.

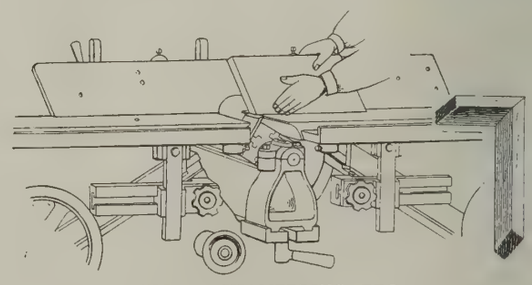
that cannot be handled easily on a Royal Standard Universal. The accompanying illustrations are very instructive in showing how to hold material for some of the different work done on this machine.

Fig. 1 shows planing up to 12 inches wide, removing the warp or twist out of rough stock and establishing a true level or flat surface. Air-tight glue joints are made in the same manner. The size of the opening between tables is 2½ inches.

Fig. 2 shows how to hold the material when making joints, breaking corners and chamfering. Fence angles to 45 degrees; it is made 4 feet long and 4¾ inches high and is finished on face and side edges.



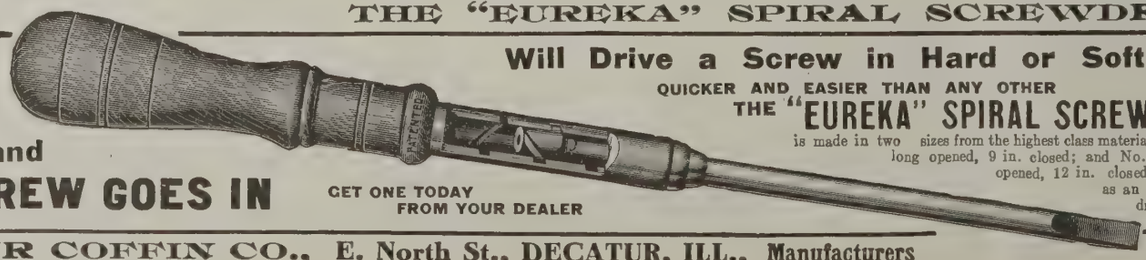


FIG. 2. CHAMFERING, ETC.

A catalogue showing many other views of the different kinds of work this machine will do can be had by contractors and builders interested in adding an outfit of this kind to their shop equipment.

The Royal Standard Universal Woodworker is manufactured by the Cordesman-Rechtin Company, 10 Butler street, Cincinnati, Ohio. This company has been making high-class woodworking machinery for years. The machine described here is one of their most popular outfits and has made many friends among builders and woodworkers on account of its low expense of operation and fine cut material it will turn out. The catalogue will be sent on request.

Three Salary Increases Amount to Over $12,000 a Year

The letters that are here reproduced are only a few of the many thousands of such advancement letters that we have in our files. These men are not men of genius—they are not the sort of men known as "gifted," "naturally bright," etc. They are plain men who have applied themselves diligently to their work and their rise in the world is due solely to spare-time study.

When I enrolled for your Complete Architectural Course I was working as a carpenter for $2.50 a day. A few months later I felt qualified to go into contracting for myself on a small scale. I kept on studying and my business increased. For the last few years, I have been an architect, employing two draftsmen and one stenographer. Last year my income was about $5,800.

EMIL ERICSON,
16 Court Street, Brooklyn, N. Y.

I enrolled for a Course in Architectural Drawing and within a few months was doing actual work drawing plans for buildings. Besides my regular work I have made from $200 to $300 a year extra drawing plans in spare time. I feel very grateful to the I. C. S. for taking me, a carpenter, earning $3 a day, and making an architect of me with the assurance of from $3,000 to $10,000 a year income.

N. R. ADAMS,
Corvallis, Oregon

When I enrolled for the Building Contractors' Course I was working for the Arizona Smelting Company. After studying the Course I went into the general contracting business and have had all the work I can do. All the technical education I have in building I have gotten from the I. C. S. My income will run from $500 to $1,000 a month besides my living expenses.

WILLIAM G. REED,
Twin Falls, Idaho

Would you be willing to give part of your spare time to study that would increase your salary $1,000, $2,000, or $5,000 a year?

If you are not entirely satisfied with your present position mark and mail the attached coupon. Doing so will cost you only postage and will place you under absolutely no obligation; it will bring to you the I. C. S. catalog of Architecture, describing in detail these courses of study that are helping thousands of men to better positions.

Send the Coupon TODAY

International Correspondence Schools
Box 1332, SCRANTON, PA.

Please explain, without further obligation on my part, how I can qualify for a higher salary and advancement to the position, trade, or profession before which I have marked X.

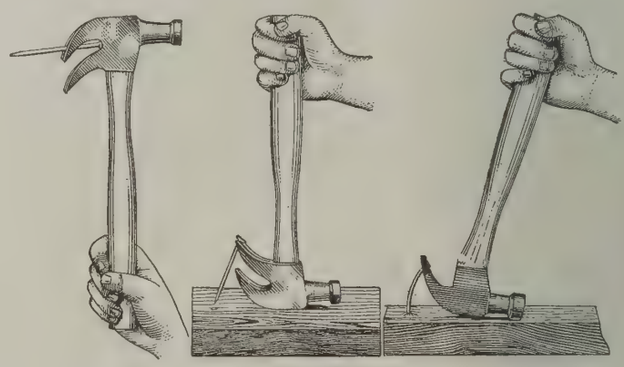
THE DOUBLE CLAW HAMMER.

The utility of the double claw hammer is so clear that the illustrations hardly need any comment. As one of the first carpenters who bought one said, "Don't explain it, I see what it is, and it's a mighty good thing too." But we are going to tell here what the manufacturers of this new tool claim for it.

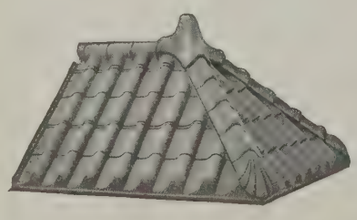


They claim that the double claw hammer will pull the nails out straight, and so straight that they can be immediately driven right back again. For "finishing work" this hammer is a great aid, as 10

to 15 per cent of all finishing nails start wrong and must be withdrawn.

The carpenter can hold on with his left hand while pulling with his right, without fear of a loose block dropping away if the nail comes out with a jerk. The nail is drawn out straight instead of making a fish hook out of it, as with the old style hammer. The center of gravity, in driving with the double claw hammer, lies exactly between the two claws. Thus, it has a more powerful drive than if too much of the weight were at the extreme end.

The manufacturers have learned that it costs at least three times as much to make a hammer in two pieces and weld these together



than to make the ordinary hammer. That is only one of the many reasons why it is worth every cent asked for it. Their advertisement in this number quotes the prepaid price for one hammer. Better steel, better handle, better finish and the better mechanic uses it. As one carpenter put it, "This Double Claw Hammer is a $4.00 a day hammer—the other is a $2.00 a day hammer."

The hammer is made of the finest hammer steel, properly tempered, and while there has been the standing offer to return the price if not satisfactory, the makers, The Double Claw Hammer Company, 453 Broadway, Brooklyn, N. Y., advise us that they have not been asked to take a single hammer back.

CONCRETE INFORMATION.

"Selection and Proportion of Aggregate for Concrete." This subject is one which concerns the engineer, contractor, foreman and mechanics. The waste is not only in material, but in the resulting strength of the mixture. Mr. Albert Moyer treats the above subject in a booklet issued by the Vulcanite Portland Cement Company, Land Title Building, Philadelphia. There are about 30 pages of valuable information, tables, etc., and our readers may obtain a copy free for their library.

Metal Tile Roofing

of Mullins make is the kind that endures. It is simple in construction—positively storm and water tight.

Guaranteed to remain in perfect condition for years, when put on according to directions. Expansion and contraction thoroughly provided for.

Widely conceded to be the most attractive and satisfactory roofing made.

Also manufacturers of Cornices, Building Fronts, Garlands, Modillions, Enriched Moldings, Capitals, Finials, Tympanum Panels, Rosettes, Faces and other architectural ornaments. Thousands of designs to choose from.

Cornice makers and the building trades will find our prices attractive and shipments prompt.

Tell us your wants and the particular kind of Sheet Metal Work you are interested in. Catalogues will be mailed you at once. Discounts to the trade on application.

Three Reasons Why

CORTRIGHT METAL SHINGLES

APPEAL to Contractors and Builders

First—They're inexpensive—cost less than slate, and no more than wood in many localities. Besides they make a permanent roof.
Second—CORTRIGHTS are easy to lay—your ordinary workmen can put them on more rapidly, and make a better job than with either wood or slate.
Third—They satisfy the house owner, because they're fireproof, stormproof and durable. Therefore you establish good-will and future business.
A special proposition to Contractors and Builders is ready. Write for it today.

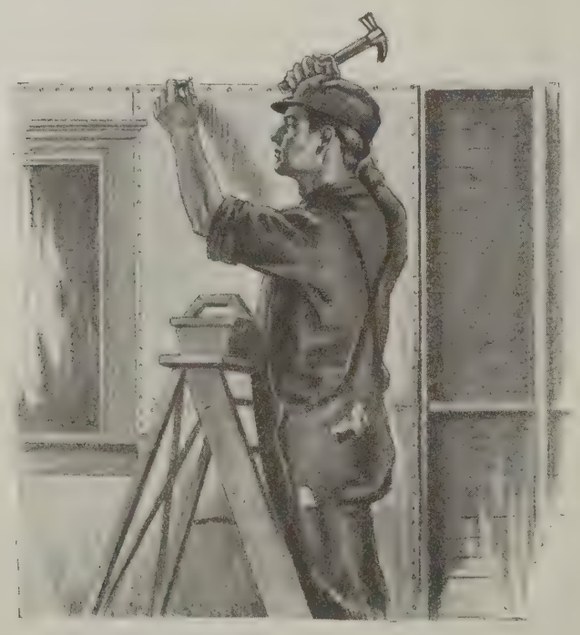
CONCRETE BRICK AND BLOCK HANDBOOK.

Our readers will no doubt be much interested in the two books on concrete which are being issued and distributed by the Queen City Brick Machine Co., of Traverse City, Mich. One of these books is a Hand Book on Concrete Brick and Block Making. It covers sixteen subjects of very great importance to the concrete worker. They are as follows:

The field for concrete.	Ways of making products.
Selecting materials.	Various building systems.
How to proportion.	Forming the product.
How to cure product.	Steam curing.
Plant arrangement.	A waterproof building.
How to estimate.	System fully illustrated.
Comparative tests.	Weights of materials.
Table of compression.	Hints on selling.
Working values.	Profits in concrete.

For the next thirty days the above company is sending out this valuable hand book absolutely free to all who inquire for it, and in addition they send along a complete catalogue illustrating and describing Helm presses and the Helm dry wall building system.



The accompanying illustration shows one of the Helm presses which is built for making pressed cement brick or the dry wall building blocks. These presses are built in different sizes and for hand or power operation. They exert a pressure of 80,000 pounds and do away with tamping. The Helm dry wall building system makes it unnecessary to use furring and lathing and consequently saves money for the builders. This system is being rapidly adopted.

Both of the valuable books mentioned above can be secured absolutely free by our readers by simply writing to the Queen City Brick Machine Co., 481 Bank Bldg., Traverse City, Mich.

BEAVER BOARD.

Modern invention has done much toward improving industrial conditions, and at the same time the genius of our architects and

builders have made our homes and other buildings far more habitable. Of what use would we consider wireless telegraphy if we had to sleep under a leaky roof, and how little would we care for steam yachts if we had to do without modern plumbing facilities in our homes? But there are leaky roofs today, and many homes are without the comforts which most of us consider luxuries.

There are a number of reasons why this should be so. A new country builds up with only the bare necessities, often of the rudest construction, depending upon prosperity to rebuild entirely or to add such improvements as can be obtained. When the time for rebuilding comes, frequently the disinclination to suffer the inconvenience of building, rebuilding and moving deters many from making more than the necessary repairs.

Room ready for Beaver Board construction. Studs evenly spaced and headers in correct position to suit panel design adopted.

For several hundred years the finished wall surface of the better class of buildings has been some form of plaster. Often the surface was ornamented with castings, or the flat panels were covered with various forms of decoration, fresco paintings, gilding, paper or hung with tapestries. Excellent as these surfaces are, they, too, have their disadvantages and many substitutes have been tried with the object of securing a better surface for durability, decoration or ease of application. Thus, we have seen the introduction of patent plasters, pulp plaster, plaster boards, and finally wall board. The search has always been for the smooth surface and the materials employed have undergone a complete change. Much of this is due to our change of construction from masonry to frame, and the change is logical. Why should we build a house of wood or frame and then line it with a masonry product like plaster? Is it not more natural to build of frame and line with a wood product, giving a surface perfectly in harmony with the rest of the structure?

There are several companies making products of this character, of which the Beaver Company is one of the best known. With the idea of extending the already very general use of their popular brand of wall board, they have inaugurated a unique advertising campaign of education addressed to carpenters and builders.

Nailing up panels.

While a great bulk of Beaver Board sales originate from the carpenter or builder who has come to know Beaver Board excellence as a wall covering, as a home-beautifier and as a heat, cold, shock and vibration-resistant, the Beaver Company realizes that its product, its properties and its possibilities are not as well known to the trade as they should be.

The National Builder this month presents the first of a series of Beaver Board educational advertisements which are to run throughout 1912, twelve advertisements in all.

Readers of The National Builder are to be taken through each step of the Beaver Board proposition, in an endeavor to thoroughly acquaint them with the wonderfully practical and decorative possibilities of Beaver Board, its ease of application and profit-making features.

The series has very properly been labeled the "A B C" of Beaver Board construction. The first "talk" begins at the obvious beginning. The carpenter is told that Beaver Board is made of pure-wood-fibre in panels so conveniently sized that waste is practically eliminated, of its practical resistant qualities, its sanitary, artistic and wearing qualities; its adaptability for walls and ceilings of both old buildings (in which it can be nailed up over old plastering) and new buildings (where it is applied directly to the studding). These "talks" we illustrate by actual photographs, tending to make the simple text simpler. For instance, "chapter one" is illustrated by the photographs shown in this article. They show all four stages of Beaver-Boarding a room in a new residence from the barestudding stage until the lady of the house has arranged her furniture and ornaments.

Before putting on decorative strips. Panels are painted at this stage.

If Beaver Board popularity continues to grow as it has been, it won't be long before it will have displaced lath and plaster as a standard. Discriminating builders and house-owners have already refused to consider lath-and-plaster at all. Hundreds of homes and buildings that haven't a bit of lath or plaster in them—all Beaver Board—have been built during the past few years.

Beaver Board superiority, of course, has been primarily responsible for Beaver Board's popularity. A big factor, however, has been the Beaver Company's very extensive national advertising to owner, builder and dealer. As a consequence there are today thousands of dealers selling Beaver Boards to carpenters, or to house-owners who are, in a great majority of cases, employing carpenters to put it up. The carpenter and the dealer have been making good money in the process and the house-owner has been saving it.

The finished room, in use.

The Beaver Board people have always held that Beaver Board is essentially a proposition for carpenters and builders, and are taking this method of bringing its merits and capabilities before every one interested. The current and following chapters will be followed with interest.

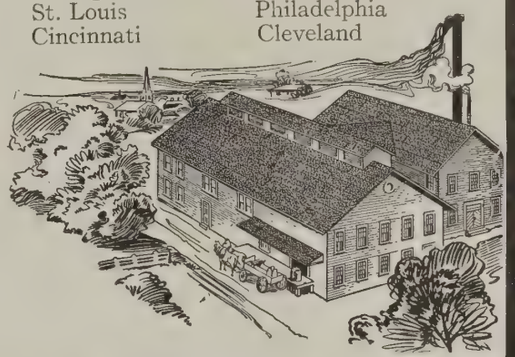
Amatite ROOFING

AMATITE has a real mineral surface and therefore needs no painting.

There have been other ready roofings in the past which had a mineral surface, but they were not practical.

Amatite, however, is successful because the mineral matter is imbedded in *pitch*. Pitch is very tough and has great adhesive power. Year after year these roofs will give faultless service without anybody giving a thought to them. This is the kind of roofing to have! The day of these smooth coated roofings that require a heavy coat of paint every year or two is past. They cost too much to maintain. More money can be spent on the paint alone during ten years than a new Amatite roof would cost.

A free sample of Amatite Roofing and further information can be obtained by addressing the nearest office.



Everjet Elastic Paint

A very low-priced black paint—very tough and durable. Stands heat so well that it can be used on boilers. For wood or metal, ready roofings, fences, iron work, farm implements, tanks, etc.

Glidden

Green Label Varnishes are the highest grade varnishes made. They are made in the largest, most complete and best equipped varnish plant in the world, and are the result of nearly half a century's experience in manufacturing varnishes for all purposes.

Wherefore, it redounds to every builder's credit to use Glidden's Green Label Brand.

To any builder who is interested in the subject of wood finishing, we will gladly send demonstrating panels of Glidden's Endurance Wood Stains and Glidden's Green Label Varnishes They give to interior trim a richness and beauty that cannot be imitated.

The five Brands we recommend your specifying:

	Per Gal.
M. P. Durable Exterior - - - -	$4.00
M. P. Durable Interior - - - -	3.00
M. P. Durable Floor - - - -	3.00
Glidden's Velvet White Enamel (Egg Shell Finish) - - - - - - - -	5.00
Glidden's Superior White Enamel (Gloss Finish) - - - - - - - -	5.00

These varnishes are high in price, but as the finish is the final touch that completes the job, the finishing material should be of the best. Price ought not to be considered.

The Glidden Varnish Company

Factories: Cleveland, Ohio; Toronto, Canada

Branches. New York—Chicago—London

Glidden

M. P. Durable Interior, because of its light color, its wonderful flowing and brushing properties and its extreme elasticity and durability, is the highest grade varnish made for interior use.

Glidden's M. P. Durable Floor stands unscathed, even when subjected to usage that would destroy any other floor varnish made. We can prove this statement. It combines hard and quick drying properties with great elasticity. It is impervious to water and will not mar nor scratch white.

Glidden's Velvet White Enamel (Egg-shell Finish) dries with the appearance of a dull, velvet finish and thus saves the expense of rubbing, though it can be rubbed and polished beautifully, if desired. It produces a more artistic finish than any other white enamel on the market, and the surface produced is waterproof and non-porous, thus resisting the action of repeated washing, alkalies and the fumes of the atmosphere.

Let us send you demonstrating panels.

INVESTIGATE Compo-Board

Best for Walls and Ceilings.

Better then than and plaster. More economical and durable. Can be put on in any weather and will stay up and look well as long as the building lasts.

Compo-board is made of strips of thoroughly dried lumber well glued. These strips are then covered with a specially prepared moisture proof paper, which is cemented under intense heat and pressure.

This makes a wall lining that will last indefinitely. Cannot crack or crumble off. Cannot chip off or mar by banging furniture into it. It is moisture and cold proof and fire resisting. Warm in winter and cool in hot weather.

Beside being a wall lining, Compo-Board has many other uses around the house and in the yard, in the office and factory. For remodelling the house or finishing off an extra room in the attic or basement, it is ideal. Summer cottages can be made as warm as the city home. Use it for partitions or back plastering.

Compo-Board can be had in strips four feet wide and one to 18 feet long, in any length in even feet.

SEND FOR SAMPLE AND BOOKLET

Fully describes Como-Board and its many uses and advantages, and the sample will show you what it is.

NORTHWESTERN COMPO-BOARD CO.

5776 Lyndale Ave. No. MINNEAPOLIS, MINN.

(The border of this advertisement is a cross section view of Compo-Board.)

WE WANT TO SEND YOU A SAMPLE

We want every carpenter and builder and home owner in America to know about and to have a sample of

UTILITY WALLBOARD

It is to your interest to have this sample and to become thoroughly familiar with this remarkable material.

Utility Wall Board marks the greatest advancement that has been made in interior building construction in a hundred years.

It is made of fibre—very hard and tough and durable. It is waterproofed on both sides. Being a non-conductor, it is largely heat and cold and sound proof.

It is very easily put on—nailed right to the studding and takes the place of both lath and plaster.

It is the only wall board on which you can safely use wall paper. At the same time it lends itself admirably to tinting and stenciling, or other forms of decoration. Made in various widths and lengths to meet all requirements of interior finishing.

Write today for the sample and for the new book of interiors.

Utility board is sold through dealers in builders' supplies everywhere.

THE HEPPES COMPANY

4502 Fillmore Street, Chicago, Illinois

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

The "ABC" of BEAVER BOARD Construction

A series of talks to carpenters about the practical use of *Beaver Board*, the pure-wood-fibre wall and ceiling material that is durable, economic, artistic; has none of the disadvantages of lath, plaster and wall-paper; and is appropriate to any type of building, new or old.

Beaver Board is essentially a proposition for carpenters and builders.

CHAPTER I

What Beaver Board Is, and How It Is Put Up and Decorated

This brief, concise description is merely to start you right, and will be followed by other advertisements dealing each month with concrete examples of its use for different purposes.

BEAVER BOARD is a pure-wood product, and can be handled as easily, quickly and satisfactorily as any wood-product. It is made in panels of various sizes to meet all requirements These panels can be cut with a fine cross-cut saw to fit about door-jambs, window-casings, etc., but the sizes are such that there is practically no waste. The panels can also be easily moulded to an arch, as they have sufficient elasticity.

Exact Instructions with Each Shipment

Although it is easy to get good results in putting up *Beaver Board*, you want the very best. So does your client; so do we. Therefore, with every shipment we send printed directions which cover all the little points that long experience has shown help to make a thoroughly satisfactory job. Always look these over carefully before beginning actual construction.

Beaver Board Decoration

Beaver Board is painted after the panels are nailed up and before the panel strips are put on. It is never papered over. Wall-paper is not only less durable and artistic than painting, but much less sanitary; and nowadays folks demand clean, sound, healthful construction in everything.

Beaver Board Sizes

Stock sizes carried by dealers are in 32 in. and 48 in. wide by 4, 5, 5½, 6, 7, 8 and 9 feet long. Sizes in stock at factory for immediate shipment are 24 in., 32 in., 36 in. and 48 in. wide in any length from 4 to 16 feet. Lengths above 10 feet require crating, for which an additional charge is made to cover actual cost. *Beaver Board* is 3-16 in. thick. Decorative strips, moulding, plate rails, etc., can be purchased from planing mills and lumber dealers, but where unobtainable can be furnished by us.

Beaver Board Advantages

Beaver Board is economical, easy to handle, suits any kind or sort of building, retards heat, cold and sound, doesn't crack, check or deteriorate with age. Its endless possibilities for all kinds of uses are fully described in our free booklet, "Beaver Board and Its Uses," with many pictures of different interiors. Write for it today.

Look for Chapter II in the next issue of National Builder.

The BEAVER COMPANY of BUFFALO

443 Beaver Road, Buffalo, N. Y., U. S. A.

THE BEAVER COMPANY, LIMITED

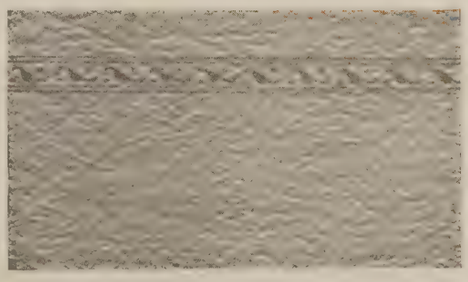
383 Beaver Avenue, Ottawa, Canada

Room ready for Beaver Board construction, studs evenly spaced and headers in correct position to suit panel designs adopted.

Nailing up panels, using flat-head nails ¾ inch from edges 3 inches apart, and bung head nails 6 inches apart for centers.

Before putting on decorative strips center nails are countersunk, sizing or first coat applied, depressions filled and panels painted.

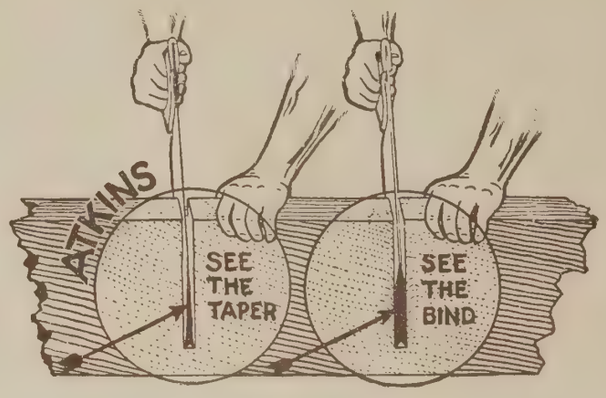
The finished walls and ceilings are more attractive and sanitary than lath and plaster, don't crack, saves frequent repairing, etc.



BEAVER BOARD

PURE-WOOD-FIBRE

WALLS & CEILINGS



BEAVER BOARD PURE WOOD FIBRE

Look for this mark on the back of every panel.

One of the greatest attractions of Beaver Board is its beautifully pebbled surface. The photograph reproduced above gives an idea of it, but no illustrations can show the soft, rich color of that surface when painted. Beaver Board is 3/16 of an inch thick.

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

LOOK HERE, MR. CARPENTER!

See the big difference between the ordinary "thin-back" saw and the Atkins "taper-ground" saw! It's easy to see why the Atkins cuts faster, easier and straighter.

The ordinary "thin-back" saw has a little bevel along the back to make it *look* thin.

The rest of the blade is of uniform thickness, except that the teeth are spread out ("set") so as to cut a path wider than the blade.

If you don't give the teeth plenty of "set," the blade doesn't have elbow room, and sticks in the wood.

But the more "set" the teeth have, the harder the saw runs. And there you are!

With the Atkins it's different.

The blade is thickest at the tooth-edge and thinnest at the back. And it tapers *all the way* from tooth-edge to back.

Almost no "set" on the teeth is needed, because the tooth-edge is the widest part of this tapering blade.

The result is that wherever the teeth go, the rest of the blade follows without a struggle. No "bucking!" No "binding!"

You can easily see why the Atkins ought to be just what it is—

The easiest running, fastest cutting, easiest guided saw you ever put through a board!

The Atkins Perfection Handle makes it still easier. Takes the strain off the wrist and gives your whole body an easier position. But you can have the old-style handle if you prefer.

Better Than Razor Steel

Silver steel is our own secret formula, and it is gas-tempered by our own secret process. Both these secrets have been carefully guarded in the Atkins factory for over 50 years.

No such steel was ever used in any other make of saw the world over. It's better steel than you'll find in most of the high-grade razors.

And it's a peculiar steel. Holds its sharp edge longer than any other, needs less filing, and yet files very easily. Doesn't rust easily, either.

ATKINS
Silver Steel
SAWS

Trial Order

Go to your dealer and select an Atkins Silver Steel Saw. Be sure the blade says "Silver Steel"—that's our best saw. Take that saw and try it! If it isn't the best saw you ever touched, take it back to the dealer and he will refund your money.

Now, Mr. Carpenter, if you want to know which is really the best saw, there's the way to find out, without risking a cent.

FREE to Carpenters

Write us today (enclosing 10 cents in stamps to cover postage), and we will send you free a good strong Nail Apron, our Carpenter's Time Book, and another mighty hand booklet, "Saw Sense." Address our Carpenter's Department.

You Make No Mistake

When You Buy RUSSELL JENNINGS Bits

Whether you buy the ordinary shank bit, or the new Precision turned shank bit, you may be sure of the quality when you see Russell Jennings stamped on the round.

Our regular style auger bit, with ordinary bit shank, is made with 3 different threads on the screw point,— standard for ordinary boring,— quick boring, for hard or gummy woods, and double quick boring for rapid work in soft wood. These bits have been the standard among the best workmen for over half a century and are backed by the RUSSELL JENNINGS GUARANTEE.

Our new Precision turned shank auger bit is the same as our regular auger bit, but with a turned shank which makes placing or removing from the brace chuck easy and rapid. Once placed it cannot wobble or pull out.

Russell Jennings Precision tools are now sold separately or in sets, and may be seen at your dealer's. Ask him for the new bulletin describing them.

Incidently, if you want to know about the care of auger bits, ask for our booklet, "How to Sharpen Auger Bits." It tells you what you ought to know about bits.

Bishopric Wall Board is made with Asphalt-Mastic. This is asphalt toughened by a patented process and it won't burn. In hot Asphalt-Mastic kiln dried dressed laths are imbedded at a pressure of 500 pounds to the square inch. The other side of the Asphalt-Mastic is surfaced with heavy sized cardboard. It is ready at once for paint, paper, burlap or other wall decoration. Or paneled its natural gray tint is highly artistic.

Bishopric Wall Board is the only wall board made with laths. Laths are positively necessary to back up a wall board—to make it rigid and substantial—and to keep a perfectly flat surface. Without lath, wall board swells, warps, cracks and pulls away from the joints.

Bishopric Wall Board comes to you in sheets all ready to put on. Any man who can drive nails can apply it. Sixteen sheets to the crate. Prices, $2.50 per 100 square feet; $6.40 per crate of sixteen sheets, or 256 square feet. Bishopric Sheathing comes in crates of sixteen sheets, 256 square feet. Prices $2.35 per 100 square feet; $6.00 the crate, f. o. b. Cincinnati.

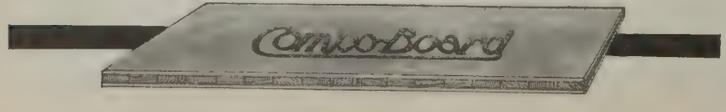
THE HEPPES COMPANY 4502 Fillmore Street CHICAGO, ILL.



This Modern Wall Lining Makes Good Under Severest Tests

By every test, Compo-Board has proven itself the most satisfactory wall-lining. It has stood the test of time for periods of ten to twelve years in hundreds of homes. It resisted earthquake shocks in California which crumbled plaster walls. It keeps the bitter cold out of log cabins in Alaska. Furniture manufacturers using it in their products found that it will not warp. In apartment houses it has stood rough usage, the knocks of furniture and the kicks of children without injury—without peeling or crumbling. It has made thousands of homes everywhere better places in which to live.

Our booklet and sample will explain why every user of Compo-Board, including the U. S. government, well known Universities, big hotels and apartment house owners, home owners, contractors and builders prefer it to any other wall lining. There are money making hints in this book for you. Just send your address on a postal.

The "ABC" of BEAVER BOARD Construction

A series of talks to carpenters about the practical use of *Beaver Board*, the pure-wood-fibre wall and ceiling material that is durable, economical, artistic, has none of the disadvantages of lath, plaster and wallpaper; and is appropriate to any type of building, new or old.*

Beaver Board is essentially a proposition for carpenters and builders.

CHAPTER II

BEAVER BOARD for Residences

The carpenter or builder who is looking for business—*and profits*—that will keep him busy no matter what the weather, will find big business opportunities in *BEAVER BOARD'S* use in residences.

Whether the house is new or old, *BEAVER BOARD*-ing is *inside* work. Unlike plaster, *BEAVER BOARD* can be successfully applied in *any* season, onto *bare studding* or *over old lath and plaster.*

Things to keep in mind in BEAVER BOARD-ing

Any carpenter can put up *BEAVER BOARD*, but there are a few little things—just a few—he must keep in mind.

He shouldn't drive a nail until he has had every detail of the job thoroughly worked out, or had us work it out for him; as in everything else, you must *plan* if you're going to *BEAVER BOARD* right.

We're willing—anxious to help. Our Architectural Department will plan the whole job for you if you wish it, and give you estimates, too.

Your problem, if it is only that of BEAVER BOARDING to best advantage a 10x12 room, will be given just as serious and careful attention as the other fellow's 12-story office building job.

Some BEAVER BOARD "Don'ts"

Don't paper or plaster over *BEAVER BOARD.*

Don't put up *BEAVER BOARD* immediately if it has become damp in transit; let it dry out—flat.

Don't paint *BEAVER BOARD* until it has been well sized.

Don't put on decorative strips until *BEAVER BOARD* has been painted.

BEAVER BOARD'S endless possibilities for all kinds of uses are fully described in our free booklet, "*Beaver Board and Its Uses*," with many pictures of different interiors. Write for it today.

BEAVER BOARD

PURE-WOOD-FIBRE WALLS & CEILINGS

BEAVER BOARD PURE WOOD FIBRE

Look for this mark on the back of every panel.

If it is a new house, earn the plastering money yourself

Once you've tried *BEAVER BOARD*, you're primed for convincing the house-owner that he needn't wait for better weather before plastering, and, indeed, needn't think of plaster at all.

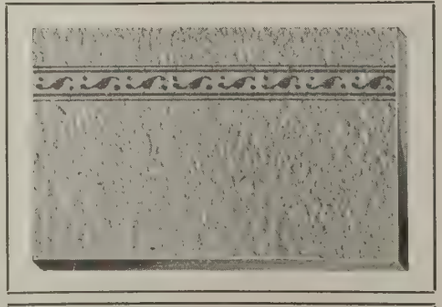
Win him over to *BEAVER BOARD*, save him the delay and trouble and litter and *the greater expense* of plastering, and create for yourself more work and more profit.

If it is an old house—

Why, there's a new, virgin field for you. Talk *BEAVER BOARD* walls and ceilings to the owner whose walls need re-plastering or re-papering.

Let BEAVER BOARD do the talking

BEAVER BOARD advantages argue its own case. Those are:



BEAVER BOARD is economical, easy to handle, suits any kind or sort of building, retards heat, cold, and sound, doesn't crack, check or deteriorate with age.

**This is the second of a series of twelve advertisements written with a view of acquainting the carpenter with BEAVER BOARD and its more-business possibilities. The first appeared in the January number. We will be glad to send you back chapters you miss.*

HERE'S A CASE OF WISDOM WORTH NOTING

WHAT WOOD DO YOU THINK WAS USED FOR

THE INTERIOR TRIM

of the superb HOTEL LEAMINGTON, MINNEAPOLIS (*shown below*)? It was

SAP GUM

F. E. LOCKWOOD, Archt., Leonard Construction Co., Contractors

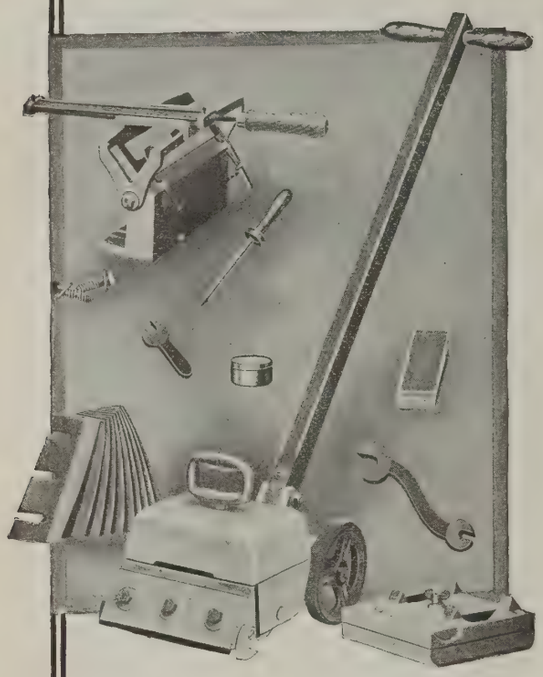
NOT some "better" wood—***there IS NO BETTER WOOD for such use*** in cases where ***reliability***, ease of handling, adaptability to the finest staining effects, and moderate cost are to be considered.

NOT some more expensive wood—why lay out unnecessary money when SAP GUM, beautifully finished and skillfully installed, is ***an honor to*** this fine structure?

SO THEY USED 6 CARLOADS OF GOOD SAP GUM

—160,000 board feet of it—in this one building.

Thrifty and up-to-date builders are fast learning that they can benefit themselves and ***add to their reputation by recommending*** SAP GUM ***to their clients.*** DO YOU?



SAP GUM has all the good qualities of RED GUM except the beautiful markings. On the other hand SAP GUM ***takes stains as no other wood does***, and thus lends itself to the nicest requirements of the architect's color schemes by permitting a wide variety of differing decorative effects.

Builders desiring to see samples of ***RED GUM*** *and* ***SAP GUM*** *both rough and finished or who wish market prices of selected* ***RED GUM*** *and* ***SAP GUM,*** *are invited to correspond with any of the following firms:*

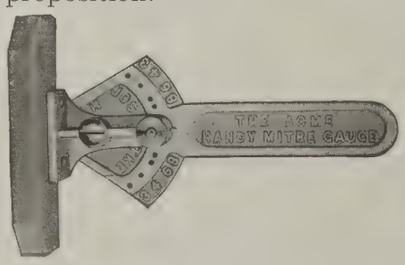
OVER $100,000.00



Has been SAVED by USERS of the

Acme Floor Scraping Outfit

during the past five years. Thousands of machines are now in daily operation, and every mail brings letters from users commenting upon the satisfactory work their outfits are doing and the vast amounts of labor expense they are saving.

Now, Mr. Contractor, you do not have to rely upon what I say regarding the merits of my machines, but I want you to let me send an outfit to you on **one week's free trial,** and you can then let the machines demonstrate on your own work just what they can do. If, after working with the equipment for one week, you are not convinced that the same will save you many dollars, and do your floor scraping better than it was ever done before, just pack up the machines, return them to me, and you will owe me nothing.

Write to-day for booklet and full details of my proposition.

The Acme Handy Mitre Gauge

is another labor saving tool. It is absolutely accurate, can be set at any angle and fits in the pocket where it is always ready for instant use. If your dealer does not carry them in stock, then write to me for circular describing this wonderful little tool.

JOSEPH MIOTKE

249 Lake Street : : Milwaukee, Wis.

PEARSON'S AUTOMATIC SHINGLE NAILER

PAYS FOR ITSELF ON ONE FAIR-SIZED SHINGLING JOB

Works well on roofs of any pitch. You can wear gloves or mittens and drive nails faster and with more comfort than the old way. Just throw the nails in by the handful (Nailer holds easily between 500 and 600 nails in the top), and start nailing.

PEARSON NAILERS are made in two sizes. The Blue Nailer is for common 3d No. 14 gauge wire nails, and the Red Nailer is for the **galvanized** 3d, No. 13, 1¼-in. wire nails. Order from your dealer or send **$5.00** for either one—express prepaid. Money cheerfully refunded if Nailer is not as represented. *Write for Circular "N."*

PEARSON MFG. CO., ROBBINSDALE, MINN.

Triple "A" Spring-Driven Floorsmoother

CUT DOWN EXPENSES

A DOLLAR SAVED is twice made. You can save a lot of money on your floor work by using up-to-date methods and machinery.

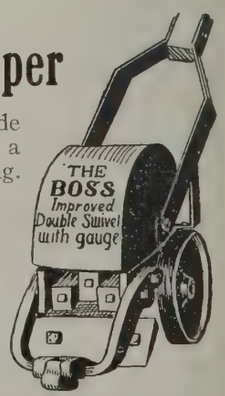
You can do much better work, and the houses you build will be worth more money, and draw bigger rent when the floors are properly surfaced.

Do it the Triple "A" way

and you will enjoy health, wealth and happiness—that's the only way.

FOR TWO CENTS you can learn all about it—

DROP US A LINE



Triple "A" Machine Co.

30 North Clark Street CHICAGO

SENT ON FREE TRIAL

It Works Like a Plane

The Boss Floor Scraper

The Boss is the only Floor Scraper made that will plane a floor without leaving a square cut where knife first starts cutting. **Why?** Because the Boss is made with a gage on front to which is attached a pear-shaped wheel which raises when the machine is pulled and lets the knife down gradually.

The Boss can be set for any thickness of shaving, it also can be set for any shearing cut, right or left, up or down, to suit the kind of lumber.

It is guaranteed to give absolute satisfaction.

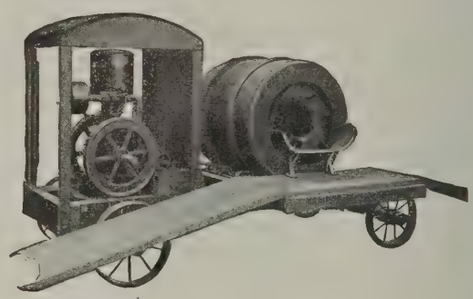
It isn't exactly a catalogue, because it gives you the cost of making concrete Blocks, Bricks, Porches and Chimneys. It tells all about the profits in making Drain Tile for farmers. The advantage of drainage, etc.



You ought to have this book if you are interested in concrete. Sixty-four pages of illustrations and interesting reading. Send at once, today, a postal will do.

W. E. DUNN MFG. CO., 4135 Fillmore St., Chicago

"THE STANDARD" Low Charging Concrete Mixer

(Formerly Eclipse)

"THE STANDARD" will be used in the future as the name of the mixer which we manufacture.

This corresponds with our firm name as well as with "THE STANDARD" Scales which are so largely used all over the world.

We find that while we have been selling our mixer under the name of Eclipse, it is known very largely by the public in general as "THE STANDARD" machine.

"THE STANDARD" mixers will be of the same high grade construction as heretofore, using all improvements and best designs from our many years of experience as manufacturers in this and other lines of machinery.

"THE STANDARD" Mixer will have our patented low charging arrangement and also our semi-automatic discharge, which together with other special features has enabled us to build up our large volume of business and have made our machinery so popular with contractors and users.

"THF STANDARD" mixer will be built following out our general plans, to produce a high grade, simple constructed machine at moderate price, omitting all complicated and unnecessary mechanism and producing by a very simple method, the thorough mixing required for high grade concrete.

"THE STANDARD" Low Charging Mixer is offered to the contractor and user as a machine of large mixing capacity and low first cost, low operating cost, and low expense for repairs, avoiding expensive "shut downs" and delays which are so frequent with complicated mixing machinery, even when this complicated machinery is in the hands of high priced experts.

"THE STANDARD" Mixer will merit the good record already built up for the Eclipse.

Write for catalogue No. 32 which gives full information regarding this low charging machine.

Northwestern Modern Concrete Machinery

The entire line is shown in books now ready for distribution

THESE 1912 CATALOGS contain the entire line of NORTHWESTERN CONCRETE MACHINERY, including Mixing Machines, Block Machines, Moulds and Tools, with beautiful halftone illustrations taken from actual photographs and complete detailed description of everything in concrete machinery. These catalogs are encyclopedias of what you ought to have and at the prices you ought to pay. They are extremely valuable as a guide and reference whether you buy machinery or not, and anyone interested in concrete in any way should have copies of these publications.

Special Northwestern Concrete Mixer Catalog

Our special mixer catalog contains a complete line of mixing machines of every size and description from the smallest type of hand mixers up to the largest power mixing machines made. This catalog shows a complete new line of Rotary Drum Mixers built in all sizes, from 7 ft. up, with combination of features that are the most attractive ever included in mixing machines. Special Sidewalk Mixers, Continuous Mixers, Block Plant Mixers and Hand Mixing Machines are shown, fully described and beautifully illustrated, many full page pictures showing exactly the details of construction. **Be sure and write for this book.**

WHOLESALE PRICES

Block Machines, $10 to $250.
Brick Machines, $22 to $75.
Mixers, $24 to $1,000.
Porch Column and Baluster Outfits, $15 to $75.
Cap and Sill Moulds, $12 to $35.
Lawn Vases, $15 to $25.
Ball Moulds, $2 to $17.
Grave Stone Moulds, $7 to $69.
Well Curbing Moulds, $4 to $7.
Drain and Sewer Tile Moulds, $6 to $83.
Block Cars, $11 to $17.
Fence Post Moulds, $7 to $12.
Silo Moulds, $14 to $150.
Coping Moulds, $18.
Hitching Post Moulds, $20.
Baluster Moulds, $6 to $18.
Jardinieres, $12.
Special Gate Post Moulds, $10 to $30.
Newel Post Moulds, $14.
Grave Markers, $7.
Burial Vaults, $90.

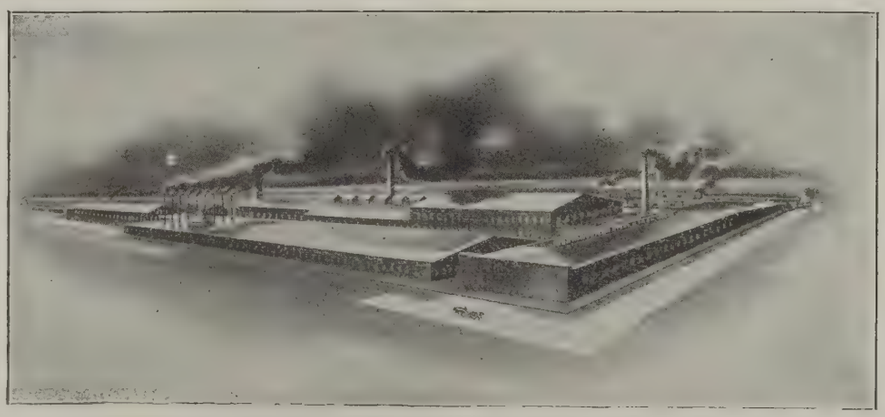
COMPLETE LINE OF—Cinder Crushers, Rock Crushers, Sand and Gravel Elevators, Sand Screens in both Revolving and Stationary Type, Motor Gauges, Wheelbarrows, Jointers, Groovers, Edgers, Corner Tools, Curb and Gutter Tools, Corrugating and Radius Tools, Roller Jointers, Brick Tongs, Curb Clamps, Curbing Edgers, Hawks, Floats, Line and Indentation Rollers, Tampers, Rammers, Name Stamps, Indentation Letters, Wall Plugs, Expanded Metal and Water Proofing, Flower Pots, etc.

We can save everyone from 10 to 50 per cent on their purchase. We make no charge of fancy prices on account of patents, territory rights, etc.

WE ARE CONCRETE MACHINERY EXPERTS

In addition to the NORTHWESTERN Line we manufacture the complete lines of several large concrete machinery concerns, and we are in the market for manufacturing propositions of this kind at any time. Owing to our immense manufacturing facilities, we are naturally in position to negotiate for large contracts because of our ability to turn out the goods at much lower cost than factories not so adequately equipped.

WE MAKE QUICK DELIVERIES



We are distinctly manufacturers and operate the largest factory of its kinds in existence. We own and operate our own Brass Shops, Foundries, Machine Shops, Pattern Works and build the entire line from start to finish, including gasoline engines. Large stocks are always carried on hand, enabling prompt shipment and quick delivery.

OUR GUARANTEE

Every machine is sent out with the distinct understanding that if not entirely satisfactory it can be returned within ten days and not only the full purchase price refunded, but the return freight charge paid by us. Our immense business has been built up on the satisfaction of Northwestern Concrete Machines and our liberal trial offer, and they are now used in every civilized country in the world.

Write for Wholesale Catalogs

We want everyone interested in concrete machinery to have copies of these catalogs. Send us your name and address and advise what particular machines or moulds interest you. Any one or all catalogs sent on request. It will pay you to get our prices before making your purchases.

Stanley Tools

This Company is the largest producer in the world engaged exclusively in the manufacture of Carpenters' and Mechanics' Tools.

Stanley "45" Plane

This tool is regularly furnished with twenty cutters.
Extra Reeding cutters as shown in cut, can be furnished at slight additional cost.
By substituting specially formed detachable bot s, also shown in the cut, special cutters known as "Hollows," "Rounds" and "Nosing Tool," can be worked.

Every tool we manufacture is gu anteed as to workmanship and material.

ELEVATORS FOR INVALIDS

"The Sedgwick Machine Works,
130 Liberty St., New York.

Gentlemen:

In my house we had no elevator and my daughter had to depend on our man to carry her up and down stairs. If she wished to let the man have an evening off, she had to go upstairs right after supper and stay there. Now the man could be dismissed so far as carrying her in the house is concerned. She is entirely independent, goes up and down by herself, can run the elevator with one hand, and she goes up and down as often as she wishes and when she wants to. The elevator is a great comfort to us and we shall be glad to have anyone needing such a thing come and see it, or write us about it. There are many invalid ladies and men who toil laboriously upstairs who, if they knew of the Sedgwick Hand Power Elevators, would not be without one."

The above unsolicited letter was written to the Sedgwick Machine Works by a well known New England Judge who has had a Sedgwick Hand Power Invalid Elevator in his house now for nearly five years. The Sedgwick Machine Works, 130 Liberty Street, New York, will furnish his name and address upon request, or will send catalog and full information as to their Hand Power Elevators and Dumb Waiters free on request. Judge B——purchased his elevator through his local carpenter.

Sedgwick Machine Works

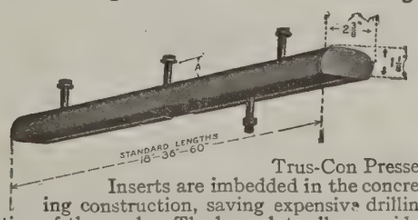
Made in all sizes and styles for use with brick or concrete block walls or with wooden or steel beams.

TRUS-CON JOIST HANGERS

Avoid cutting away and weakening of timbers and walls—save labor, time and money.



Trus-Con Joist Hangers are made from open hearth steel plates, and are proven by actual test to be the strongest on the market. Note the bulb-shaped reinforcement at upper angle.

We also furnish Post Caps, Post Bases, Wall Plates and Base Plates made in rolled steel, malleable iron, or cast iron.

Write for catalog and prices.

SHAFT HANGER SUPPORTS *for* CONCRETE BUILDINGS

Trus-Con Pressed Steel Inserts for Supporting Shaft Hangers in Concrete Buildings.

Trus-Con Pressed Steel Inserts are imbedded in the concrete during construction, saving expensive drilling after completion of the work. The long slots allow a wide variation in position. Special washers prevent bolts turning in the slots. Write for details and prices.

Through I. C. S. Training

Two Thousand Two Hundred Fifty Carpenters have voluntarily written to us that the International Correspondence Schools opened to them the door to increased pay, promotion, and prosperity in new positions and occupations. But this is not all: 1,616 more letters come from other men who, from other or no occupations, have become carpenters, architects, and contractors thorough I. C. S. training. This is the very best evidence of results accomplished by I. C. S. students. These men are making their spare time increase their wages, build homes, and win independence. If you are not one of them, you are neglecting a great opportunity—neglecting your duty to yourself and those dependent upon you.

The I. C. S. have taken thousands upon thousands of men and fitted them for larger and better-paying positions. What we have done for others, we can do for you. I. C. S. Courses are adapted to meet your particular need, for by a Course you can rise to a larger and more prosperous career.

Mark and mail the coupon. It will bring to you, without cost or obligation, full information about the promotion you wish to secure.

"AMERICAN" CONTRACTORS' PORTABLE SAW BENCH

Now is the time to prepare for spring business—and, first of all, look into the "American" Contractors' Saw Bench—the bench that pays for itself on its first job and then becomes a steady money-maker.

Of course, there are other portable saw benches—but only one "American" Bench, built by "American" methods, with the "American" experience and guarantee behind it, by the concern which has made the name "American" on saw mill machinery a guarantee of maximum satisfaction.

Novo Contractor's Trench Pump Outfit

Novo Hoisting Outfit

NO TANK
NO FAN
NO FREEZING
TROUBLE

GIVES BETTER SERVICE THAN STEAM OR ELECTRIC MOTOR

Novo Engine Direct-Connected to Pump

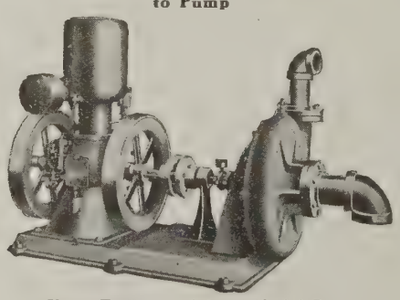
The Novo has many advantages for hoisting or other contracting work over other means of power.

No licensed engineer is needed—anybody can run a Novo.

It occupies small space and is readily moved—it's the lightest engine for power developed.

No expensive electric wiring has to be done—the Novo is self-contained.

No coal to buy—and be stolen.



"The Engine For Every Purpose"

The Novo Engine is adaptable to every contractor's needs within range of its horse-power. It is simple, reliable, exceptionally economical, and very compact. Working parts are enclosed against dirt and constantly lubricated by a splash system—even the main bearings. The Novo cooling system is self-contained and guaranteed proof against freezing damage. Weather conditions do not affect the Novo Engine. 1 to 10 H. P.

Two Men Do the Work of Twenty Five

PROFITS depend on good shop management. Time-eating methods of turning out contract jobs must be cut out. Where's the economy in hitching man power to saws when a small investment in an Eveready Saw Rig will be an every day income-producer with little depreciation? You can't afford to get along without such a compact, simple, easy-to-handle outfit as this. It takes up little room in your shop—

Can Be Moved Anywhere. One Man Can Pull It. Two Men Can Lift It and Your Wagon Can Take It to Any Job.

These are weighty reasons, Mr. Contractor. A few minutes figuring will convince you that a machine that will do all your jig-sawing, dadoing, mitering, beveling, ripping, boring, sanding, etc., for **25c for 10** hours is a mighty profitable proposition. Fistfuls of letters from enthusiastic contractors—big and little—prove our claims. The

TRADE OSHKOSH MARK

Eveready SAW RIG

Is Guaranteed for Life

Operating cost 2c per hour—Never tires—never stops because of hot weather—neither perspiration nor sunshine has any effect on it—alway good natured—always on the job—will work overtime.

It pays for itself in a surprisingly short time. When not in use it doesn't cost a cent. But there's scarcely a day you'll not use it at a profit.

The Engine and Frame.—It's a quick actor—a snap of your finger! a twist of your wrist! and off she goes with a merry hum. It is a 4 H. P. of the valveless type which gives double the power of 4 cycle styles and has no complicated parts. The bearings are large, will stand unusual strain and are enclosed, away from grit and dust. A highly sensitive governor insures steady movement under any load. The table, frame and skids are of very best rock maple air and kiln seasoned. Will never warp.

Write for prices. Then work your pencil for 5 minutes comparing your present costs and that of operating an Eveready. The big chance is that you'll order—for you'll conclude as others have proven that—

It Will Increase Profits on Your Contracts

You Run No Risk

Return This Rig at our expense—after six days' trial in your own shops—if it is not exactly as represented. Every one is sold under our steel-riveted guarantee—hand signed if you ask it.

Send for Literature

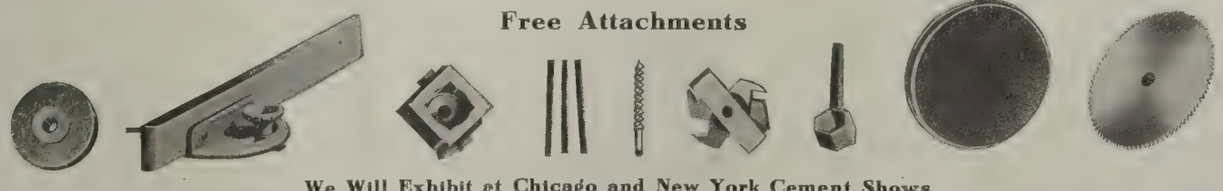
giving complete description of the Eveready, price, etc., at once and commence to save money.

ALL THESE ATTACHMENTS FREE

Jointer Head—This works on exactly the same principle as an up-to-date planer. Produces a smooth, even job with no deep cut as the material leaves the jointer head. 2½ inches in size.

Boring Attachment—A high class attachment. Guaranteed absolutely accurate. Extra long boxes insure easy long-running qualities on the guides. Bits, standard size.

Jig Saw—Not a cheap one, but the best 13 inch jig we can make. All joints reinforced with steel, equipped with brass bushings. Once use it and you won't part with it.



Sander—The best one yet—a great time and money saver over old methods in change and economy of paper. Our method of holding paper will not blister as do many others. 10 inches in diameter.

Saw Gauge and Mitre Device—Saw Gauge of best gray iron, 18 inches long, adjustable to any bevel. Mitre Device adjustable to any angle and can be used as a cross cut gauge.

Dado Head—Our own special design. Does smooth, even work with or across the grain. Makes window frames, dados, etc.

Emery Wheel—A 6-inch wheel made for grinding tools is also furnished with this rig.

Our screens are all mortised, tenoned, joined with waterproof glue and pinned with steel pins, will last a lifetime

And You will Then be Able to Close Many a Contract that Would Otherwise be Lost

The demand for Architectural Perspective is increasing yearly because those who build are demanding, in addition to the plans, perspective drawings of their buildings. A well made perspective drawing, properly shaded and set off by a little landscape and secondary detail, pleases the eye, and is a valuable adjunct to the regular plans and elevations. Our correspondence course in ARCHITECTURAL PERSPECTIVE and DRAWING of BUILDINGS is complete, practical, and can be learned at home at odd times. Instruction likewise given in twelve separate, complete Art Courses, for pecuniary profit, or pleasure only, as desired Year Book sent upon request.

These Shingles Are Fully Guaranteed

THOUSANDS of buildings—homes, schools, churches, etc., are today covered with Reynolds Asphalt Shingles. Many of these have stood the heave of frost and the wear and tear of storm for 10 years and are in every way as good as when first laid.

Reynolds Asphalt Shingles have "made good"—they have stood the test. So satisfactory are they in durability and appearance, that leading architects and builders are specifying them for new work on the best class of modern homes.

Reynolds Flexible Asphalt Slate Shingles

Reynolds Asphalt Shingles **last.** They are 8x12¾ in. and lay 4 in. to the weather. They are fire-resisting and weather-proof. Never split, warp nor rot. **Cannot** color rain water. These shingles are mineral surfaced and laugh at wind and weather. No better shingles are made than these. If you want to enjoy life, roof your home with Reynolds Asphalt Shingles and—"forget it." We also make strictly high-grade granite surfaced roofing in rolls.

J-M Moulded Transite Asbestos Shingles
VERSUS
The Laminated Kind

J-M Transite Asbestos Fireproof Shingles are moulded under powerful hydraulic pressure in one solid, compact, homogeneous mass.

Therefore they cannot exfoliate, warp or curl like the laminated kind, which are made like paper on a paper-making machine, are liable to do.

Therefore J-M Transite Asbestos Shingles have no weak spots like shingles made in layers pressed together. They are more closely knit, have double the life, are more ornamental and render more efficient service than the kind built up layer-on-layer.

J-M Asbestos Shingles are furnished in all sizes and in three colors: Natural Gray, Indian Red and Slate.

Try It FREE

Why, compared with the grindstone or emery wheel, it is mere child's play to do the toughest job of grinding—and with the patent tool rests and attachments an apprentice can do any job of sharpening, such as gumming saws, sharpening plane bits and twist drills as well as a high paid mechanic. Try it 30 days absolutely free—then if you don't want to keep it, return it at our expense.

A Work Shop in Itself

Extra Attachments convert the Luther "Hummer" Tool Grinder into jig and circle saw, lathe, force-feed drill, blacksmith forge, etc.—you can completely equip your workshop at very low cost—free book illustrates and describes extra attachments—17 in all. Write for Free Book today.

Dimo-Grit Sharpening Stones

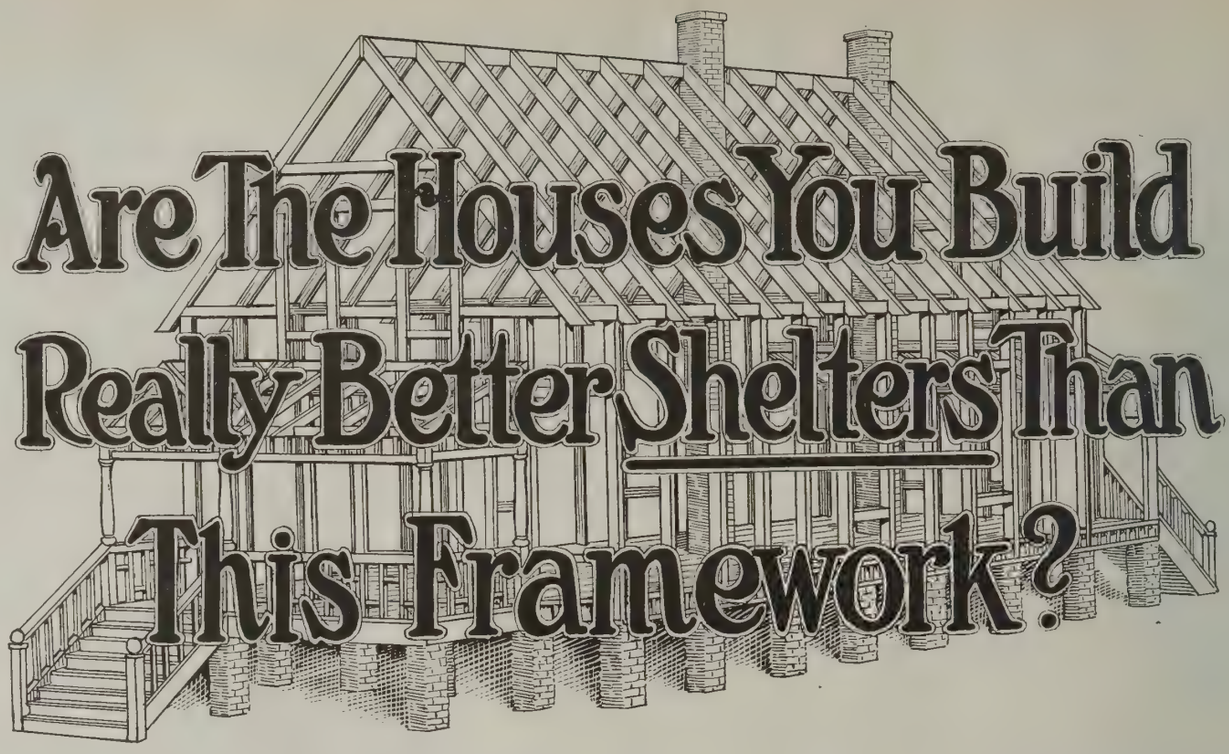
Ask your dealer for Dimo-Grit sharpening stones—the fastest, smoothest sharpening substance for steel. Look for the name "Dimo-Grit" on the stones.

Cuts Steel as Emery Does Copper

Dimo-Grit, the new artificial diamond abrasive, peels steel away in tiny shavings—25 times faster than grindstone, 10 times more efficient than emery—no need of water cooling, no danger of drawing temper. Will not glaze or wear lopsided. Dimo-Grit is especially adapted for steel. Carborundum Wheels supplied when wanted.

Luther Shop Tool Grinder

Foot and engine power—built completely of steel and iron, enclosed shaft drive like an automobile, dust-proof bearing—runs as easy as sewing machine—4000 revolutions per minute by foot power.



14 Machines in One 1—Fine Dimo-Grit Wheel. 2—Coarse Dimo-Grit Wheel. 3—Universal Toolrest. 4—Chisel and Plane Bit Guide. 5—Dimo-Grit Razor Hone. 6—Dimo-Grit Scythe Stone. 7—Dimo-Grit Saw Gummer. 8—Felt Polishing Wheel. 9—Medium Dimo-Grit Wheel. 10—Cloth Buffing Wheel. 11—Dimo-Grit Oil Stone. 12—Dimo-Grit Pocket Hone. 13 Plane Bit Honing Attachment. 14—Twist Drill Sharpening Attachment.

40-Page Free Book

Shows all ways this machine saves and earns money and makes work easier—gives valuable pointers on tool sharpening. Prove this machine's value to you in your own work. Send for full information, then decide if you want to try the shop outfit for 30 days free. Don't delay. Write today.

Are The Houses You Build Really Better Shelters Than This Framework?

After all is said, isn't it true that the single word "shelter" completely covers the purpose for which any house is built? Whether you're building a detached house or an apartment, its primary requisite is that it be a **shelter**—(1) from the **public view,** (2) for the **safe-keeping** of your personal effects, (3) from the **wind, rain and snow,** and (4) from **heat** and **cold.**

(1) Curtains and blinds, (2) strong doors and locks, (3) solid walls and roofs—all do their work well. But how about **heat** and **cold?** Come, let's be frank—are your houses **really** shelters from **them?**

LINOFELT
—Linen Felt made from Flax Fibre

in the walls you build will keep cold on one side and heat on the other just as a solid black curtain keeps light and dark separate. Clapboards, sheathing, brick, hollow-tile—no matter of what material or how thick you build the walls—they **don't** insulate against heat and cold.

This glimpse at the scientific side of it means enthusiastic customers and clients for you. To stop the passage of heat and cold demands a substance containing a countless number of microscopic sealed **dead** air-cells, with the cells separated by material of the lightest possible specific gravity.

Flax fibres meet this condition better than any other substance capable of use in building. Linofelt is a quarter-inch quilt of specially treated flax fibres bound between two sheets of building-paper—rosin-sized or waterproof. In resisting the passage of heat and cold Linofelt is. **much** more effective than **38** thicknesses of building-paper.

There's the brief scientific fact. It shows you why Linofelt, used in walls and roof instead of building paper, will cut 40 per cent off your customer's coal bills every winter—and keep his house cool in summer as well.

That means **real shelters** from heat and cold. Linofelt comes in rolls 200 feet long and 3 feet wide. It will never add more than one per cent to the cost of building, and **need** not add anything.

Build with Linofelt, and make your houses faithfully serve their primary purpose; make them **genuine shelters.** Write for our special booklet and complete information today. Call upon our staff of draughtsmen for any specifying you wish. There's no corner-coupon here; we want to get into **personal** touch with you. Write us fully **now.**

WHO SAID ALL THIS ABOUT CYPRESS?

"THE WOOD ETERNAL"

(*Here's a part of the good things they said:*)

"CYPRESS is put to almost every use as an interior trim for houses.....natural color or stained.....contains little resin.....thus affords a GOOD SURFACE FOR PAINT, WHICH IT HOLDS WELL..... popular.....for kitchens, where it is subjected to dampness and heat..... *shrinks, swells or warps but little*.....For the parts of houses exposed to the weather it serves equally well. AS SIDING IT PRACTICALLY WEARS OUT BEFORE IT DECAYS.....made into porch columns it retains its shape, *holds paint,* and has sufficient strength.....It is placed as cornice, gutters, blinds.....and railing, and *is much used for Porch Floors and steps*..... Much CYPRESS lumber is employed in the construction of *SILOS*..... The FARMER puts the wood to many uses.....ITS LASTING PROPERTIES FIT IT WELL for curbs..... *Resistance to decay* fits it for stable floors and timbers near the ground, as well as for.....gates, and especially for fence posts... .one of the best available woods for picket fences, because it *shows paint well* and holds it for many years, *but lasts a long time without it*.....widely used for this purpose.....in regions remote from its range..... It is PRE-EMINENTLY FITTED for (*greenhouse construction*).....where it is called upon to *resist dampness, excessive heat, and all the elements that hasten decay*.....sash, frames, benches, boxes, and practically all else.....the builder needs.....Agricultural implement manufacturers make seed boxes of it, wagon makers.....for beds.....carriage builders and automobile makers work it into panels for fine bodies..... *Its slight tendency to warp* has caused its employment for incubators.....freight-car siding.....many builders of *gasoline launches* are said to be using Cypress *exclusively* for hull planking.....makes handsome church pews.....Telephone boxes and switchboards of *CYPRESS* are coming into use.....spools.....beehives;.....seine floats;.....tables.. ..curtain poles; .....patterns;.....shelving and counter tops;.....shims;.....tool boxes. CYPRESS has been substituted for white oak for wine barrels....The same....freedom from taste is claimed for it by pump makers, who recommend it for that reason," (etc.)

(*Here's who said it—*) *a reprint from:*

U. S. GOVT. REP., Bulletin 95, June 30, 1911, pp. 44-46.

WHEN YOU BUILD (palace, cottage or pasture fence)
Why not "Stop Depreciation Before it Begins — *Use CYPRESS At First!*"
WHEN "FIXING UP" (big new porch or little back steps)
"Why Replace Rotten Wood *with Wood that Will Rot?*" (*Use CYPRESS, of course.*)

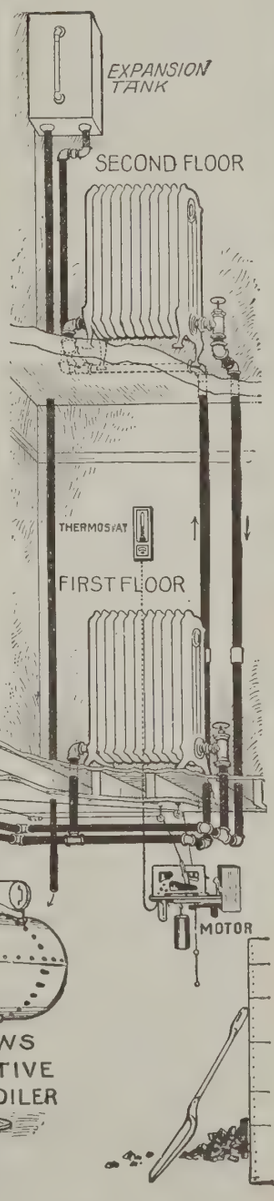
Andrews Hot Water Heating Systems

$198 Average Price

14 Andrew Heaters in one Block



Geo. C. Andrews
The man who does it right in 44 States.

Profit for the Contractor

WE have made lots of money for other contractors who read this paper and we'd like to make some for you. It is a great advantage to you to include **Andrews Heating and Plumbing Systems** in your contracts, and we assure you that there are no systems which give such general satisfaction. They are the easiest for you to handle, too, for we do all the estimating for you and make the plant complete all ready to screw together, so one of your carpenters' helpers can erect it. You can make a nice profit without much work.

360 Days Free Trial

Guaranteed by Bond

We take all the risk of the plant's success. Also the financial risk, providing you want us to bill your customer direct and pay you a commission. Let us give you a free estimate on your next job and you'll see the advantage of doing business with us.

SPECIAL FREE THERMOSTAT OFFER

In order to give your end of the business a good start, we will give you or your customers one of our famous "Hired Man" Thermostats, providing you write us within 30 days and order an Andrews Plant or Boiler during 1912. This Thermostat regularly sells for $20, is guaranteed for life and should be a good inducement for your customers to contract with you right away for their heating plants.

Send for Andrews BIG BOOK

On Heating—Plumbing—Water Supply Sewage Disposal—Gas Lighting

PLUMBING

The Andrews Plumbing line is complete of the very best material. Complete plans and instructions for erecting accompany each order. Pipes are cut to fit, threaded, etc. so that any handy man can easily erect. Write for estimate.

ANDREWS STEEL BOILERS

The two styles of Andrews Steel Boilers, vertical and locomotive, are the highest types of hot-water boilers. They are made of steel-plate like power boilers and their very large fire travel together with the close proximity of fire and water make them heat quicker than any other boilers on much less fuel. A child can clean either style in a few minutes. Average annual cost of coal $3.00 to $5.00 per room. Our catalog also shows cast iron boilers.

SEWAGE DISPOSAL

The Septic Tank is one of Mr. Andrews' own inventions. A small steel tank placed underground just outside the basement treats the sewage in such a manner that it becomes purified and passes off into a drain bed. An almost indispensable device for any home not having sewer connections. Cheap and lasts forever. State size of house and grounds when writing for estimate.

GAS LIGHTING

The very best gasoline gas system made makes finest gas for cooking, lighting and gas-engine use. Entirely safe, lasts a lifetime, easily operated; more economical than city gas and giver more light and heat.

Write for estimate, giving sizes and number of your rooms.

ORR & LOCKETT HARDWARE Co

Established 1872

Most Contractors and Builders doing business in Chicago or nearby towns know that Orr & Lockett's is the one best place to buy their hardware and supplies. But there are others who do not realize what an advantage it is to have the benefit of our services and long experience, and this advertisement is intended for them.

In the first place any contractor in buying from us is assured of the best and most suitable piece of hardware for each particular purpose. We very seldom fill an order with the goods of any one manufacturer exclusively, but are able to choose those pieces which are acknowledged to be the leaders in each manufacturer's line. Thus the entire order contains only the highest grade articles—not a weak link anywhere.

Then in the matter of packing our goods for shipment we employ only experienced men who sort and label each piece from the specifications so that the workmen on the job lose no time in handling. Any contractor will realize the great advantage in receiving his hardware in this shape.

There are many other reasons why every contractor and builder will find Orr & Lockett's the most satisfactory place to deal, and we shall be glad to give these reasons to anyone interested. Just remember that as we do the bulk of the better class of this business in the Middle West there must be some good reason for it, so let us hear from you.

SPECIAL NOTE for those attending the following conventions:

Illinois Lumber and Builder's Supply Association, Chicago, Ill., Sherman House, February 13, 14, 15.

Fifth Annual Cement Show, Chicago, Coliseum, February 21-28.

Clay Products Show, Chicago, March 7-12.

While you are in Chicago don't fail to visit this store and see our remarkable stock of Builder's Hardware and Supplies, Contractor's Tools, Supplies, etc. You will find that we carry the largest and most complete line in the country. Come in and ask all the questions you wish.

NATIONAL BUILDER DESIGN No. 350

W. P. R. Pember, Architect, Albany, N. Y.

For Floor Plans and Elevations, see Supplement of this Number. Estimated Cost, Architect's Fees Not Included, $3.117.36

THE UNAKA CORPORATION RESIDENCE

THE house shown on the supplement sheet for this month is one of a number designed for a large building company, and shows the result of careful planning to get ideal results for the small family.

While this particular house was designed for a southern climate, yet it will be noticed that it varies only slightly from the best construction in the northern states.

The people of the South are beginning to realize that to have their houses comfortable they must be protected not only from the cold in winter, but from the extreme heat in summer. For this reason we see houses lined with the various weatherproofing substances, double floors, etc., exactly as in the northern states. The matter of heating is also as necessary as in the North, for while heat is only required for a few months, yet it is just as necessary as in the northern locations.

*Materials are figured at Omaha prices. Carpenter labor figured at 40 cents an hour.

Estimate of the Unaka Corporation Residence*

By I. P. HICKS

Incidentals, 5 per cent	148.44
Total estimate	$3,117.36

There are within the walls of this building 19,000 cubic feet, which makes the cost of construction approximately 16¼c per cubic foot.

EDITORIAL NOTES AND COMMENT

The outlook in the building trades is quite encouraging.

* * *

A survey of "Contracts to be let," and work proposed, warrant optimism, and indicates more than usual activity in all branches of trade.

* * *

The financial conditions continue to improve, and there seems to be a decided advancement in the volume of business transactions. While the gain is very gradual and conservative, there is every evidence that the improvement will be lasting. Reports from all over the country show the condition of the national and international money market to be in an easy condition. This general prosperity cannot help but affect the building business favorably as people are coming more and more to believe in investing their money in real estate and in building office and apartment buildings which will bring in an income that will not be subject to the uncertainties of a stock market.

* * *

The unusually severe weather during last month (January), seems to have made things pretty lively for plumbers and firemen, and what with frozen and bursted pipes, forced and overheated stoves and furnaces, people in the northern part of the country were kept in a state of unrest for quite a period. The losses that can be traced directly to the recent "cold spell" will run well up into the hundreds of millions, and yet, as Puck said: "What fools these mortals be," for they still keep on building defective fire and frost inviting structures, the destruction of which often means the loss of millions of dollars.

* * *

That has happened which all men dreaded, the burning of a skyscraper—strange indeed that it has not happened before. Fortunately it occurred out of business hours. Had it been during business hours there would have been a hundred people in it for one who was there. Fortunately the Equitable building is one of the very oldest of the skyscraping class, once the wonder of New York now a pigmy among giants. Being one of the earliest of such buildings it is fair to assume that its fire conditions were among the very worst. The elevators were not running. Whether, if they had been, it would have been any better for the unfortunate victims is matter of surmise. The elevator shaft is a splendid flue for smoke and superheated air, should these develop within reach of it.

* * *

It is said of the more modern buildings that you could build a fire in any part of them, and it would do no more than a local damage. Many people are skeptical as to the possibility of making any building really fireproof. This is a mistake. In Germany, where it is not permitted to collect insurance on the full value of any building in which a fire originates, apartment houses have long been the rule, but no one runs out for a fire in a neighboring apartment. In Italy many old buildings are absolutely fire proof, and such, let us hope, are the majority of these extraordinary buildings, some of which have a population during business hours of ten and twelve thousand, representing, counting those dependent on them, a city full of people. Even in the Equitable building there was evidence of the fireproofings of parts, as witness the preserving of the valuable papers and securities in the vaults. Here were small rooms subjected to tremendous heat, that were fireproof enough to protect the contents of the rooms. This fact in itself is a lesson that might be worthy of serious consideration.

* * *

True, the Equitable Life building was admittedly not fireproof, and therefore its destruction throws no light on the question whether the so-called fireproof buildings are in reality absolutely safe. Neither was the Equitable building a very high one, as New York structures go today, and just for that reason the incidents connected with its burning suggest at least two practical lessons to the civic authorities of towns and cities. One is that no building should be allowed to run higher than three stories unless it is absolutely fireproof; the other is that the maximum height of a building should be determined by the width of the street on which it fronts. No building should be higher than the measure of the width of street it faces, measuring from the base of the building to the building line on the opposite side.

* * *

To allow the erection of high buildings that are not absolutely fireproof, is to put a premium on the destruction of human life. It has often been found in practice that it is difficult for people to escape from a third story of a burning building, and the danger increases in geometrical progression with every additional story. Moreover, as every fire in a high building proves, the narrowness of the ordinary street greatly increases the difficulty of the firemen, and the working of the fire-extinguishing apparatus, and thus adds to the danger of widespread conflagration. It is seldom difficult for firemen to rescue inmates from a second or third story, but it is often a task of great danger to take them out of a fourth; it becomes practically impossible to save them when they are in a seventh or even a sixth. To think of hundreds of helpless men and girls at work in the upper flats of some high building in our cities should be enough to convince members of municipal corporations of the necessity of constraining proprietors to safeguard, as far as practicable, all non-fireproof high buildings, and of preventing the erection of any more structures of the dangerous sort, and these measures should be strictly enforced regardless of circumstances.

* * *

A federal judge has administered a strong and merited rebuke to the grand jury that indicted for kidnapping, the detective who captured the McNamaras and to the state court which arrested him and held him to heavy bail. The state court naturally acted under the state law, which forbade extradition from the state court. This legislation was an assertion of state rights at the expense of public justice. It is pronounced by the federal court to have been beyond the powers of the legislature, as it contravened a federal statute. The passing of it suggests an extraordinary lack of confidence in federal justice or else sympathy with criminals. The action of the grand jury can only be put down to sympathy with workingmen, or the fear of terrorists.

DAYLIGHT

By E. B. BIRKENBEUEL

IT IS AS strange as it is true that the best things in life are the easiest to get, if one only half tries. Since people first saw the sunshine on the earth they have cowered in the shade. Not content with shade, they built houses that were dark as well as warm, and poorly ventilated. Seeing it done every day prevents us from wondering why house builders will insist on shutting out light and air. Dungeon cells of the other days often had but one small window, and sometimes none at all, not merely for security but for punishment. Dungeons going out of style their builders turned house-builders, and now we have windowless houses.

When planning your house, first remember that the primary object is to protect one from the elements. If an especially dark room is wanted for photographic purposes it should be designed with that end in view. If a room is wanted for living, eating, playing, working, or sleeping, or even for a store-room or clothes press, make it have windows; make it have enough of them to let in every ray of light and breath of air that tries to enter. And if the room is not to be used at all, then by all means give it light. Don't enclose any space with four walls and a door, for when you open that door happiness steps out, never to return.

And so it is that the best things we have in life come in at our windows, glass or no glass. So give us plenty, you who plan; give us big ones, you who build, and shadows will scatter, and the musty ghosts of lonesome discontent will vanish with the stirring of the air.

HANFORD, CAL., November 23, 1911.

Mr. Fred T. Hodgson, Chicago.

Dear Sir:—I wish to express my best regards for the really good paper, THE NATIONAL BUILDER. About two years ago I came to this country, customs and language strange to me. By reading, if I could say so then, your valuable paper, I pretty soon became familiar with the different technic and terms used in this country, and I hope to stay a steady, ready reader, even if I go back to my old country.

Yours very truly,

E. FECHNER.

PEARL FOR MARQUETERIE

THE use of mother-of-pearl is a time-honored practice among cabinet makers, and some particulars as to its source and character will be of very general interest to workers in wood. Mother-of-pearl shells are found on the Pacific coasts of North and South America, in the islands of the Pacific Ocean, in the Philippines, on the coasts of Australia and in the adjacent islands, on the coasts of India and in the islands of the East Indian Archipelago, in the Persian Gulf, in the Red Sea, and in Zanzibar. These shells, which form an important article of commerce, are largely used for inlaying furniture, musical instruments, Japanese and Chinese lacquer work, European lacquer, and papier-mache work. In the colony of Tahiti mother-of-pearl shells are found chiefly in the Tuamotu (or Low) Archipelago, which embraces the Tuamotu (or Paumotu) and the Gambier Islands, and extends in a southeasterly and northwesterly direction for 1,000 miles, the greatest width of this belt of islands being 300 miles. With only a few exceptions the eighty-two islands composing this archipelago are now low-lying atolls of coral formation, narrow strips of land forming a chain of islands and islets, in most cases separately by passes of water and stretches of partially submerged coral reefs.

WHERE THE SHELLS ARE PRODUCED.

While shells are produced in all the islands they are found of good quality and in paying quantities in fewer than one-fourth of the lagoons. The time for the opening and closing of the diving season, which usually lasts from May 1st to November 1st, and the names of the islands open for the season are published months in advance in the "Official Journal" of Tahiti, together with the regulations to be observed and the penalties for their violation. The large islands are divided into three sections, only one of which is open during a season, and the small lagoons also are open only once every three years. This year there were open thirteen sections and lagoons, some of the latter being insignificant. Before the opening of the season Papeete merchants send to the islands schooners laden with supplies, which are stored in portable houses built chiefly of corrugated iron.

The shells in the lagoons are regarded as the property of any natives who will dive for them, but as almost all the good divers live in the Tuamotus they reap the profits of the diving season. The schooners transport the divers and their families from other islands to those open for taking the shells. These people carry with them pigs, bread, and other things to give to the islanders, among whom they are to live for some months. The merchants advance supplies to the divers and also furnish them lumber to make their boats, each of which is constructed of three boards of California redwood and provided with an outrigger to steady it in the lagoon. During the season a favorite island presents a lively scene with its encampment of as many as 1,000 men, women and children.

DIVING FOR SHELLS.

The hours for diving are from 9 to 2. The diver paddles his canoe out into the lagoon and anchors it, and, if he happens to hit upon a good place, he may not move his boat during the five hours. A basket to hold the shells is let down by a rope tied to the boat. On the end of another small rope, also tied to the canoe, is a piece of lead weighing from fifteen to twenty pounds. The diver, who wears only a narrow loin cloth, places one foot upon the lead, with the rope between his toes, stretches the rope with one hand held against his chest, utters several loud yells to empty his lungs, refills them quickly with pure air, and descends rapidly, feet foremost, to the bottom of the lagoon. His goggles exclude the water and enable him to see from twelve to fifteen feet. He tears the shells from their supports, usually a piece of dead coral, to which they are firmly fastened. He may fill the basket with thirty or thirty-five pounds of shells at once, and he may have to dive several times to fill it. When his time is up the diver ascends by means of the rope, and immediately wipes himself dry with a towel. He rests and warms himself in the sun from ten to fifteen minutes before going down again. A good diver will go down from twenty to twenty-five times in the five diving hours. As the basket is filled it is drawn up and the shells are emptied into the boat. The man's wife, or some other member of his family, who accompanies him in the canoe, occupies herself by opening the shells, putting the contents in a bucket and washing the shells, from which she also removes the barbs.

A PRECARIOUS OCCUPATION.

This colony has the best divers in the world. They dive all the way from 6 to 120 feet (rarely more) in their work, and remain under water a minute and a half for the average man, two to two and one-half minutes for a good diver, and three minutes for a few exceptional experts. Among the pearl divers of Ceylon the highest record is 110 seconds. Diving for shells is hard and wearing work. Like many other industries, it exacts its toll of human life. At the beginning of each season the nose and ears of the diver bleed when he comes up out of the water, and sometimes he vomits blood. His eyes become affected and paralysis of the arms and legs is not uncommon. He is at his best between the ages of twenty and twenty-five; after thirty he begins to decline and is able to dive less and less as he grows older. Boys who wish to become divers for shells begin to practice soon after entering their teens. Between fifteen and seventeen, when they have not yet learned the limit of their capacity, they occasionally stay down a little too long, and give out before the boat is reached by the rope. It is said by those well informed that half a dozen men usually lose their lives in this manner during each season.

More than thirty diving machines were imported from the United States and used during the seasons of 1903 and 1904, but the authorities feared that the supply of shells might be depleted and the use of machines was interdicted before the merchants realized any net profits from their use.

CHARACTER OF SHELLS PRODUCED.

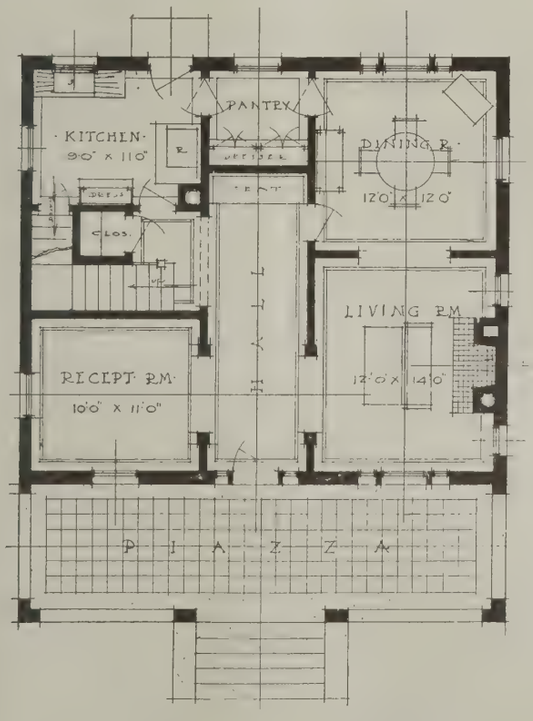
Mother-of-pearl shells are the calcareous covering of the bivalve pearl oyster Melcagrina margaritifera. This mollusk thrives best in lagoons where it is protected from heavy seas and shifting sand. It is necessary for it to have some sort of support, such as dead coral, stones, or wood, to which it may attach its shell by means of its byssus. The shells produced in this colony are of the black-edged variety and are the best of the kind found in the world. As they are brought to Tahiti for exportation they are known in the markets of the world as Tahiti black-edged shells. The dark edge is from a half to three-fourths of an inch in width. The rest of the inside is of a bright pearly appearance, with iridescent hues around a wide border, including the dark edge, the play of these shifting rainbow colors being extremely beautiful as the shell is moved in the light. Many fine large specimens of these shells may be seen in Tahiti homes, where they serve as ornaments. The smaller ones would make attractive desert plates. The outside of the shells is quite rough, but it also takes a fine polish and then reflects iridescent hues as effectively as the bright inside does.

EXPORT OF SHELLS.

Local schooners bring the shells in bags or in bulk to Papeete, the commercial center of the colony. The work of assorting the shells according to size and quality is done chiefly by native women, who also help men to pack them in strong boxes with a capacity of about 225 pounds each. Nearly all Tahiti shells are shipped by way of New Zealand to London, which is the world's greatest market for this particular article of commerce.

AN ODD FIND

THE discovery of garnets and gold in blasting away rock for the foundation of the Hotel McAlpin, at Herald Square, New York City, is regarded by Mr. Frank M. Andrews, president and architect of the world's largest hostelry as an unusually lucky omen, spelling undoubted success for his enormous enterprise, and Mr. Andrews is so impressed by this find that he has decided upon a novel scheme to put the precious ore and gems to some practical use. Gimbel Brothers have been conferred with for the construction of an artistically finished round top marble pedestal, fifteen inches in diameter which is to be inlaid with garnets and gold taken from the McAlpin excavation. Gimbel Brothers' expert jeweler, who has charge of this curious undertaking, declares that the execution of this contract is quite possible and Mr. Andrews' representatives are now engaged in mining the quartz and mica in order to secure enough garnets and gold to carry out this project and a beautiful artistic effect is promised. The pedestal will probably be one of the features of the McAlpin reception room and will be considered by Mr. Andrews as a mascot of his largest and most important architectural feat. It is hoped that the pedestal will be finished within the next four months, when it will be placed on exhibition in Gimbel Brothers' jewelry store.



Frederick P. Stafford, Architect.

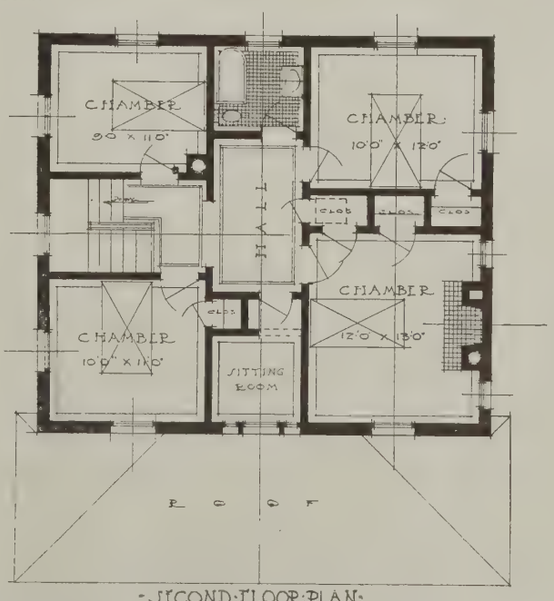
A CONCRETE RESIDENCE

By FREDERICK J. MESEKE

Herewith is presented an attractive two-story house at Ossining, N. Y., as designed and built by Mr. Frederick P. Stafford of Briarcliff Manor, N. Y. The house being plain and straightforward, an excellent example of concrete construction, is therefore most adaptable for the suburbanite.

A piazza extending the entire width of the house has been

FIRST FLOOR PLAN



arranged for enclosure during the winter months, thereby affording a luxurious sun parlor.

The foundations, 9 inches in thickness, extending below the frost line where not excavated, are of reinforced concrete. The cellar is well ventilated and lighted by ample windows. The floor is of concrete with cement finish.

The exterior walls above grade are of reinforced concrete 6 inches thick, furred 4 inches on the inside with the rough lumber that was used in the forms, then lathed and finally plastered, as is the entire house. The furring has been done to avoid any possible dampness striking through the plaster. This scheme provides a warm house in winter and a cool house in summer.

The partitions are of 3-inch concrete blocks. The floors are of 5-inch slabs and have all necessary beams and girders.

The stairs, with the exception of the cellar stairs, which have a cement finish, are entirely of concrete covered with wooden treads and risers.

SECOND FLOOR PLAN

Concrete has been used for the entire fireplace.

The exterior finish is slightly rough and the roof is covered with tin.

The entire cost of the house, including the plumbing, heating and lighting, was but slightly more than $5,000.

Another way to finish the exterior of such a house would be obtained by using small pieces of brick or warm-colored stone or marble in the aggregate.

EXTENDING THE FIELD OF THE POWER SAW

By J. CROW TAYLOR

GRADUALLY the planing mill and the builder are getting closer together, or to state it more specifically, there is a gradual extending of the field of power-driven woodworking tools into building operations itself.

Some of this extension is obtained by way of doing more of the work in the planing mills before it is sent out, and another extension of it is in taking machinery right on the job to do lots of work that heretofore was done by hand.

Especially is the power-driven saw extending more and more into building operations. It is not really robbing the hand saw of any of its prestige or usefulness. It is simply coming on to help out. There are probably more hand saws being used today than ever before and more work being done by them, yet they do a much less share of the total work.

The work required has been increased wonderfully and many new factories have entered. For one thing the preparing of false work for concrete calls for so much ripping and cross-cutting that the power-driven equipment is really essential. Moreover, the greater quantity of heavy work to do and the necessity of helping out hand labor in some way so as to accomplish it has brought the power-driven rip-saw into the building operations in several forms.

There is the rip and cross-cut saw table proper, and there is the band saw, which is used both for ripping and shaping and, accompanying this is the pony planer sometimes. However, it is the power-driven saw that is extending its way wonderfully into what was formerly a field of hand labor in building operations and the up-to-date builder must take cognizance of it and keep step with the times if he would get his share of the work and obtain a fair profit therefrom.

It is not merely the cutting of stuff for false work and the cutting, with power appliances, of bridging and other small items of which great quantities are needed, but we are getting to the point where much of the framing and cutting of rough lumber itself can and should be done by power-driven saws.

Some of it, as stated, can be done by the planing mill or in the shop at home by having plans and specifications laid out so thoroughly that all the dimensions can be framed. That is only one end of the work, however. The other one is bringing right on to the work itself power saws, either electric power or gasoline, depending on which the local conditions favor.

It is found that a power-driven saw is not only convenient in cutting and shaping regular stock, but now and then while one is at work on the job there is wanted a special width or shape that calls for ripping or sending back to the mill or somewhere to get it. Here is where the power-driven saw comes in handy and really helps pay for itself. One can rip not only straight lined square edge stock of any width that may be desired, but also rip at various angles by using jacks and cut tapering strips and do a wonderful lot of work that formerly had to be done laboriously with a rip-saw, hand-axe, and plane.

In fact, the power-driven saw is such a convenience that notwithstanding the use of power-driven machinery in the carpenter's and builder's shop at home it will be a part of the tool equipment of the future on the job. There will be portable power-driven saws to do lots of the work formerly done by hand saws. Hand saws will still be carried on the job and used perhaps as much as ever, but we must remember that there is lots more work being done than formerly, and it would be practically impossible to get help enough to do all that was formerly done by main strength and elbow grease and that the cost of lumber has gotten to the point where one must economize in its manipulation by the use of labor-saving devices of this kind.

Cleaning Stained Marble

If the marble is polished you do not want to use any cleanser that will injure the polish. Hence use this: Take equal parts by weight of ox gall (fresh from the beef if possible), pulverized soap, and pipe clay, to which add a little turpentine. Apply a heavy coating of this to the marble and let it become perfectly dry, when it may be rubbed off and the part washed with soft warm water. A second treatment is sometimes necessary.—Master Painter.

GOTHIC ARCH OF DOUBLE CURVATURE

By JOHN Y. DUNLOP

THE introduction of the arch as an architectural form led through the Basilica to the construction of those glorious Gothic Cathedrals, which were erected in the middle age. At this time, the Gothic masons were exhausting the possibilities of stone as a building material. They heaped it up in towers that rose on open archways through the lofty roofs of the surrounding naves and tapered away in shell-like spires, embroidered in all the fret work of Gothic tracery.

Later in the Thirteenth Century the Gothic spirit, taking account of mechanical forces, employed material at hand according

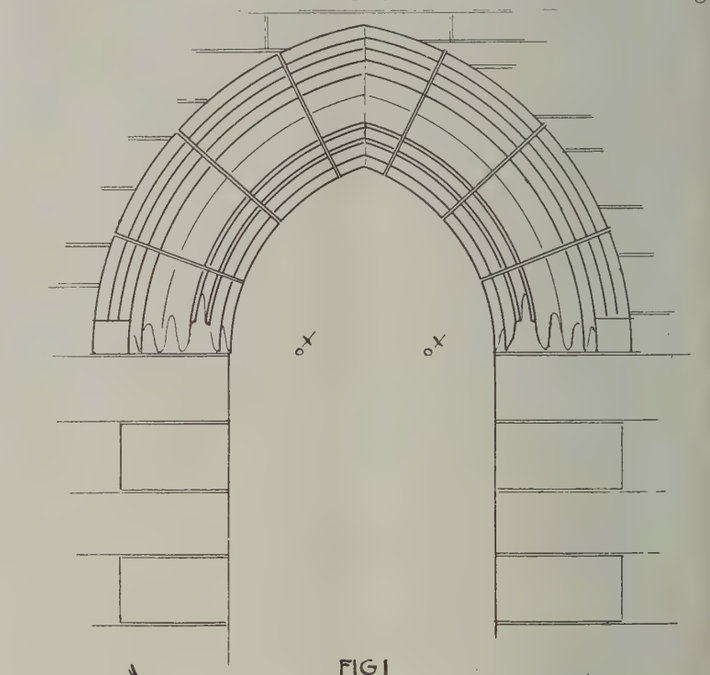


FIG 1

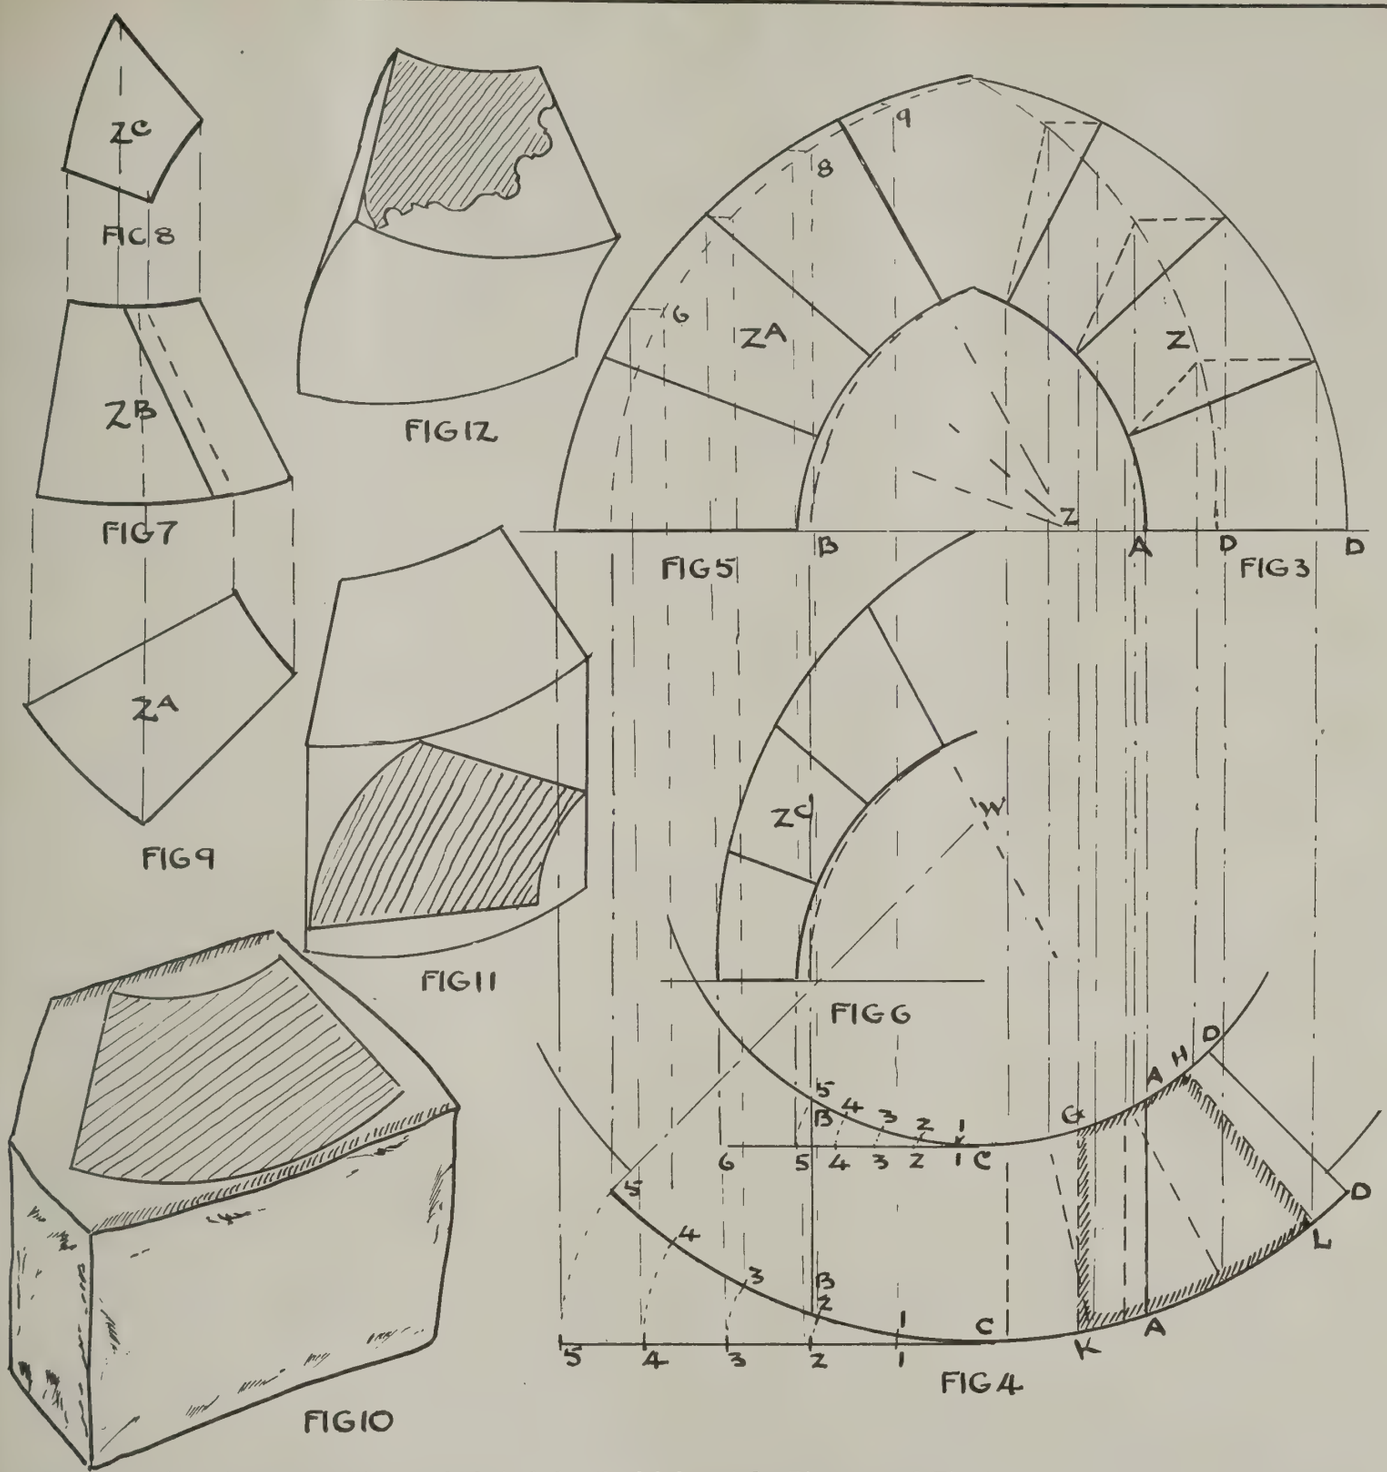
FIG 2

to their nature: it sought for those laws of elasticity and equilibrium, which were to be substituted for those of inert stability, the only laws known to the Greeks and Romans.

They also studied very closely how to economize material, because it was the force to elevate human labor from being the mere carrier of material to the highest form of technical art and skill.



Amongst the early Gothic architects, the arch absolutely determined the form of the support. The arch again determined not only the structure, but the form which it took, and the architecture was dictated solely by the arch. Thus, the material through the form which it dictates may be said to influence architecture in this period.

It should also be observed that the Gothic architects of western Europe had at hand stone that was strong and hard, but which split in thin pieces—they had not at their disposal either the marbles of Pentelicus nor the blocks of granite which the Romans procured from Corsica and the East. Thus, they were compelled to erect considerable building with thin courses of stone, whereas other nations erected small buildings with large blocks of marble.

Figure 1 shows the elevation of a Gothic doorway circle or plan, the wall of the tower being built with irregular coursed rubble.

Figure 2 shows the plan of the opening, with the moulded soffit of the arch intersecting on the circular jamb.

To set up the elevation for the face moulds:

Draw the plan of the arch, Fig. 4, which includes the label moulding and the elevation, Fig. 3.

Set off the joints on the face and back of the arch and proceed to develop the left half of the face.

Set off the straight line C5 and develop the face of the arch C5 on to it.

Set off ordinates from the developed line and take projector across from the points 6, 7, 8 and 9.

Describe a quadrant through the points obtained.

Develop the curve on the soffit in the same way and draw the radiating points to pass through Z.

To obtain the development of the concave side, develop each circle on the back of the arch. C6 shows the development of the line C5 into a right line—the rest of the drawing is similar to that adopted for the face arch and will be easily understood.

Figure 6 shows the complete development.

The moulds required for the working of each arch block are a bed mould and two face moulds, one for the face of the block and the other for the concave side.

The face moulds are now obtained, but required to be separated. Figure 8 and Fig. 9.

Figure 4 shows the bed mould of the second stone in the arch GHKL, and ZA and ZC is the face mould of the same stone, and Fig. 7 the mould for the same stone on the opposite side.

To work the second arch stone:

The stone for the arch block should be large enough to work the bed mould square through Fig. 10. If there is a broken corner in the rough block, it should be arranged for the corner where the stone has to be cut away.

Work the two beds, bottom and top, parallel to each other and of the height of the face mould.

Scribe on the bed mould, Fig. 10, on both ends. Next, work the concave and the convex faces through.

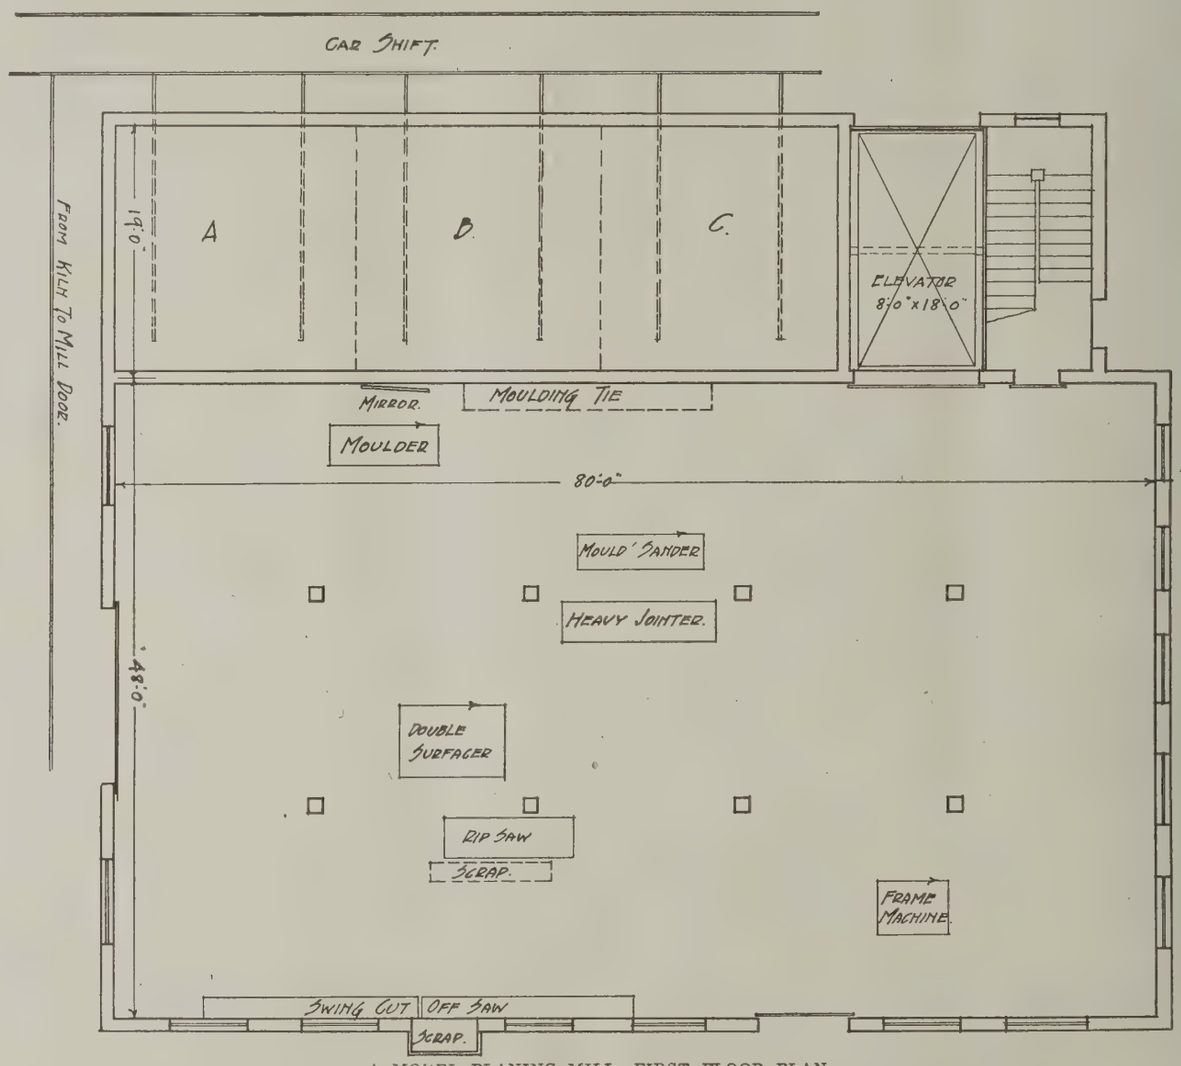
Now scribe the face mould, Fig. 11, on the convex face and the mould ZC on the concave face. Next, work the arch joints, which are winding or warped surface, and should be worked similar to the soffit of a winder step.

Cut the soffit and the outside of the arch block.

To complete the block, scribe on the joint mould of the arch and cut the soffit moulding through.

PLANNING A PLANING MILL

By CHAS. CLOUKEY



When about to take up the important task of making plans for a small planing mill there are so many things to be considered besides the necessary or desirable machines, that it is almost necessary to know the location of the proposed site before anything definite can be offered.

As this request comes to me in a general way and is desired to embrace the salient points of a common want in small planing mills, including certain provisions for enlarging by and by, I am offering the two floor plans with their respective arrangements of machines, which I will take the pains to explain at some length.

The term "planing mill" as used here means a factory for the manufacture of sash, doors, and the general run of building mill work. By a small planing mill is meant one having but one set of the necessary machines, and to plan it so as to build on later to advantage, means that few if any of the original machines must be moved in order to accommodate the larger business. It also means that some extra expense must be put into the original plant, but this lies mainly in making the building more substantial. In the item of dry kiln as shown in this plan, it is larger than would be needed for the size of factory planned, but when the capacity of the mill is doubled, the kiln would not be too big. However, it is not a waste of room to use part of the original kiln for storage of dry lumber or completed mill-work, and it would not be necessary to pipe the whole kiln until it was needed for drying purposes.

In the beginning of this subject, I wish to lay down a few fundamental principles of factory practice, and while they seem simple and perhaps of little consequence, they are really so far-reaching in their importance as to make the difference between a struggle for existence and the smooth working of a profitable business.

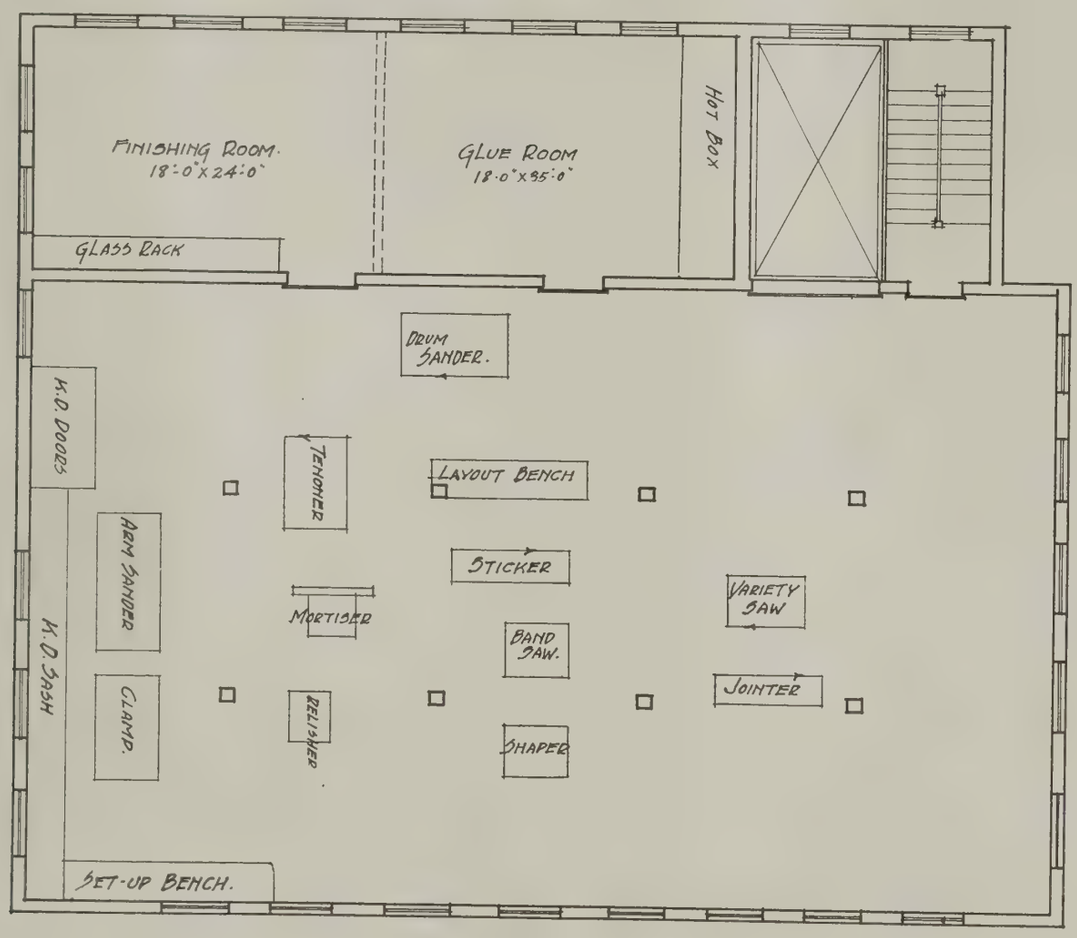
In the first place there must be a route of progress from the lumber sheds to the loading of the finished product. This naturally means that the planer, rip saw, jointer and cut-off saws must be placed in the end of the mill nearest the lumber yard. And when I say in the end of the mill, it means that one of the most important features of a mill like this is to have the course of progress lengthwise of the building. This is necessary on account of trucking the material and also on account of building on to the end of the building away from the lumber yard and sheds.

A MODEL PLANING MILL—FIRST FLOOR PLAN.

The plan here given contemplates building the addition on to the end of the old building near the elevator, and if it is necessary to build it in any other position, the plan would have to be modified to suit. But in all the planning we must not lose sight of the fact that the material is to pass through the building lengthwise.

To return to the trucking feature, it cannot be emphasized too much, that very little material in a factory like this should ever touch the floors. The floors should be stout and smooth no matter of what material made. Perhaps the worst material to put in a factory floor is common soft wood of any kind having large or small knots in it. If it is to be wood, maple is good and so is edge grain yellow pine or western fir. If it is concrete so much the better for the trucks and for the fire risks.

A careful study of the plan submitted will show that the posts supporting the second floor and the roof are about 16 feet apart each way, and that the machines are drawn and located in proportion to those distances. It will also be observed that on the lower floor the scheme of handling the material on trucks can be carried out with ample room if the stuff is kept on the trucks so as to be moved with facility.



By the side of the rip saw should be kept a truck for strips

and edgings as the room here is somewhat limited, but the trucks may be shifted out by the side of the cut off saw or in front of the planer, as there will be room between the planer and the material to be put through it if properly piled or if placed on trucks.

The moulder is placed on the left hand side of the room, and in case of extension, another machine may be placed immediately beside it. The moulding sander is located by the side of the jointer but feeds toward the back of the building, while the jointer feeds toward the planer. Perhaps a small factory would not need the moulding sander, and if not, there would be all the more room for the storage of loaded and empty trucks in the space between the jointer and the moulder. There must be plenty of trucks. In a mill of the size indicated here, there should be at least two trucks for every man employed in the mill. Material piled on the floors in the way and men and boys handling stuff over and outside elevator door may be hung on weights to slide up, or it may be hung on a track and slid under the stair platform, provided the space in the stairway is as wide as the door.

It will be noticed that there is a fire wall between the dry kiln and the factory, and that this extends to the top of the building. The elevator and stairway are included in one fire wall space and all of the doors are sliding doors. These doors should be covered with sheet iron with asbestos sheathing underneath.

I have not indicated just what the dry kiln should be except as to size, and that it is divided into three compartments. The partitions in the kiln may be made of brick or they may be made of heavy canvas to be rolled up in case it is desirable to open the kiln all into one room. The kiln cars should be designed so as to run out onto a truck on the shift track so as to be shifted from one compartment to another or run around to the mill door without

SECOND FLOOR PLAN.

carrying it about a few pieces at a time will soon pay interest on a hundred trucks. They not only save on the stuff with which they are loaded, but they save by not having that same material piled on the floors in the way of other material to be handled. Have plenty of trucks. The best size is 2 ft. wide by 4 ft. long with removable stakes.

Another feature almost as important as the ones already mentioned, is that of having the elevator big enough. It is not so important just how big a load it will lift, as it is to have the platform big enough to acommodate the material likely to be carried on it. As in most factories of this kind, I have planned to have the drum sander on the second floor, and this makes it necessary to take a good deal of long stuff up on the elevator. The platform should be long enough to accommodate 18 ft. boards, and the frame of the same should be open to a height of 8 ft. This may call for a little extra expense in the elevator itself and in the housing for the same, but it will be blessed many a time when there are large fixtures to be taken down.

Also, the elevator should open out upon the yard as shown, or upon the street as the case may be, so as to be able to stop on the level of the wagons. This makes easy and quick work of loading, and that is a saving not to be despised. When loading out car lots the factory trucks may be run from the elevator on to the wagons and hauled to the car without a separate handling. The unloading. However, this feature can be dispensed with in the beginning and installed when the factory is enlarged.

The fire wall next to the kiln shuts off light from the outside, but plenty of light can be had for the moulder by placing a mirror on the wall so as to reflect the light from the windows to the working parts of the machine.

At the swing cut-off saw will be seen a scrap box built out from the main wall of the building with a door on the outside. As it is necessary to build out for a saw recess, it will not cost very much more to add enough room to make the scrap box, and it is mighty nice to not have any of this scrap piled inside of the mill.

The back end of the mill is intended for both machine and bench work on window and door frames, for it is better to not have this work taken to the second floor if there is room below. As this department has but one or two machines all of its own, it can be easily moved to any convenient location.

Considering the second floor, we find the variety saw and jointer facing each other, and as they are used so much in conjunction, it is a real saving to have them located this way. The band saw seems to be somewhat crowded, but as a band saw table is higher than the other machines, they will not interfere seriously with its operation.

The three sash and door machines that come first in the regu-

lar course of the work are placed in a very convenient relation to each other. After the stock goes through the sticker it has to be sorted, part of it going to the relisher and the stiles and checks ready for the bench or the stock racks. From the relisher the stock is right at the set-up bench and next to this bench is the clamp, and then the arm sander. If the stock is anything else than check-rail stuff it will be taken across the room to the drum sander.

The drum sander is the only machine which has a questionable location, and for a small mill this is not so bad. If the mill should be enlarged a better place might be found for this machine. The only objection to its location as shown here is that it would obstruct the doors to the finishing room and glue room more or less while it is running. However, in a small mill the several classes of work may be accommodated to each other without serious loss of time. The position of the sander will permit the running of any length material desired.

It will be seen that special care has been taken to locate the machines so that they will not interfere with each other, and that they will also accommodate work of unusual length. For instance, the tenoner is set so that extra long stuff may extend into the door to the finishing room; feeding room is clear from the arm sander to the sticker; stuff 25 ft. long can be ripped on the variety saw; the mortiser has a clear space of 16 ft. on one side and 30 ft. on the other; and material from the drum sander may pass out of the window directly behind the machine.

The matter of windows has been treated in rather an off-hand way, but a safe rule for factory windows is to put them in as large and as close together as can be done without weakening the walls of the building. So much depends upon the neighboring buildings, that local conditions must necessarily prevail in the number, size and location of windows. If considerable light is cut off from the sides there should be built enough skylights to make up the deficiency.

The plan shows the k. d. sash rack in front of three windows, but in reality the racks are built around the windows, leaving the window opening through the racks.

The finishing room is planned to serve as a glazing room as well, but in case the mill was increased in size it would probably be necessary to move the finishing room to some other location and use the whole room for glue work.

All the wall space from the set-up bench clear around to the elevator may be used for cabinet benches, and should accommodate at least ten bench men.

I have not given a place to a jig saw, as a small mill can easily get along without one, but if it were to be put in there is room between the shaper and the relisher. If the small mill must be very economical in the way of machines to start with, it may cut out the moulding sander, jointer and frame machine down stairs, and the relisher and drum sander up stairs, but if the builder expects to do a good business he will be able to earn a very satisfactory interest on the investment as planned here.

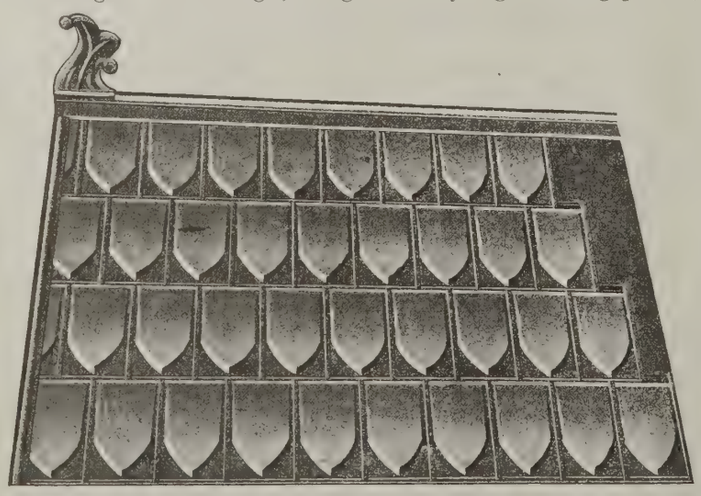
This factory as planned can be run at a small profit with ten good men if the business handled is capable of a fair margin according to the best manufacturing standards, and the same mill, without any additions can easily use 40 men if the work is distributed to all departments so as to keep a man at each machine most of the time.

A distinctive feature of this mill is that there is truck room between all the machines and between the machines and the posts, and if the most is made of this privilege, a large amount of material may be worked through with little confusion and delay.

The machines are so grouped as to be driven from a single line of shafting crosswise of the building, and if the mill should be extended in length, another lineshaft farther down the room would take care of the new machinery unless an electric installment was made.

It would be a waste of time and gray matter to make a plan for the belting and shafting for this mill, or for the exhaust pipe system. If individual motors were used and not directly connected machines, some of the machines might have to be moved a little from the positions shown, in order to use the proper length of belts.

The plan does not deal with the lumber sheds nor with the power plant if there is one, as they are things better figured out according to the lay of the available ground. I will say, however, that the lumber sheds should be close to the front or planer side of the mill and should slope considerably from the sheds to the door of the mill so as to make easy work of carting in lumber.



Perhaps from the suggestions herewith submitted, those who are contemplating the building of small mills may cull some ideas of value and so get first off some of the benefits which have come to others as the wage of heart-breaking toil and discouragement.

METAL SHINGLES

By H. M. SANDERS

IT IS claimed, we believe, that the first successful metal shingle for a roof covering, was introduced by a man by the name of Cooper of Jersey City, N. J., in 1885.

This may be true as to the introduction of a metal shingle called a galvanized shingle, being coated by a galvanizing process,

dipped in tanks of molten zinc or spelter, which secures a plated metal called galvanized iron. But it is also on record that three (3) years prior to this date, 1885, and in the year 1882, tin shingles were made and introduced by a Mr. Walters of the same city—Jersey City, N. J., so that it would appear that metal shingles were first introduced on the market twenty-nine years ago, or at least since 1882.

Like the introduction of other material for a specific purpose, the inception of the idea grew partly at least and primarily, perhaps, out of the condition of the times. This being the case, it presents the question of the whys and whyfores of the change to other material for that purpose. What is the object by so doing, and what is the advantage to be gained in making the change? If it be an improvement on the wood shingle, it must be a material which will not warp or crack, and measureably speaking, will act as a protection against fires. In other words, be an incombustible material.

The metal shingles seem to meet all these requirements, and have stood the test of endurance for a quarter of a century or more. For an ornamental roof finish, the ornamental shingle is perhaps the most attractive, and will not warp, crack or break. But the nature and character of the metal shingle, being a thin, light metal, it needs to be stiffened and made rigid by means of raised surfaces, in order that it may show a good outline finish as a roof, and at the same time act as a preventative in stormy weather under the changing climatic conditions, against leaks in the roof.

Shingles of this character cannot be safely used on roofs where its pitch is less than a quarter pitch; that is, three inches in twelve inch pitch. A third, or steeper, pitch is better.

In the illustration herewith given, we have shown but one of the many ornamental patterns of this metal shingle now on the market, with its method of construction and application.

Fig. 1 shows the point of the roof at which to commence laying the metal shingle roof, at the lower left hand corner. It also shows five full and one-half shingle in position, the second course breaking joints with the first, each layer or course commencing with a full shingle, being followed with the alternative half slate. This, when completed, forms the more finished roof, as shown in Fig. 2.

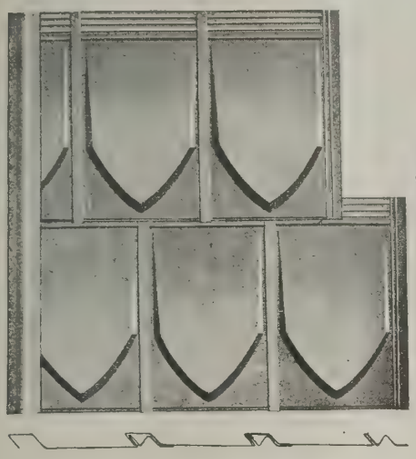


Fig. 3 shows pattern of valley lining into which the shingles are locked after being cut to the proper angle.

Fig. 4 is a section of the hip mould, with a socket on each side to receive the top end of the bracket.

Fig. 5 is a sectional view of a deck mould, and Fig. 6, a sec-

tion of the hip with its receptive socket for the shingles the same as the ridge mould as shown in Fig. 4.

In Fig. 8 we come to a constructive feature in the metal shingle, the interlocking of the side seams of the shingles. We call attention to this one especially, as we believe it was the first method introduced, and dates back to 1882. It will be noted that the lower shingle is nailed through flange as shown in Fig. 8. Two nails on each shingle, one near the top and the other about three inches from the bottom of the shingle. At the time this method of construction of the side of the shingle was introduced, its use was only anticipated for the shingles. Three years later in 1885, a

Mr. Cooper, already spoken of, conceived the idea of using galvanized shingles instead of the tin, and also introduced the interlocking device for the side seams of the shingle, as shown in Fig. 8. Apparently there was no great change in the bottom or top finish of the shingles, except so far as to meet the change in the style of the ornamental face of the shingle.

Fig. 9 shows method of attaching the bottom of shingle to the eaves of the roof, in this case to a metal gutter with the top of the back edge of the gutter turned out one inch, and the bottom edge of the shingle locked on to it.

Fig. 10 gives us an idea of how the top edge of each shingle is finished, with ribbed sections across to top from one side to the other, also showing how the bottom edge of the next course of shingles laps down closely over the lower rib to prevent driving storms from driving up over the ribs. These ribs across the top of the shingle, as will be observed by referring to Fig. 1, extend only to the locked edge on each side, allowing for the side, interlocking edges to extend the whole length of the shingle.

These shingles, whether of 1C tin or galvanized iron, are first cut to size, 7x10 or 10x14, as the case may be, out of the black sheet and then tinned or galvanized. This process gives a better finish to the face of the shingle, as malleable heat can be applied to the metal before stamping the same.

The weight of a metal shingle roof is very light as compared to other roofs, varying per square (100 square feet) from 95 to 110 lbs., while the weight of a shingle roof per square is about 400 lbs.

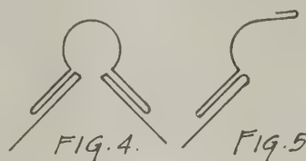

FIG. 4. FIG. 5. FIG. 6.

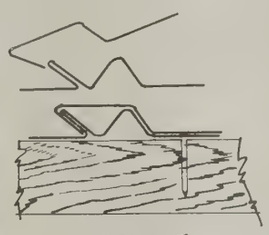

FIG. 7.

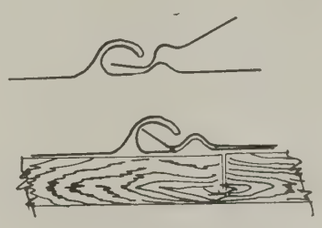

FIG. 8.

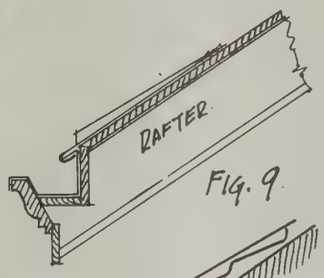

FIG. 9.

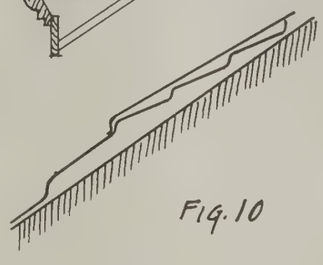

FIG. 10

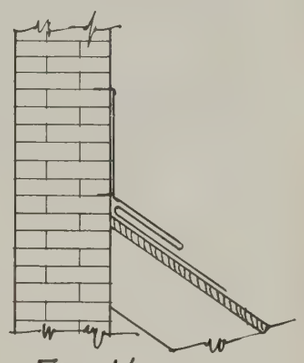

FIG. 11.

Thus, it can be readily seen that the metal shingle permits a much lighter construction of the frame of the roof than the shingled roof. Some of these roofs of metal shingles that were put on twenty-five years ago are in a fairly good condition today. This applies, we believe, to the tin or galvanized shingle.

The roof should be covered with a layer of roofing felt before putting on the shingles, and the shingles should be painted both sides and well dried before laying. After being laid, give it a coat of Metallic Paint—the sooner the better.

THE MOST DURABLE PAINT

By A. ASHMUN KELLY

The paint that proves durable to the utmost possible in one place, may fail entirely when used in another place or for a different purpose. Hence the question as to what constitutes a durable paint hinges upon this consideration, What is it to be used for? For instance, a paint that is durable on general upright exterior work will not prove durable on a porch floor, nor will it answer for a tin roof. Metals require certain paints that will not do so well on wood, and vice versa. In brief, each part of the structure requires its own specific paint.

The most durable paint for a tin roof is that made from a good and very finely pulverized oxide of iron paint, thinned with pure raw linseed oil, adding also a small portion of good brown japan driers. At certain seasons of the year the paint will be made more durable by the omission of the driers. Linseed oil is a natural or self-drier, and will dry in a certain number of hours, although brown oxide is not a self drier, and needs usually some help in this direction, say in cold or threatening weather.

The most durable paint for the exterior of a house and similar structures is composed of such pigment material as may be best adapted for the locality and climate. Thus ordinarily white lead and raw linseed oil and a little drier form a durable paint. The addition of most color-matter tends to make it more durable. The less driers used the more durable the paint.

The most durable paint for a floor, whether inside or outside, will be made from pigments that are not soft, and we find yellow ochre of the best grade the most useful pigment for this purpose. Its color, when added to white lead and some zinc, may be changed by the addition of other pigments, and the addition of some red lead tends to harden the paint, while some add a little good hard gum copal varnish, but a good formula may be made up as follows: Equal parts of white lead and zinc white, color as desired, and thinned with a mixture of raw linseed oil and half as much turpentine, with a liberal addition of driers.

The durability of any paint will depend to a great extent upon certain conditions of climate, weather, material to be coated, and manner of application, so that it does not rest solely upon the paint itself. It is well to bear this fact in mind. Damp weather, unseasoned lumber, lack of skill in the application of the paint, these factors will largely determine the durability of a paint, for no matter how excellent the paint, it will not prove durable in spite of adverse circumstances. A rather poor paint in the hands of a skilled painter will give better results, as a general thing, than a good paint will in the hands of an unskilled painter. The good workman will begin at the foundation, and build up to a good finish. (To be Continued.)

OUR FEBRUARY COMPETITION

One of the hardest things to do is to decide between the merits of a number of articles on different subjects.

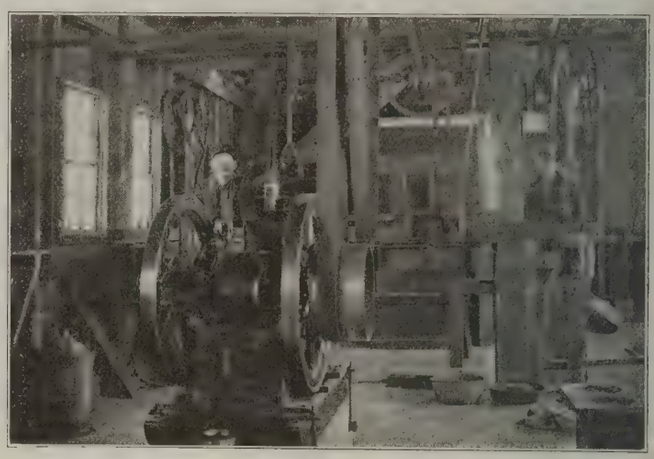
In this competition we have decided to give the $10 prize to Mr. Zimmerman on account of the illustrations and the business-like way in which he has built up his reputation from a small start.

We believe every reader of THE NATIONAL BUILDER will be benefited by reading his article.

HOW TO KEEP BUSY IN WINTER

By DEWIT C. ZIMMERMAN

A carpenter to keep busy in winter should have a shop. It is also necessary that the shop be in a good location to get work. Then the carpenter should have the ability to handle a shop with machinery—we are not all adapted to machinery. In addition

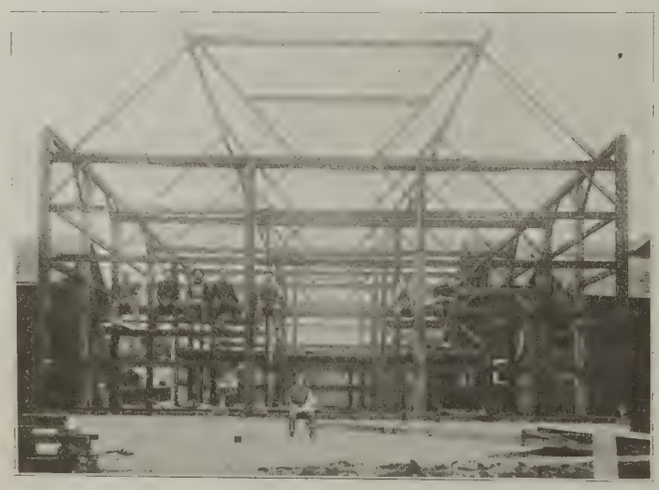


THE SHOP.

to this, he must have the ability to get work—to go after it and when he does get it, to leave his customer satisfied. That is the best way to advertise.

Some of my experiences: The day following the blowing up of the battleship Maine, I built my first shop, 8x12x8 feet high, with just room enough for a bench, a little stove and a grindstone. I then built a windmill to run the stone, which worked all right when the wind blew. As I was good at grinding tools, I began looking for such jobs as sharpening knives, lawn mowers, scissors, etc., and made a good day's pay out of this work every week. The customers that came were satisfied and sent me others. That was a great lesson to learn—others were advertising my work!

Remember, I am a carpenter and doing this work on the side on such days as we were unable to work on the job. The grinding business increased so that I felt obliged to get power more reliable than a windmill, so I bought a second-hand 3 H. P. steam engine, and the 8x12-foot shop then being too small, I put on an addition, 8x8-feet, making my shop 8x20-feet. Later, I made some fly screens for myself, which so pleased my neighbors that they wanted screens too. This produced a complication: I had lots of screens to build and no machinery to do it with; my steam engine was too slow—it took too long to get up steam; my shop was too small to keep much lumber on hand. So I cut the shop in two, moved it apart and built in between, mak-



FIRST FLOOR OF SHOP.

ing my shop 14x20-feet, and determined to have the best power I could get, I bought a 4 H. P. gasoline engine built by the International Harvester Co., which I believe is the best engine on the market today. I then took my old steam engine, which was

SECOND FLOOR OF SHOP.

an upright, turned it upside down, raised it from the floor about five feet and made a mortise machine out of it, which works fine. Then I bought a piece of shaft 1½ by 3 feet long, had a ½-inch hole drilled in the end with a set nut to hold a drill

PHOTOGRAPHS OF WORK UNDER CONSTRUCTION AID IN OBTAINING MORE WORK.

USING NEW BUILDINGS FOR JUDICIOUS ADVERTISING.

chuck. After mounting this on a frame with an adjustable table attached, I had a boring machine. I then rigged up a bandsaw and began to build screens.

My shop soon became the attraction of the whole town. I had to work nights until quite late, and couldn't keep up at that. One day when I had laid off from my regular job to get caught up with my orders a man came in my shop with two saws to have filed. He said: "Why aren't you working on the job?" I told him I had so much work of my own that I had to lay off and catch up with my work. He said he was going to build a house and wanted to know if I would do the job and called my attention to the fact that, having a good shop, I could do a lot of the millwork there. I took the job and built all my window and door frames in the shop, but finding the shop was too small, and having a chance to buy a building 20x40-feet, I bought it and remodeled it, putting in a cement floor down stairs, and now have a shop.

I am in the building business today. At this writing I have two houses on the go and over five hundred screens to build by spring, and not one of those screen orders did I solicit. I am going to send you a photograph (Fig. 1) of my first house under construction. The photograph is not a good one, but it will show you how I began to advertise, and before that house was finished, I had a job to build one of the best and largest barns in this part of the state. This barn was built of old car timbers that had some nails in, and the carpenters when framing would often cut into a nail. I had my gasoline engine and my old grindstone on the job, and maybe they didn't help some. A photograph of that barn under construction is shown in Fig. 2.

My shop today is 20x40-feet, two stories high, equipped with a 6 H. P. gasoline engine, my boring machine and mortiser. I made a turning lathe, cutoff and rip saws, hand saw, and my old grindstone is still there. My tools are always sharp. It takes five gallons of gasoline to run my shop eight hour good hard running. I also have a wood worker. I do a great deal of my millwork; for instance, I take rippings—good lumber that some would throw on the woodpile—and make screen moulding out of them that otherwise would cost one-half cent per foot.

About those brothers that are out of work in winter, tell them for me to put up a shop. If they are not able to build a fair-sized one, put up a small one. It will build a larger one for them and may be the means of building them.

SOME WELL DESIGNED FLOWER GARDENS

By IDA D. BENNETT

(Continued from January.)

PLAN "C"—A ROUND GARDEN.

May be constructed in almost any situation, in the center of a lawn, at the side or rear of the house or anywhere where one finds a convenient space for it and may be as ornamental in character, according to its accessories and planting, as one may wish.

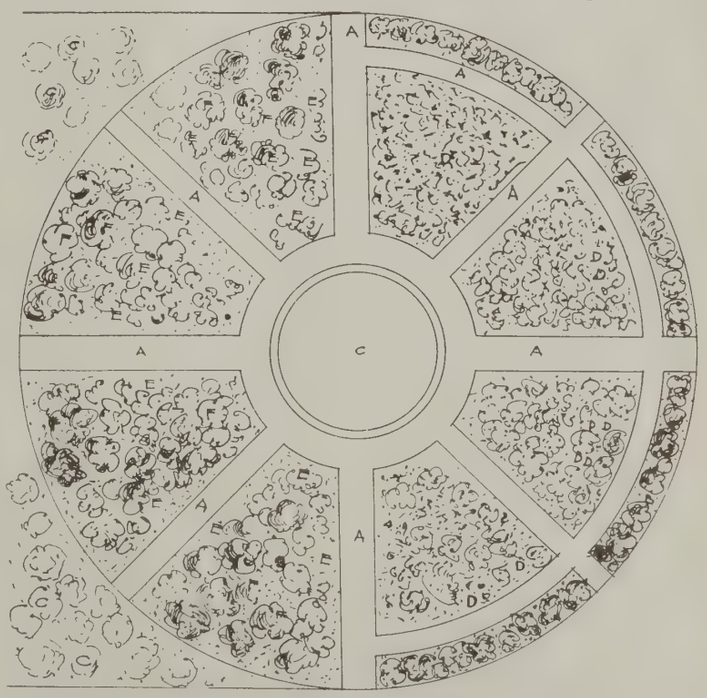
The plan is a simple circle with four straight walks extending from circumference to circumference, but broken in the center by a smaller circle which may be utilized as a place for a water-pool, a summer house, surrounded with turf, a beautiful tree—often the possession of a notable tree on the lawn will suggest the plotting of a garden of this sort about it and a most charming result will be achieved.

A sun dial may be effectively displayed on such a circle of turf or a lawn table with gay colored Japanese umbrella and encircling seats will furnish a delightful place for afternoon tea or the sipping of iced drinks on a hot day.

In laying out a garden of this sort it will only be necessary to find the exact center of the plot and with a garden line first mark off the inner circle. If this is to be surrounded with a paved walk of any kind, a second circle three feet wide should be drawn about this and other circle should mark the outmost boundaries of the garden.

The laying out of the beds will be accomplished by simply drawing four straight lines across the circle at equal distances apart and marking off, on each side of these other parallel lines as the boundaries of the walks; these should, for convenience be about three feet wide, the resulting beds will be quite narrow at the start, but will widen rapidly until, in the rear, they assume quite dignified proportions.

Where a bed of this sort occurs in the midst of a lawn it will be best to fill the beds with low-growing plants of uniform height, but where it occurs at the side or rear so that only one side debouches upon the lawn a different and much more interesting treatment is possible. It will be possible to plant those beds directly in front with low-growing annuals or with roses, or annuals may be used in the two front beds, roses in the beds on either side, perennials in the outside beds of the rear division and shrubbery in the last two. In planting these rear beds the taller shrubs and perennials should be massed towards the rear and center of the beds, the lower growths towards the front and sides, this gives graduated masses of foliage and bloom that is much more effective than uniform height.



It will be noticed that a narrow circle is cut off from the front part of this design and this is again separated from the main plot by a still narrower circle. The idea, here, is to make a narrow bed of some low-growing flower, preferably pansies about the front of the garden and to separate it from the rest of the plot by a narrow walk. A circling bed of pansies against the green of the sward is the most effective manner of growing these lovely flowers and so varied are the colors that they may be found to harmonize with almost any color scheme—or lack of it, that may be decided upon.

Other low-growing flowers—as sweet alyssum, dwarf nasturtiums, verbenas, phlox dromundi, heliotrope and the like may be substituted for the pansies with good effect, but nothing, in my opinion, is quite so lovely as these.

If one wishes the rear of the garden to be square, then a straight line across the rear will accomplish the result and the resulting triangles may be filled with flowering or ornamental trees or with evergreens, using lower-growing shrubs for the beds and so retaining the outline of the circle.

If roses are a feature of any part of the planting, then a summer house covered with ramblers will be appropriate for the center.

The walks here may be constructed of cement, laid in brick, of gravel or even of hard coal ashes and cinders, which last makes excellent, hard, clean walks, always dry in the morning or after

a rain and springy and easy to walk on; best of all they cost practically nothing and furnish an easy disposition of ashes. In laying paths of this material it is best to have the ashes sifted and if this has not been done in the cellar as they were used it may be done as the paths are laid by aid of a mason's gravel sieve. A few feet of rough ashes may be laid on the path to start with and raked smooth; then the sieve should be placed in front and the ashes thrown through it, the screened ashes falling on top of those already placed and the cinders at the foot of the screen where they should be spread out, the screen moved in front of them and ashes sifted through to cover them. In this way a very even, smooth path results which the first hard rain will pack even and hard. Such a path is far pleasanter to work on than one of gravel or expensive brick or cement.

BUILDERS' REFERENCE TABLES

By J. GRANT ROBINSON, Architect

(Continued from January, 1912.)

The formulas for strength are used as follows, both giving the same results:

(A) Safe load in pounds $= \frac{2b \times (D \times D) \times C}{L}$

(B) Safe load in pounds $= \frac{2a'' \times D}{L \times C}$

Note: a is area of joist in square inches,
b is breadth of joist in inches,
d is depth of joist in inches,
C is coefficient for the different woods as given below,
L is length between supports in feet.

No. 3. The value of C and C :

Long leaf yellow pine	C = 120
Long leaf yellow pine	C = 100
Short leaf yellow pine	C = 90
Texas yellow pine	C = 90
Oregon pine	C = 90
Spruce	C = 70
Hemlock	C = 60

Explanation of formula as per A: Desired to find the safe load in pounds a 2x12 spruce joist will carry, $2 \times 2 = 4 \times (12 \times 12)$ or $144 \times 4 = 576 \times 70 = 40{,}320 \div 20'0'' = 2{,}016$ pounds safe load that the joist will carry, or a trifle over 75 pounds for each square foot of floor.

Note: To find the safe load of a joist (beam) spaced 16" per square foot of floor, divide the total safe load by 4 and multiply by 3, then divide the result by the length of the beam.

Formula to find the width of a joist (beam) when the depth and length and load are given:

$$\text{Breadth in inches} = \frac{\text{Span in feet} \times \text{load}}{2 \times \text{square of depth} \times C}$$

Note: Desired to find the thickness of a joist 12" deep by 20'0" long and a load of 2,016 pounds, $2{,}016 \times 20 = 40{,}320 \div (2 \times 144) = 288 \times 70 = 20{,}160$; now $20{,}160 \div 40{,}320 = 2''$ thick.

Note: The ends of joist (beam) should rest 4" on a wall or girder when possible, but never less than the safe load of the wood used in compression for cross-grain. (See note for girder.)

Rafter inclined: The tables can be used for rafters also, by taking the lengths in the tables for the horizontal length of the rafter for the span; the same formula is used as for a level joist or beam.

STIRRUP IRON OR JOIST HANGERS

Below is a table of sizes of iron that should be used in stirrups:

Size of Joist.	Size of Iron.
2x 6 in. to 2 x12 in.	¼x2 in.
3x 8 in. to 3 x12 in.	¼x2½ in.
4x 8 in. to 4 x12 in.	⅜x2½ in.
6x12 in. to 4 x14 in.	½x3½ in.
8x12 in. to 6 x14 in.	½x4 in.
8x14 in. to 10x14 in.	⅝x4 in.

Girders: See tables No. 6, 7 and 8; Plate I: A girder carries a much greater load than a joist or beam and the length alone does not determine the load area it supports. First, to find the area of floor supported by a girder, we take the full length of the girder between supports and half the distance on each side to the next nearest wall or girder. Note: Suppose a mill building was 36 ft. 0 in. wide and had two rows of columns and girders, equally spaced from each wall and spaced 12 ft. 0 in. center to center, and the girders ran from column to column, then the girders would be, say, 12 ft. 0 in. apart and 12 ft. 0 in. from each wall, and 12 ft. 0 in. long; we find in that case that each girder has to support $12 \times 12 = 144$ square feet of floor.

Note: Desired to carry a live load of 150 pounds and a dead load of 50 pounds, or a total load of 200 pounds per square foot of floor, or $200 \times 144 = 28{,}800$ pounds in all. Now to find an Oregon pine girder to safely carry the above load, the girder is 12 ft. 0 in. long and we will assume 14 in. deep; by looking in table No. 7 on Plate I, under 14 in. and 12 ft. 0 in. long, we find 2,940 pounds. Now $28{,}800 \div 2{,}940 =$ not quite 10 in., so we will take a 14x10 in. stick to carry the load.

Floor joist and beams for mill and all houses can be computed in the same manner, no matter how spaced; on tables No. 6, 7 and 8 you will find two sets of figures in the same spaces; the bottom figures are for strength, the top are for stiffness, and sometimes called deflection, and should be used as stated in tables, and in January notes.

Formula for stiffness:

$$\text{Safe load} = \frac{8 \times \text{breadth} \times \text{cube of depth} \times e}{5 \times \text{square of span}}$$

or

$$\text{Breadth of beams} = \frac{5 \times \text{load} \times \text{square of span}}{8 \times \text{cube of depth} \times e}$$

The value of e, 1/30 in. and for 1/40 in. per ft. span:

Long leaf yellow pine	137	103
Oregon pine	110	82
Short leaf yellow pine	110	82
Spruce	100	75
Hemlock	80	60

The tables in Plate I are figured for 1/30 of an inch per foot of span.

For the safe compression strength of timber across grain, see table below:

No. 6.

For white oak	600 pounds per square in. of cross section.
Long leaf yellow pine	500 pounds per square in. of cross section.
Short leaf yellow pine	450 pounds per square in. of cross section.
Texas yellow pine	450 pounds per square in. of cross section.
Oregon pine	400 pounds per square in. of cross section.
Spruce & Norway pine	250 pounds per square in. of cross section.
Hemlock and cypress	200 pounds per square in. of cross section.
California redwood	175 pounds per square in. of cross section.

NOTES ON STIRRUP IRONS AND WALLS.

The end bearing of a girder on a wall, post, cap or stirrup iron should be large enough not to exceed the safe load as given in the table above.

Desired to determine the end bearing of 8x12 in. yellow pine girder carrying a load of 36,000 pounds. Each end will therefore support one-half of the load, or 18,000 pounds; divide 18,000 by 500, the safe load for square inch = 36 sq. in. bearing. As the girder is 8 in. wide, the bearing must be $36 \div 8 = 4\frac{1}{2}$ in. wide, and 5 in. wide would be the right width to use. To find the least thickness, we will divide the 18,000 pounds by the safe strength of iron in tension, which is 12,000 pounds per square inch of metal, so $18{,}000 \div 12{,}000 = 1\frac{1}{2}$ square inches = ⅜ inches thick; but the stirrup should be made ½x4 inches. Where a girder rests on a wall it should have a bearing at least 8 inches and if the thickness of wall permits it should be up to 12 inches for very heavy loads, and should have a steel or cast iron plate or stone template under the end to distribute the load over a sufficiently large surface of the wall to safely carry the loads.

As the strength of masonry varies largely according to the quality of material used, workmanship, and age, it is impossible to give absolute figures for safe unit pressure for all classes of work, but the values given below are believed to fairly represent those for the usual kinds of ordinary architectural masonry. To compute the size and thickness of plates, it is necessary to use the bearing strength of masonry per square inch of surface.

SAFE LOADS FOR MASONRY.

Common brick laid in lime mortar	160 pounds
Common brick laid in Portland cement mortar	250 pounds
Portland cement concrete	250 pounds
Rosendale cement concrete	200 pounds
Stone work in lime mortar	110 pounds
Stone work in Portland cement mortar	150 pounds

Desired to find the size of thickness of a cast iron plate under the ends of a yellow pine 8x12 in. girder, resting 6 in. on wall, carrying a load of 36,000 pounds, bearing on a brick wall laid in Portland cement mortar; now each end will have a load of one-half or 18,000 pounds, so 18,000 pounds $\div$ 250 = 72 square inches. Now the girder bears 6 in. on the wall, will make the plate $72 \div 6 = 12$ in., and the projection each side of girder will be $12 - 8 \div 2 = 2$ in. (To be continued.)

PLATE 2. STANDARD I-BEAMS TO BE USED AS FLOOR BEAMS AND GIRDERS.

Compiled by J.G. Robinson, Architect.

Tables giving the uniformly distributed safe loads in pounds per lineal foot

Notes on the use of these tables.

Figures above the heavy lines are based on coefficient of strength as given by Carnegie hand-book. Fibre stress taken at 16000 pounds per sq. in. Figures below heavy line based on deflection just under 1/30 in. per foot of span

Example— What 7" beams, spaced 4'0" on centers, and 14'0" span, will carry a total load of 140 lbs. per square foot of floor. The load per lineal foot is 4 × 140 = 560. Follow across the 14 ft. line to the 7" columns. A 7"/15# I will carry 564#, and should be used.

Length in feet.	9" I Beams				8" I Beams				7" I Beams			6" I-Beams			5" I Beams.			4" I Beams				3" I-Beams.			Length in feet.

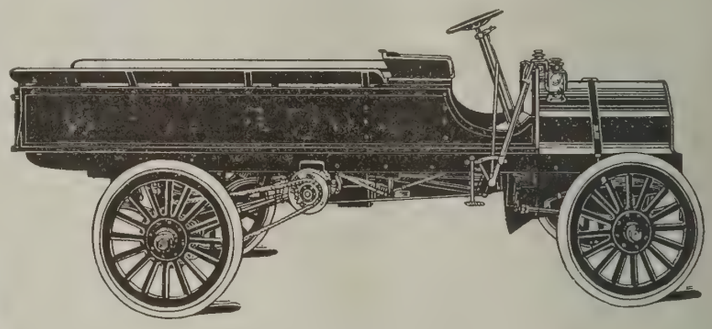
THE CONTRACTOR AND THE AUTOMOBILE

PIERCE-ARROW WITH TRAILER.

The time is already past when the question with the contractor is whether or not he should have an automobile or auto truck. The facts which have been shown by the various tests and use of cars and trucks of various styles readily convinces one that the contractor who has use for two horses, has use for an automobile or truck. One of the reasons for using a truck is that of humanity to the horses. How often we see in slippery weather horses pulling even a small load entirely incapacitated, and an object of pity, while the automobiles with far greater loads turn out to go by. On the ground of efficiency, there is no question but that even the smaller delivery wagons will do the work of a number of teams, and do it far more economically and satisfactorily. Very often, there is call for material to be delivered on the job when the men are standing around, waiting, and where a saving in the delivery

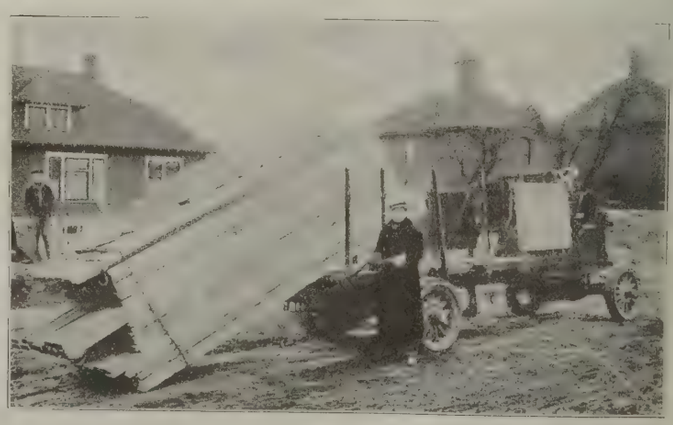
INTERNATIONAL-HARVESTER "COMMERCIAL" CAR.



of a load of material means a saving of the time of possibly a dozen men.

Trucks and cars for the use of the contractor vary greatly. For the contractor of limited means, an open delivery wagon costs little more than a good team, and has the advantage of always being ready and of being able to go over ground where horses cannot. From the standpoint of price, the motor vehicle is recognized today as the best and cheapest, whether it is to be used for business or pleasure—unfortunately with many contractors the matter of pleasure cuts but a small figure, their idea being to get from one job to another in the shortest possible time and getting their material on the job with the least loss of time and labor.

As a matter of fact, an automobile not only economizes in a matter of horse flesh, but it makes the owner himself doubly useful. In his car, he can take care of several times as many jobs as by any other means of transportation, and he can keep in far better touch with all the work under his jurisdiction.



The fact that the car only takes up half the space of a horse and wagon further increases its utility.

While American ingenuity has been responsible for a great deal of the development in automobile circles, other countries are equally alive to the importance of better vehicles. It is probably in this country that the motor truck has received more attention than in any other country on account of the conditions under which

CHASE DELIVERY CAR.

they must operate. Here we have towns far apart in which a contractor must work, and we also have roads none too good over which the cars must travel. Horse drawn vehicles are at a great disadvantage in places of this character, as the power is applied so far from the wheel base that a great deal is lost in transmission. With the automobile, the power can be applied as required directly under the load, and the turning action of the wheels lifts the car out of a bad spot, as well as carries it forward. Where the roads are good, the contractor can frequently double up and carry two loads with one motor, as shown by the cut at the top of this page.

UNLOADING LUMBER FROM A SAMSON TRUCK.

A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.

NOW that the student has finished the copying of a set of building plans, we will give him suggestions whereby he may draw a set of original ones. If he has thoroughly understood all that has gone before, he will have little difficulty in working up these next few plates; but if there are points which arise that confuse him, he should review the previous lessons.

In Figure 22, we have a conventional floor plan of a one-story bungalow. The location of each room, closet, porch, etc., is shown, the size of each and a number of other points. In Figure 23 is given a rough perspective sketch of the exterior of the bungalow. It is required of the student to make a set of working drawings from these figures, properly dimensioned. When he has finished them to his satisfaction, he should take them to some architect,

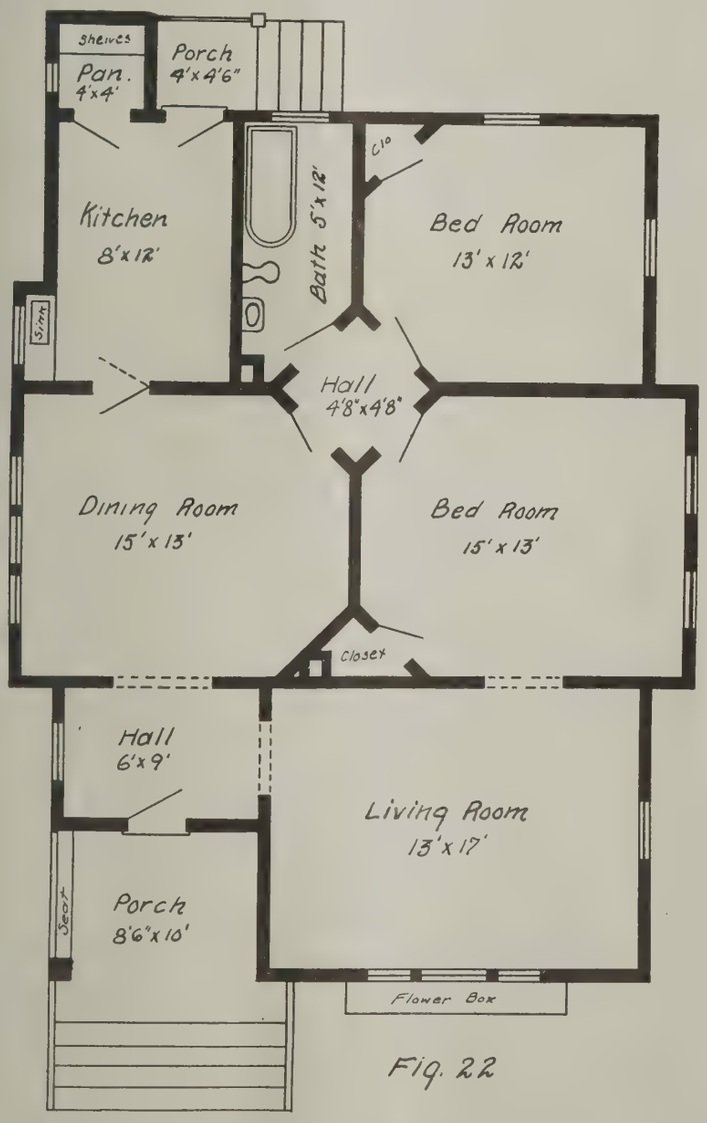


Fig. 22

contractor, or other person engaged in building lines, and let them be criticised. In this way he will find out his weak points, or he will have the satisfaction of knowing that he is capable of drawing simple house plans.

PLATE XXVIII. FLOOR PLAN.

Lay the plate out with a 10x15 inch margin. The drawing should be made with a scale of one-fourth inch to one foot. Lay out all the wall lines, 6 inches thick, paying no attention at first to doors or windows. There are no stairs to plan, which greatly simplifies the work. Put in all the doors shown 2 feet 8 inches wide. There are three openings, shown by dotted lines, which do not require doors; these are wider than the door openings. Next locate the windows. Consult Figure 23 while doing this. Plan in

Figure 23.

the chimneys and closets next, then the bath fixtures, the sink and pantry shelves. Complete the drawing with the porches and steps, using a 10 in. tread on the latter. Put in all dimension lines, and dimension fully. Remember, if you experience any trouble, consult the work given with Plate XVIII. Plates XXIX to XXXV are not shown, as they are to be entirely drawn by the student.

PLATE XXIX. FOUNDATION PLAN.

The foundation plan will be very simple as there is no cellar. Use a 12-inch concrete wall, running well under ground, with a substantial footing. Locate the pier supports for the porches and chimneys, the girder and the plumbing pipes.

PLATE XXX. PLAN OF ROOF.

The roof shown is a common hip, with a wide cornice. Be sure to locate the chimneys and the toilet room vent.

PLATE XXXI. FRONT ELEVATION.

It will be in the drawing of the elevations that the draftsman will find his first hard problem. Here he may use the sketch, Figure 23, to good advantage. It shows no foundation, the siding running down to the ground line. Up to the first floor window sill line is shown wide siding, 8 inches to the weather. The rest is narrow stuff, so each board need not be shown on the drawing. Do not forget to show the vertical section on this drawing.

PLATES XXXII AND XXXIII.

RIGHT AND LEFT SIDE ELEVATIONS.

An idea of the appearance of the left side may be gleaned from the sketch, but the student will be forced to rely upon his own ability to draw the right, which is much the simpler one.

PLATE XXXIV. REAR ELEVATION.

After the other elevations have been completed, the rear will work up easy, as no new problems are here presented.

PLATE XXXV. DETAILS.

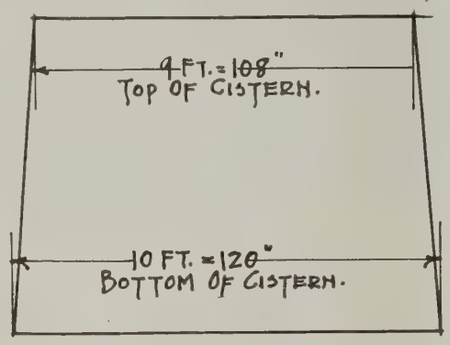
One plate of details will suffice on a simple problem such as this one and it may include both interior and exterior details.

In these plates the student should remember he is drawing a set of plans from his own ideals. An owner would probably want many changes, such as different size for the rooms. It is a good plan to rearrange the rooms, etc., changing the dimensions more or less and locating the doors and windows differently. Several complete sets of plans can thus be drawn without varying greatly from the above dimensions.

(To be continued.)

OUR READERS' PAGES

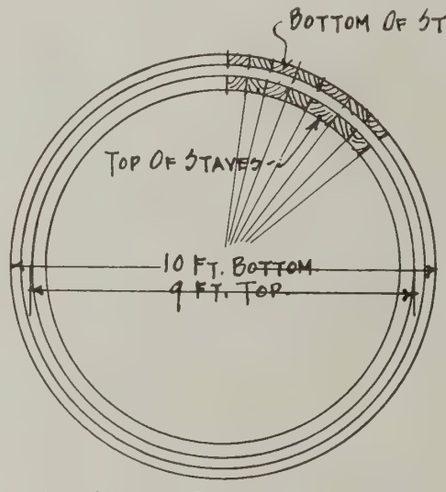
[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. These columns are open to our readers at all times without cnarge, and any questions or experiences will be given proper space.—Editor.]



ANSWERS

A WOODEN CISTERN.

From J. E. T., Eagle Lake, Texas.



The inner circle shows diameter of top of cistern; the outer circle shows diameter of bottom of cistern. The darkened spaces between the radii show relative or comparative width of top and bottom of staves.

If C. H. B., Alice, Texas, will strike the circles, as here suggested, on a smooth floor and draw the radii as shown, he will easily

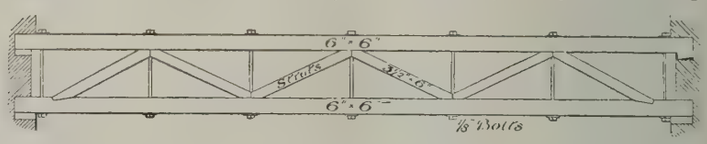
be able to determine the width of both top and bottom of staves, whether wide or narrow, also their exact bevel.

To determine length of hoops, multiply any given diameter by 3.1416, or in other words, multiply the diameter of cistern at any

point where he wishes to place a hoop by 3.1416, which will give length of hoop.

For instance, the bottom is 10 ft.; 3.1416 × 10 = 31.416 = 31 ft. and nearly 5 in.; 31 ft. and 4 in. will be long enough. The top is 9 ft.; 3.1416 × 9 = 28.2744 = 28 ft. and nearly 4 in.; 28 ft. and 3 in. will be long enough.

HANDY TOOL BOX.

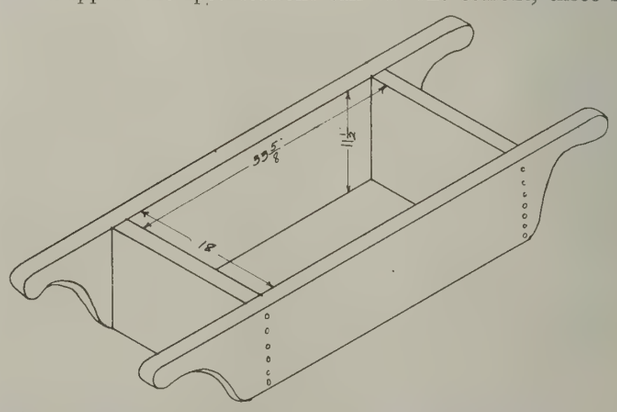


From "W. W. B.," Shingle House, Pa., answering the question of how to construct a tool box:

In building a tool box from which it will be easy to take out certain tools without disturbing the others, make a frame for the chest with corners 2x2 rabbited to receive rails for panels. Make the whole front panel separate from the rest and hang it to the bottom of the chest, which must be strong, with strap hinges. To support the front of chest, put in a ¾-inch board 8 inches deep. For planes and saws, put a ⅜-inch rod through a groove in board clear through the whole chest, also one through under bottom. Then make three drawers grooved in ends for guides so that the drawers can be close together. Put your small tools in drawers and you can just simply drop the front panel and there are your tools right at hand. My chest has aso a hollow cover with a separate lid and lock for maps and drawings. I have carried this chest for over thirty years in several states and have had it copied several times as the handiest chest out.

ROOF TRUSS.

From "Builder," Green Bay, Wis.:

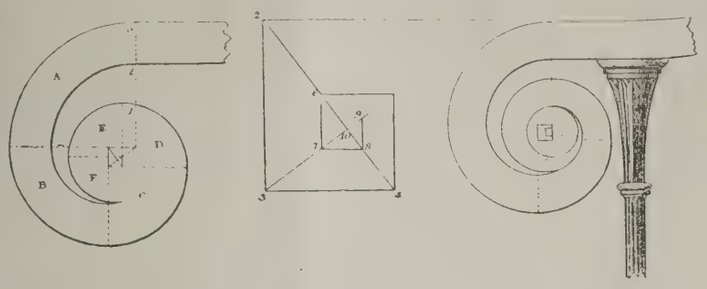


In reply to the query of "A B. C.," Marcus, Wash., I would suggest that he build up beams or girders of two by twelve-inch stuff, the whole length of the width of building—forty feet. If the long stuff is unattainble, use shorter stuff and make good butt joints and be sure and have no two joints opposite each other. Plane the planks and lay them flat on each other—it would be better to have a beam twelve by twelve inches, and your building

would require at least eight of them, the end walls—with plates laid in mortar and bolted would serve for receiving ends of roof joists. Joists would, of course, run lengthwise of building, on one girder: in other words, the joists should break joints, and should be well herringbone bridged throughout. I send you diagram of a truss, Fig. 1, that may be used in place of girders as written, but, while much better, are much more expensive. Many trusses that would be well suited for this work have been illustrated in back numbers of THE NATIONAL BUILDER.

BOX FOR MIXING CONCRETE.

This box contains four cubic feet, equal to one barrel or four bags of cement. To use, the box is filled even full with sand and then lifted up, as many times as the specifications call for, leaving the sand on the mixing board. The stone or gravel is then measured in the same manner and four bags of cement added. Suppose the specifications call for one cement, three sand



and six crushed stone. Fill the box three times with sand and six times with stone and use four bags of cement. The quantity of cement can be measured by filling the box in the same way. Every contractor should have one or more of these on every job, as it will then be easy to convince the architect or inspector that the right proportions were observed. These quantities will make practically one yard of concrete.

STEP SCROLL.

From "Stairbuilder," Keokuk, Iowa:

For the information of "Student," I submit the following methods for drawing scrolls of several kinds: In Fig. 2 is shown a very simple manner of describing a scroll. Take the width of the rail in the dividers, and repeat it three times on the line 1-2-3, which gives the first or greater radius for the quadrant. A.

Refer now to Fig. 3, where the scheme of centers is drawn out at full size. Draw 1-2 at right angles to the first line, and make it equal to two-thirds the width of the rail. Draw 2-3 at right angles to 1-2; make it equal to three-fourths of 1-2, and join 3-1; through 2, and at right angles to 3-1 draw the line 2-4; then draw the line 3-4 at right angles to 3-2, the line 4-5 at right angles to 3-4, or parallel to 3-2, and so on with the other lines, always squaring from the one last drawn, and thus the centers are obtained, from which the quadrants B, C, D, E, F, in Fig. 2 are drawn.

Fig. 4. This shows a vertical scroll, sometimes used for terminating a hand-rail when space cannot be afforded for a horizontal scroll. The method of drawing it is so obvious as to need no description.

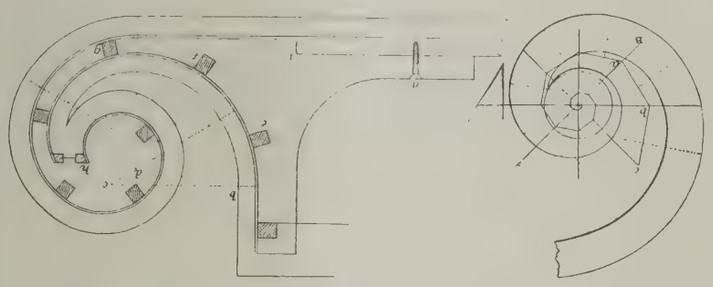


Fig. 5 is a scroll step suitable for a scroll of a rail. The centers of the various arcs are found as in Fig. 6, the same centers being used for the line of balusters and the line of nosings; then to describe the block and step, take the length of the radius of one of the arcs in the rail mold from its center to the center of the rail, and from its corresponding center in the block, which will extend the compasses from the center of the curve to the inside of the baluster, and describe from each center in succession, to produce the interior curve of the block. The width of the block at its neck, that is, at g, should always be commensurate with the size of the baluster, as there shown; from this place, the outer or convex line of the block is determined, and is struck round from the same centers as before, which are also used for the nosing line, thereby showing the size of the step board. At a is shown what is usually called the tail of the block. It is secured by a screw to the thick part of the riser. At i is shown the shoulder of the riser; from this point the riser is reduceed to a veneer, which is carried round the convex portion of the block as far as the point h, where it is secured by a pair of counter-wedges, there shown in section. On the back part of the step is a line indicating the position of the second riser of the stairs, and the section of the baluster on the second step is shown; from this baluster to the next, at e, should be equal to half the going of one step; and, in spacing the balusters round the scroll, it is desirable that their distances from each other should gradually diminish as they approach nearer to the center of the scroll, and that the balusters of the inner revolution should be as near as possible in the center betwixt those of the outer revolution; otherwise they will look crowded and irregular.

HEAVY TIMBER FRAMING.

From a "Reader," Grand Rapids, Mich.:

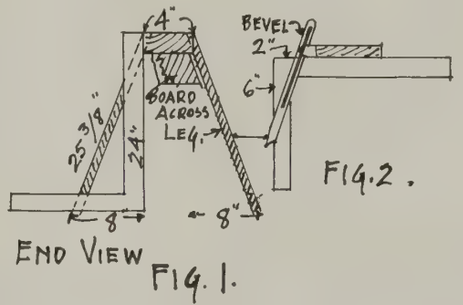
"Carpenter" should purchase "Hodgson's Heavy and Light Framing," Price, $1.00.

BALL ROOM FLOOR.

From "Contractor," Detroit, Mich.:

A good springing floor may be built by laying two tiers of joists side by side. The upper joists should be two or three inches narrower than the main or lower joists, and should stand up above the lower ones an inch and a half, at least. That would allow the floor to spring that much. The ends of the top joists should not be fastened or anchored into the walls.

BROKEN PLASTER CEILING.



From "Thos. De. Brau," Sheboygan, Wis.:

"General Reader," of Middletown, N. Y., may make good use of the made-up plaster boards to repair his damaged ceiling, with advantage. Write to one or more of the dealers who advertise prepared "plaster board," for particulars, prices, and directions. You will find them informing and of benefit. It would be a good idea to nail strips of lath, about half an inch thick, onto the lower edge of the joists before putting on the board, as the strips would hold up the old plaster, and give a good nailing hold for the Compo or other board at the joints—an important matter.

SAW HORSE BEVELS.

From "A. A. S.," Chicago, Ill., in answer to "T. T. D.," Wichita, Kan.:

Brother, I think I can enlighten you as to your saw horse. Bevel figures on the steel square. There are many ways of building these "Bronchos," but suppose the top, 2x4 inches lays flat.

The bevel you speak of all depends on length of leg, and distance apart at lower end. Make a rafter problem of it. If horse is 2-feet high, that the run, if legs are 20-inch spread, 4-inch out for top leaves 16 inches, that's rise, 8-inch pitch by 24-inch run—See Fig. 1. Reduce, and set bevel on square as in Fig. 2. You know how to apply. If you wish leg to stand the other way 2 inches, lay square on edge of top at gain, 2 inches and 24 inches, and you have pitch mark. If you wish horse higher, or any more pitch to legs, use same method. You will find 4 to 5 inches to 1 foot run the most convenient pitch for saw horse legs. Illustration ought to give idea, and use judgment as to size wanted.

QUESTIONS

TIMBER FRAMING.

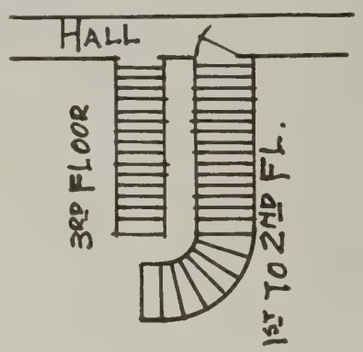
From "Jas. McI.," Chicago, Ill.:

I am about to leave this city for the Canadian Northwest, where I am informed a good framer can get steady and remunerative employment—and where I intend to take up land on the great wheat belt, if I can find some small town or village near a timbered district; and I would like to ask some of your readers, who may know of such places, to kindly name them in this department, and also advises me as to what kind of framing tools I would be most likely to require up there for houses, barns, stables and bridge work.

A BRICK CISTERN.

From "J. B.," Lancaster, Pa.:

I wish to build a cistern to hold rain for washing purposes only. I want it five feet in diameter, deep enough to hold twelve barrels of water. I want to build it of brick laid in cement mortar.



How deep must this cistern be to hold twelve barrels? Will a four-inch wall be sufficient or will it require nine-inch? What

proportion should the cement mortar be mixed and how should the inside be finished? Would be thankful for an approximate cost.

A GATE AT THE STAIRS.

To the readers of THE NATIONAL BUILDER:

I would like if some one would help me out a little. I want to put gate of some kind at head of steps, second floor, to keep

children from falling down. I want it so, when open, it will be clear of passage way. Here is the sketch of where I want it.

COST OF WORKING "KIT" OF CARPENTER TOOLS.

From an "Apprentice Boy," South Bend, Ind.:

My brother made me a Christmas present of a year's subscription to THE NATIONAL BUILDER, and on the first of this year I made a contract to serve as an apprentice to the carpenter's trade. And now I want to buy a working "kit" of tools to use at home—and I would like to know about the cost of them, if some kindly-disposed person would let me know through this column I would be thankful.

A CONCRETE BARN.

A. O. Peterson, Eastwood, Minn.

I am making a concrete barn 34x62 outside dimensions, with a basement for manure, and I want to make a concrete floor for the horses and cattle, and would like to know how thick to make the floor and size of beams and posts, also distance apart, arrangement of reinforcements as I want no steel girders. I want everything out of concrete. Any information on this will be greatly appreciated.

From Carpenter, Ocean City, N. J.

In reply to W. A. H. in November issue, had I received such an order, I should have given him a sash 18 inches x 42 inches x 1⅜ inches thick, with leaded glass inserted in same. To be more precise, I would have said casement sash instead of single sash.

SCREENED SLEEPING PORCH.

From B. H. O., Pontiac, Mich.

I am about to build a porch screened in for sleeping purposes in summer time. It will be sided up about 3½ feet above the floor; the remaining space, which will be about four feet to the ceiling, will be screened in. I would like some ideas from readers on placing light and substantial doors or blinds of some sort to be closed during rain storms, etc., or would a waterproof ducking of some sort be advisable? Would also like to know of a good cement, strictly waterproof, to be placed around chimneys in place of flashing.

DAMP BUILDINGS.

From T. L. C., Mulvane, Kans.

A remedy for the following would be greatly appreciated: Various houses around here are very damp, paper is soaking wet, more especially in closets. Houses are old and new, boxed and plastered with cement plaster. Others are not boxed and plastered with lime or cement. All are damp and disagreeable. Everybody here burns gas.

BONDING NEW BRICK TO OLD.

From C. V. L., Indian Springs, Tenn.

Will some reader please give me a good method of bonding new brick work to old?

PORCH ROOF DESIGN.

From "H. J. J.," Russell, Kan.:

Can anyone give me an idea as to how to build a porch roof that would be watertight with only four inches fall to ten feet? I finished the house last fall and expect to build the porch this

spring. The building is 40x40 feet and the porch will be built on three sides with two circle corners, cement floor and stone railing of about 3½ feet high. This is a country home, seven miles northeast of Bunker Hill, Kan. I enclose photograph and shall appreciate the views of other readers on this subject.

LOUVRE AND FRAMES.

From "Willis B.," Middletown, N. Y.:

I would feel obliged if some brother reader would send you for publication a circular louvre and frame, with diagram showing slats and giving lines for their bevels and formation. Anything on this subject, in your next issue, will be much appreciated by one of your younger readers.

From M. A., Northampton, Mass.

What is meant by the square root of the square? What is the best and quickest way to find the run of valley and common rafters? What is meant by the total span of a roof?

POWER MACHINES FOR THE CONTRACTOR

THE general use of machinery by the builder is of comparatively recent origin. The earliest kinds of building, as shown by the hieroglyphics or word pictures of the early ages, shows all the work being performed by the hardest kind of manual labor, with the exception of the roller which can scarcely be called a machine, and the pick and crow-bar. The main dependence of the contractor was in numbers of men. In one way this was just as well, probably, as the materials available did not readily permit of the labor saving machines which we have today. The mortar in use in ancient days, although remaining in perfect condition at the present time, did not set rapidly enough to permit rapid construction. The lifting of heavy stones, if performed by a machine, would call for machinery as heavy as the heaviest we have today, and would either call for special machinery in special places to take the place of what was accomplished then, and could be now, by mere force of numbers, and just as we have devised labor saving machinery for the production of materials, so we have devised machinery which saves actual labor of construction. The use of handtools is far in advance of what it was comparatively a few years ago, but it is in the realm of machinery that the greatest advance has been made, and which can be taken advantage of by the contractor of today.

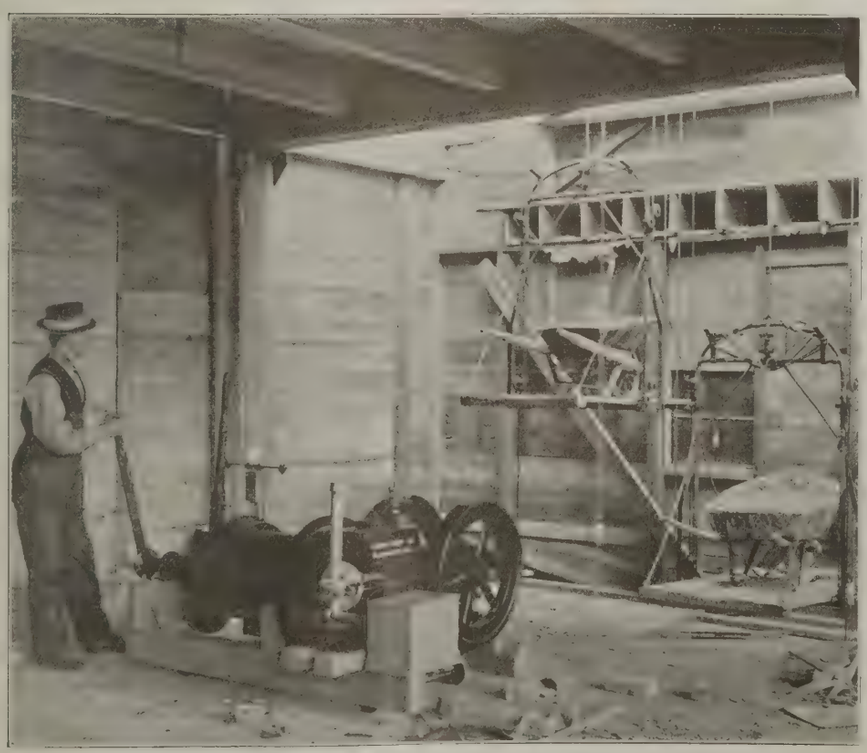
In the choice of power, we have for many years had steam. This furnished ample power for most purposes, although deficient in some respects. For instance, the outfit of an engine and boiler necessary to do certain work was bulky and heavy, which gave the machinery a lack of portability. With the advance of electricity much of this loss was obviated, as a small motor took the place of a heavy and cumbersome engine and boiler. The power, too, was immediately available, it being only necessary to connect up

the wires. The use of electricity is somewhat limited, owing to the companies which furnish the current not having extended their lines so as to be available. The lack of uniformity in voltage and current frequently causes annoyance and expense when a contractor takes his plant to another section of the country. There is probably no more ideal source of power when it can be cheaply obtained, but unfortunately in new buildings the electrical wires are almost the last thing to be permanently installed.

We are, therefore, led to believe that the use of the portable gasoline engine is the ideal motor for the contractor's use, as it is always available at a moment's notice and can easily be adjusted to the same frame and special machinery which it operates. Its weight is a great feature in its favor, being much lighter than either the steam engine or the electrical motor. The variety of gasoline engines meet the demands of every machine and an engine can be selected perfectly suited for the particular purposes for which it is to be used. In this regard there are two and four cycle engines which come in one to six cylinders, and a contractor can readily select from the work in hand which style of engine will promote his work the best. The cheapness of these motors frequently permits each individual engine to have its own motor, thereby greatly simplifying the selection.

The number of places in a modern building where power can be used to advantage, and should be used for economy, are limited only by the size of the operation. Where a vast amount of excavating is to be done, a good shovel or excavating machine can be used. Machines of this character will do the work of many men with teams. In connection with the excavating of buildings of any size or depth, an excellent plan is to arrange a hoist to assist the teams to get out of the hole. By the use of a comparatively small engine the load for each team can be practically doubled, as the hardest part of the entire trip with the excavating material is in first getting to the street. A hoist arranged in this way will save its cost in the first few thousand yards taken out.

In many places a contractor is obliged to work under severe disadvantages. In the cut shown at the top of this page is shown one such incident. In this part of the country it was necessary to construct a concrete wall close to a lake in a sandy soil, which permitted the water to readily fill the trenches. By the use of a gasoline engine the pumping out of the trenches can be kept up and the work proceed rapidly.



The extended use of reinforced concrete calls for a vast amount of sawing and cutting for forms, braces, etc. Figure as we will, it is still necessary to cut and dress a large amount of material. Nothing is handier for this purpose than a portable saw rig, such as we have shown in the illustration. As will readily be seen, these rigs can be moved not only from job to job, but from place to place about the building. During the first part of construction

it may be necessary to leave the machine out in the open, while later during the work it can be carried from floor to floor, thus the machine is brought to the work and the work performed with the greatest possible saving of time, labor and material.

With the increase in the height of structures, it has been necessary to perfect means for getting the material from place to place. Many contractors rig up a hoist similar to that shown on this page for the purpose of taking up material for the various doors. The writer has seen in an eight-story building the cumbersome chain hoist pulled up by man power, in which from two to four men were constantly employed to raise the material for a dozen or more men above. The same work could have been easily performed by one man and a small engine. The contractors of today are alive to the situation and are obtaining machines for this purpose, as well as for the many other purposes about a building, such as mixing concrete, crushing stone, polishing floors, etc.

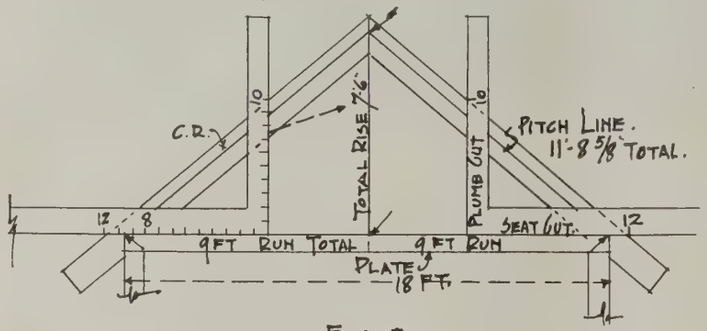
The question of preparation enters so largely into every job that the contractor must be prepared at all times to start a job in a hurry and carry it forward with the greatest possible speed and efficiency, and it is the contractors who have the labor saving machines on hand who are first called upon to take the rush jobs, for the money is sure and large in proportion to the actual work performed, and being prepared for large work is the best method of getting it.

RAFTER WORK

By A. A. STAFFORD

In the December issue I gave a simple method of finding the backing lines for hip rafters by illustration. At this time I will show by illustrations a section of a 10-inch pitch roof with hip and jack rafters. The building being eighteen feet wide, all that portion of rafters that are outside and above the corner of the plate must be made to suit the building they are for.

I will endeavor to show how these lengths and cuts can be gotten by the use of the steel square and pocket rule. Fig. 5 shows the side cuts, length by run for common rafter. Remember first, that one inch on either square and rule equals one foot. Remember second, to take total lengths so you do not have to multiply and make a mistake. In this case, 9 ft. is run of common rafter, Fig. 3, 9 inches on blade of square, now 10 inches for every foot run,



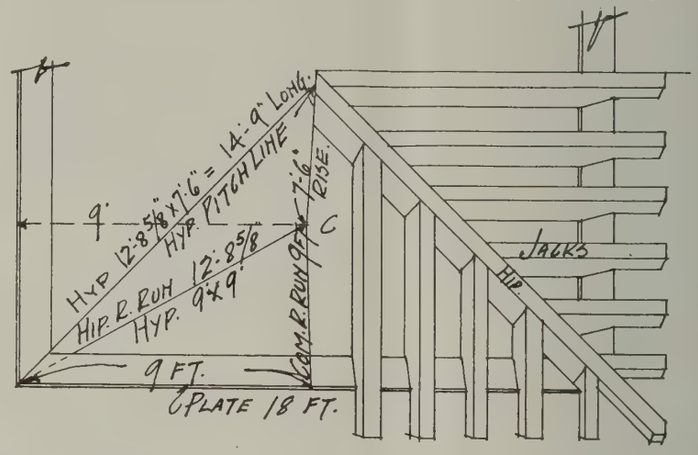


Fig. 3.

9 in. x 10 in. = 90 ÷ 12 in. = 7 ft. 6 in.—use 7½ in. on tongue of square, measure 9 in. x 7½ in. with rule, read on rule 11 23/32 in. Now let's see what part of 1 ft. this fraction is. ½ in. = 6 in., ¼ in. = 3 in., ⅛ in. = 1½ in., 1/16 in. = ¾ in., 1/32 in. = ⅜ in. Count it out on your rule, 11 23/32 in. reads 11 ft. 8⅝ in., for the length of common rafter. Taking the length and run, 9 in. x 11 23/32 in., gives the side cut of jacks as shown in Fig. 4. Always cut on the larger number. Of course, most every carpenter has a code of rules for 8 in., 10., and 12 in. pitches, but many of them when they get away from these three pitches are lost. Study these figures carefully and you won't be lost on any pitch if you do the measuring across the corner of your square correctly and apply figures properly. Now lets see about that tedious hip that so many nearly get and then chop off the rest with a hand ax. Look at point C, Fig. 4, this being plumb line to top of hips 7 ft. 6 in., and 9 ft. from the plate edges. The lines on the drawing are not to be scaled on account of view. Now measure across the corner of the square to find the run of the hip. The hypotenuse 9 in. x 9 in., or 9 ft. x 9 ft., reads on rule 12 23/32 in. or equals 12 ft. 8⅝ in. run for 7 ft. 6 in. rise, now having these two, lets measure again. The hypotenuse of 12 23/32 in. x 7 ft. ½ in. reads on rule 14¾ in., or equal 14 ft. 9 in., which is the length of the hip rafter. The length and run, 14¾ in. x 12 23/32 in., gives the side cut. Simplify fractions by using 15 in. x 13 in. For side cuts, you must cut off enough more to allow for one-half thickness of timber the rafter leans against. If a jack

was cut just right to fit pitch line, see Fig. 4, and the hip rafter was 1¾ in. thick, then you have to cut off a piece ⅞ in. thick from jack so it would set in place.

Notice in Fig. 3 how the squares set on top of the plate for the cuts for top and seat of common rafter, and the reading 12 in. run 10 in. rise for pitch. Now, if you slide square on run to read 9 in., you will find top to read 7½ in., so it is plain to see

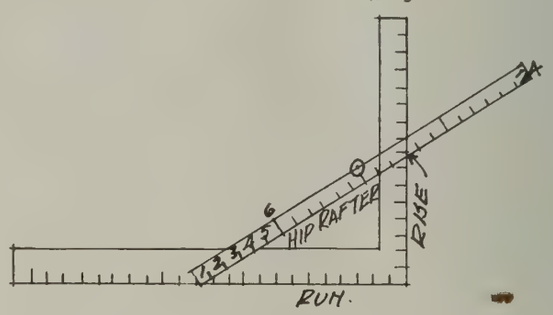

Fig. 5.

that 9 in. x 7½ in. cuts 10 in. pitch, same as 12 in. x 10 in. By using the slide rule, and being accurate in your readings, you will have more convenience many times in roof framing.

THE THINNEST VENEER

The thinnest veneer made in commercial quantities and in a general commercial way is the veneer made from Spanish cedar into stock for veneering cigar boxes. There are used in this country approximately 5,000,000 feet of Spanish cedar annually for the making of cigar box lumber and cigar box veneer. Approximately 500,000 feet of this is cut into veneer of which it takes 100 sheets to measure an inch in thickness. Some of it is cut so thin that it takes 110 sheets to make an inch in thickness. Here is an interesting problem for those who like to figure out things, to take a pencil and figure out how many feet, surface measure, of veneer cut in this thickness with a rotary machine can be made out of 500,000 feet log measure of Spanish cedar.

Even what is called the thicker cigar box lumber is as thin as the average thickness in veneer. About a million feet of Spanish cedar per year is cut into ½ inch in thickness and between ¼ and ½ a million is cut 3-16. These are the standard thicknesses for cigar box lumber taking the industry as a whole. When it comes down to the real thin stock this is getting it down pretty fine and this thin stock in veneer cut 100 to 110 to the inch is used for covering poplar and gum cigar box lumber so as to make it have the appearance and some of the aroma of Spanish cedar. The finished stock then is about ⅛ or 3-16 in thickness. No big hydraulic presses are used for this veneering either. The veneer is simply spread and brushed out and the stock piled up one on top of the other to dry.—Lumber Review.

REPAIRING CONCRETE FLOORS

There is a popular and widespread fallacy to the effect that a concrete floor once chipped or cracked is practically at the end of its usefulness. This is undoubtedly due to the results of unskilled workmen attempting to repair a damaged floor. Unless proper care is taken and the workman engaged on the job has sufficient knowledge of concrete, a repair job is most unsatisfactory.

In this connection, says 'Concrete,' the practice of a Boston firm is worth noting. In certain of the concrete buildings erected by this firm floors have been chipped in particular places because of some phase of the industry which gave rise to dropping heavy materials in one place, as, for example, the winding rolls in a paper mill. When a floor has become chipped out in some such manner as this, the proper method of repairing is to chip out with mallet and chisel a recess usually square, of sufficient depth to reach to the bottom of the deepest break in the concrete surface. The rough surface resulting from this process is then treated with acid to bring out the solid aggregate, or else a stiff brush is used to remove all the loose dust, and the recess washed out by sluicing out with a hose. When all the dust particles have been removed the recess is grouted with cement and before this has set the granolithic finish is applied and leveled up with the rest of the floor. Repairs made in this manner are just as permanent as the remainder of the floor, as the bond between the new and the old concrete will be perfect if all the loose material has been carefully removed.

BUILDING TRADES' INTERESTS IN THE COURTS.

Prepared for the National Builder by George H. Murdock, Newark, N. J.

As a general rule the master is bound to use ordinary care to furnish the servant with a safe place to work.—Texas Co. v. Strange, 132 S. W. (Texas) 370.

Where the employer provides a scaffold for masons to work on, it is his duty to use ordinary care to see that it is safe, and failure so to do will make him liable for resulting injuries.—Texas Co. v. Strange, 132 S. W. (Texas) 370.

Where a mechanic's lien statement, when read as a whole, is sufficient to enable an interested person to locate the property with reasonable certainty, it is sufficient as to description of the land.—American Bridge Co. v. Honstain, 128 N. W. (Minn.) 1014.

Where temporary structures, erected to complete a main structure, are put up by the same workmen as are engaged on the main structure, the workmen who have put it up assume the risk of such structure being unsafe.—Texas Co. v. Strange, 132 S. W. (Texas) 370.

A bricklayer, having no duty to erect scaffolds as a place to work, such structures being furnished by the master and erected by carpenters separately engaged, is not a fellow servant with the carpenters.—Texas Co. v. Strange, 132 S. W. (Texas) 370.

Where a bricklayer has discovered the danger that a scaffold would fall, and immediately after and before he could protect himself from injury by the use of ordinary care, the scaffold fell, he did not assume the risk of injury.—Texas Co. v. Strange, 132 S. W. (Texas) 370.

A bricklayer who has discovered that the scaffold on which he is to work is in immediate danger of falling cannot wait thereon for it to be repaired, unless his conduct in so doing is that of an ordinary prudent man.—Texas Co. v. Strange, 132 S. W. (Texas) 370.

Where a bricklayer goes upon a scaffold as a place of work, the scaffold having been built by carpenters engaged in the same general employment, he has the right to assume that the master has performed his duty to provide a safe place to work.—Texas Co. v. Strange, 132 S. W. (Texas) 370.

If a bricklayer goes upon a scaffold, and there discovers it is in immediate danger of falling, and without using proper care to protect himself from injury remains thereon, waiting for another division of workmen to repair it, he assumes the risk of his position.—Texas Co. v. Strange, 132 S. W. (Texas) 370.

Even if a flat building built for rent was not completed for a month after the time provided by the contract, refusal of interest to the contractor prior to the filing of the lien, a month after the completion and delivery of the building, was ample damages for the delay, there being no evidences of application for rooms before the completion and delivery.—Jones v. Nelson, 112 P. (Wash.) 88.

A surety on a building contractor's bond for performance of the contract, executed after the time fixed in the contract for the completion of the work, is put on notice of the granting of an extension of time for the completion of the work, and he cannot escape liability on the ground that prior to the execution of the bond an extension had been granted.—United States Fidelity & Guaranty Co. v. Means & Fulton Iron Works, 132 S. W. (Texas) 536.

Where the obligee of a contractor's bond did not extend the time for the completion of the work, but permitted the work to continue after the time fixed for completion, the surety on the contractor's bond was not thereby discharged from liability, since the acquiescence of the obligee in the continuance of the work by the contractor did not result in injury to the surety.—United States Fidelity & Guaranty Co. v. Means & Fulton Iron Works, 132 S. W. (Texas) 536.

Where a building contractor's bond for performance of the contract was executed several months after the time for the completion of the work, the surety was put on notice that for some reason the contract had not been complied with so that, if he desired information, he must make inquiry, in the absence of which the silence of the obligee was not fraud precluding a recovery.—United States Fidelity & Guaranty Co. v. Means & Fulton Iron Works, 132 S. W. (Texas) 536.

Where a contractor, who took from a subcontractor a bond conditioned on the faithful performance of the contract and stipulating that no liability should attach to the surety unless in case of default the contractor should promptly on knowledge deliver to the surety notice thereof, relied on the assurance of the subcontractor that it would properly remedy a defect in the work and supposed that the defect had been remedied until the contractor discovered the contrary after the collapse of the work, it was not incumbent on the contractor to notify the surety of the defect.—United States Fidelity & Guaranty Co. v. Means & Fulton Iron Works, 132 S. W. (Texas) 536.

A contract for work which stipulates that, if the architect shall certify to the neglect of the contractor to prosecute the work, the owner may, after notice, provide labor and materials and deduct the cost thereof from any money due or to become due to the contractor, and if the architect shall certify that the neglect is sufficient ground for such action, the owner may terminate the employment of the contractor and complete the work, gives to the owner the option, on default of the contractor, either to terminate the contract and stand on his legal rights, or to terminate the contractor's employment and proceed to complete the work.—Steiger v. London, 126 N. Y. S. 256.

Plaintiff, a carpenter, was employed in erecting a house. A scaffold for the work was built in sections. Two planks laid side by side rested on cross-pieces, one end of a cross-piece being nailed to the house, and the other end to an upright. As the work progressed the scaffold was raised, the planks being put on cross-pieces higher up. While plaintiff was doing this, one plank being placed on the higher cross-pieces and he being on the other, the one on which he was walking broke from a defect therein. Held, that the scaffold was one used in erecting the building and furnished by the employer for that purpose, within Labor Law (Consol. Laws, c. 31) §18, so as to make the employer liable, and that plaintiff was not merely changing the scaffold, and not using it as such.—Jones v. Gamble, 126 N. Y. S. 143.

BOOK NOTICES

Notice.—All books noticed in these columns may be obtained from this office at Publisher's prices. All postage or express prepaid. Money and address must accompany all orders.)

DR. GRANT'S SYSTEM OF HANDRAILING SPIRAL STAIRS.—Being an exceedingly simple solution of this hitherto unsolved problem. By C. C. Grant, M. D., of Red Deer, Alberta, Canada. Consists of 38 pages and 8 full-page plates.

This is somewhat of a new departure in the science of handling, based on the system known as the "Sectorial," with this difference, that Mr. Grant makes use of a temporary cylinder to wrap his rail around, while in the "Sectorial" method two-hinged board as employed to lay out the wreaths and pitches. The cylinder method, is of course, much simpler than the "Sectorial," but is more costly as a new cylinder must be constructed for each change in diameter of well-hole. "A system for rails of an elliptic nature was evolved by Nicholson," says the author, "and later was simplified by Riddell, which endeavored to furnish a face mould, a joint on each end of a crooked chunk of wood, with a line on the face of each joint. All modern works on railing are founded on Riddell, and merely attempt to simplify his methods. The result is that spiral stairs have not become general."

This work will be quite interesting and instructive to rail-builders, old and new. We may have more to say of it at a later date. The work can be obtained from this office.

PATENTS.

The following list of recent patents and trademarks relating to building interests is especially reported for THE NATIONAL BUILDER by Wm. G. Henderson, solicitor of American and foreign patents and trademarks, Norris building, 501 F street, Washington, D. C. A copy of any of the United States patents will be furnished by him for 25 cents.

1,013,109. Machine for mixing concrete, etc. Chas. E. Bathrick, assor. F. C. Austin, Chicago.

1,013,475. Appliance for molding concrete walls. Theo. H. Brown, assor. N. J. Blomgren, Minneapolis, Minn.

1,013,534. Floor-surfacing machine. H. W. Cheney, Norwood, O.

1,013,536. Concrete block machine. Chas. E. DeForrest, Lima, O.

1,013,553. Latches for double doors. Ben. W. Johnson, Grafton, Pa.

NORTHERN PINE.

While there are some thirty-seven species of pine grown in the United States, no one state grows all of the species, nor, on the other hand, is there any state which does not grow one or more. Some of the varieties, such as Loblolly Pine of the South and White Pine of the North and East and the Western Yellow Pine, occupies large regions in considerable abundance. Others are so scarce that few either use or recognize them. No variety, however, is found in the United States which has not been used in some way to serve man's needs.

During recent years, nearly fifty per cent of the total lumber output of the United States was pine. The Southern varieties of long leaf practically furnished more than any other single species, and was closely followed by White Pine. Western Yellow Pine has recently furnished vast quantities of lumber, and other western varieties are ranking high in production. In the South four varieties are generally classed as Yellow Pine, the general appearance of which is similar, but the characteristics vary considerably. These varieties grow practically all the way from Chesapeake Bay to Texas, with the exception of Southern Florida.

White Pine grew originally in practically all of the states above the latitude of North Carolina, and the cut of this wood has probably exceeded that of any one of the species. While some timber trees have a wider commercial range, White Pine has been the leader in the market for 250 years. Even today, although the original forests are reduced to mere fragments of what they once were, the second growth is meeting heavy demands. In Massachusetts the cut in 1908 was 238 million feet, practically all of second growth. It is probable that approximately the same cut will be made every year without exhausting the supply. This requires a growth of about twenty-five feet of wood per acre growth each year, so it will be seen that the supply of White Pine lumber need never fail in this country, provided a moderate area is kept producing with proper care.

During the last thirty years, the largest cut of White Pine has come from the lake states, Michigan, Wisconsin and Minnesota. The quantity from the virgin forests is rapidly decreasing, and much dependence is now placed upon the second growth. This country will probably never again see the large sticks of lumber which were formerly cut as they came from trees centuries old, and it can hardly be expected that forests of second growth will be permitted to attain that age or that the owners will wait for the trees to attain a height of 150 feet and a diameter of 4 or 5 feet.

The estimates which have been made from time to time can only be regarded as approximate. Lumber cruisers profess to be able to estimate closely through large areas in an incredibly short space of time, but the amounts which have been cut are vastly larger than the timbermen have considered the area was capable of bearing. Of course, much of this is due to the fact that the cutting out of the larger trees allows the smaller ones to mature, and so keep up the supply, but the fact remains that there are still immense quantities of White Pine in the United States.

The early lumbermen depended entirely upon the rivers to carry down the logs. The saw mills were built upon the rivers, so that the logs could be floated direct to them. As time went by, it was found that it was necessary to build railroads into the forests, where the teams could not reach them, and haul the logs to the rivers. The expense of this, added to the cost of getting out the lumber, to a certain extent has created the impression that the supply was fast failing.

As fast as areas available for farming were cleared of lumber, a large acreage was taken up for this purpose and so cannot be counted as being available for continuing the supply. There is, however, a vast amount of timber growing upon the settled farms in pasturage, woodlots, etc., all more or less available.

No industry is so full of romance or human interest as that of White Pine. The first frosty days of winter seem a sign for getting ready for the big woods. The hands all work from daylight to dark, breakfast being prepared and eaten by lamplight and the teamsters and cooks frequently working far into the night. The work proceeds in the cold atmosphere with tireless energy, camp competing with camp to secure the highest output, the first run down the river, and prestige along other lines. Pages have been written upon the work in the woods—the breaking of jams and the dangerous drives. Riding the logs over the rapids was frequently a part of this work, and the more perilous the work, the more willing the men seemed to carry it on.

On the uses of White Pine, there is little can be said except that few woods compare with it for all general purposes. One of the first uses to which it was put was shipbuilding, its lightness being a valuable quality. For many years it was the wood used for masts and spars the world over, enormous quantities being shipped to Europe during the reign of the masted ships.

Bridge building owes much of its development to White Pine. While it is not as strong as long leaf Yellow Pine, there are still many places its use is preferred. The fact that it was not subject to atmospheric changes with very little shrinkage or swell made it especially useful. The timber stood, too, for years without paint, immune from decay.

In house building, White Pine has been and is the favorite wood for both rough construction and outside finish, as well as for the inside finish. Where the woodwork is to be painted, it is extremely valuable and no wood excels White Pine for this purpose. As it is easily worked, the expense of putting it in place is much less than the harder woods.

White Pine is also used largely in furniture, especially for furnishing cores and backgrounds upon which the finest veneers are applied. The same is true in its use in doors, where a white pine core is built up of the proper size, so that the expensive veneer of mahogany or other wood can be applied.

For a wood so widely known as White Pine, the diseases and injuries to which it is peculiarly liable have very little effect upon it after it is grown. Where once the seed has sprung up, nothing seems to stop its ultimate growth; a moderate forest fire kills the young trees, but new growths immediately start up.

The Northern Pine Manufacturers' Association, 1119 Lumber Exchange, Minneapolis, Minn., have prepared booklets showing the many other advantages of White Pine, and request that contractors, builders and others interested write them and ask for "Why—When—White Pine Book." It will be of interest to everyone .

RED GUM VENEERS.

In 1910, as in the three previous years, red gum was much more widely used for veneer than any other wood, and in each of the four years constituted approximately 30 per cent of all wood used. The large increase in consumption over other woods is explained by the fact that it is considered an ideal wood for the rotary machine and that the stumpage is more easily obtained than that of any other wood, except yellow pine. The tendency of red gum to check and warp when used as lumber is overcome by converting it into veneer. It cuts well, especially in the rotary process, and with improved driers is easily kiln dried. Furthermore, for the manufacture of built-up lumber red gum is especially adaptable because it takes glue readily and because it can be used as either face wood or filler. More than two-thirds of the total increase in the amount of wood used for veneers in 1910 over the amount used in 1909 is due to the greater use of red gum.

The total quantity of wood used by the 563 veneer manufacturing establishments in the United States reporting in 1910 amounted to 477,479,000 feet, log scale, which was about 10 per cent more than the consumption in 1909, according to the annual Federal report on the statistics of forest products.

The widening range of uses for veneer largely accounts for the increased production. Formerly veneer making was confined to a few hardwoods selected for beauty of grain and used as an exterior finish for high-grade furniture and cabinet work. With the improvement of veneer machinery and methods of drying there has developed a large demand for veneers cut from cheap woods and used for packing boxes, berry cups, fruit baskets, veneer barrels, drawer bottoms, filling in three-ply lumber, glass backing, and novelties, such as butter dishes, wooden plates, and fancy confectionery packages.

On account of the constantly increasing price of hardwood lumber used for making furniture, fixtures, and cabinets, built-up lumber, which is usually made of three-ply veneer, is being extensively substituted. For manufacturing this built-up material, it is possible to use woods which heretofore have been but rarely used, owing to their tendency to twist and warp when sawed into lumber.

KIND OF WOOD.	WOOD CONSUMED IN MANUFACTURE OF VENEERS (M FEET, LOG SCALE).			
	1910	1909	1908	1907

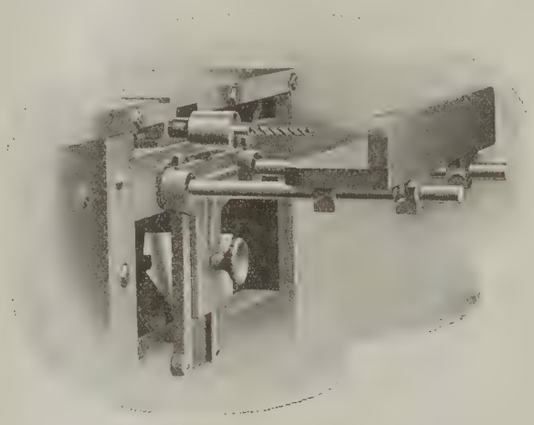
Chestnut	1,736	1,577	1,138	400
All other	2,611	3,499	3,982	2,290
Imported:				
Total	16,534	24,550	20,018	11,644
Mahogany	8,773	16,057	11,487	6,722
Spanish cedar	5,099	5,140	6,558	3,922
All other	2,662	3,353	1,973	1,000

Table 1 shows the quantities of the different kinds of wood consumed in 1910, 1909, 1908, and 1907.



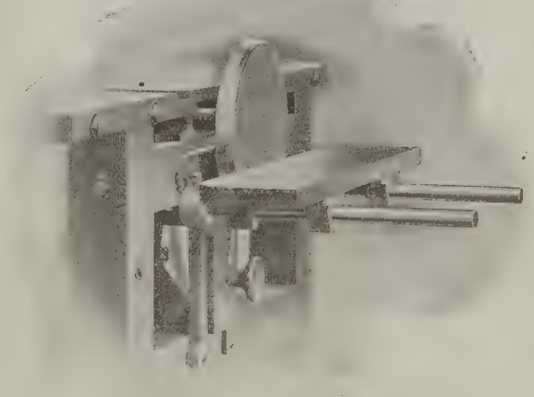
Next to the red gum yellow pine is the most important wood in respect to the quantity used in the manufacture of veneer. It stood second in 1910, 1909, and 1908, while in 1907 it stood third, cottonwood occupying the second place. The consumption of yellow pine in 1910 was less than in 1909 or 1908. The importance of yellow pine and cottonwood in the manufacture of veneers is explained by the extensive demand for cheap veneer products. Yellow pine is used for fruit and vegetable packages, while cottonwood is converted into trunk boxes, veneer boxes and cases, drawer bottoms, and mirror backing. During each of the past two years maple, yellow poplar, white oak, and birch have shown increases in consumption, while each of those woods showed a decrease in 1908. Less basswood, sycamore, and ash are reported for 1910 than for any one of the three previous years. The adaptability of Douglas fir for making veneers is becoming more widely recognized, as indicated by the fact that the quantity reported in 1910 exceeds the combined quantities for the three previous years.

The quantity of imported woods reported as used in the manufacture of veneer in 1910 was less than that reported in either 1908 or 1909. Veneers manufactured in foreign countries and imported are not included in the figures given in the tables.

THE EVEREADY SAW RIG.

The Oshkosh Manufacturing Company, 414 South Main street, Oshkosh, Wis., have for several years been well known as manufacturers of woodworking machines, more particularly adapted for the larger saw mills, lumber camps, planing mills, etc.

The great success which has met the introduction of their Eveready Portable Saw Gig for Contractors has given them considerable reason for gratification. On this page we are able to show two of the adjustments which are included in the rig equipment of the Eveready. As will be seen by the first cut, the boring outfit is adjustable within wide limits and can be used while another man is using the saw. The long gauge on the adjustment insures correct work and the machined dovetail joint will also take up the work incident to long use. The bit socket in this boring adjustment is designed to take the regular standard size bits, which may be obtained at any hardware store.



BORING ATTACHMENT.

We also show the sander, which can be readily attached in place of the boring outfit. The same action which does the boring supplies the power for the sander and allows the borer to be used independently of the saw.

A novel arrangement is used for changing the paper and economizes in the consumption of the same. The use of the sander under these conditions easily convinces one of these improvements on the woodworker.

The engine used in the Eveready is specially designed for this machine. It is a 2-cycle, valveless type developing four actual horsepower. The extra large water hopper and ribbed cylinder head insures ample cooling capacity during the most severe working conditions, and the working parts of the engine as well as of the entire woodworker are protected from the dust. It is of interest to know that the governor on the engine is very sensitive, keeping the motor running at even speed at all times. With the various work which is required of a woodworker, this is an important consideration.

SANDING ATTACHMENT.

The Oshkosh Manufacturing Company are very proud of this machine and believe that the simplest guarantee is the best. Their guarantee is simply that if it does not suit, it can be returned at their expense. Under these considerations any responsible contractor can obtain the saw rig and try it out on his highest contract. His opinion will determine whether or not he will keep the machine. The Oshkosh Manufacturing Company are anxious to hear from every contractor interested in a machine of this character.

KORELOCK DOOR DESIGNS.

The Paine Lumber Co., Ltd., Oskosh, Wis., has prepared for distribution to the architects and builders a most complete catalogue showing many designs, finish, etc., which are obtainable from their immense plant. It is probably the most complete book ever issued on the subject of hardwood doors, and its careful makeup allows it to be used as a reference book on doors, being classified under architectural subdivisions. In this manner anyone interested in something in a colonial house, can, by referring to the index, clearly locate the complete array of colonial designs and make such selections as will fit his particular building. Another feature, not generally included in the makeup of a catalogue of this character is a unique index which appears on each page. By the use of this index, anyone considering any particular door and wishing further information as to glass, sizes, layout, standard sizes, designs, etc., can readily turn to the further information. In this way the designer will save a great deal of time in finding all the information on any subjects which he wishes.

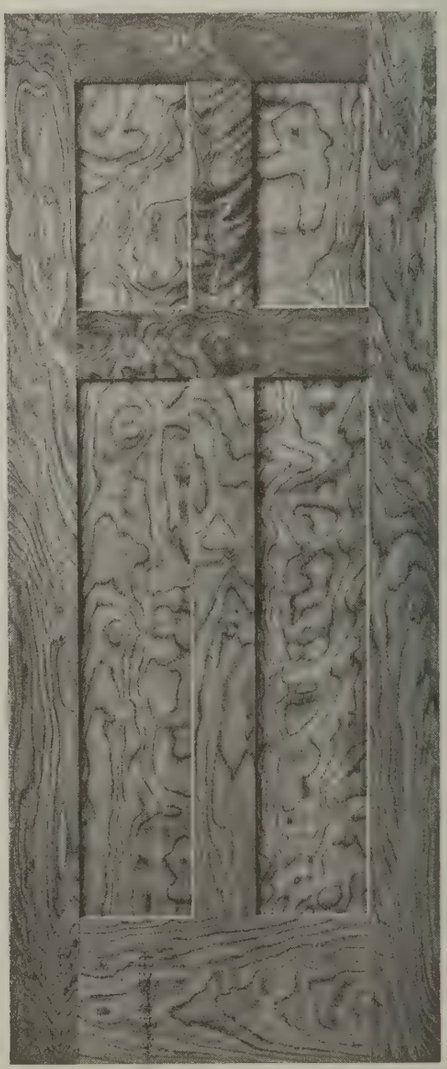
Several pages are given to door sections, showing details of construction. On the Colonial door page, it is possible for the architect or designer to select exactly the moulding which appeals particularly to him, or are suited to the particular work in hand.

KORELOCK DOOR WITH BIRCH VENEER, SHOWING INLAYING OF HOLLY AND EBONY.

Often we see Gothic mouldings used where the classic orders should be preserved, and often we see modern mission trim clashing with the colonial details. This section also shows the best methods for using panels, glass, mirrors, etc.

A great many times we have been asked if there is any published list of standard door sizes, showing the width of rails, stiles, etc., for various styles of doors. The list given in this catalogue is the most complete we have ever seen, and will be of great value to the designer in making up his details. The doors are classified as solid mould doors, and also raised and flush panel doors.

Many of the designs in the book show glass panels of various designs. Some of the front doors have a full-sized glass panel, while some mission doors have only small panels at the top. A table shows the regular sizes in which doors of this character are detailed and made.



In the list are suggestions for finishing. This gives in great detail the various methods in which Korelock doors can and should be finished. Various paints, oils, shellac, fillers, etc., are described, and their use fully explained. While it would be presumptuous to suggest that a novice could finish the doors from these instructions alone, still they will give the ordinary mechanic or owner an excellent idea how the work should be done.

One of the styles of doors which is attracting considerable attention at present is the perfectly smooth or "Sanitary" doors, on which there are no moulding to catch the dust or harbor disease germs. The Korelock construction is particularly adapted to doors of the character, as the veneer has a permanent foundation to build upon.

The matter of inlaying is attracting a great deal of attention upon the finer grades of work, many doors, such as in hotels, offices, and the higher classes of residences being constructed in this manner. A light line of wood contrasting in color with one of the panel is inserted as a narrow ribbon, giving the appearance of a panel, while doing entirely away with mouldings, etc.

The designs that can be obtained in inlaying are practically unlimited, and the wood used in the narrow penciling includes white holly, ebony, mahogany, rosewood, tulip, satin wood, etc. Combinations of these in inlaying produces beautiful and artistic effects. Where one is so inclined, the address or monogram can be inlaid, making the door or panel individual works of art.

This permits the widest display of originality on the part of the architect and shows the individuality of the home owner at practically

FOUR PANEL KORELOCK DOOR IN CRAFTSMAN DESIGN.

little or no difference in cost. As each home owner desires to show his friends something new and which can be seen only in his particular house, the advantage of this style of ornamentation can be easly seen. The cuts shown herewith show some of the patterns, but give only a slight idea of the extent to which the inlay may be carried. Different combinations of wood in different widths and patterns, when combined with glass panels of the various styles of doors, add greatly to the artistic beauty of the house. It must be remembered that the doors are practically the only part of the house which can be moved and the action of the light in playing upon the finish of the surface gives a pleasing variety of color and tone. In this way the doors closely approximate the value of furniture as an addition to the appearance of a finished room.

As the home builders in general are going to appreciate the fact that doors of the highest quality, such as Korelock, are really no more expensive than doors of inferior finish, every architect and contractor and home owner should have this book for reference. We are advised by the Paine Lumber Co. that THE NATIONAL BUILDER readers can obtain this beautiful book without cost, and we trust many will take advantage of the opportunity.

You have probably taken your Simonds Saw in just this same way and displayed it to the admiring gaze of some friend.

Like the fellow in the picture, you probably said—"Simonds, I tell you it's a great Saw."

No, the Simonds Hand Saw isn't a very old product—even though the Simonds Co. has been in business eighty years. We made other kinds of Saws for a great many years before we yielded to the demand for a Simonds Hand Saw.

Ten years on the market has proved the Simonds Saw, has tested it, has shown the undoubted call for an extra high quality Saw. The story of public approval is shown by public demand.

Every Simonds Saw is fully warranted. Ask your hardware dealer. Tell your friends about this Saw—send for a free copy of Simonds' Guide for Carpenters. If your dealer doesn't sell Simonds Saws, write us saying what kind of a Saw you want.

STAIR BUILDING AND HAND RAILING

By FRED T. HODGSON, F. A. I. C. 300 Pages, 300 Illus., 12mo, Cloth. Price $1.00.

This is an excellent work for the young carpenter who is ambitious to become an expert in handrailing and stairbuilding, inasmuch as it commences at the very beginning of the art, and shows how to lay off a stair on the floor, placing the newels, laying off treads and risers, strings, winders, wells and flyers.

The object of the author is to lead the student step by step, in such a way that he takes in the whole art of stairbuilding before he is aware of it. This is decidedly the best and most practical work on stairbuilding on the market, and just what the untrained workman wants. The part of the book devoted to handrailing exhibits three different methods of laying out and working handrails suitable for any kind of stairs—straight, circular, elliptical, or for stairs with landings, dog-legged, newels or cylinders. These systems of handrailing have been taken from the best sources on the subject and have been revised and edited in the most careful manner. Sent postpaid on receipt of price by

HODGSON BOOK COMPANY :: :: 542 S. Dearborn St. :: :: CHICAGO

THE CARE OF THE SAW.

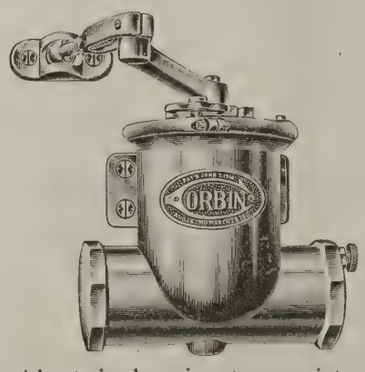
How many carpenters have saved a few cents on the price of a saw and too late realize it was costing them many times that amount to use it day after day. The practical carpenter has learned that the truest economy is to buy the best saw which he can, as the saving in time and power will soon make up any small difference. Moreover, the saw of good quality will outlast several poor saws, not only in the time between filing, but also in the actual length of life. When it comes to cross-cut saws and wood saws, we have the additional fact that two men were employed on a saw, and the loss in labor is doubled. It is very easy to see that the time lost in using a poor saw is real money and that the first importance is to buy good saws and the second, to take care of them.

In the selection of saws, there are a number of things to consider outside of the actual quality of the saw: The use to which it is to be put, the hard service it is to have, whether the owner himself is to use it or employes, the kind of wood and the facilities for sharpening and keeping in condition all have their bearing on the selection.

There is a wide choice, too, in the design of saws. Some men prefer a rather light saw while others prefer one of a much heavier weight. In cross-cut saws, there is a much wider variation, the territory in which the man has been working frequently influencing him in the choice of the shape of saw used in that particular locality.

After the selection of the saw, the care of it is of the utmost importance. The teeth should be kept sharp, properly set, and of even length. This varies somewhat with the different qualities of the wood to be worked and is a further item for individual selection.

"On the Care of the Saw," the E. C. Atkins Co., Inc., of Indianapolis, Ind., have prepared a most interesting little booklet containing explicit directions for filing and caring for saws of many descriptions. The Atkins Co. are well known as manufacturers of the Silver Steel Saws, and with their many years' experience are well calculated to be able to get up a book of this character. Every carpenter and contractor should have this booklet for the purpose of being posted himself and also to instruct his men how to keep their saws in shape.



We understand the Atkins Co. are willing to send this booklet on request, and we would suggest that you write to them direct at Indianapolis for a copy of it.

THE CORBIN DOOR CHECK AND SPRING.

Many items contribute to comfort in our modern structures, but it is doubtful if any are more important, save more time or do their work better, than the door check and spring. The door should be closed when not in use and still be always ready to open. It should close itself quietly without jar or slamming.

The P. & F. Corbin Company of New Britain, Conn., are placing on the market their 1911 model door check and spring. Among the advantages which they claim for it are:

It is adaptable for right-hand and left-hand doors without change.

It is supplied with or without the hold-back attachment. The hold-back attachment can be adjusted to stop the door at any point.

The spring used is long and resilient, reducing the crystallization to a minimum and giving a quick, live action, which is highly desirable.

The spindle has a lower bearing which absolutely prevents side pressure or friction and gives rigidity to the check.

The rack and pinion in the check give control to the door at all points from the wide-open to the closed position. The movement in closing is steady, without shock or jar at any point.

The parts are few and strong, easily accessible and quickly replaced.

The liquid used is one which has been carefully compounded with a view to securing immunity from changes due to difference of temperature. It is non-freezing and not affected by extreme heat.

The checking pressure is confined to the cylinder. There is no pressure at the spindle so that the liquid is not forced upward and the check will not leak.

The brackets used are the same as used with other models of the Corbin check.

Six sizes are made to swing all doors from the lightest screen door to the heaviest doors made.

While this is a rather short description for an excellent device, the cut may help to give an idea of its construction. We understand the Corbin Company are anxious to hear from anyone interested in hardware of this character.

SAW POINTS.

A knowledge of the principles upon which his tools are constructed is one of the first requisites to keeping them in order.

Under the heading, "Saw Points No. 7," Mr. Charles Morrill, 277 Broadway, New York, is sending out a booklet showing the essentials in saw filing and care. The information is valuable and timely, as the rush of work and high wages render it imperative that every carpenter should be an authority on saw filing.

A postal to Mr. Morrill will bring this booklet, and it is worth many times that to every mechanic.

LUTHER'S JIG SAW ATTACHMENT.

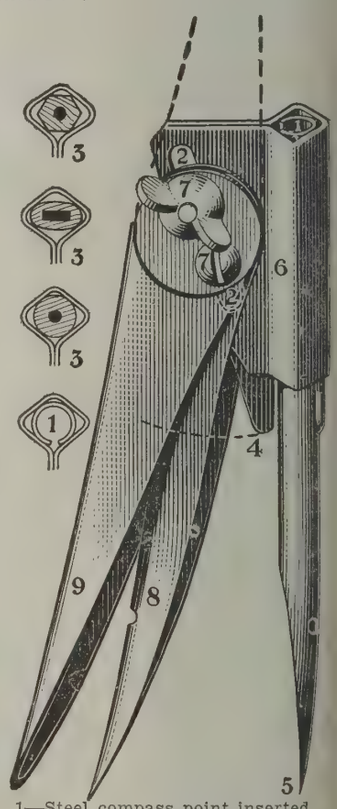
The Luther Grinder Mfg. Co., 410 Michigan street, Milwaukee, Wis., have designed a jig-saw attachment for use in connection with their grinders. This is a most valuable attachment for the use of carpenters and pattern makers, as it is used on the same frame as the head for the grinding wheels, another cap being supplied in place of the one used in grinding.

Every carpenter has more or less use for a jig-saw. For scroll work and pattern making it is indispensable. This jig-saw is heavily built, and, although a large range of work can be done on it, the necessary power can be very easily developed by foot. It can take work up to two inches in thickness.

A particularly valuable feature in certain classes of work, and which comes in handy in almost any sawing, is the adjustable table. By means of this, work can be done at any angle and the same angle rigidly maintained throughout the job.

A pulley attachment for power is also supplied so that gasoline or engine power may be used in place of foot power if this is an object.

The Luther Grinder Company have recently greatly increased their manufacturing capacity and are now located, with all their fine machinery, etc., in a fireproof building. They are anxious to send their catalogues to every contractor, builder, mechanic and home owner.



P. S.—We understand that the Luther company make a kitchen machine which keeps the knives sharp and preserves the good temper of the entire family as well.

THE PEERLESS DOUBLE COMPASS AND SCRIBER.

(Patent Applied For.)

The Peerless 5½-inch double compass and scriber is superior as a compass because it has a double joint with a thumbscrew on each side, thus making it more secure and rigid than any other compass on the market. This does away with the old style, clumsy, quadrant compass. It therefore can be used in much narrower spaces than the ordinary compass. It also swings on a center so that it can be easily adjusted to the width desired by operating only one screw. Either leg can be made the longer, as desired. The legs can be adjusted up or down to three-quarters of an inch. The three points become one when the compass is closed, thus providing a very useful tool for all conditions. No other compass has these features.

It will be seen that the legs numbered 8 and 9 may be used in connection with each other, forming an entirely separate scriber. When so used, the steel point, No. 5, is taken out entirely. Pencils of any length and of various shapes can be inserted in place of the steel leg and held equally well. In this way the compass becomes a scriber with almost an endless diversity of uses. The steel leg, when inserted with pointed end up (inverted) will hold round or very short pencils, which will be found very useful. All pencils can be fastened by one movement of the new lever and just as easily removed. However, it is only necessary to adjust the pencil once in a great while because of the three-quarter inch adjustment feature. To insert, put the pencil in the holder at the top, then drop it down to the length desired; then simply shut the lever and the pencil will be held rigidly. To remove pencil, force it forward.

1—Steel compass point inserted.
2-2—Adjusting slot.
3—Pencils inserted.
4—Lever for fastening pencils.
5—Steel compass point.
6—Any style or length pencil or the steel point can be inserted in this holder equally well.
7-7—Double locking device.
8—Sharp steel point for compass work.
9—Broad point. Can be swung out of the way as indicated by dotted lines.

The broad point can be placed against the jamb, in scribing in doors, or against fine woodword, plaster walls, etc., without marking or marring same. It is also used as a protector for the pencil point.

Potter Bros., specialty manufacturers, 614 West 110th street, New York, the manufacturers of the double compass and scriber, are well known for the excellence of their other specialties in this line, the sales of which have reached upward of 1,400 dozen, and no doubt the demand for this device will be equally great.

Prices are given in their advertising this month, and goods will be sent direct upon receipt of price. Address, Potter Bros., Specialty Manufacturers, 614 West 110th street, New York.

CONTRACTORS' AND BUILDERS' LEVELS.

Even the small jobs require to be laid out accurately, the grade must be determined and often a great deal of grading and leveling done about the building. Many builders think that the ability to use a builders' level requires a high college education and a sort of initiation into the realms of astronomy and necromancy, when as a

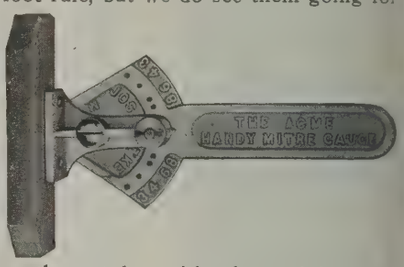
matter of fact it is far simpler, quicker and more accurate than using a level and straightedge.

Any man who can wind and set a watch can operate an engineers' or builders' level or transit, and any man who builds anything larger than a chicken coop should have a good instrument.



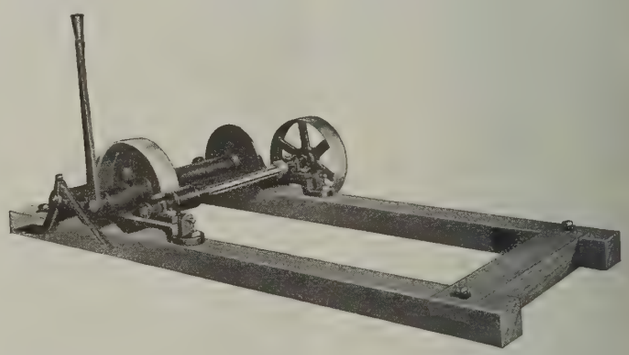
The possession of an instrument stamps the contractor or builder as being in the "accurate" class, for he can check up his work. He can allow the owner to squint through the telescope and convince him that the grade, heights, etc., are right.

Believing that their name should be constantly before their customers, present and prospective, the David White Company, 421 East Water street, Milwaukee, Wis., are sending out calendars which are both useful and ornamental.

The calendar shows in colors one of their engineer's levels, finished in gun metal and polished bronze, and will be a constant reminder that the company are manufacturers of high-grade instruments. A postal will bring a calendar and a catalogue.

THE ACME HANDY MITER GAUGE.

No carpenter would think of having to run to his tool box every time he wanted to use a two-foot rule, but we do see them going for a trysquare, bevel or miter box every time they have use for one, because, as ordinarily made, these separate tools are so bulky that they cannot easily be carried about on the job.



The necessity for a tool which would take the place of these three tools led Mr. Jos. Miotke, 249 Lake street, Milwaukee, Wis., to perfect the Acme Handy Miter Gauge. As will be seen from the cut herewith, the tool is small enough to go in the pocket, and being made of aluminum, is so light that its presence is not a burden to carry around.

As a serviceable tool, however, it is right on the job every time. The graduations are such as are most commonly met with, and when set the gauge is extremely accurate and cannot slip.

While the "Acme" is sold generally by hardware stores, those not familiar with it may obtain a descriptive circular from Mr. Miotke.

CONTRACTORS HOISTS.

When we were building only one or two-story houses, the question of raising material was of relatively small moment. It was generally possible to provide a good runway by which material could be wheeled to the second and even the third floor, but with the advent of high buildings it became necessary to provide means for rapidly raising quantities of material to the upper floors, as methods of construction and improvements in material allows the work now to be carried on with far greater rapidity than a few years ago. The

quick setting action of Portland cement has reduced the time for laying walls from seventy-five to eighty per cent.

In order to get the material to the upper floors some form of hoist therefore became absolutely necessary. As the work for this class of machine lasts only a comparatively short time on each building, the machine had to be made in such a manner that it was portable and adjustable to practically any place in which it was to be used.

Recognizing this then, the Erie Clutch and Pulley Co., 114-116 West Twelfth street, Erie, Pa., designed a hoist known as the "Reliable Erie," having a capacity of 600 lbs., adjustable and sufficient for all the ordinary work on a building, such as brick, mortar, lumber, etc. The cut shown herewith will give a good idea of the simplicity of the hoist itself. As will be seen, the hoist can be used in connection with practically any kind of power, steam, electricity or gasoline, and the hardwood skids, on which it is mounted, permits it to be easily moved from place to place.

Contractors who are interested in getting material rapidly and economically to the upper floors of a building during construction are advised to investigate this hoist, as the saving which it will do on one job will practically pay for the complete outfit.

CABOT'S SHEATHING QUILT.

The Samuel Cabot, Inc., booklet on Cold-Proof, Heat-Proof and Sound-Proof Construction not only describes their famous "Quilt," but gives a number of examples in which the Quilt has demonstrated its value for these purposes.

The booklet also shows exactly how the best results may be obtained at the minimum cost for labor and materials.

It is a well-known fact that modern construction in which wood forms any considerable part is far from sound-proof. For instance,

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

Don't Miss This Opportunity

We Want One Carpenter or Builder in Every Community to Demonstrate, Take Orders for and Apply Our EDWARDS METAL SPANISH TILE ROOFING on a Liberal Commission.

Here is a chance to build up an independent, profitable business for yourself right at home. Many carpenters are now devoting their entire time to selling our metal roofing Others have made big profits **simply devoting part of their time to selling and laying our Metal Spanish Tile.**

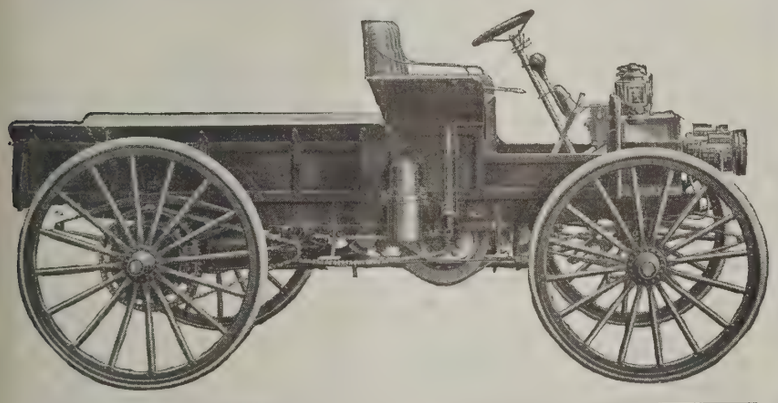
Edwards Metal Spanish Tile

Is being advertised in the leading magazines and is now known to thousands of home builders and owners everywhere. Wherever it has been used it has made a decided "hit" because it shows off to good advantage on the roof and has numerous points of superiority over any other style of roofing.

Architects are specifying Edwards Metal Spanish Tile, for they know it will do away with roofing "troubles." Builders like it because of the finished appearance it gives any house on which it is used.

Our Metal Tile are stamped out of the highest quality Worcester terne plate in exact imitation of the most expensive Terra Cotta Spanish Tile. They come either "dip" painted or heavily galvanized, size 10 x 14 inches. Our patented interlocking side lock makes it possible to make a perfectly moisture-proof roof without soldering. Edwards Metal Spanish Tile afford the fireproof advantages of Terra Cotta Tile, but are much lighter in weight, cost but a trifle more than ordinary roofing and will last a lifetime.

WRITE US TO-DAY ABOUT YOUR TERRITORY. Our business is growing so rapidly that it is necessary to have an agent in every community. The territory is going fast. One day's delay may mean that someone else will be given your territory. DON'T DELAY. WRITE TO-DAY FOR OUR SPECIAL AGENTS' PROPOSITION.



Note the construction of patented interlocking device, protecting nail heads from weather and providing perfectly for expansion and contraction of the metal.

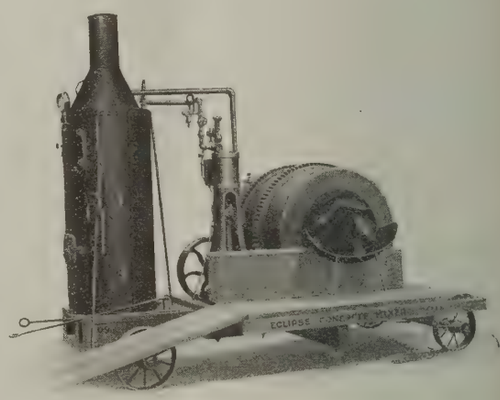
EASIEST AND QUICKEST TO SET
Won't blow off or be dropped off by children or careless servants. Can't be set wrong. The best of them all. Only sash hanger on the market with gauge lugs which make it impossible to set it in any way but the right way. Nine-tenths of the trouble with sash hangers comes from their being set wrong. The Watrous No. 18 is ALWAYS right. Full directions with each set.
E. L. WATROUS MFG. CO., Des Moines, Iowa

the ordinary apartment house, with end joists and partitions, is really a series of sounding-boards, which pass any unusual sound or vibration, such as coming from a piano or phonograph, from room and from floor to floor. The annoyance caused by the sound of these instruments passing beyond their natural limits is a continual source of neighborhood trouble, the blame seldom falling where it belongs; on the head of the ower or landlord who failed to properly build his house. These troubles can and have been removed in many high-class buildings, and could have been avoided at a much less cost than the loss of rent resulting from their omission.

Intending builders, as well as contractors and builders, should be posted on the value of "Quilt" in deadening sound, as well as in its heat and cold protection qualities. The booklet is small and concise, for the busy man, and is sent free on request to Samuel Cabot, Inc., 141 Milk street, Boston, Mass.



CHANGES IN THE L. S. STARRETT CO. ORGANIZATION.

The L. S. Starrett Company, which has the largest manufacturing establishment of fine mechanical tools in the world, has recently increased its capital stock to $3,500,000, of which $1,500,000 is to be six per cent cumulative preferred stock and $2,000,000 common stock.

The officers of the company are: L. S. Starrett, president; F. A. Ball, vice-president; F. E. Wing, treasurer and secretary; W. G. Nims, assistant treasurer; with a board of nine directors consisting of the officers named and M. B. Waterman, Augustus P. Loring, John A. McGregor, J. H. Drury and W. B. McSkimmon. The last four named are officers of the Union Twist Drill Company, the second largest machine factory in Athol. The Union Twist Drill Company becomes a stockholder of the L. S. Starrett Company and as such has representation on the board of directors, which is increased from five to nine.

The L. S. Starrett Company was incorporated in 1900, succeeding to the business established by L. S. Starrett in 1880 and conducted by him individually up to the time of its incorporation. The capital stock of the incorporation was $100,000 in 1900, since which time the business has increased far out of proportion to the original capital. L. S. Starrett continues in active control of the business.

THE "STANDARD" LOW CHARGING CONCRETE MIXER.

Every contractor who has mixed concrete by hand realizes the value of machine mixing. A better "mix" is obtained at far less labor, and in a fraction of the time.

On small jobs, however, the mixer has sometimes been at a disadvantage, as in many styles of mixers it was necessary to build a platform four feet or more above the ground with an inclined runway, and the labor required to do this—and the space required—often prevented the contractor from getting the best results from the job.

Under the name of the "Eclipse" Mixer, the Standard Scale & Supply Co., 1345-47 Wabash avenue, Chicago, have been manufacturing a concrete mixer which has become well known to the trade. In the future, however, the same mixer will be known as the "Standard" in order to avoid the confusion of names.

"The Standard" Scales, manufactured by the same company, and which has been on the market for so many years, have made the name "The Standard" in connection with scales familiar in every section of this country as well as foreign countries, and "The Standard" Mixers will in the future we as well known all over the world as "The Standard" Scales.

The illustration shows "The Standard" Low Charging Concrete Mixer, with steam engine and boiler. The simplicity of construction of this machine as shown by the illustration will commend it to all experienced contractors who are familiar with the difficulties of keeping complicated machinery in operation on the contractor's plant. The mixer is charged directly from the low-charging platform shown in illuustration, and the entire batch is in view of all while it is being mixed. This feature is important, especially for reinforced work, where it is often necessary to be very particular as to the mix before discharging.

The discharging arrangement on "The Standard" Mixer is very simple and semi-automatic, requiring the men to throw the discharge lever only past the center in either direction, when a strong spring completes motion of the lever and the discharge door.

One special feature of "The Standard" Low Charging Mixer is because of the simplicity in construction, it is much lighter and can be readily moved from one job to another or placed inside of buildings or in locations where other outfits could not be used.

The machines are built in all sizes, from 2 or 3 cu. ft. capacity up to 40 cu. ft., and with steam, gasoline or electric power. Full information will be sent upon request to the manufacturer.

Any Man Can Get $1,000.00

Who Joins Fritter's $1,000 Class

For Goodness Sake Listen To Me.

Reader, I, Fritter, am talking to YOU!—Am saying, that you; yes, you, can get $1,000; but be warned—only 5,000 can be accepted. So get mighty busy—write Fritter today. It costs nothing to investigate this remarkable $1,000 class.

5,000 Men Will Get $1,000 Each

You, by acting **now**—today—can get the thousand allowed to your section. This money—$1,000 or more per man—goes to **mechanics, clerks, farmers, preachers, doctors lawyers, teachers**—people from all walks of life—**any man, anywhere**—up to 5,000, who is willing to join Fritter's $1,000 class. Nobody barred. Not a fairy tale, fake or humbug; for listen—it's going on daily—hundreds have received their thousand—some many thousands. If you can use $1,000—real money—payable $35 to $75 weekly—say so—don't hesitate—don't delay a minute, but get the thousand-dollar hustle—**get your first $1,000**—first start, first taste of real independence—power, influence, luxuries—get these through Fritter, just as hundreds have done. Poor men joining his wonderful $1,000 class

Without Capital—Without Experience

—starting with only their nerve—finishing with thousands; yes, thousands of dollars. You, if willing to join hands with Fritter, can easily enjoy same abundant prosperity. Knowing the reason dispels all doubt—creates confidence—enthusiasm

CLASS GETTING OVER $2,000.00 PER MAN.

Korstad (Minn. farmer) received **$2,212.13 in 2 weeks**; Zimmerman (Ind. farmer) **$3,856 in 30 days**; Stoneman (Nebr. photographer) **$3,841.68 in 60 days**; Rasp (Kansas agent) **$1,685 in 73 days**; Juell (Canada clerk) **$6,800**; Oviatt (Iowa minister) **$4,000**; Hart (Va. farmer) **$2,000**; Wilson (Ky. cashier) **$3,000 in 30 days**; Beem (Kans.) averaged **$164.25 weekly** for 3 months; Langley (Dak. liveryman) **$115 first day.** No wonder these men bless the day they joined Fritter's $1,000 class. Reads like fiction, yet it's the gospel truth. **Proven by sworn statements—investigation—personal interviews.**

10 MINUTES' WORK $6.50 Cash, Presto!

IT'S SOLVED. The long-desired, much wanted, universal bathroom has come. Requires **no plumbing, no waterworks—no water systems. 10 minutes to install—$6.50 to buy. The equivalent of any $200 bathroom.** Self-heating—hot or cold running water facilities. Cleansing, friction, massage and shower baths in any room. No tubs to clean bowls or buckets to fill. Simple, durable, handsome, sanitary. The dream of millions come true. Modern homes, modern bathing facilities within the easy reach of every man, woman and child in the land. No experiment. **Used by U. S. Government. Over 200,000 delighted customers.** With such an article, with exclusive selling rights, with Fritter's help and your nerve you're bound to make from $1,000 to $5,000 this year. **It's not a question of ability, location or capital** (for we **give credit** to active workers), but **whether you act quick enough to get into Fritter's $1,000 class. Once in you're good for a $1,000 anyhow.** Reese solicited 60 people—sold 55; McDaniels 20—sold 19; Lodewick 41—sold 39; 17 orders in one day; Hart "16 in 3 hours"; Wilson 102 in 14 days.

Sectional View of "Energizer"

Address Fritter personally today—make him prove his claims and above all that you too can get $1,000. Don't accept anything without proof. First get Fritter's entire proposition—it's free. Then decide. Just a postal will do.

THE CREAM OF A THOUSAND HOUSES.

The United States is known among all the nations of the world as being given to homes for the people. While the large cities are obliged for economical reasons to tolerate apartment houses, the country places are rapidly building up with small homes, which display the individuality of the owner and the skill of the architect.

Under the above title, Mr. Jens C. Petersen, State Bank Bldg., Traverse City, Mich., has selected from the thousands of homes which he has built, those which come nearest to the ideal of the home owner. A few of these houses run over $3,000, the majority of them being between $1,200 and $2,000.. That these houses can be built for the prices named is vouched for by the statement of the architect, owner and contractor, showing that the houses were actually built within the prices named.

On another page of The National Builder will be found the advertisement of Mr. Petersen, and we believe that those intending to build will do well to have his portfolio of houses before advancing very far with their plans, as the many unique and economical ideas will convince one that Mr. Petersen is at the front in the forward trend in the science of planning homes.

APPLIED ART.

Human ingenuity has made deep inroads into the realm of art. As the printing press revolutionized the world, scarcely less has modern methods of reproduction influenced art.

Where formerly paintings or drawings were prepared laboriously, even if lovingly, by hand, the modern press grinds them out by the thousand. But has the number of artists decreased? Hardly. The demand for them is far greater than the supply, and those who can originate or carry out new ideas are really in line for a good income for life.

Art has truly been commercialized and the art student of today looks forward to a steady position.

Modern schools of art have foreseen the trend of commercialism and have made provision for supplying the lack of competent artists. Among the schools catering to this class of employment is the School of Applied Art, at Battle Creek, Michigan. Here "art for art's sake" is taught, but with it, too, is the undercurrent of training making it possible for the artist to live while practicing his art, and handing down, not one or a dozen paintings or objects of art, to be prized in cathedrals and museums, but thousands of copies which will educate and edify all the people.

Yes, commercialism has recognized art as a help to its success, and applied art is benefited while being so used. One has only to glance at a modern magazine to realize to what an extent the study of Applied Art is of value. On every hand are posters, catalogues, etc., displaying the highest grade of art in its applied or commercial form.

The School of Applied Arts teaches both at its home studio and by correspondence. Many have not the means to enable them to give their entire time to study, but by the correspondence course can soon greatly improve their conditions. Many students report that while studying at home they have made more than enough to pay their tuition.

Anyone contemplating the study of art, whether for their own edification or as a source of income, should consider the courses offered by this school.

THE IMPROVED SIMPLEX CONCRETE MIXER.

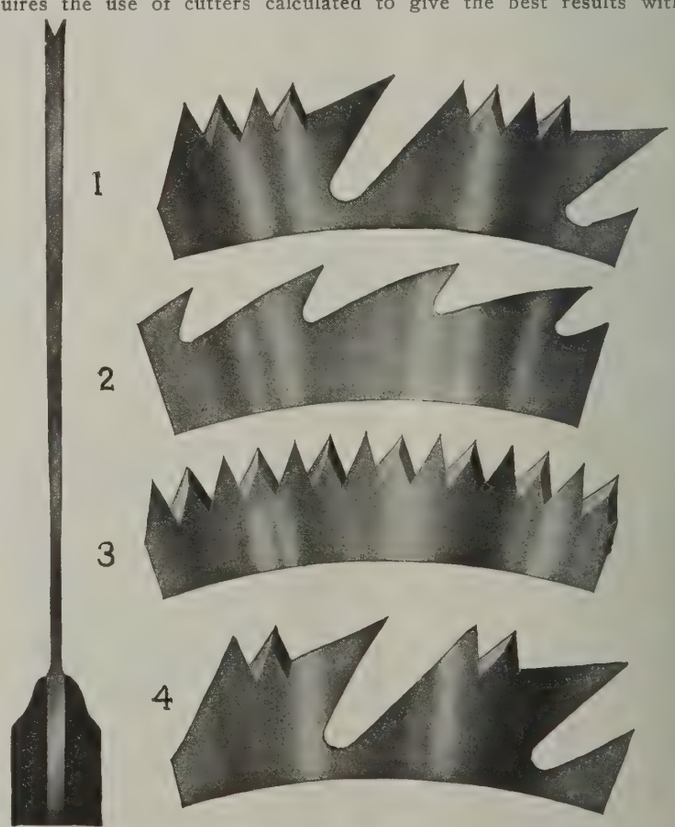
There are many things which enter into good concrete construction. Besides material and mere strength, a certain amount of skill must be used in the selection of the materials and the greatest care used in the working of the same. For various localities, the construction varies considerably, and through the different seasons. details of constructions must be governed by the action of the weather upon the setting of the cement. Many failure are reported from time to time of concrete construction, where forms have been removed before the concrete was perfectly set, and where equally reprehensible work was done by the contractor or his employes.

There are many places where poor work can be done, which will not lead to direct failure. In the matter of concrete blocks, there is practically more latitude between the best construction and the poorest than there is in any other class of construction, which enters into a building. Blocks can be made hard, dense and strong, equal to the best monolithic work; on the other hand, they can be made so soft, porous and weak that the blocks scarcely hold themselves in place at all when put in the wall. The use of poor blocks has done more to prevent the construction of the concrete block industry than any one thing, and it is the more deplorable from the fact that such work is absolutely unnecessary.

There are many machines on the market for the use of the concrete contractor, all of which aid greatly in reducing the expense for labor, the time for construction, the appearance and solidity of the work, and last but not least, the cost of the job. The use of machine mixers is insisted upon in many specifications, and properly so, for it stands to reason that one hundred mixings or turning over of the material in the space of a few minutes is better than half a dozen by hand, taking several times longer. By the use of a machine, concrete is not only mixed quickly, but is more thoroughly mixed and placed in the trench or block machine in much less time than by mixing by hand. It is possible, also to gauge the quantity more accurately.

Many concrete mixers, like the Simplex Mixer as made by the Miles Manufacturing Co., 303 East Franklin street, Jackson, Mich., are practically automatic in their crushing, mixing and discharging; the only labor necessary being to get the material into the various hoppers. With a machine of this character, it is further possible for the superintendent or inspector to watch the work a great deal closer with a great deal less effort, and any contractor knows that any time or labor he can save the inspector will greatly redound to his credit. The contractor who uses a machine of advanced design is soon known as being the leader in his line, and the small cost of a mixer is soon made up by the benefit he receives in this direction.

For several years, the trend of concrete construction, especially in the small towns, has been in the line of concrete blocks. The first of these were made in rough wooden forms, the operation of which was slow and laborious, and not always productive of the best results. Ths variation in sizes was not evenly made, and there was, unfortunately, a variation in the sizes of blocks supposed to be the same size. This necessitated considerable work by the mason inserting them in place, and created an unfavorable impression from their appearance.



The Miles Manufacturing Co. also manufacture a block machine which embraces many of the special principles of the best construction. The machine is uesd with comparatively wet concrete, thus doing away with a large amount of the tampering necessary with some machines, as the blocks are moulded face down, it allows the use of a finer facing ot fine sand, crushed granite, marble or other colored mixture on the face of the stone. The machine is adjustable to make some forty different sizes of blocks from 4 inches to 24 inches in length and from 4 to 12 inches in thickness. It is also adjustable to make bay window blocks, angles of any degree, circles, etc. While a large part of this work is accomplished by means of extra parts, still the machine is complete for all ordinary work at the start.

The manufacturers claim that as they have five thousand machines in use, the "Miles" is deserving of careful investigation. A catalogue of these two and other machines made by the Miles Manufacturing Co., having the complete range of work capable on them, will be sent on request.

HUTHER BROS.

The use of modern woodworking machines is extending so rapidly to the contractors throughout the country in the shape of saw rigs, combination woodworkers, etc., that the contractor has become more or less independent of the planing mill.

The use of these machines to the best advantage, however, requires the use of cutters calculated to give the best results with

the least power. For various classes of work, such as cross-cut sawing, ribbing, dadoing, moulding, grooving, mitering, etc., special forms of cutters are required.

The Huther Bros. Saw Manufacturing Co. of Rochester, N. Y., are experts in the design of saws, cutters, etc., for this class of work. Their last catalogue, called the "Woodworkers' Addition No. 32," shows a vast variety of cutters for various purposes, and shows how the proper cutter may be selected.

The cut shown herewith shows the regular teeth used in their hollow-ground mitre saws. We understand that the Huther Bros. Saw Manufacturing Co. are anxious to give this catalogue a wide circulation and for that reason are sending it free to all who ask for it.

Glidden

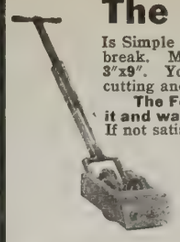
Green Label Varnishes are the highest grade varnishes made. They are made in the largest, most complete and best equipped varnish plant in the world, and are the result of nearly half a century's experience in manufacturing varnishes for all purposes.

Wherefore, it redounds to every builder's credit to use Glidden's Green Label Brand.

To any builder who is interested in the subject of wood finishing, we will gladly send demonstrating panels of Glidden's Endurance Wood Stains and Glidden's Green Label Varnishes They give to interior trim a richness and beauty that cannot be imitated.

The five Brands we recommend your specifying:

	Per Gal.
M. P. Durable Exterior - - - -	$4.00
M. P. Durable Interior - - - -	3.00
M. P. Durable Floor - - - -	3.00
Glidden's Velvet White Enamel (Egg Shell Finish) - - - - - - -	5.00
Glidden's Superior White Enamel (Gloss Finish) - - - - - - -	5.00



These varnishes are high in price, but as the finish is the final touch that completes the job, the finishing material should be of the best. Price ought not to be considered.

CORDESMAN-RECHTIN CO. 10 Butler Street CINCINNATI, O.

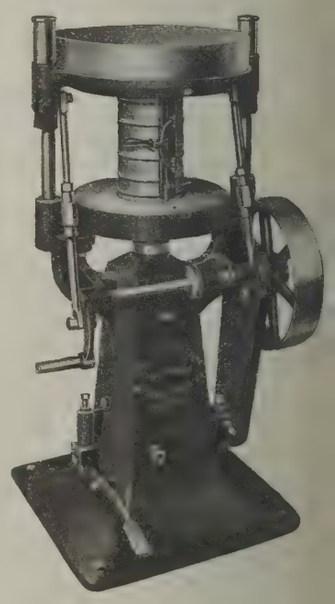
"DURABILT COLUMNS."

Possibly the greatest objection to wood columns is due to the tendency to warp or shrink and so open up joints extending far into the center of the column. In an ordinary column this means entirely through the shell, so that an opening is made for dampness to enter, starting trouble right away where it is difficult to get at it.

One of the methods used to overcome trouble of this character is shown in the method adopted by Harris & Cole Brothers of Cedar Falls, Iowa. A column made in this manner has no exposed joints to be affected by the weather, whether the column is kept painted or not.

Harris & Cole Brothers are well known as manufacturers of the finer grades of red gum and oak finishing lumber, trim and mouldings. Their facilities for getting out special widths and sizes on short notice are surpassed by few mills in the country, and their large stock is of the first quality.

SIMONDS GUIDE FOR MILLMEN.



In a neat little booklet the Simonds Manufacturing Company of Fitchburg, Mass., takes a party of interested millmen through their plant at Lockport, N. Y. From the offices, through the melting rooms where crucibles are carefully filled with the necessary ingredients to make perfect steel, the chemical laboratories where a careful check is kept on all the processes, to the rolling mill, is a fascinating trip for those who consider the quality of the material. Many metals take a fine polish, but few meet the severe tests necessary to class it as saw material.

For the manufacturer, the businesslike manner in which the rolling, shearing, cutting, stamping, finishing, etc., is carried on call for his approval.

But there is one place where the visitor is not allowed to enter, although its purpose is plain. Under the big "Danger—Keep Out" sign is the transformer house, where the high tension wires from the big Niagara Falls turbines enter with their tremendous power to be stepped down to a safe current for the many motors throughout the plant. From three thousand volts the current is reduced to four hundred and forty. Thus, if he wishes, every Simonds saw owner can at the same time possess a souvenir of Niagara Falls, made by electricity.

Those interested in seeing how extensive a plant is necessary to keep up the demand for Simonds goods can obtain this interesting booklet by writing to the Simonds Manufacturing Company of Fitchburg, Mass., and mentioning the January, 1912, number of Simonds Guide for Millmen.

CEMENT DRAIN TILE.

While some sections of the country are clamoring for water for their parched and dry land, others are praying for relief fom too much water. If it were possible to mix the soil, seasons and climate of the dry portions of Oregon and Washington with the swamp lands of Mississippi and Louisiana, the result would probably be an ideal condition for farming purposes.

But it is not alone the very dry countries that want water, nor the very wet that would get rid of it. Much of the finest soil in the United States suffers for want of proper drainage at certain seasons of the year. Books have been written on the subject, fortunes spent to reclaim acres of land by drainage.

The underlying requirement of drainage is "tile," and permanent results are obtainable only by permanent drain tile.

For many years the agriculturist has depended upon burned clay tile for his supplies, and it is only in recent years that it has been possible to find a substitute at a reasonable price, in fact, one which every cement worker could make without a large outlay for equipment, buildings, storehouses, etc.

With the advent of cement products, at reasonable prices, efforts were made to perfect a machine by which cement drain pipes could be made in quantities and at low cost. A cylindrical form and casing would do the work, possibly, but at an enormous loss of time and material.

The W. E. Dunn Co., 4135 Fillmore street, Chicago, Ill., recognizing the need for a practical machine of this character and being well versed in the manufacture of machines for making cement blocks, cement brick and cement porch columns, have placed on the market a machine for making cement drain tiles, which they claim eliminates much of the inconvenience usually attending work of this character. So certain are they that it will meet every requirement, that we understand they offer to send it on fifteen days' free trial. So many other good points are claimed that we ask every interested reader to get their catalogue and see for himself. The machine as shown herewith will give a good idea, but if one has use for it, the real machine will be shipped on approval. It takes faith in one's machine to send one out under such conditions, but we believe the W. E. Dunn Co. have the goods.

Be the man who gives orders

If you aspire to be one of the men who do things, to rise above the poorly paid class, and to be independent, you must have special training. You have the ability, but it is latent, it needs developing. By our practical and complete correspondence courses we can positively teach you to become proficient in DRAFTING—

Estimating, Plan Reading, etc., by Mail

in full or partial courses to fit your individual need. The courses cover every conceivable branch of the building trades. Conducted by a large and successful firm of Chicago architects—your lessons are supervised by them. Blue prints of buildings actually being erected in Chicago to study from. Courses are especially prepared for contractors, bricklayers, carpenters and all men in construction work. Low tuition, easy terms. No text books to buy. Send for instructive folder.

CHICAGO TECHNICAL COLLEGE, 655 Athenaeum Building, Chicago, Illinois

We also teach these same courses, including architectural, mechanical and structural drafting, at our Chicago School. Day and evening classes. If interested in the resident course ask for Catalog y.

Move the Old House to Another Lot—Instead of Wrecking It—You Can Make More Money by Doing So

THE LA PLANT HEAVY HOUSE MOVING TRUCKS ARE MADE

Of steel—on scientific lines—are interchangeable so they can be worked singly, in pairs or in fours. Write for Catalogue N and see how easy it is to wheel a building a mile in a day—and how little the cost is for La Plant outfit compared with the profit to be made in moving houses instead of wrecking them.

LA PLANT TOOL CO. 900 E. Nevada St., MARSHALLTOWN, IOWA

You Ought to Know Me by This Time

I'm the man that stands for the BAY STATE BRICK and CEMENT COATING. It is a sure protection against moisture when applied to concrete, stucco, plaster or brick. It does not destroy the pleasing texture of concrete and the best architects and builders specify it.

Your stucco or concrete house or mill needs my coating. I've been making my coating for more than twelve years and have learned by experience the requirements of concrete, cement and stucco construction. My coating sticks where it is put and is a fire retarder.

KRAOPLATE BLACKBOARDS.

Educational lines are being extended so rapidly that those directly interested realize the advances which are being made. New systems of teaching are being introduced, new methods and theories being worked out. To carry out advanced lines of thought, many buildings are being replaced by others of modern construction, and the equipment should be in keeping with the rest of the building.

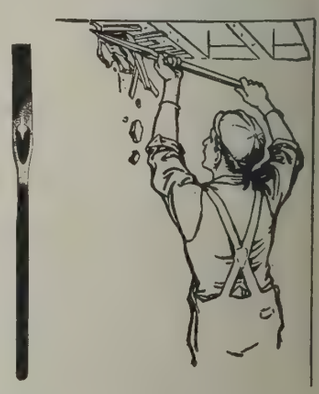
For many years it has been recognized that one of the best methods of teaching the little scholars many things is by blackboard illustration. Only those who attended, or visited, the "country-school" realize how imperfect these blackboards can be. Rough, cracked, spotted, glazed, shiny, bare, a source of torment to teacher and scholar, and a continual expense to the district.

Many efforts have been made to produce a perfect surface for blackboards. Coatings on plaster are, as a rule, short-lived and unsatisfactory for hard usage. A dense substance, that neither water nor hard usage will affect, is necessary as a base, and the surface must retain its color and surface through all the usage to which it will be subjected.

The Atlas School Supply Company, 1020 Van Buren street, Chicago, Ill., are making a specialty of Kraoplate, which in many respects forms an ideal surface, so heavily coated with waterproof slating that we understand the manufacturers guarantee it for ten years under ordinary schoolroom usage.

Those having the erection, alteration or equipment of school buildings under their supervision are urged to investigate Kraoplate blackboards, as their low price makes their use advisable, and we understand that a special price is made to carpenters and contractors. The Atlas School Supply Company also manufacture and handle a large line of other school supplies.

RIB LATH AND RIB STUDS.

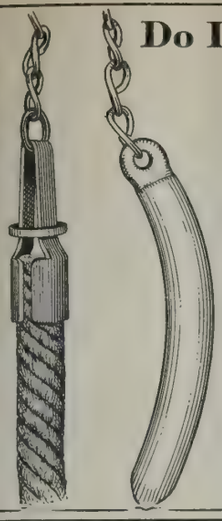


Fireproof construction, if used at all, should be carried out to the logical limits. If the outside walls are fireproof, it decreases the exposure hazard, but the interior remains subject to the ravage of the flames which originate within the building.

That interior fireproofing is possible is seen from a catalogue of the Trussed Concrete Steel Company of Detroit, Mich., showing the construction possible with their rib lath and rib studs for plaster and stucco. The pages show examples from small cottages to large apartments in which this construction is used, and shows the wonderful adaptability of this form of stud and fabric.

Not only can this lath be used for interior partitions, but for the exterior walls as well. The finest effects in stucco are obtained, while the construction is also incombustible. The drawings in the booklet showing the details of construction are good examples for the draftsman to follow, and the builder will find many items of value in the pages of this excellent booklet, which we understand is sent on request.

A NEW PRY AND NAIL PULLER.



It is an expensive pry for the carpenter who takes one of his fine framing chisels to use as a crow-bar when a piece of flooring or ceiling is to be removed. It is expensive because the chisel is not made for that purpose and it is generally broken or at least dulled. Also, when it comes to pulling out a nail, and one of those nails made made years ago and driven into a piece of hardwood for the purpose of staying right there, the carpenter will find his hammer unable to pull the nail out.

The illustration accompanying this article shows the Bonner pry bar and nail puller, which the manufacturers state is even handier than a hammer. It is made in 14 and 23-inch sizes of special dull steel and tempered to stand the hardest wear and tear.

The small size is an especially good tool for the home owner to have around. The larger size is blue finished and just what the average carpenter and contractor likes. This new tool can be bought at the hardware stores or direct from the manufacturers. It is made by the C. O. Bonner Mfg. Co., Champaign, Ill., who are mailing circulars about it at this time.

THE EXTERIOR—PORCH CEILINGS ARE OF UTILIAY WALL BOARD.

A UTILITY WALL BOARD BUNGALOW.

When Mr. Ellis of Hot Springs, Ark., decided to build there was no doubt in his mind but that he wanted a perfect home, within the limits of cost and other conditions. From the satisfactory results which he obtained and the praise he received from his visitors, he is

THE LIVING ROOM.

more than ever convinced that Utility Wall Board was just the thing to use.

In accordance with his first plans, every one of the five rooms in the bungalow is finished with Utility Wall Board. The bathroom and halls also have the walls and ceiling of the same material, and the ceilings of the porches are likewise in panels of this most satisfactory covering.

A BED ROOM.

In this case, the owner was looking for "ideal" results. Why not judge from the photographic reproduction whether or not he is satisfied?

While cost is not necessarily a determining factor, the low price of Utility Wall Board makes a building cost materially less than one with plaster. The convenience and ease with which it is put on, and the saving of time would be enough to warrant its use at even an increase over plastered surfaces.

But suppose you want to decorate your walls—you can wait a few months for plaster to dry out and set thoroughly, so that the lime will not burn the colors out of the paper or kalsomine. The bare white walls will soon be covered with finger marks and dust, and isn't it a temptation to mark on a nice white wall, especially after someone else has made a few lines on it?

With Utility Wall Board the first operation is the only one, and the wall is ready for decoration, whether by oil or water paint, enamel, paper, burlap or tapestry.

Anyone having taste enough to pass upon a set of plans for his home has sufficient talent to select the colors and materials to decorate the walls. Except in some of the higher grades of paper-hang-

THE KITCHEN.

ing and burlap, the ordinary householder can do all his decorations himself at his leisure, making his house a real home with his own hands.

But while we have spent considerable time on this bungalow, we should remember that this is only one of the many places where Utility Wall Board may be used to advantage. As it comes in large sheets, forming a water-tight and air-tight surface, it is of value wherever it is desired to exclude the air, moisture, heat or cold. Its homogeneous nature prevents its warping, twisting or opening up at the joints. As it is waterproof, it repels the moisture where plaster, cement and similar surfaces usually soak it up like a sponge.

Utility Wall Board is possible not only in new buildings, but in old. Where plaster is damaged and falling it can be used to good advantage. When the attic roof beams are bare and cold, use it, and have a nice, livable room. When you want to refinish your living room, or dining room, use Utility Wall Board, and put on a beamed ceiling at small cost.

So many places might be mentioned that we can only refer you to the manufacturers, the Heppes Co., 4502 Fillmore street, Chicago, Ill. Their large, new catalogue shows many pleasing examples which are well worth studying.

Amatite ROOFING

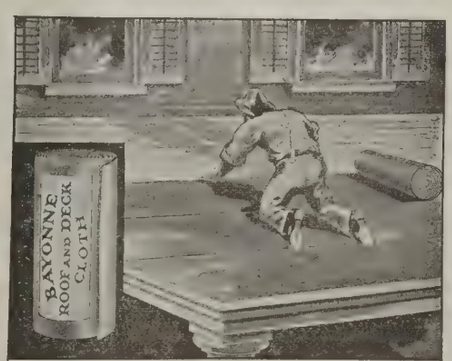
Mineral Surfaced

Needs No Painting

EVERYTHING about Amatite appeals to the man with common sense. He can see its superiority at once—the real mineral surface *which never needs painting;* the two layers of Pitch which is the greatest waterproofing material known; the two layers of heavy Tarred Felt—all these contribute to the popularity of Amatite.

We can make Amatite better and cheaper than anyone else on account of our greater facilities, and consequently we sell it at a surprisingly low figure.

Simply the fact that it needs no painting is enough to make a man sit up and take notice—especially the man who has spent time and money in painting and repainting smooth surfaced roofings.



Write today for further information.

Asbestos "Century" Shingle Roof—Residence F. B. Tainter, Scarsdale, N. Y. Architect, Benj. Edwards, Scarsdale, N. Y. Contractor, J. T. Booth, Scarsdale, N. Y.

Asbestos "Century" Shingles

"The Roof that Outlives the Building"

The extremely light weight of Asbestos "Century" Shingles means a good bit more saving to your client than perhaps you realize.

You can plan for a lighter roof framing—probably a lighter framework all the way down to the foundation.

That's a big item saved—especially the way lumber prices are now. It may make enough difference to provide him that extra room he'd like to have—or added niceties in trim and decoration and plumbing.

In every way it will pay you to look into Asbestos "Century" Shingles. They are absolutely fire-proof. They do not deteriorate with weather, climate or time. They need no painting—no repairs.

You can get Asbestos "Century" Shingles in numerous shapes and sizes—and in **three colors**—Newport Gray (silver gray), Slate (blue black), and Indian Red.

New Books for Building Mechanics

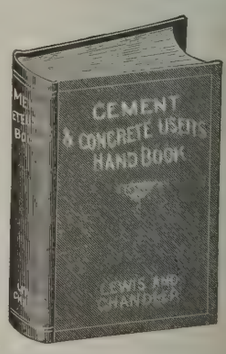
MODERN PLUMBING ILLUSTRATED. By R. M. Starbuck.

This book represents the highest standard of plumbing work. It has been adopted and used as a reference book by the United States Government, in its sanitary work in Cuba, Porto Rico and the Philippines, and by the principal Boards of Health of the United States and Canada.
It gives connections, sizes and working data for all fixtures and groups of fixtures. It is helpful in demonstrating and in figuring work. It gives the mechanic quick and easy access to the best modern plumbing practice. Suggestions for estimating plumbing construction are contained in its pages. This book represents, in a word, the latest and best up-to-date practice, and should be in the hands of every architect, sanitary engineer and plumber who wishes to keep himself up to the minute on this important feature of construction. 400 octavo pages, fully illustrated by 55 full page engravings. Price.....**$4.00**

STANDARD PRACTICAL PLUMBING. By R. M. Starbuck.

A complete practical treatise of 450 pages covering the subject of Modern Plumbing in all its Branches, a large amount of space being devoted to a very complete and practical treatment of the subject of Hot Water Supply and Circulation and Range Boiler Work. Its thirty chapters include about every phase of the subject one can think of, making it an indispensable work. Fully illustrated by 347 engravings. Price.....**$3.00**

PRACTICAL STEAM, HOT-WATER HEATING AND VENTILATION. By A. G. King.



This book is the standard and latest work published on the subject and has been prepared for the use of all engaged in the business of steam, hot water heating, and ventilation. It is an original and exhaustive work. Tells how to get heating contracts, how to install heating and ventilating apparatus, the best business methods to be used, with "Tricks of the Trade" for shop use. Rules and data for estimating radiation and cost and such tables and information as make it an indispensable work for everyone interested in steam, hot water heating and ventilation. It describes all the principal systems of steam, hot water, vacuum, vapor, and vacuum-vapor heating, together with the new accelerated systems of hot water circulation, including chapters on up-to-date methods of ventilation and the fan or blower system of heating and ventilation. 367 pages. 300 detailed engravings. Price.....**$3.00**

CONCRETE CHIMNEYS, SLATE AND ROOF TILES. By A. A. Houghton

The manufacture of all types of concrete slate and roof tile is fully treated. Valuable data on all forms of reinforced concrete roofs are contained within its pages. The construction of concrete chimneys by block or monolithic systems of is fully illustrated and described. A number of ornamental designs of chimney construction with molds are shown in this valuable treatise.....**50 Cents**

POPULAR HANDBOOK FOR CEMENT and CONCRETE USERS. By Myron H. Lewis

This is a concise treatise of the principles and methods employed in the manufacture and use of cement in all classes of modern works. The author has brought together in this work, all the salient matter of interest to the user of concrete and its many diversified products. The matter is presented in logical and systematic order, clearly written, fully illustrated and and free from involved mathematics. Everything of value to the concrete user is given, including kinds of cement employed in construction, concrete architecture, inspection and testing, waterproofing, coloring and painting, rules, tables, working and cost data. Price.....**$2.50**

ORNAMENTAL CONCRETE WITHOUT MOLDS. By A. A. Houghton.

The process for making ornamental concrete without molds, has long been held as a secret and now, for the first time, this process is given to the public. The book reveals the secret and is the only book published which explains a simple, practical method whereby the concrete worker is enabled by employing wood and metal templates of different designs, to mold or model in concrete any Cornice, Archivolt, Column, Pedestal, Base Cap, Urn or Pier in a monolithic form—right upon the job. These may be molded in units or blocks, and then built up to suit the specifications demanded. This work is fully illustrated with detailed engravings Price.....**$2.00**

CONCRETE FROM SAND MOLDS. By A. A. Houghton.

A practical work treating on a process, which has heretofore been held as a trade secret by the few who possessed it, and which will successfully mold every and any class of ornamental concrete work. The process of molding concrete with sand molds is of the utmost practical value, possessing the manifold advantages of a low cost of molds, the ease and rapidity of operation, perfect details to all ornamental designs, density and increased strength of the concrete, perfect curing of the work without attention and the easy removal of the molds, regardless of any undercutting the design may have. 192 pages. Fully illustrated. Price.....**$2.00**

CONCRETE WALL FORMS. By A. A. Houghton.

A new automatic wall clamp is illustrated with working drawings. Other types of wall forms, clamps, separators, etc., are also illustrated and explained.....**50 Cents**

CONCRETE FLOORS AND SIDEWALKS. By A. A. Houghton.

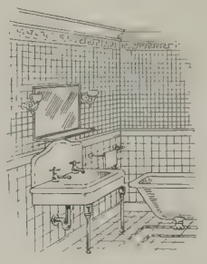
The molds for molding squares, hexagonal and many other styles of mosaic floor and sidewalk blocks, are fully illustrated and explained.....**50 Cents**

CONCRETE SILOS. By A. A Houghton.

Complete working drawings and specifications are given for several styles of concrete silos, with illustrations for molds for monolithic and block silos. The tables, data and information presented in this book are of the utmost value in planning and constructing all forms of concrete silos....**50 Cents**

MOLDING AND CURING ORNAMENTAL CONCRETE. By A. A. Houghton.

The proper proportions of cement and aggregates for various finishes, also the methods of thoroughly mixing and placing in the molds, are fully treated. An exhaustive treatise on this subject that every concrete worker will find of daily use and value.....**50 Cents**



Any of these books sent prepaid on receipt of the price. Address **NATIONAL BUILDER, Pontiac Building, CHICAGO, ILLINOIS**

METAL TILING

For the Kitchen and Bathroom.

Carpenters can apply it.

METAL CEILING

Something exceptional—out of the ordinary class—and as plain or elaborate as you like. Patterns especially adapted for residence work. Nothing better for a new house, or to repair an old one. Catalogue.

Northrop, Coburn & Dodge Co., 30 Cherry Street, NEW YORK

THE ROOFING PROBLEM

Will be confronting you Contractors and Builders again before long.

Prospects for spring business are good and the demand for

CORTRIGHT METAL SHINGLES

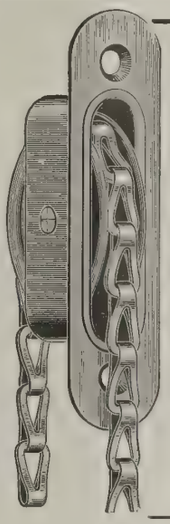
will be heavier than ever, for there is no question that they are supplementing the wood shingle in all progressive sections of the country.

They're fireproof, stormproof, handsome, easy to put on—yield a good profit to you, and last as long as the building itself without needing repairs.

Our special proposition to contractors and builders will interest you. Better write for it today.

Cortright Metal Roofing Co.
Philadelphia and Chicago

Taylor Portable Steel Derrick



Tested at factory, hoisted and swung complete circle 1900 lbs. Shipped ready to operate. No wrench or tools required to set derrick on job. Made in two sections. Beam section connects post by tipping in a vertical position and projects at such an angle to clear side wall of building and has sufficient height to hoist wheel-barrows, window frames and timbers. One man can climb a ladder with either section. Consider the durability of a derrick constructed entirely of malleable Iron and Steel and that of Wood, more compact, more powerful.

Derrick complete with three way block, channel steel brackets, bolts for attaching to building, price $40.00, and four and one-half cents per ft. for crucible steel cable attached. Drum capacity 300 ft.

Special platform and chains for attaching derrick to gondola railroad cars, price $15. Chains for hoisting wheelbarrows, price $2.00.

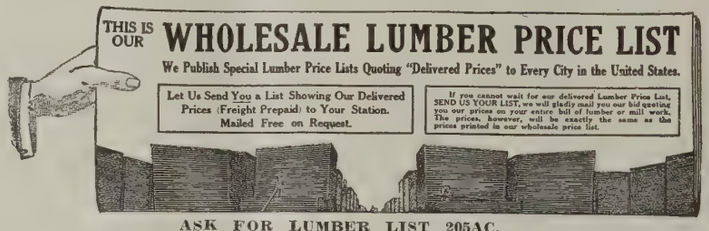
LUMBER, LATH AND SHINGLES

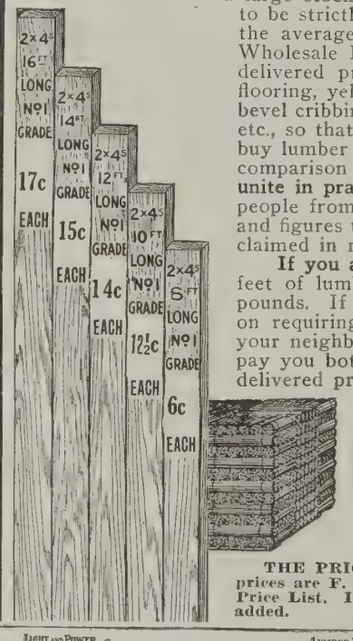


VIEW OF PLANT IN ILLINOIS.

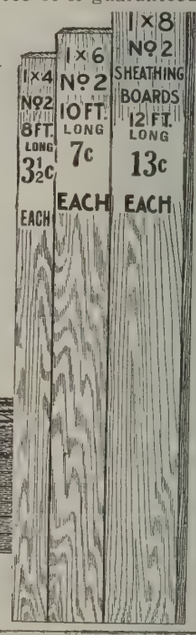
THE WHOLESALE AND RETAIL MERCHANTS BUY LUMBER FROM THE PRODUCING MILLS, WHY DON'T YOU?

We Are Producers and Can Save You $100.00 on the Average House Bill of Lumber

You save lumber dealers' profits when you order from us. Better still, we give you a finer grade of material than the average dealer carries. Furthermore **we can insure delivery in a few days.** We are now operating **two immense lumber plants,** one in Louisiana, another in Illinois. Our Louisiana plant is located in the great lumber forests with saw mills, dry kilns, log trains, planing mills, etc., in connection, permitting us to control our costs and grades and enabling us to sell you the finest lumber manufactured for all building purposes at strictly manufacturer's prices. Our Illinois plant is located on the two largest and fastest freight railroad systems in the North with direct connections to over twenty different railroads. We make a specialty of prompt shipment from this point to the Central and Eastern States, reducing the time in transit from weeks to days. Whether you want a single carload of lumber or twenty carloads, we can make shipment in record breaking time. Remember, our prices to you are strictly manufacturer's wholesale prices, in most instances a saving of from $5.00 to $10.00 per thousand feet.

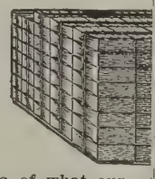


EVERY MAN THINKING OF BUILDING SHOULD HAVE THIS PRICE LIST



THE OPPOSITE PAGE SHOWS WHAT WHOLESALE PRICES WILL DO

ASK FOR LUMBER LIST 205AC.



930 DIFFERENT DESIGNS AND SIZES OF BUILDING LUMBER for all building purposes. Do you realize what it means to have such a large stock of this great big assortment of lumber located at a nearby plant, every piece of it guaranteed to be strictly up to grade and which can be purchased at a saving of about $100.00 on the average order? **We pay the freight to your station** when you order from our Wholesale Lumber Price List, which you can have for the asking, and which quotes delivered prices on yellow pine and cypress finishing lumber, yellow pine and fir flooring, yellow pine ceiling, siding, partition, dimension lumber, shiplap, plain boards, bevel cribbing, joists, lath, cypress and red wood siding, cypress and red cedar shingles, etc., so that you can tell to a penny what a carload of lumber will cost you. Do not buy lumber of any kind until you get this list. It will pay you to make an intelligent comparison of prices. **Architects, construction companies, contractors, carpenters all unite in praising the quality of our lumber.** In our lumber list we print letters from people from Connecticut to Colorado who have bought lumber from us, giving facts and figures that will surprise you, and proving beyond a shadow of a doubt all we have claimed in regard to **saving, quality and quick service.**

If you are thinking of building even a small size house you will need about 9,500 feet of lumber, 14,000 shingles and 10,000 lath. This will make a carload of 30,000 pounds. If you have a barn or any other outbuildings to put up you can safely figure on requiring a minimum carload. If you only require a few thousand feet, perhaps your neighbor has some building to do and can order his lumber with yours. It will pay you both handsomely to make up a club order and secure our wholesale carload delivered prices.

Do not forget that we are producers of lumber, operating two big plants. You can purchase lumber from us for the same money that your local dealer pays for his supply. Write for our Wholesale Lumber Price List today.

THE PRICES shown on this page are for the purpose of giving you some idea of what our prices are F. O. B. our Southern mill (without freight added). Write for our Wholesale Lumber Price List. It names you these same items, also our full assortment, with freight to your station added.

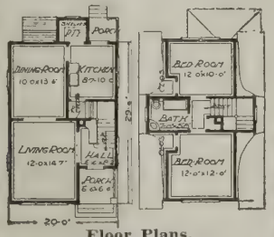
WHICH ONE OF THESE HOUSES INTERESTS YOU?

TO EVERY CARPENTER AND BUILDER

Here's a Gift of $20.00

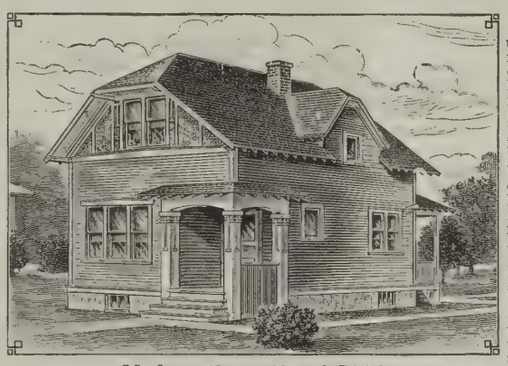
PLUS A SAVING OF NEARLY ONE-HALF.



We can now furnish plans for 110 modern homes, all of which we illustrate and describe in our new Book of Modern Homes. We will send this book free and postpaid to every reader of the American Carpenter and Builder. Write for it. Read about the wonderful bargain on this page which we offer you for February. We practically make you a present of $20.00, but remember that even at our regular price the materials which we furnish for Modern Home No. AC194 for only $599.00 is worth fully one-third more.

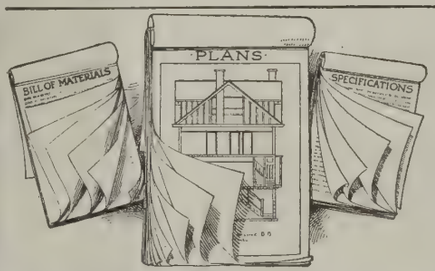
Note the sketches of the different houses on this page. They will give you some idea of the splendid assortment of designs shown in our Book of Modern Homes. If you are interested in any of these houses just cut out the little picture, paste it on your letter and ask us for any information regarding it you may think necessary. We will be glad to answer your inquiries without any obligation whatever on your part.

Ask for Catalog AC196.



$599.00 IS OUR REGULAR LOW PRICE | **OUR FEBRUARY PRICE IS $579.00**

Floor Plans.



Do You Know Why We Can Save You So Much Money on a House? The Opposite Page Tells the Story. READ IT.

Modern Home No. AC194

Here is a five-room house that can be built complete for $1,250.00. We furnish all of the material, consisting of lumber, lath, shingles, siding, finishing lumber, building paper, pipe, gutter, sash weights, hardware and painting material for $579.00. After February 29th our price will be $599.00. If we receive your order at any time before March 1st we will ship the material whenever you get ready to start building up to June 1st at this low price. Look into the merits of this house, send for the plans and examine them thoroughly. We expect to sell 100 Modern Homes No. AC194 during this sale, and we are willing to sacrifice our own profit for the advertising these 100 houses will bring us.

TAKE THESE PLANS FOR 50 CENTS.

We have never before offered a set of plans for less than $1.00, but in order to show you what a big bargain we are offering you in Modern Home No. AC194, we will sell you during February, the complete blue prints, specifications and an itemized bill of materials for only 50 cents. Order now and save half a dollar.

THE ORIGINAL TRACINGS FOR OUR HOUSES COST US $100.00 A SET. The architectural service, which usually costs a builder from $100.00 to $200.00, we offer you practically free. Get the plans for Modern Home No. AC194, study them if you like, but if you want to take advantage of a free gift of $20.00 be sure to get your order for the material to us before March 1st. You do not have to start building before June 1st and we will make shipment at any time before that date to suit your convenience.

Would you like to see reproductions of actual photographs of houses built according to our plans and with our material in all sections of the country? You can see them in our Book of Modern Homes, together with letters from the builders, telling of substantial saving, high quality and good service.

When you are writing for our Book of Modern Homes enclose 50 cents in stamps or money order and ask us to send you the plans for Modern Home No. AC194. BETTER DO IT TODAY. **THE BOOK OF MODERN HOMES IS FREE.**

OUR NEW BUILDING MATERIAL AND MILL WORK CATALOG IS NOW READY.

Our 1912 edition of our big Building Material and Mill Work Catalog is now ready, containing many new items, new illustrations, new cover design and filled from the first to the last page with the greatest building bargains it is possible to secure. We will send it to you free with the plans for Modern Home No. AC194, or if you do not want the plans at 50 cents a set, write for the catalog anyhow. You will have some repairing or remodeling to do during the coming months. This is the book that cuts your expenses down to nearly one-half. Compare the prices shown below with the prices you are now paying. We can make you a proportionate saving on all kinds of doors, windows, door and window frames, flooring, moldings, etc., of guaranteed quality.

28 Years Experience. 3½ Acres of Floors

Introductory Trial Offer

If the SELF-SETTING PLANES are not sold in your town and you write us saying "I saw your trial offer in N. B.", we will send you particulars, a carpenter's pencil and our $1.00 CERTIFICATE, which we will receive as $1.00 in part payment for a SELF-SETTING PLANE, as stated in our $1.00 CERTIFICATE, and if this S. S. PLANE is unsatisfactory and returned at our expense, we will send you $1.00 more than you sent us, as the $1.00 CERTIFICATE says.

As this paper guarantees we will do as our advertisement says, you know the plane must be O. K.

ALL WE ASK is to have you TRY the SELF-SETTING PLANE on your own bench, in your own way, with or against the grain, on the WORST cross-grained eaty, knurly, knotty, hard or soft wood you can find, THAT IS FREE FROM SAND OR DIRT.

If it is not worth to YOU or YOUR MEN, TWICE ITS COST, return it at our expense, as above stated.

If you send us the addresses of ten carpenters, no matter where they live, we will send you another carpenter's pencil, hard and tough.

Give the SELF-SETTING PLANE a chance to PROVE ITS WORTH if it fails, RETURN IT AND WE WILL RETURN YOUR MONEY.

Carpenter's Hard, Tough Pencils, 30c per dozen, postage prepaid.

FROM FOUNDATION TO FLAGSTAFF

Don't stick along at an **under** job through all the best years of your life. Don't let the humdrum drudgery of every-day routine CRUSH your ambition. Don't be satisfied with merely pushing a saw and driving nails. Learn to PLAN as well as to work—to use your BRAIN with the **same skill** that you use your hands. Learn to fill a BIG SALARIED job—the kind of a job that hundreds of other men, with no more natural ability than you, are filling with ease and success.

HOW YOU CAN LEARN MORE AND EARN MORE

You can MASTER EVERY DETAIL of your line of work. EVERY BRANCH of building construction, EVERY ANGLE of architecture and carpentry—can do it in your spare moments and at almost no expense at all. You can have the knowledge and experience of over FOUR SCORE EXPERTS at your command ready for instant use whenever you want it—can fit yourself to **fill any first-class position above you that you desire**—simply by allowing us to place in your hands this great ten-volume set, **without your sending us one cent in advance.**

THIS CYCLOPEDIA OF
Architecture, Carpentry and Building

is the most exhaustive, comprehensive and practical work on the building trades that has ever been published. It covers every detail of building construction from foundation to flagstaff, from common carpenter work to reinforced concrete and steel, from masonry to heating and ventilation; from specifications and estimates to building laws and superintendence. It covers all the PRACTICAL things that you WANT TO know, all the things that you've GOT to know if you're going to be a success. It contains over 4,000 drawings, full page plates, diagrams, etc., has 4,760 pages, is bound in handsome half morocco and printed on special paper in large clear type. No CARPENTER, CONTRACTOR or BUILDING OWNER **can afford to be without it a single day.**

Get these books FREE and see for yourself

just what they are before you send us a single cent. Look them over carefully at your leisure, keep them for seven days before you decide whether you want them or not, and then if you don't believe that each volume is actually worth more to you than the price of the **entire set, send them back at our expense and the transaction won't cost you one penny.** If you do decide to keep them, our charge will only be $24.80, spread out thin in easy payments of only $2.00 a month. We don't ask you to buy these books on our description of them. We don't ask you to trust our judgment. We simply ask you to get the books and see for yourself.

Free with every order received before March 1st, 1912

With each set is included a year's Consulting Membership entitling you to the advice of our business and engineering experts free. This will give you practical help in handling working problems which are too specific to be taken up in detail in the cyclopedias. There will be no limit to this service. A single problem solved for you might be worth more than first cost of the books. Order the books now.

GREYHOUND HAND SAWS

SPEED & EASE

TRADE MARK.

The more you know about hand saws the more you can appreciate "GREYHOUND" hand-made hand saws, with their easy-running and rapid cutting qualities and wonderful durability. This saw will be imitated by others—but not equalled.

They are made from Bishop's Refined "GREYHOUND" Steel—a material which leads everything yet produced for use in hand saws. The purity of the steel, the toughness, the even and accurate temper, gives a saw that is the most suitable for particular work, and the most practical for ALL work where a hand saw is used. Made in both straight and skewback, also narrow patterns. Specify which you desire. Remember our warranty accompanies each saw. And the warranty means that if 30 days' trial does not convince you that the "GREYHOUND" saw is the **best** for your use, you get your money back.

Order one today and let us take all the risk. If you want literature first, write us.

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

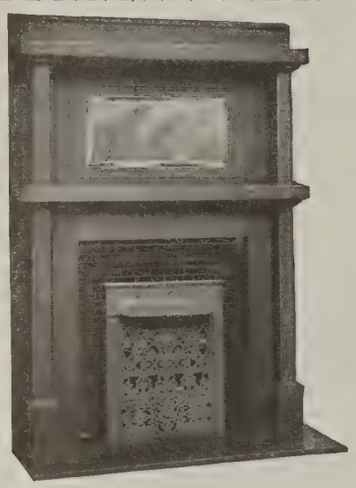
THE DOUBLE CLAW HAMMER

¶ Pulls the nail out straight without a block. ¶ Relieves the strain on your arm when doing scaffolding, siding and ceiling work. ¶ You hold on with your left hand while pulling with your right—this gives you more power and the nail is not rolled into a fish-hook, as with the old hammer. ¶ You drive the nail in again. For "finishing work" the Double Claw Hammer is a great aid, as 10% to 15% of all finishing nails start wrong and must be withdrawn.



Under strong competition you pay 75c for a good hammer. The high nailing feature of the Double Claw Hammer is worth 75c many times over. The straight and easy drawing of nails is worth another 75c. The ease and pleasure in using a tool like this cannot be measured by the slight additional cost. Better handle, better steel, better finish, the better mechanic uses it first.

ASK YOUR DEALER, or send $1.50 and we will prepay charges.

DOUBLE CLAW HAMMER COMPANY
453 Broadway - - - - - Brooklyn, N. Y.

The Double Claw has all the good features of the old hammer, and a lot more besides.

COLOR PLANS and designs for decorating any room in any home, office, store or church with Alabastine, will be supplied by our art department free of all expense to architects, carpenters and builders having charge of such work.

Beautiful cut stencils for carrying out the decorative work now so much in vogue will be furnished by the Alabastine Co., to be used in connection with

Alabastine

THE SANITARY WALL COATING

Where the merit of Alabastine is known there it is used. Any architect, builder, decorator or property owner who comes to know the advantages of Alabastine, becomes an advocate and user of it. We want you to know about Alabastine and to feel that you are doing your customer a favor when you recommend its use.

WHAT IT IS

Alabastine is a water color, fine in texture, artistic in tint, for use on all interior surfaces, whether plaster, brick, cement, wall board or canvas.

It is a dry powder in white and many tints and colors, that may be used as manufactured, or combined and intermixed to produce any color desired.

Alabastine is ready for use by mixing with cold water. It is put up in 5-lb. packages and specially packed in bulk for large jobs where desired.

It is durable, sanitary, artistic and economical. Write us for more detailed information.

WHY IT IS BEST

Alabastine is best because it is durable, by that we mean that when once applied to a suitable surface, it can later be retinted and redecorated, putting succeeding coats of Alabastine over the old ones without the necessity of going to the expense or passing through the disagreeable experience of washing the walls.

Should you ever desire to wash Alabastine from your wall it can be done, which is not the case with paint once it commences to scale off.

An Alabastined wall can be re-coated when soiled at less expense than to wash a painted surface.

FOR NEW BUILDINGS

Alabastine is the ideal material for all new buildings because, unlike kalsomine sold under various names, when once on the wall it forms a perfect surface for any future treatment. Paper can be applied over Alabastine, a new coat of Alabastine can be put on or it may be painted. Many people desire to allow their new building to stand until it is through settling and all cracks have shown. Instead of living in a building with white, glaring walls, soft Alabastine tints may be put on and afterwards treated in any way desired without removing this Alabastine. Alabastine for an ordinary plastered surface or on wall board will not, when purchased at retail price, cost for regular tints to exceed 1½c per square yard for material. The cost of applying would be extra, but it costs no more to apply Alabastine than the cheapest kalsomine.

OVER WALL BOARD

Alabastine makes the only suitable material for use on the various wall boards. It costs much less than paint, is too superior to be compared with any kalsomine, as it is durable and may be recoated. The surfaces of these boards vary, some of them will take a coat of Alabastine with no preparation, others will work by giving them a coat of varnish or shellac size. If interested please write us.

They Save Man Power

ATKINS Silver Steel SAWS

HERE is a clear demonstration of only one of the scientific advantages of SILVER STEEL SAWS. In the picture you will see ATKINS' Famous No. 53 with Perfection Handle. Follow the line down the man's arm and see where the force of stroke is centralized. On the saw teeth. You know that you can push harder and easier from an elevation that is in a direct line. Just so with the Perfection Handle. What could be easier than the motion shown in the picture above? The Perfection Handle is the only shape of Handle that naturally places the saw blade in this position. That's why we recommend it.

Now Note the Dotted Line

See how the straight handle throws the saw blade downward. See where the greatest force is exerted. On the back of the saw. Is this not energy wasted needlessly?

WE MAKE BOTH KINDS

If you still prefer the old style straight handle, ask for the following skew back Saws—Nos. 51, 52, 66, or the following straight back saws—Nos. 54, 55, 64 or 67.

The following are the most popular saws fitted with Perfection Handle. In skew back, Nos, 400, 53, or 68. In straight back, Nos. 65 and 69.

OUR FREE OFFER. If there are any carpenters who have not as yet received one of our aprons free of charge, we will be glad to forward one upon receipt of ten cents to pay postage and will send with it full information in regard to High Grade Saws.

HOW TO BUY THEM. Your dealer most likely sells SILVER STEEL SAWS. If not, he will be glad to order for you from his wholesale house. Specify ATKINS SILVER STEEL. None genuine unless plainly marked "SILVER STEEL" on the blade. If your dealer won't supply you, write to us. We'll see that you are taken care of.

DISSTON TRIUMPH SAW-SET

SPECIALLY ADAPTED FOR HAND SAWS, CROSS-CUT SAWS, CIRCULAR SAWS AND ALL SMALL SAWS.

THE IDEA embodied in this Saw-Set is one that will commend itself to every user of a saw-setting tool. The principal feature is the use of two plungers operated by the two levers or handles; pressure on the lower lever forcing plunger "D" against the body of the saw, thus holding it rigidly in position and preventing slipping, whilst a continuation of the pressure on the upper lever operates plunger "C" in setting the tooth.

In action it is easy and powerful, and while it will perfectly set wide and heavy saws, it is also particularly adapted for narrow blades, such as web saws, narrow band saws, etc. If the gauge "B" is properly adjusted, the result will be a uniformity of set that cannot be obtained by any other hand set.

Another important point is the head of the Set is made open, enabling the operator to quickly adjust the Saw-Set to the tooth, the work being in plain view at all times. The gauge "B," for regulating depth of set, has a wider bearing than in most saw-sets, thus doing away with the tendency to incline the tool to one side or the other, which would give an uneven set to the teeth. The anvil "E" is fitted with four bevelled surfaces, suitable for different sizes of teeth.

IN OPERATING First adjust the anvil so that the bevel most suitable for the size tooth to be set is brought into position, hang the Saw-Set on the saw so that the gauge "B" rests on the teeth; adjust this gauge for the depth of set to be given, by the use of set-screw "A." Use care not to go too deeply into the body of the tooth, as all of the set should be in the point itself. Taking too deep a hold is liable to distort the body of the blade or break out the teeth. The top of plunger "C" should be in line with the top of tooth to be set.

We claim this to be the best Hand Set ever put on the market, and a trial will convince any one of its superior merits. If the instructions as to adjustment are carried out the results will be entirely satisfactory to the operator.

The **Triumph Saw-Set** is manufactured in three sizes, the smaller size, No. 28, being suitable for Hand Saws, Back Saws, Web Saws, narrow Band Saws, etc.; the medium size, No. 18, for small Circular Saws, etc., and the large size, No. 8, for Cross-cut Saws, Circular Saws, etc.

Made only in POLISHED FINISH.

Common Sense Tools for Common Sense Men

WHAT could be simpler than a turned shank? The new RUSSELL JENNINGS PRECISION Bits have turned shanks and can be placed more easily and rapidly with less tightening of the brace chuck than any bit you ever saw. Once placed they stay put; they can never "wobble." These bits are the well-known Russell Jennings, having the extension lip, double twist, and screw point, which has made them the standard of excellence for more than half a century.

THE RUSSELL JENNINGS Precision tools are now put up in a variety of sets, packed in neat basswood boxes, having clips and other devices for holding the tools.

SETS include brace with Precision chuck for Precision tools with turned shank; or Universal Precision chuck for either Precision bits or bits with ordinary shank.

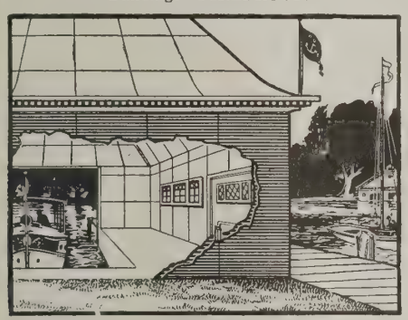
This Will Bring You More Spring Building



Bishopric Wall Board Just the Thing for Park Buildings—FIREPROOF.

Scores of jobs are waiting for you to point out the uses of Bishopric Wall Board. Far better than lath and plaster. Guaranteed to last as long as any building. Cost so low that it can be used in any kind of building. Get our special proposition to Builders and Contractors and prepare NOW, not only for your usual lines of building—Houses, Stores, Factories, etc.—but ALL KINDS OF BUILDINGS FOR AMUSEMENT RESORTS AND PARKS, BOAT HOUSES, BATH HOUSES, CHATAUQUAS, BOOTHS, SUMMER THEATERS, ETC.

Shows Construction of Bishopric Wall Board.

Bishopric Wall Board means the best finish and the speediest finish.

Handsome and Lasting Finish for Boat Houses or Bath House.

Used in the finest residences as well as cottages, bungalows, etc. Makes remodeling easy; no mess, no dirt. Bishopric Wall Board takes paint, paper or burlap.

This is the Year for Lower Priced Materials

Make the most of the opportunity Bishropic Wall Board gives you. Show the owners that Bishopric outlasts laths and plaster many times over; that it is air-tight, moisture-proof, rat and cockroach-proof, a non-conductor of heat or cold, and FIRE-RESISTING. Made with non-burning Asphalt Mastic (our exclusive patent) in which dressed lath is firmly imbedded. Lath is positively necessary to keep any Wall Board flat and rigid, and to prevent warping, swelling and pulling away from seams. Bishopric Wall Board is the only Wall Board made with lath.

Bishopric Wall Board comes to you in sheets 4x4 feet all ready to put on. Any man who can drive nails can apply it. Sixteen sheets to the crate. Price, $2.50 per 100 square feet; $6.40 per crate of sixteen sheets; or 256 square feet. Bishopric Sheathing comes in crates of sixteen sheets, 256 square feet. Price, $2.35 per 100 square feet; $6.00 the crate, f. o. b. Cincinnati.

Bishopric Wall Board makes the most satisfactory finish for office buildings, stores, apartment houses, schools, churches, theaters—every kind of building. Its fire resisting quality has been proved in actual use.

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

FIVE THOUSAND CARPENTERS HAVE ASKED FOR AND RECEIVED SAMPLES OF

UTILITY WALL BOARD

A large majority of them are using Utility Wall Board in the houses and other buildings that they are putting up. Every wide-awake carpenter and builder appreciates the convenience and economy of Utility Wall Board. It appeals to him because it is so easy to put on—so tough and durable—so easily adapted to every type of building—because it does away with all the muss and bother and delay of lath and plaster—because it gives universal and lasting satisfaction wherever it is used.

Utility Wall Board is moisture proof. It does not warp or crack. It is put on directly over the studding—or over old plaster. It will stay on as long as the building lasts.

If you haven't had your free sample, write for it today.
Also for the illustrated book.

Builders Who Know This Modern Wall Lining Use No Other

M. BARRY & SON, of Chicago, Ill., write: "Compo-Board is the best of its kind we have ever used. It is cheaper, cleaner and more easily put on than any material we know of." So say hundreds of others who know from experience. For instance: N. A. Beck, a contractor in Burlington, Iowa, won the everlasting gratitude of a customer by using Compo-Board directly over a plaster ceiling that had begun to crack and fall off in spots. Thos. S. Whitbank, a real estate broker in Philadelphia, uses thousands of feet in remodeling houses. Woodruff Mfg. Co. of Washington, D. C., use many thousand feet in government contracts.

The exclusive features of Compo-Board make it the most satisfactory wall lining. The basis of its construction is a wooden slat, arranged so the grain of the wood runs in different directions, making it non-warpable. It is non-porous and airtight—hence, impervious to cold, heat, moisture and vermin. Can be papered, painted or kalsomined more satisfactorily than plaster, with or without panels. Write for sample and interesting booklet containing many money-making hints for contractors, builders, architects and home owners.

The "ABC" of BEAVER BOARD Construction

The third of a series of twelve monthly talks to carpenters about the practical use of Beaver Board, the pure-wood-fibre wall and ceiling material that is durable, economical, artistic; has none of the disadvantages of lath, plaster and wall paper; and is appropriate to any type of building, new or old.*

Beaver Board is essentially a proposition for carpenters and builders.

CHAPTER III

BEAVER-BOARDING STORES

Here's an almost unlimited field for the carpenter who'd keep busy no matter what the weather or season.

And this field is growing at a tremendous rate.

It's because Beaver Board has so many advantages for this work.

Instead of cracked, dingy plaster and unsanitary wall paper, it means pure-wood-fibre panels, handsomely painted and stenciled—quickly and easily put up.

A clean, light, artistic interior helps to sell the goods. It has every advantage over heavy, expensive, ugly metal ceilings.

You can get frieze and panel effects, wainscoting, covework, arched, beamed or mullioned ceiling effects easily.

Beaver Board makes attractive backgrounds for show windows.

It's just the thing for partitions—the floor space can be quickly and economically partitioned off to suit the tenant.

You can't get away from all these merits—and they mean more work for you. It's a carpenter and builder proposition and has more profit and reputation buying possibilities than any you ever tackled.

We'll Plan the Whole Job for You

We maintain an expensive Architectural Department for your benefit. For the asking, we'll plan the whole job for you and give you estimates also.

Your problem, if it is only that of Beaver Boarding a 10x12 candy store, will be given just as thorough attention as the other fellow's 12-story office building job.

It's Very Easy to Put Up Beaver Board

If the directions which come in every bundle, are followed intelligently, putting up Beaver Board is as simple as assembling the simplest of knocked-down furniture.

These are some of a *very few things* you must be careful about in putting up Beaver Board:

Don't nail Beaver Board closer than 3/8 of an inch from the edge of the panels.

Don't place Beaver Board before using where it will absorb moisture.

Don't put up Beaver Board until all necessary headers and furring strips have been set in between the studs and rafters.

Don't paint Beaver Board until it has been well sized.

Here's Beaver Board's Case in a Nutshell:

Beaver Board is economical, easy to handle, suits any kind or sort of building, retards heat, cold and sound, doesn't crack, check or deteriorate with age.

Beaver Board's endless possibilities for all kinds of uses are fully described in our free booklet, "Beaver Board and Its Uses," with many pictures of different interiors. Write for it today.

*These chapters began in the January number. If you missed back chapters, write us—we'll mail them to you.

BOOST YOUR OWN REPUTATION, MR. CONTRACTOR, BY TELLING YOUR CUSTOMERS—"PUT A STOP TO DEPRECIATION—BUILD WITH CYPRESS *AT FIRST*"

IS THE "LIFE-SAVER" of an HONEST CONTRACTOR'S REPUTATION

Here is a letter just received from a builder who **knows** by experience. Probably you feel the same way. Why not **CUT OUT TROUBLE?**

——— — ——— **Contractor and Builder,** — ——— **Street,**
PITTSBURG, PA., Mar. 22, 1911.

Southern Cypress Manufacturers' Association, New Orleans, La.

Gentlemen: Please send me information about Cypress lumber. Have about a dozen frame houses, from two to 16 years old, which I never get through repairing. Window frames, sash, siding, sills, etc., become rotten in a few years, and *the contractor gets a bad name* (as if it was his fault!)

Yours respectfully, ——— ———

This is a bona fide letter—"hot off the bat." The facts are all too true. HE WILL BE A CYPRESS MAN FOREVER. HOW ABOUT **YOU?**

We say it again—that by honest and intelligent advice on **woods** we are not only saving losses to people who are going to **build anyhow**—but we are also

CAUSING MORE PEOPLE TO BUILD

This is going to be of more and more benefit to **you** month by month. It is **up to you** to intelligently take advantage of this by **learning for yourself** that **CYPRESS** is not only the ONE BEST OUT-DOOR WOOD for the owner—but also the ONE BEST WOOD FOR **YOU.** Cypress **"makes good."** That helps your reputation. Cypress is easy to work—that's **good for your tools.**

We are giving away complete working plans and specifications for THIS SHINGLE HOUSE. Many thousands of people ALL OVER THE U. S. are writing for them. THEY WILL HAVE TO GET **YOU** TO DO THE WORK.

THEY WILL INSIST on CYPRESS.

It will be MONEY IN YOUR POCKET TO HELP THEM GET JUST WHAT THEY WANT.

CYPRESS

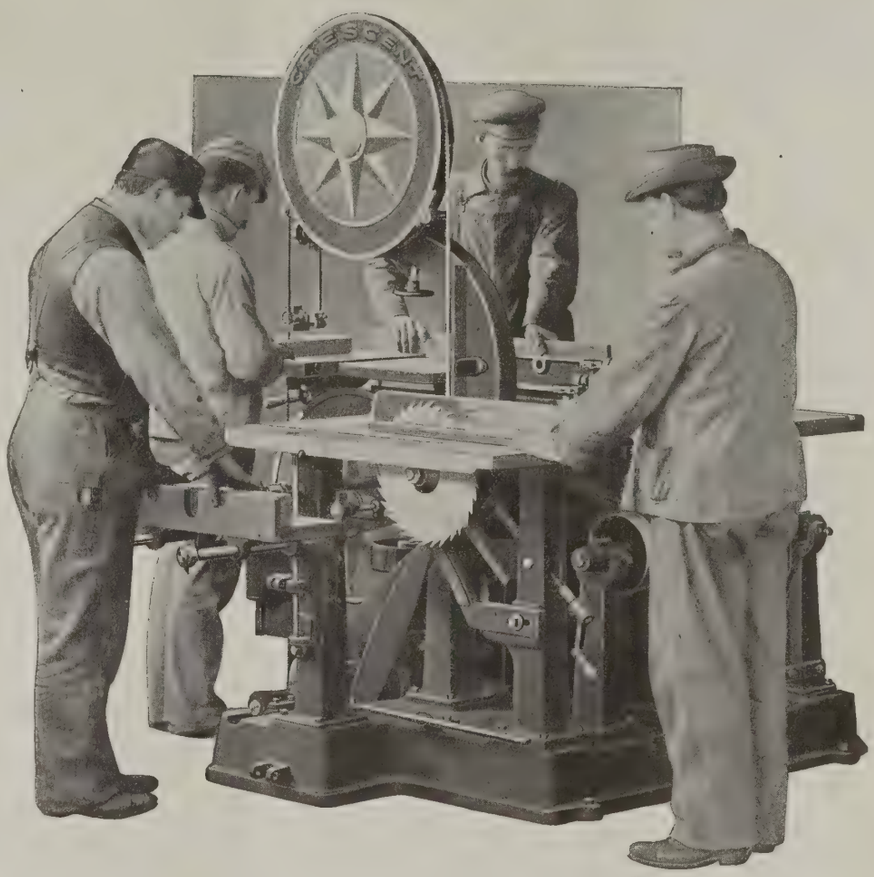
is the "comer" in YOUR territory.

LISTEN FOR IT

Why not FIND OUT what CYPRESS can do for YOU, NOW? WRITE US—ASK YOUR OWN QUESTIONS—about your own needs, big or little. You can rely on detailed and reliable **CYPRESS** information if you address our "BUILDERS' HELPS DEPT." We will recommend **CYPRESS ONLY FOR USES WHERE IT IS THE BEST WOOD TO USE.**

SOUTHERN CYPRESS MANUFACTURERS' ASSOCIATION

1212 HIBERNIA BANK BUILDING, NEW ORLEANS, LA.



We are *producing* CYPRESS—*and talking it—but not retailing it.* BUY IT NEAR HOME. *ASK your lumber man if he sells CYPRESS; if he does not, ask him WHY. Then WRITE US. We will tell you where you CAN get CYPRESS.*

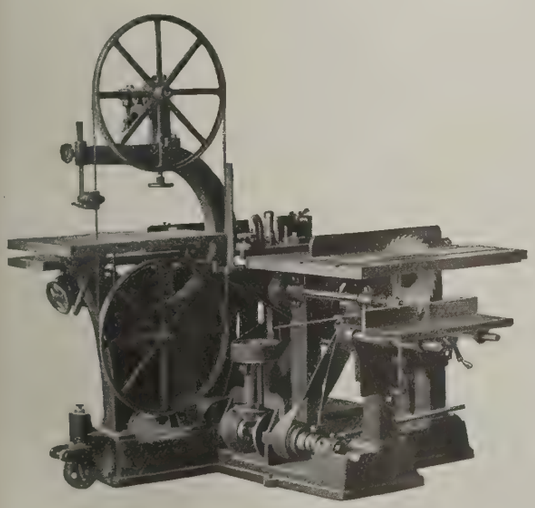
See How Easily Four Men Can Work on The No. 51 Crescent Universal Wood Worker Without Interfering With Each Other

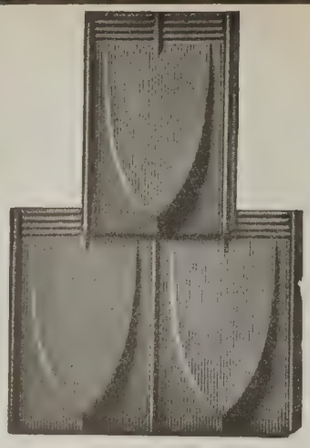


EACH man has absolute control of his own machine, independent of any other. He can start or stop it at will and he can handle his work without hindering his fellow workmen.

Your competitors are investigating the merits of this splendid machine, because they are looking for a machine that will enable them to cut down the cost of their work and increase profits. The No. 51 **CRESCENT** Universal wood worker is the machine that will accomplish this.

Keep in advance of competition and put in this tool, as it will enable you to turn out a greater variety of work than anything you have ever had offered to you. It has special features of construction that make it impossible to compare the machine with any other combination wood worker on the market.

With a machine of this kind in his shop or out on a job a contractor is sure to increase his profits. The machine is better built than any variety wood worker or any combination machine you have ever examined. Each part has its own independent adjustments. The fundamental principle of each machine is identical with larger machines of the same kind.



When you buy this machine you have a complete planing mill instantly at your command. If the combination machine you bought does not come up to your recommendations, look into the merits of this tool. It will please you. If for various reasons you have not investigated the merits of combination machines, send for the circular anyway. You will find something of interest in it and besides we want you to know all about the tool.

If you are interested in our general line ask for catalogue of band saw, saw tables, shapers, jointers, variety wood workers, planers swing saws, disk grinders and borers.

SAP GUM

Three years ago the architect or builder would have had a hard time to find any building of importance in which the owner had been courageous enough to use ***RED*** *or* ***SAP GUM.***

Today there are literally hundreds of apartment houses and fine residences in every section of the United States in which ***RED GUM*** has been deliberately chosen for the trim solely because of its actual beauty and entire practicability; and ***SAP GUM*** has also come into general favor for many builders' uses.

In places where White Enamel trim is required ***SAP GUM*** is the ideal material. Not only does it take and hold the white enamel better than any other wood, but it is possible to get good ***SAP GUM*** cheaper than any other wood hitherto used for White Enamel Woodwork. ***SAP GUM*** presents remarkable qualities where moderate priced trim of good appearance is desired. Another field in which ***SAP GUM*** has reached supremacy is in the manufacture of porch columns. ***SAP GUM*** takes stains and wood dyes beautifully, and the popular Flemish, Mission and Weathered Oak finishes are easily reproduced in ***SAP GUM.***

Anyone planning to build apartment houses, office buildings, hotels, residences or specially designed furniture, should defer final arrangements and correspond at once with any of the following firms regarding samples, prices and lists of important buildings of all types wherein RED and SAP GUM have been used with eminent practical success and signal artistic satisfaction.

1—For the reversible shear cut.
2—Up and down to fit every angle that a scraper edge may be turned to.
3—To scrape corners and close to baseboards.
4—To use entire edge before resharpening.
5—For simple, quick and easy resharpening, without removal of blade.
6—For sandpapering attachment.

b—OF THE OPERATING HANDLE—
1—To an easy working position according to height of the operator.
2—For use in very small rooms or halls.

c—OF THE WEIGHTS—to conform with any size of scraper edge that may be required—for light or heavy cutting—to prevent waves on all kinds of work—to do the work in the easiest practical way.

EFFICIENCY:

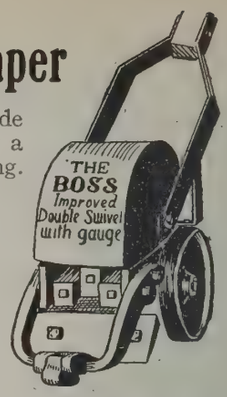
a—In Weight to insure a smooth wide cut.
b—In Motive Power to insure ease of operation, great capacity and A-1 quality of work.

? ? ?

Now, how would you like to own such a machine? There's only one made that really fills the bill—that is the

TRIPLE "A"
SPRING-DRIVEN FLOOR SMOOTHER

THIS IS THE MACHINE that you and every other contractor in the business needs, so don't let the grass grow under your feet—send for full particulars now.



THE PRICE is right and the machine will earn its cost for you on practically every job. It will last a lifetime.

SENT ON A WEEK'S FREE TRIAL.

Triple "A" Machine Company
24 N. Clark Street, CHICAGO

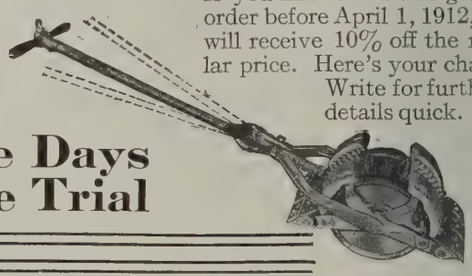
It Works Like a Plane

The Boss Floor Scraper

The Boss is the only Floor Scraper made that will plane a floor without leaving a square cut where knife first starts cutting. **Why?** Because the Boss is made with a gage on front to which is attached a pear-shaped wheel which raises when the machine is pulled and lets the knife down gradually.

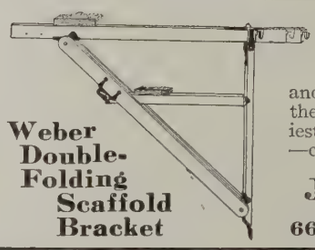
The Boss can be set for any thickness of shaving, it also can be set for any shearing cut, right or left, up or down, to suit the kind of lumber.

It is guaranteed to give absolute satisfaction.



G. J. Keppinger, MAIN OFFICE Dwight, Ill.
Manufactured also in Canada

Do You Use
The WEBER DOUBLE ACTING Floor Scraper
No? Read This Offer



Send for a Weber Floor Scraper on five days' free trial. Give it the hardest floor scraping test you can. If it doesn't suit you, return it at our expense.

10 % Off on All Orders Received Before April 1st

If you like it and will give an order before April 1, 1912, you will receive 10% off the regular price. Here's your chance. Write for further details quick.

Five Days Free Trial

Weber Double-Folding Scaffold Bracket

Saves One-third Of Your Time

and money. Any contractor who has used them will tell you they are the best, handiest brackets made. Very light and strong—can't swing. Write for details.

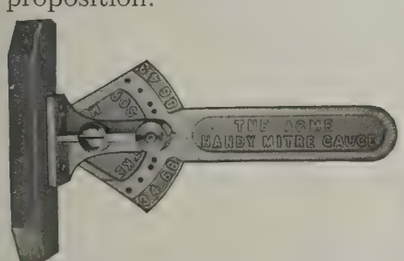
OVER $100,000.00



Has been SAVED by USERS of the

Acme Floor Scraping Outfit

during the past five years. Thousands of machines are now in daily operation, and every mail brings letters from users commenting upon the satisfactory work their outfits are doing and the vast amounts of labor expense they are saving.

Now, Mr. Contractor, you do not have to rely upon what I say regarding the merits of my machines, but I want you to let me send an outfit to you on **one week's free trial,** and you can then let the machines demonstrate on your own work just what they can do. If, after working with the equipment for one week, you are not convinced that the same will save you many dollars, and do your floor scraping better than it was ever done before, just pack up the machines, return them to me, and you will owe me nothing.

Write to-day for booklet and full details of my proposition.

The Acme Handy Mitre Gauge

is another labor saving tool. It is absolutely accurate, can be set at any angle and fits in the pocket where it is always ready for instant use. If your dealer does not carry them in stock, then write to me for circular describing this wonderful little tool.

Wholesale prices on everything needed for concrete work

Northwestern prices save you from 15% to 50% on any machinery, moulds, tools, appliances and accessories used in concrete work. We are the largest manufacturers of concrete machinery in the world. We add no profits because of patents or territorial rights, and our big volume of business enables distribution direct to the user at wholesale prices. All machines guaranteed and returnable at our expense, inside of ten days, if not satisfactory. Big stock for immediate shipment. We also build machinery for other concrete machinery concerns, and are especially equipped for big contracts.

Northwestern Concrete Machinery and Tools

Our Cone Batch Mixer sells at about a third the price of any other standard mixer—will reduce labor costs about one-third. Less than waist high intake makes quick charging. Special discharging device releases any amount of mix from shovelful to cartload, shooting it directly into wheelbarrow or moulds—no slopping. All sizes from 7 ft. up.

Get Our New Mixer Catalog Illustrates superior features and construction of Northwestern Mixers—the largest line in existence—a mixer for every purpose at wholesale prices—sidewalk, contractor's, block plant, continuous mixers, etc., hand, gasoline, steam, electric power, combined hand and power mixers, etc.

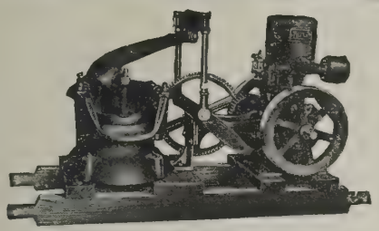
Novo Hoisting Outfit



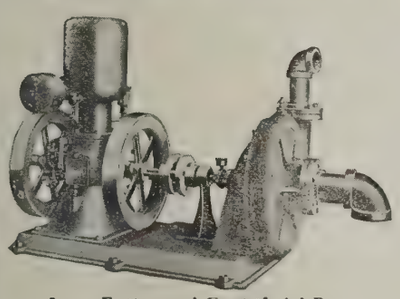
NOVO ENGINE

"The engine for every purpose"

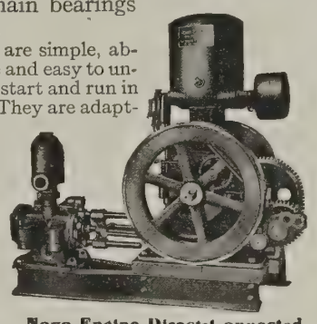
NO TANK
NO FAN
NO FREEZING TROUBLE

Novo Engines Are Adaptable to Every Contractor's Needs

for hoisting, drilling, rock crushing, shop machinery, portable saw rigs, pumping and all power work within range of their capacity—1 to 10 h. p.



Novo Contractor's Trench Pump Outfit



Novo Engines and hoisting rigs have many advantages. They occupy a minimum of space; the engine is the lightest made for the power developed. Being of vertical type, a Novo runs with less vibration than horizontal engines and gives uniform wear on cylinder and piston.

The cooling system of the Novo is simple, self-contained and guaranteed against breakage from freezing. The Novo has the lightness of air-cooled engines and the advantages of the water-cooled, without the disadvantages of either. Working parts are interchangeable and protected from dirt within the crank case. Perfect lubrication of parts and main bearings is secured by a splash system—cylinders are oiled direct. Extra wide main bearings give long life.

Novo Engines are simple, absolutely reliable and easy to understand. Will start and run in any weather. They are adaptable to all contracting work.

Novo Engine and Centrifugal Pump Direct-Connected

NOVO ENGINE CO.

CLARENCE E. BEMENT, Sec'y and Gen'l Mgr.
228 Willow St. LANSING, MICH.

Why Not Save 1-3 of the first cost of your mixer?

Not a theoretical saving but an actual saving in dollars and cents.

Get a collection of ***high charging*** mixer catalogs and study them from the ***economy*** standpoint. You will find they are very careful to recommend a ***charging elevator*** with nearly every machine. The fact is, on ***nine jobs out of ten*** they are only economical when ***equipped with*** a charging device. Now make a careful comparison of the price lists and you will find the ***price averages one-third more*** for the charging contraption.

You save every cent of this useless expenditure, not in theory but in actual money, as proved by the price lists, by buying the low charging direct from barrows.

"The Standard" Concrete Mixer.

But this does not begin to tell the story.

It requires one-third to one-half more power to operate the charging device.

It requires an extra **high-priced man** to operate it.

The entire complicated mechanism of a mixer—the part that is always getting out of order and causing no end of expense and trouble—is the very part required to operate this charging elevator.

That includes the friction clutch. Do you know what genuine clutch troubles really are?

You save every cent of this expense, and all the annoyance you buy with it, by purchasing **"The Standard"** mixer.

The charging platform is only 2 feet above the ground.

Both the charging platform and inclined runways are a part of the mixer, moved with it and set up ready for work in a moment's time.

Now sharpen your pencil and figure.

One-third of the cost is an item worth considering.

That means not only one-third more money in first cost but one-third more interest on your investment.

It often means the difference between a profitable investment and a prohibitive price to the small contractor; it's an economy the biggest contractor **cannot afford to overlook.**

And, remember this, **"The Standard"** mixer is a perfect mixer, unexcelled in quality of output or quantity of work performed by any other mixer.

It's saving money for the biggest contractors in the business. Do a little investigating and it will save money for you. Complete new catalog No. 32 by first mail if you say so.

Contractors and Builders Here is a Money Maker for You!

80,000 lbs. Pressure

Make Pressed Brick and Blocks and Increase Your Profits.

Hand and Power Presses

This Machine Will Earn You $20 to $50 a Day

There's big money for the man with the Helm Press in the concrete business. We are continually getting letters from our customers reporting daily profits of $20 and upwards. Many report as high as **$50 a day.** And **you** can make just as much if you get into the business right. Our press is the only one you will consider if you want to make the biggest profits.

80,000 Pounds Pressure It's this terrific pressure that makes Helm Block and Brick the finest looking and most permanent. **Wet mix concrete** is used, insuring absolute cohesion. Then the irresistible, crushing power of the press welds all the elements into bricks and blocks that will last for ages. One Helm owner landed a **$90,000 government contract** after government experts had subjected the Helm products to the most severe tests and decided they were the best to be obtained.

1,000 Blocks a Day The Helm has turned out as high as 1,500 brick an hour. Three men can make **1,000 blocks** or **10,000 brick every day** and do it **easily.** Our power machine has 50% greater capacity than the hand machine. With either hand or power machine you can bid on large contracts where the **big money** is made. You are in a position to deliver brick and block according to schedule, and to get out rush orders in a few days that would take your competitors weeks.

Don't think of buying a brick or block machine until you have **investigated** this marvel of the concrete industry.

Send Coupon for FREE Concrete Book

Here is the most complete and thorough book on Concrete, taking up all sides of the business. It tells how to make the **big money** in concrete. All about different methods of concrete manufacture, curing, etc. Your name and address on the coupon brings this book at once, **free.** Send it **right now** before you forget.

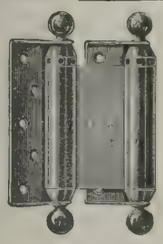
Stanley Tools

In the well known "BED ROCK" Plane as now constructed, we offer the user of high-grade tools a Plane that is the strongest and most perfect in adjustment of any Plane ever manufactured.

The design of the sides, which is a new and distinctive feature, adds greatly to the strength and attractiveness of the Plane, as will readily be seen from the illustration.

The new method of fastening the frog to the seat permits of the frog being adjusted either forward or backward without moving the lever or the cutter.

The shape of the knob has been changed, the new shape permitting a much firmer and easier grip than before.



The high grade of material used and the great care taken in their manufacture, enables us to guarantee these Planes in every respect.

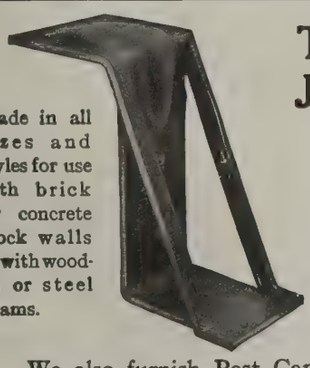
ELEVATORS FOR INVALIDS



"The Sedgwick Machine Works,
130 Liberty St., New York.

Gentlemen:

In my house we had no elevator and my daughter had to depend on our man to carry her up and down stairs. If she wished to let the man have an evening off, she had to go upstairs right after supper and stay there. Now the man could be dismissed so far as carrying her in the house is concerned. She is entirely independent, goes up and down by herself, can run the elevator with one hand, and she goes up and down as often as she wishes and when she wants to. The elevator is a great comfort to us and we shall be glad to have anyone needing such a thing come and see it, or write us about it. There are many invalid ladies and men who toil laboriously upstairs who, if they knew of the Sedgwick Hand Power Elevators, would not be without one."

The above unsolicited letter was written to the Sedgwick Machine Works by a well known New England Judge who has had a Sedgwick Hand Power Invalid Elevator in his house now for nearly five years. The Sedgwick Machine Works, 130 Liberty Street, New York, will furnish his name and address upon request, or will send catalog and full information as to their Hand Power Elevators and Dumb Waiters free on request. Judge B——purchased his elevator through his local carpenter.

Sedgwick Machine Works

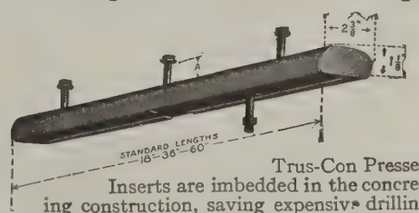
Made in all sizes and styles for use with brick or concrete block walls or with wooden or steel beams.

TRUS-CON JOIST HANGERS

Avoid cutting away and weakening of timbers and walls—save labor, time and money.



Trus-Con Joist Hangers are made from open hearth steel plates, and are proven by actual test to be the strongest on the market. Note the bulb-shaped reinforcement at upper angle.

We also furnish Post Caps, Post Bases, Wall Plates and Base Plates made in rolled steel, malleable iron, or cast iron.

Write for catalog and prices.

SHAFT HANGER SUPPORTS *for* CONCRETE BUILDINGS

Trus-Con Pressed Steel Inserts for Supporting Shaft Hangers in Concrete Buildings.

Trus-Con Pressed Steel Inserts are imbedded in the concrete during construction, saving expensive drilling after completion of the work. The long slots allow a wide variation in position. Special washers prevent bolts turning in the slots. Write for details and prices.

For Foot and Power

Suitable for carpenters, pattern and cabinet-makers and all wood-workers requiring accurate work, also for sawing soft metals. Will cut up to 3 inches thick, swings 24 inches, has powerful tread motion, cuts rapidly and is easy to operate. Has adjustable tension spring on upper spindle, dust blower, drill attachment, iron tilting table, etc. Will furnish tight and loose pulleys for power in place of treadles when desired.

This is acknowledged to be in all respects the most complete foot-power scroll saw made.

We make a complete line of Foot, Hand and Light Power Wood-Working Machinery, suitable for Carpenters, Builders, Cabinet-Makers and other Wood-Workers. It will pay you to investigate their merits.

No. 347. Combination Saw and Dado Machine.

Looking for a Modern Saw Bench?

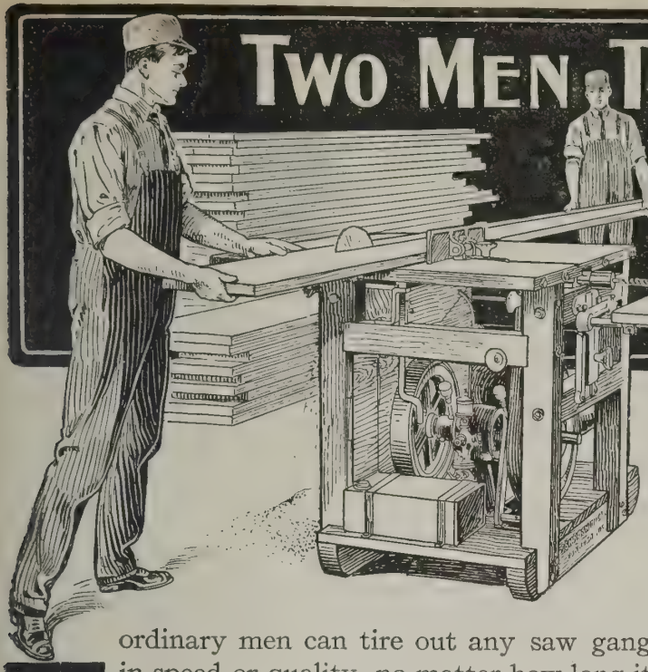
The above cut represents our new Combination Saw and Dado Machine.

The **Frame** is quite substantial, with closed front.

The **Ways** adjust for depth of cut, and

The **Carriage** moves on rollers having ball-bearings.

The **Saw Mandrel** runs in self-oiling boxes, and is brought into the work by a foot treadle, thus leaving both hands free to handle the work.



For further particulars concerning above and other machines, address

TWO MEN TIRE OUT TWENTY-FIVE

YES, and they'll do better work. Watch any gang of men. They get in their "best licks" during the first few hours. Then speed and quality commence to drop at an alarming rate. This drop explains why a whole lot of contracts don't pan out like you figure. Get an Eveready and save your men's time and strength for other work. With it, two ordinary men can tire out any saw gang you ever saw. And there won't be the sign of a drop in speed or quality, no matter how long it runs.

TRADE MARK OSHKOSH

Eveready SAW RIG

"Guaranteed for Life"

Two men can load it onto your wagon. Once on the job it can be skidded anywhere. With help of the free attachments pictured below, it does rip, cross-cut and jig sawing, dadoing, mitering, beveling, boring, sanding, tool grinding, etc. The frame table and skids are of the very best rock maple, air and kiln seasoned. Guaranteed to remain perfectly true. Contains a 4 h. p. gasoline engine of new improved type. Simple to understand; any of your men can easily operate it. Just a whirl of the wheel and she's off! Costs **2c an hour** when running—**nothing** when idle. The Eveready is not an experiment. We have made heavy duty saw rigs for years and know just how they ought to be made. This wide experience and a finely equipped factory also enable us to put the price down surprisingly low for such sturdy quality. Especially when you get all

These Standard High Class Attachments FREE

Jointer Head—This works on exactly the same principle as an up-to-date planer. Produces a smooth, even job with no deep cut as the material leaves the jointer head. 2½ inches in size.

Boring Attachment—A high class attachmemt. Guaranteed absolutely accurate. Extra long boxes insure easy, long-running qualities on the guides. Bits, standard size.

Jig Saw—Not a cheap one, but the best 12 inch jig we can make. All joints reinforced with steel, equipped with brass bushings. Once use it and you won't part with it.

Sander—The best one yet—a great time and money saver over old methods in change and economy of paper. Our method of holding paper will not blister as do many others. 10 inches in diameter.

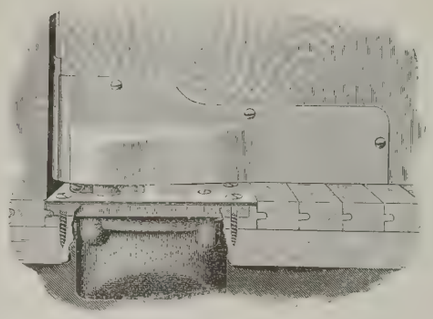
Saw Gauge and Mitre Device—Saw Gauge of best gray iron, 18 inches long, adjustable to any bevel. Miter device adjustable to any angle and can be used as a cross cut gauge.

Dado Head—Our own special design. Does smooth, even work with or across the grain. Makes window frames, dados, etc.

Emery Wheel—A 6-inch wheel made for grinding tools is also furnished with this rig.

Free Attachments

Try the Eveready Six Days FREE



Then if You Can Get Along Without It, Return It at Our Expense

We mean just what we say! Send for one right now. We'll ship it immediately on receipt of the order. You take it right out onto your hardest job and work it for six days steady. If you don't want it then—just ship it back **freight collect**. There won't be any kick from us. If you keep it, just bear in mind that it is not guaranteed for three years or five years—it is actually "guaranteed for life." Send for full details, prices, guarantee, etc., right now. **They're free.**

Buy a FAMOUS PORTABLE Universal Woodworker and Get *Value* for Your Money

WE ARE MAKING TWO CHALLENGES on behalf of the FAMOUS Universal Woodworker: *FIRST:* We challenge any builder of woodworkers to show a machine possessing one important feature not possessed by the FAMOUS. *SECOND:* We challenge them to show *as many* important features embodied on one machine as those which form part of the FAMOUS.

We are the pioneer builders of Universal Woodworkers in the world. It was the FAMOUS that proved the **existence** of a demand for a **good** universal woodworker; it is the FAMOUS that is **satisfactorily filling** the demand today. Over a thousand are in use.

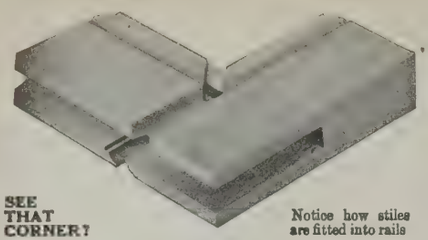
The latest FAMOUS innovation is the Portable woodworker—a planing mill on wheels, which can be moved around from job to job without having to be taken apart or reassembled.

The work of thirteen woodworking machines can be done on this FAMOUS Portable Woodworker. And a number of men can work at the same time if necessary.

Here are the thirteen machines which the FAMOUS displaces: 27″ Band Saw; 10″ Jointer; Reversible Shaper; Saw Table; Boring Machine, Tenoner and Mortiser; Knife Grinder; Emery Grinder; 10″ Power Feed Sander; Disc Sander; Power Feed Planer; Dadoing Machine; Panel Raising Machine. All are independent of each other.

Then there is the power plant. This is a sturdy little three horse-power gasoline engine, complete with batteries and all necessary belts—entirely self-contained.

The FAMOUS is so durable that we guarantee it for life—no half-hearted statements. We couldn't have sold over a thousand without we had the **best** machine! Nearly eleven hundred FAMOUS Woodworkers are in use today—and not one has ever been returned for repairs nor been found fault with in any way.



We make woodworkers in all sizes to suit all needs, from machines to fill the small contractor's requirements to woodworkers for planing mill use. As **investments** they are as safe and will pay bigger dividends, than gilt-edge bonds.

Write for our interesting literature today. State your business and let us estimate on just the machine you are likely to need. Don't wait but **write right now.**

"AMERICAN"

CONTRACTORS' PORTABLE

VARIETY WOOD-WORKER

Study the illustration—read the description herewith—consider the possibilites of this new machine in YOUR work—and decide for yourself whether you can AFFORD to do without the manifold advantages of the "AMERICAN."

The "American" Contractors' Portable Saw Bench was, and is, the best bench made. **The "American" Contractors' Portable Variety Wood-Worker marks another great forward stride in "bringing the mill to the job."**

For the "American" Wood-Worker is more than a saw bench. **It is a miniature planing mill to be taken right onto the work.** Note what it brings you in the way of equipment.

On its table you'll find a Rip Saw, Cut-off Saw, Mitre Saw, Dado Machine, Gaining Machine, Grooving Machine and Rabbeting Machine.

At its side is an independent Jointer, Planer, Matcher, Moulder, with which a Sander Drum, Disk Sander, and Emery Wheel are furnished and can be used.

Its boring table has a 6-inch feed, and serves as a work rest in sanding or grinding.

And here is the vital thing—three men can work at one time on the "American," at three different operations, without interference or change in the machine.

This three-man capacity is an exclusive feature, **giving one "American" Wood-Worker a work output equal to three ordinary saw benches.**

A 3 H. P. gasoline engine or a 3 H. P. electric motor (d. c. or a. c.), built in, is regularly furnished with the "American." But on order and at extra cost, a 6 H. P. engine or a 5 H. P. motor can be furnished, for heavier work.

With its standard power, the "American" will cut 75 to 125 **lineal** feet of 1¼-inch lumber, or 30 to 60 feet of 2-inch, per minute; and will rip 3-inch stock easily or heavier when fed slowly.

With the larger power, the capacity is correspondingly increased and 4-inch or even heavier lumber can be handled rapidly and cheaply.

As to materials, workmanship and construction, it need only be said that they are of **the standard "American" quality, which means that nothing better can be had in any machine at any price.**

The saw table and jointer tables are of cast iron, strongly ribbed, carefully planed, and provided with more rapid and accurate adjustments than have hitherto been deemed necessary.

The frame and boring table are of seasoned hard wood, bolted up and braced and fitted to have **all the strength and rigidity of a solid iron casting, but without its weight.**

In fact, neither labor nor expense has been spared in making the "American" Wood-Worker measure up to the most exacting requirements of contractors, builders, and wood workers in genesal.

Whether your work be the rough framing of a house, its interior finish and trim, or the making of forms for concrete construction—**an "American" Contractors' Portable Variety Wood-Worker will mean for you more work and better work, in less time and at less cost, and with bigger profits.**

And the price is but a trifle more than that of the plainest saw bench.

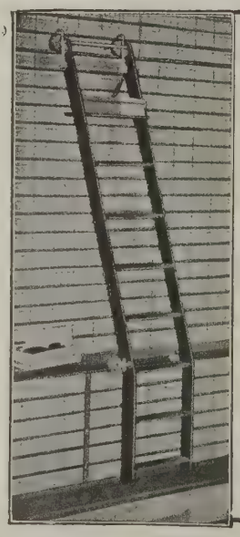
Sheet Metal Statuary *of* Rare Artistic Worth



WITHIN the last quarter of a century there have been reproduced at the Mullins Factory, Salem, Ohio, statues of Sheet Bronze and Copper that are nothing short of marvelous. Many of them were made from the models of famous sculptors, to their entire satisfaction.

We are prepared to reproduce, in minute detail, the most delicate lines of any model. It is this faithful portrayal which helps to account for the world-wide fame of Mullins Sheet Metal Statuary. Diana on the top of Madison Square Garden, the group on the New York Life Building, the Statue of Progress, Chicago, are among our earlier achievements.

We also make Fireproof Metal Windows, Skylights, Cornices, Finials, Metal Tile Roofing and Sheet Metal Ornamental Work of every description.

Tell us what you're interested in and we'll send the proper catalogs at once. Estimates promptly submitted on architect's drawings. Attractive prices. Quick, satisfactory service. Discounts to the trade on application.

Don't Miss This Opportunity

We Want One Carpenter or Builder in Every Community to Demonstrate, Take Orders for and Apply Our EDWARDS METAL SPANISH TILE ROOFING on a Liberal Commission.

Here is a chance to build up an independent, profitable business for yourself right at home. Many carpenters are now devoting their entire time to selling our metal roofing Others have made big profits simply devoting part of their time to selling and laying our Metal Spanish Tile.

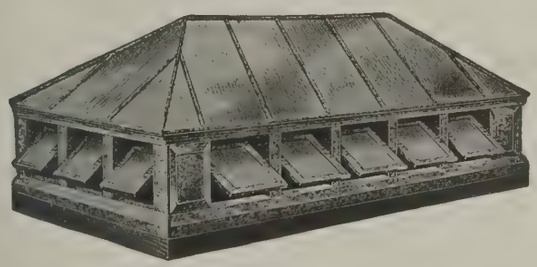
Edwards Metal Spanish Tile

Is being advertised in the leading magazines and is now known to thousands of home builders and owners everywhere. Wherever it has been used it has made a decided "hit" because it shows off to good advantage on the roof and has numerous points of superiority over any other style of roofing.

Architects are specifying Edwards Metal Spanish Tile, for they know it will do away with roofing "troubles." Builders like it because of the finished appearance it gives any house on which it is used.

Our Metal Tile are stamped out of the highest quality Worcester terne plate in exact imitation of the most expensive Terra Cotta Spanish Tile. They come either "dip" painted or heavily galvanized, size 10 x 14 inches. Our patented interlocking side lock makes it possible to make a perfectly moisture-proof roof without soldering. Edwards Metal Spanish Tile afford the fireproof advantages of Terra Cotta Tile, but are much lighter in weight, cost but a trifle more than ordinary roofing and will last a lifetime.

WRITE US TO-DAY ABOUT YOUR TERRITORY. Our business is growing so rapidly that it is necessary to have an agent in every community. The territory is going fast. One day's delay may mean that someone else will be given your territory. DON'T DELAY. WRITE TO-DAY FOR OUR SPECIAL AGENTS' PROPOSITION.



Note the construction of patented interlocking device, protecting nail heads from weather and providing perfectly for expansion and contraction of the metal.

THE DOUBLE CLAW HAMMER

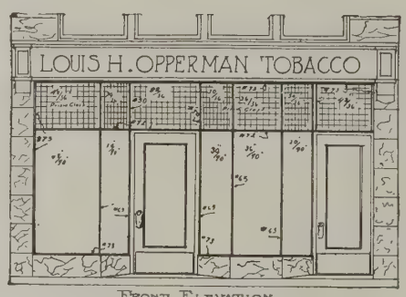
¶ Pulls the nail out straight without a block. ¶ Relieves the strain on your arm when doing scaffolding, siding and ceiling work. ¶ You hold on with your left hand while pulling with your right—this gives you more power and the nail is not rolled into a fish-hook, as with the old hammer. ¶ You drive the nail in again. For "finishing work" the Double Claw Hammer is a great aid, as 10% to 15% of all finishing nails start wrong and must be withdrawn.

Under strong competition you pay 75c for a good hammer. The high nailing feature of the Double Claw Hammer is worth 75c many times over. The straight and easy drawing of nails is worth another 75c. The ease and pleasure in using a tool like this cannot be measured by the slight additional cost. Better handle, better steel, better finish, the better mechanic uses it first.

ASK YOUR DEALER, or send $1.50 and we will pre-pay charges.

DOUBLE CLAW HAMMER COMPANY
453 Broadway - - - - - Brooklyn, N. Y.

The Double Claw has all the good features of the old hammer, and a lot more besides.



And You will Then be Able to Close Many a Contract that Would Otherwise be Lost

The demand for Architectural Perspective is increasing yearly because those who build are demanding, in addition to the plans, perspective drawings of their buildings. A well made perspective drawing, properly shaded and set off by a little landscape and secondary detail, pleases the eye, and is a valuable adjunct to the regular plans and elevations. Our correspondence course in ARCHITECTURAL PERSPECTIVE and DRAWING of BUILDINGS is complete, practical, and can be learned at home at odd times. Instruction likewise given in twelve separate, complete Art Courses, for pecuniary profit, or pleasure only, as desired. Year Book sent upon request.

Every Three Minutes an American House Catches Fire

A large proportion of them from flying sparks falling on the roof

Cortright Metal Shingles

ARE FIRE-PROOF

Read this letter from the owner of the house shown below:

Bremen, Indiana.

Gentlemen:

I am more than satisfied with the Cortright Metal Shingle Roof. They cost but little more than wood shingles to start with, and make a *fire* and *lightning proof* covering that looks 100 per cent better than wood shingles.

Yours very truly,
SAMUEL MUTTI.

Being fireproof, together with their many other advantages, Cortright Shingles please any house owner.

And why they are so popular with Contractors and Builders is because Cortright Shingles are much cheaper than slate, and as reasonable as wood in many sections of the country.

We have a good proposition to offer you. *Write us.*

SILVER LAKE BRAIDED SASH CORD

was originated by us, and for forty years has been recognized as—

THE STANDARD

Established 1869

These Shingles Are Fully Guaranteed

THOUSANDS of buildings—homes, schools, churches, etc., are today covered with Reynolds Asphalt Shingles. Many of these have stood the heave of frost and the wear and tear of storm for 10 years and are in every way as good as when first laid.

Reynolds Asphalt Shingles have "made good"—they have stood the test. So satisfactory are they in durability and appearance, that leading architects and builders are specifying them for new work on the best class of modern homes.

Reynolds Flexible Asphalt Slate Shingles

Reynolds Asphalt Shingles **last**. They are 8x12¾ in. and lay 4 in. to the weather. They are fire-resisting and weather-proof. Never split, warp nor rot. **Cannot** color rain water. These shingles are mineral surfaced and laugh at wind and weather. No better shingles are made than these. If you want to enjoy life, roof your home with Reynolds Asphalt Shingles and—"forget it." We also make strictly high-grade granite surfaced roofing in rolls.

LEARN MORE AND EARN MORE

Don't be satisfied with merely pushing a saw and driving nails. Learn to PLAN as well as to work—to use your BRAIN with the **same skill** that you use your hands. Learn to fill a BIG SALARIED job—the kind of a job that hundreds of other men, with no more natural ability than you, are filling with ease and success.

AN HOUR A DAY WILL DO

An hour a day spent in careful study will enable you to MASTER EVERY DETAIL of your line of work. EVERY BRANCH of building construction, EVERY ANGLE of architecture and carpentry. You can have the knowledge and experience of over FOUR SCORE EXPERTS at your command ready for instant use whenever you want it—can fit yourself to **fill any first-class position above you that you desire**—simply by allowing us to place in your hands this great ten-volume set, **without your sending us one cent in advance.**

THIS CYCLOPEDIA OF

Architecture, Carpentry and Building

is the most exhaustive, comprehensive and practical work on the building trades that has ever been published. It covers every detail of building construction from foundation to roof, from common carpenter work to reinforced concrete and steel, from masonry to heating and ventilation; from specifications and estimates to building laws and superintendence. It covers all the PRACTICAL things that you WANT TO know, all the things that you've GOT to know if you're going to be a success. It contains over 4,000 drawings, full page plates, diagrams, etc., has 4,760 pages, is bound in handsome half morocco and printed on sjecial paper in large clear type. No CARPENTER, CONTRACTOR or BUILDING OWNER **can afford to be without it a single day.**

Get these books FREE and see for yourself

just what they are before you send us a single cent. Look them over carefully at your leisure, keep them for seven days before you decide whether you want them or not, and then if you don't believe that each volume is actually worth more to you than the price of the **entire set, send them back at our expense and the transaction won't cost you one penny.** If you do decide to keep them, our charge will only be $24.80, spread out thin in easy payments of only $2.00 a month. We don't ask you to buy these books from our description of them. We don't ask you to trust our judgment. We simply ask you to get the books and see for yourself. We'll send the entire set, express prepaid.

Free with every order received before April 1st, 1912

With each set is included a year's Consulting Membership entitling you to the advice of our business and engineering experts free. This will give you practical help in handling working problems which are too specific to be taken up in detail in the cyclopedias. There will be no limit to this service. A single problem solved for you might be worth more than first cost of the books. Order the books **now.**

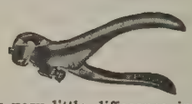
METAL TILING

For the Kitchen and Bathroom.

Carpenters can apply it.

METAL CEILING

Something exceptional—out of the ordinary class—and as plain or elaborate as you like. Patterns especially adapted for residence work. Nothing better for a new house, or to repair an old one. Catalogue.



Northrop, Coburn & Dodge Co., 30 Cherry Street, NEW YORK

IF YOU USE A SAW

You Need this Book

There is nothing of greater importance than a correct knowledge of the proper care and use of tools, among which the Saw, to give the best results, demands the most expert attention. Our Booklet will give you a better knowledge of the proper treatment of saws. Send postal for Saw Points Booklet No. 7. IT'S FREE.

There is very little difference in the appearance of Saw Sets. They vary greatly, however, in results or operation, in the quality and mechanical perfection.

The Morrill Saw Set

manufactured by Chas. Morrill for 30 years is the only Saw Set that is perfect in construction and that will set a saw properly. The Chas. Morrill is the only Saw Set that is absolutely guaranteed.

CHAS. MORRILL : 279 Broadway NEW YORK

THE NEW CABOT'S "QUILT"

The Original Scientific Insulator and Deadener
50% Better than Ever Before

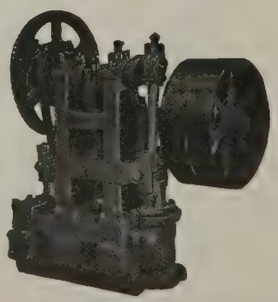
Photograph of New Rolls of Quilt. Note narrow space in middle for splitting into 18" strips.

IMPROVEMENTS

Made in 250 foot rolls.

Wonderfully strong, untearable paper.

Fastened stitching that cannot rip.



No creases or lumps.

18-inch strips to go between studs.

One layer is warmer than forty layers of common building paper. The only perfect sound-deadener.

For Floor Plans and Elevations, see Supplement of this Number. Estimated Cost, Architect's Fees Not Included, $3.080.68

THE MARCHANT RESIDENCE

Economy in design can usually be accomplished by careful attention to details, without neglecting the appearance. This design is particularly pleasing and has proven very satisfactory as a residence.

It will be noted that the front porch is on the side, as the house is close to the street. Windows have been placed in the gables instead of the shingle panels, as shown on the elevations, thus providing ventilation for the small attic space.

Estimate of Marchant Residence *

BY I. P. HICKS

EXCAVATING AND MASONRY.

130 yards excavating, 35c	$ 45.50
550 cubic feet concrete wall, 25c	137.50
400 square feet 8-inch cement block wall, 23c	92.00

China case	8.00
Pantry case	7.00
5 closets, $1.50	7.50
Total carpenter labor	$508.00

RECAPITULATION.

Excavating and masonry	$ 353.00
Lumber bill	608.66
Mill work	375.35
Carpenter labor	508.00
Hardware and nails	65.00
Tin work	20.00
Plastering 774 yds., 27c	208.98
Plumbing	260.00
Electric wiring	50.00
Painting	165.00
Heating plant (hot water)	320.00
Incidentals, 5%	146.69
Total estimate	$3,080.68

The cubic feet contained within the walls of this building is 21,000, making the cost of construction approximately 14 2-3 cents per cubic foot.

EDITORIAL NOTES AND COMMENTS

It is not the man who drops his hammer before he has driven the nail home, when the clock strikes 12 or 6, who gets much beyond ordinary wage.

The alert, bright fellow, who is always on the lookout for his employer's interests, and who never shirks his stunts, is the fellow who is made foreman when there is an opening, and gets all the choice jobs on the work.

From reliable news before us, we are inclined to believe that business in most of the Southern states is likely to be unusually brisk. By private dispatches from Birmingham, Ala., Memphis, and several other Southern cities, a number of important building and engineering contracts are under way, and a number of others are now under consideration.

A big slice, five miles long, is to be taken off each side of Broadway, New York, and will be the greatest cleaning-up the famous street has ever experienced. The Board of Estimate authorized the pruning process, aimed at the excessive decorations which have by slow degrees of decades been encroaching upon the busy thoroughfare. Excrescences upon the face of the street in the form of porches, signs, pillars, sidewalks stands and show cases, and perhaps even parts of fronts of buildings, will have to come off. The necessity of making all possible room for pedestrians who crowd varying portions of the long stretch of the street is given as the reason for the board's order.

The New York Record and Guide, in speaking of the inequalities of the cost of similar buildings in different cities, says, "that, with the simple exception of San Francisco, it has been said that it is more difficult to carry on building construction work in the city of New York than in any other city in the whole United States. In the case of the former city, the difficulties are those imposed by labor, while in New York City, the difficulties are due to complexity of building laws. In discussing this subject and that of simplifying legal building requirements, the writer gives some rather interesting figures showing the cost per cubic foot of construction in several of the leading cities. In New York construction is about 2 cents per cubic foot higher than in San Francisco, while in San Francisco construction costs run from 12 to 15 cents more than in other cities similarly situated with regard to shpping and railroad facilities."

As a matter of fact construction in both New York and San Francisco should be lower than in Chicago, Denver and New Orleans, yet the range of cost for average buildings in American cities is as follows:

Construction Costs.	Cents per cu. ft.
New York (Greater)	23 to 28
San Francisco	21 to 26
Chicago	20 to 25
Boston	20 to 23
Pittsburg	20 to 22
New Orleans	19 to 20
Oakland	18 to 21
New Haven	18 to 19
Philadelphia	16 to 18

From the above it is apparent that the local operator in Greater New York has to pay more for the legal requirements imposed upon his contractor than do operators in other cities, due allowance being made for the fact that union wages are higher in New York and in San Francisco than they are in any other city in the country.

The hygienic aspect of illumination have not yet received the attention which the importance of the subject deserves. But the recent establishment of the French government of a technical committee on this subject should have beneficial effects, not only in France, but in other countries also. The committee is a representative character, and includes medical men, representatives of gas and electric lighting, and inspectors of factories and workshops. Among its duties will be the study, from the standpoint of health, of various methods of artificial lighting; the examination of the effects of prejudicial gases; the fixing of a minimum of illumination favorable to vision; the study of methods of measuring illumination; investigating means of lighting for various industrial operations; reporting on impairments of vision; and the best methods of preventing these. It will be seen that the committee has an arduous as well as an important task before it.

SOMETHING OF SHERATON

THERE is a tendency abroad to furnish and finish interiors in the styles of Chippendale, Sheraton, Hepplewhite, Adams and other masters of English cabinet work. It is a little more difficult to distinguish Sheraton from Happlewhite's work than it is to recognize either of the two from the style of Chippendale. Sheraton was addicted to more profuse ornamentation than Hepplewhite, but both wrought well within the lines of good taste; and like the great master—Chippendale—often converted the simplest lines into "things of beauty" apparently without effort.

The illustration showing a bedroom furnished in Sheraton style, with a touch, here and there, of Hepplewhite, makes a charming and restful scheme for a bedroom, particularly when the items are made up of Cuban mahogany with bronze trimmings. The chair, desk and settee, are Sheraton, but the other furnishings carry the stamp of Hepplewhite, or if not his, they are exceedingly fine imitations.

If Sheraton had not been a cabinetmaker and designer in woodwork of reputation, he would have become famous as a mechanician, as he had the qualities, in a large degree, which go to make up a skillful and efficient mechanic.

He flourished in a period when bedrooms were frequently used as sitting rooms, and very many ingenious pieces of bedroom furniture were concealed in bookcase forms, of desks or writing stands. Even washstands folded up and became cabinets. It is well to remember that in 1750 thousands of silk weaving looms were established in England at Spitalsfield, Cheshire, Yorkshire, Essex, Derbyshire, Lancastershire and Norfolk. Moreover, at this period up to the beginning of the nineteenth century an enormous lot of Indian silk and cottons were used; in 1759 the manufacture of printed linens was authorized and encouraged by the French government.

Sheraton was a man of great originality and far in advance of the times, full of quaint combinations, hidden drawers, parts that were convertible, turning from one use into another, cleverly hidden accommodations for boxes or writing materials or toilet articles—desks that could be turned into a table, a chair or a lounge. He was not a good business man, he was an honest one, and would not allow a defective piece of work pass out of his hands. He would either destroy or thoroughly make the work over again, though the defect might be of so slight a nature as not to be noticed by the purchaser.

This is partly taken from the Grand Rapids Furniture Journal to whom we are indebted for the accompanying illustration.

WORTHY OF NOTICE

By G. D. CRAIN, JR.

"Mornin'," said the veteran contractor, as he entered the familiar office of the architect and began to look through the blueprints spread out on the table for the delectation of the builders who wanted to enter bids. "Keeping you at the drawing-board pretty steady these days, eh? Well, the more jobs the better for all of us, including your uncle Henry.

"I suppose you fresh young architects," he continued, looking up from his inspection of the drawing, "wonder how in the world we old boys who were putting up residences before you were doing more than chew on a pacifier, manage to keep up with the procession. I'll admit that things are different, and that the builder today has to 'wise up,' as the sporting editor of the Daily Bugle puts it, and find out what owners and architects are driving at with all of their cubby-holes and window seats and built-in buffets and things."

The old fellow settled himself in a chair and bit off the ends of a plug of Hold-Fast with a contemplative air.

"Nowadays," he went on, as the young draughtsman prepared to listen with proper respect for the ruminations of the old-timer, "the home is equipped with conveniences which we would have called luxuries in the old days. Distinction is the key-note. Every residence must be different in detail and yet possess qualities of comfort and convenience. I suppose you architects realize these facts, handling prospective builders with their fancies and individual ideas every day as you do.

"You would surely laugh at the ease with which the old-time architect could get up his plans. Residences were a big lure for investors in those days, and when a man inherited money, or scooped a pile in some manner, he would proceed to immortalize himself by erecting a row of houses to be known by his name. I remember that my first big contracting job was the erection of Quinn's row, just after the war. There were seven brick houses in that row, each with ten rooms, all absolutely alike and so similar in detail that I judge many a poor occupant had a terrible time picking out his own domicile the morning after the night before. The ceilings were high. There was lots of waste space in the halls and comfort was unknown in the terms applied to that luxury nowadays. We had big grates in every room, so that folks were steaming their faces the while they were freezing their backs, as James Whitcomb Reiley says.

"If you find two houses in the same neighborhood now that are of identically the same style outside and inside, you can put it down that those structures were erected at least fifteen or twenty years ago. The modern policy of builders is originality, and with the introduction of the numerous household conveniences, time and space-savers, the building interests certainly lose nothing by the latter-day notion. It naturally involves more time, trouble and expense to handle a thousand and one details when you are finishing a job, but the additional expenditure is something that the modern owner is willing to pay for, and in addition a man who takes pride in his work derives a lot of satisfaction from turning out an original job.

"The finish of a modern residence, both exterior and interior, requires more time now than it used to take to erect and complete an old-time home. When you have the roof on, the plastering done and the glass in, you are just beginning on the minute features, for then you have to watch the sub-contractors who are handling the woodwork, the men who are doing the wiring, and the plumbers, steam fitters and other workmen who are installing the multifarious incidentals in the modern home.

"There was a time when the same wood finish extended through the entire house. In fact, a man considered himself pretty lucky to have a stained wainscoting or a hardwood floor at all. Nowadays the finishes are indispensable, and furthermore they all have to be different. In view of the fact that people live all over a house, as the saying is, and do not confine themselves to the sitting-room, bedrooms, dining-room and kitchen, leaving the halls and parlors in bleak frigidity except when there is a special occasion, the public is demanding something different in every room.

"The drawing room, reception hall and library, possibly the dining-room, will be finished as richly as the owner can afford. The more public portions of his residence which are open for inspection all the time have to put up the best possible appearance. Accordingly, the parquetry in these apartments will probably be of mahogany and white maple, in fancy figures, and even the picture molding will harmonize with the effect.

"The dining-room, in line with the demand for Mission furniture, will probably be finished in Flemish oak, with heavy green burlap panels extending around the walls for about four feet, set in oak borders. Burlap is a very popular wall covering, and various shades, rich reds and greens and yellows, are used in mural panels everywhere from the dining-room and library to the nursery, where they can be ornamented with Mother Goose pictures or Teddy Bear decorations.

"Often the owner specifies that his bed-rooms be finished individually in separate schemes, to harmonize with new sets of furniture that will be installed. Therefore we have quartered oak and birdseye maple bed-chamber woodwork. I'll tell you, the expansion of art in this country is something terrific. You won't find a person nowadays who lacks in what we used to call 'taste,' but which is really appreciation of artistic values in the home.

"Then we have permanent wardrobes in bed-rooms. They are replacing the old-fashioned clothes' closets which were the bane of every architect's life. The owner, I remember, used to hammer away at the architect for more closets, and if there was anything the builder abhorred it was the unsanitary, obtrusive and all-around ugly storage place under the stairway or behind the door. But it's a comparatively easy matter to leave space in the wall for the permanent warddrobe and have the woodworkers set in a handsome case of suitable wood, ornamented with plate mirror doors.

"Another new wrinkle in interior finishing is the additional facility which is provided by electrical workers for consumption of current domestically. Ten years ago a man thought he was doing fine to have an electric chandelier in every room and perhaps a wall lamp or so for reading or writing. The current was formerly used only for lighting, but now the General Electric people, the Westinghouse company and other manufacturers in the world of ohms and amperes have boosted consumption of current in the home wonderfully. We have electric toasters, electric irons, hot water heaters, foot warmers, et cetera. Do you think that the public is going to switch off the light so that it can get a socket connection when it wants warm toast or a hot toddy? Not much. The electrician has to provide auxiliary sockets at convenient intervals through the house, so that the owner can run a connection any time without interfering with his illumination.

"Plumbing and heating have changed a lot, too. The call is now strong for individual lavatories in bed chambers. Wash-bowls are constructed upon such sanitary, easy-to-clean principles now that there is absolutely no danger when milady has a lavatory in the corner of her boudoir, and it is infinitely more convenient. Then again, steam heating has become an every-day institution and radiators from hot water furnaces have to be purchased in suitable shapes and designs so that they can be tucked away out of sight. Nowadays a man doesn't range a big radiator alongside the wall in his room as though he were in an office building. He secures a squat shape which can be shoved close under a window, and then he gets a window seat with an asbestos cover to place over the unsightly convenience. That's the way the whole story goes, comfort and artistic effect blending at every turn.

"One of the neatest tricks I have yet discovered in the way of consolidation in residence building is up in that park job I'm bound for now," concluded the contractor, as he deftly shot his quid into a nearby-by cuspidor and arose to don his coat. "The owner had your boss draw plans for a garage in the basement of his house, for the lot is small and he doesn't want to waste any space which can be beautified in summer. The entire structure is concrete, with a reinforced floor over that portion of the basement which is occupied as a garage, and there isn't a bit more fire hazard. I think you might call that the last word in compressed residences and garages. Come up and take a look at it some time—I've got to be going now.

"So long!"

CONSTRUCTION OF SQUAB HOUSES

By GEORGE RICE

MANY persons are going into the squab raising business, and the introduction of this profitable business has resulted in demands upon carpenters and builders for designs and constructions of buildings for this purpose. The squab house is erected differently from the common hen house. The squab structure has to be made to comply with certain conditions not demanded in the usual type of poultry house. Men who have designed and made poultry buildings for years, find that they have a few things to learn and consider, when they build squab houses. The site is first selected with a view of giving the place proper publicity. The dealer in squabs for the market depends upon a certain amount of advertising in order to dispose of his products. If he has the house erected in a remote place, he must depend greatly upon the general market for the sale of his products, but if he has his place on a

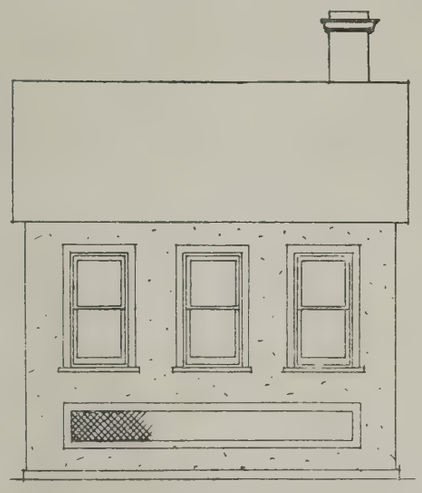

FIG. 2.

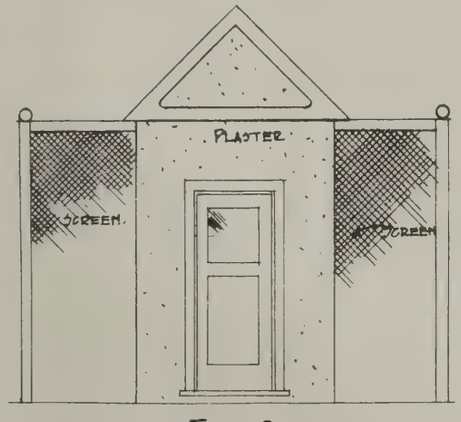
main street, where a neat looking front can be made, persons passing may notice the business, and hence advertising results and numerous sales occur. The builder of the house for the up-to-date patron, advises a location in a public thoroughfare. It is a good idea to have a concrete basement. The first floor of the squab house can be on the ground, but for purposes of storage and in order to get a dry floor for the stock, cellars can be made to good advantage. A general outline of the ground floor is shown in Figure 1. Ordinarily these houses are made for the accommodation of about one



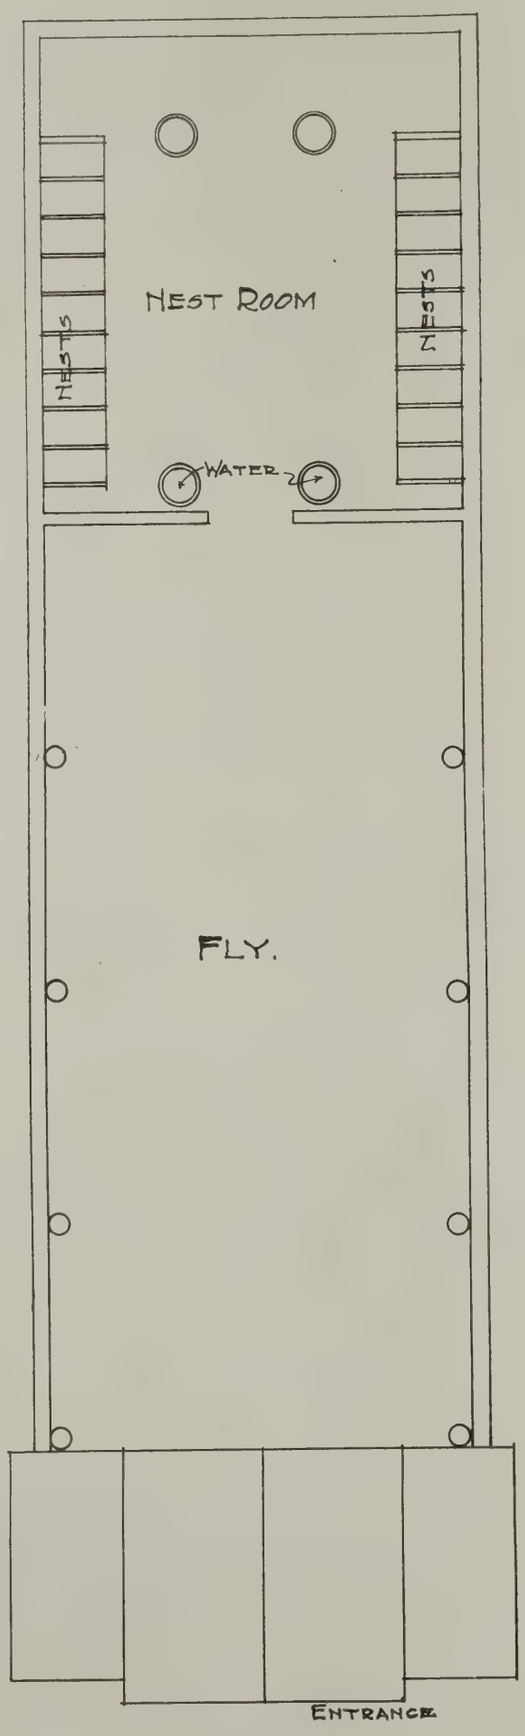


FIG. 3

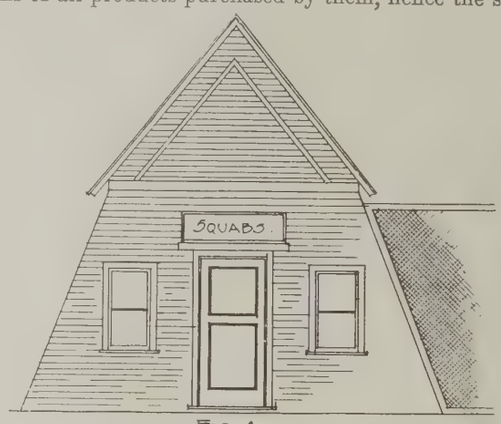
hundred pairs of birds. This would call for a building about 60 feet long and about fifteen feet wide to harmonize well with the length and give the required dimensions for the interior fittings. Sometimes the entire length of the squab house is separated into divisions of about ten feet each, with the individual nests arranged in each of the divisions. In case of necessity, therefore, one or more divisions can be separated with doors of lattice work. In the presented diagram, however, there are no divisions, except the one at the back, forming the nest room. The nests are made in the usual tier form used in the making of nests for any poultry house.

PLAN
FIG. 1.

Each carpenter would have his individual design for a nest. In the nest room are the water tanks and in the front or main room the feed troughs as well as water tanks. But these articles are portable and can be arranged by the owner of the squab house to suit the conditions prevailing. Plenty of room is given in the main apartment for various reasons. The owner of the house must depend a good deal upon advertising his products and doing a profitable business in order to keep the industry alive. A wood or concrete floor is put in and on this persons can walk readily. The place may be kept quite neat if the flooring is hard. Hence the proprietor can invite prospective purchasers into the house to see how the birds are bred. In this age of inspection by large buyers, it pays to have plenty of air, ventilation and space in which stock is bred. Large buyers for the markets and the hotels make careful inspections of all products purchased by them, hence the squab man



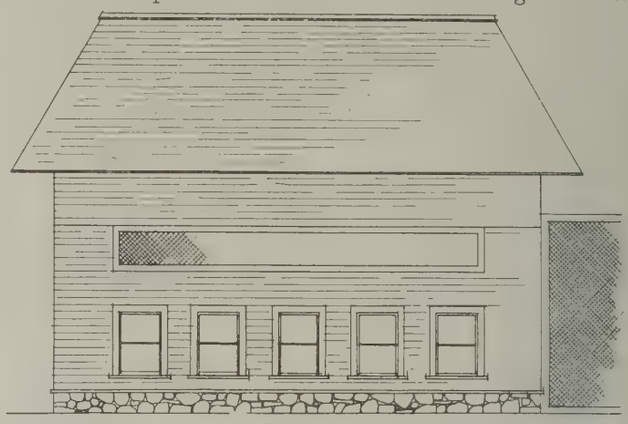


Fig 4

may be called upon sometimes to have his house so clean that ladies can be invited inside. All this advertises the business, and means profit to the owner.

The house should be lathed and plastered for northern climates. In the tropical climates, of course, this can be dispensed with. You need a tight roof on the house and shingles or metal will answer all purposes. The metal roof, however, would require an interior protection to prevent the heat in summer penetrating too much inside. A pen can be made inside for storing feed. Wire

Fig. 5

covered windows should be distributed about the building with a view of providing ample light. A good whitewashing inside helps to make the interior light and clean.

Concrete fronts with some artistic ornamentation are not at all out of the way. If possible, have the office and salesroom in the front section, which should be designed in attractive form, with concrete walls and plenty of windows, as shown in Figure 2. Or the front may be without the office and sales department, and can be arranged with a wire front, as in Figure 3. This is in case the fly for the stock extends along the front. Another form is shown in Figure 4 with the fly for the birds along the side. Still another type of building is shown in Figure 5. Buildings of this character with ample fly room for 100 pairs of birds, can be put up for $500. In fact, it is possible to erect moderate structures for much less.

BUILDING CONTRACTS

By W. J. STANTON

A WORKING CONTRACT is one under which work or labor is to be performed in the erection, construction or repair of same building, edifice, structure or other work. A mere request by the builder for bids or tenders for the erection or construction of particular works is not an offer on his part to accept any particular bid or tender, or to accept the lowest bid or tender, and without an express or implied acceptance of any bid or tender submitted there is no building contract. The acceptance of the bid must be unconditional and without change in the terms of the offer, and if the acceptance varies from the terms of the bid or tender the contractor is entitled only to consider such acceptance as a new offer to be accepted by him upon the terms thereof. Where a tender is not responsive to the proposal, it is an offer by this contractor to do the work according to the terms of the bid, and its acceptance by the builder creates a contract according to the terms of the bid.

A proposal for the construction of a particular work may be made as an offer, though made to no particular person, and if accepted by another before its withdrawal, will create a building contract. No particular form of words is necessary to constitute an acceptance of a bid or tender, provided the intention of the builder to acept is evidenced. There must exist such circumstances as will show an intention to accept the bid. A provision in the proposal for tenders stating that the bidders will be required to give security for the performance of the work may be waived by the builder, and a valid contract created upon the acceptance of a bid though no security is given by the bidder. A tender and acceptance may constitute a building contract, if so intended by the parties, although the acceptance may refer to a formal contract to be drawn up afterwards.

Where contracts for the construction of public works are to be let on competitive bids, public policy requires that competition in bid should be unrestrained and agreements between intending bidders to stifle competition in bids are illegal as against public policy. If such agreements result in letting the contracts at an unreasonable price to one of the parties to the agreement, the municipality may, on the ground of fraud be relieved from the contract.

To render a building contract valid there must be a mutual and real consent to the terms of the contract. Where one so conducts himself that a reasonable man would believe that he was assenting to the terms proposed by the other party, and the latter upon that belief performs the contract, the former cannot assert in fact that he did not intend to consent to the terms proposed. In making tenders, the fact that the contractor, through negligence in computing the cost of the work to be done, makes a mistake, it will not prevent a valid contract from arising upon the acceptance of the tender in good faith, or authorize a court of equity to grant to the contractor relief from the contract on the ground of mistake. Where the parties to a written building contract sign the same, the terms of the contract, in the absence of fraud, are binding upon both parties and one cannot escape liability on the ground that he made a mistake as to the terms of the contract.

A working contract may for the purpose of describing the work to be performed refer to particular plans and specifications or other writing. It is not necessary that such plans and specifications be signed by the parties, it will be sufficient if they are referred to with certainty. Where the working contract does not sufficiently describe the work to be done, but refers for such description to particular plans and specifications if the plans and specifications referred to cannot be identified the contract will be invalid for uncertainty. The fact that a building contract refers for a particular description of the work to be done to alleged plans and specifications not in existence will not constitute a fatal uncertainty if the contract itself sufficiently describes the work to be done.

A consideration is always necessary to the validity of a working contract. Thus where a building contract has been fully performed by a contractor his further agreement to perform extra work must, to be binding upon him, be supported by a consideration. Where the contractor refuses to perform his contract, and the builder promises to pay him additional compensation in consideration of the continued performance of the contract, the authorities are not agreed upon the question whether the promise for additional compensation is supported by a sufficient considera-

tion. The majority rule seems to be that such a promise is valid as an abandonment of the original contract and the creation of a new contract, where the contractor has agreed a particular work for a certain amount, his agreement while the work is in progress to take a smaller amount has been held to be without consideration.

Working contracts which provide for the performance of work and labor and the furnishing of materials are not as a general rule required to be in writing and where the parties verbally agree upon terms with the intention of creating a binding contract, the fact that the execution of a formal written contract is in the contemplation of the parties does not make the writing essential to the completeness of the contract. Where it is understood that the contract shall be reduced to writing before it shall become binding, it is of course, necessary that this be done before a binding contract is created. Where the contract is not to be performed within one year it must be in writing. Where the contract is in writing there must be a delivery of the written instrument, but such delivery must be to a third person for the benefit of both parties. Thus, a valid delivery may be made to the architect to hold for the benefit of both parties.

Working contracts may be implied as well as expressed. Thus, where one at the request of a builder performs work and labor without an express agreement for compensation, the law supplies a promise on the part of the builder to make a reasonable compensation therefor, and it has been held that where one stands by in silence and sees work done in the improvement of his premises, of which he accepts the benefit, a promise to pay therefor may be implied. Where, however, the contractor sublets his contract, the law will not imply any agreement on the part of the builder to compensate the sale contractor for the work and labor performed by him. Where an express working contract is invalid by reason of some formal requisite, the law will imply a contract to make a reasonable compensation for the work and labor performed thereunder.

Working contracts frequently refer to particular plans and specifications for the details of construction, and they thus become constructively a part of the contract. Where original plans and specifications are referred to and identified, the omission to annex a copy threof to the contract is immaterial though the contract expressly recites that a copy is annexed thereto. The contract may require the work to be constructed according to plans and specifications thereafter to be prepared by a particular person; where there is a difference between the contract and the plans and specifications referred to for details of construction, the contract controls, and where the contract refers to original plans and specifications, and recites that a copy thereof is annexed to the contract, in case there is a difference between the copy annexed and the originals the latter control. Where there is a variance between the plans or drawings and the written specifications, the latter will prevail.

(To be continued.)

"SEGMENT" FLOORS AND CEILINGS

By ROBERT GRIMSHAW, Ph. D.

THE name "Segment" floor is given by a well-known Weimar Architect, Herr Joh. Bermbach to a system composed of concrete segments of circular arcs of specified radius which may be combined in various manners according to the requirements

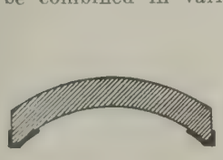

Fig. 1.

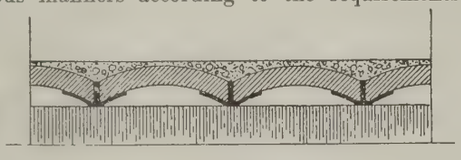

Fig. 2.

as regards load, insulation, etc.; it is also adapted to ceilings and walls. One of the special advantages claimed therefor is that it requires but little asphalt to be used in connection therewith, and

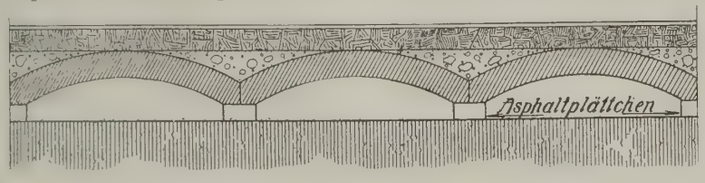

FIG. 3.

secures perfect immunity from moisture, as only the edges of the segments, as seen in Figure 1, require coating of the waterproofing composition. Figure 2 shows a floor built up in this manner. Of

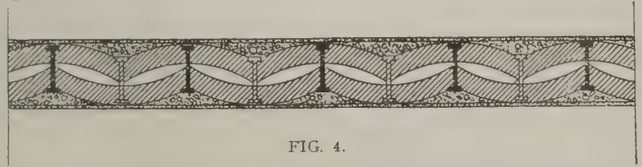

FIG. 4.

course, the curved-under outline of the segments contributes towards keeping out the sound.

The arrangement shown in Figure 3 in connection with asphalt strips of narrow slabs is preferred by some in cases where the amount of moisture is considerable.

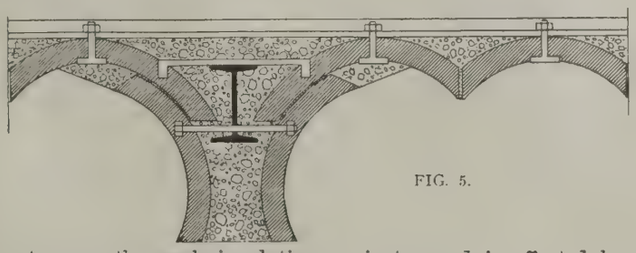

FIG. 5.

A more thorough insulation against sound is effected by an arrangement not here illustrated; where there are two layers of segments, the upper arches set staggering with regard to the lower one, thus forming two sets of hollows.

A further but rather more expensive system for walls, is that shown in Figure 4, where the protection against sound, and the insulation against the passage of heat, are still greater. The two sets of segments are united by irons at suitable points; the filling

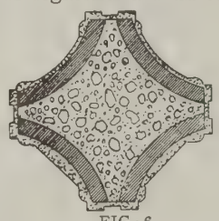

FIG. 6.

FIG. 8.

material closes the joints effectually; and the vertical character of the spaces makes them poor lodging places for vermin.

Figure 5 shows how walls may be built with such segments and

FIG. 7.

profile irons; for a given amount of material the lateral resistance to wind and driving snow is greater than that of thinner walls.

From the same segments arranged in two and fours as in

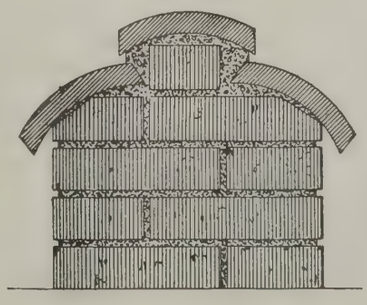

FIG. 9.

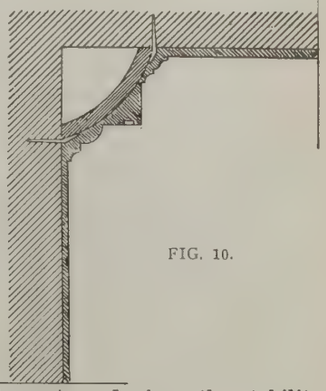

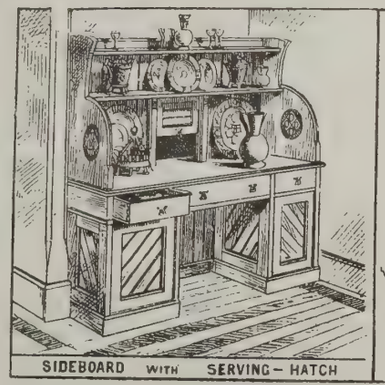

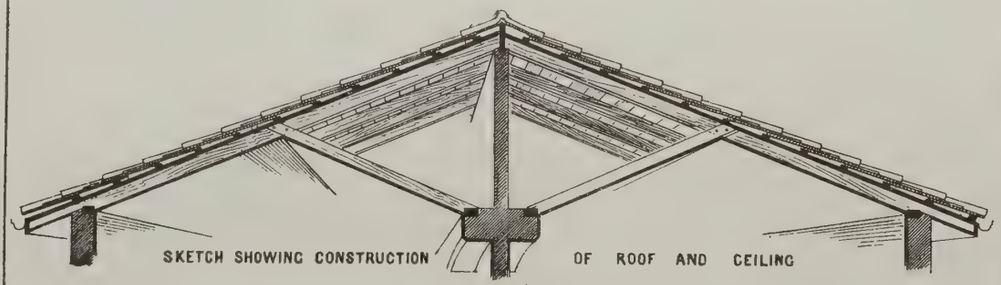

FIG. 10.

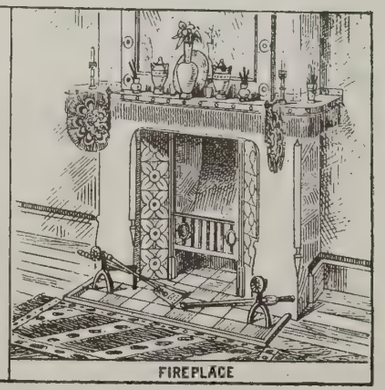

Figures 7 to 12 there may be made posts and piers, the stability of which may be increased by profile iron.

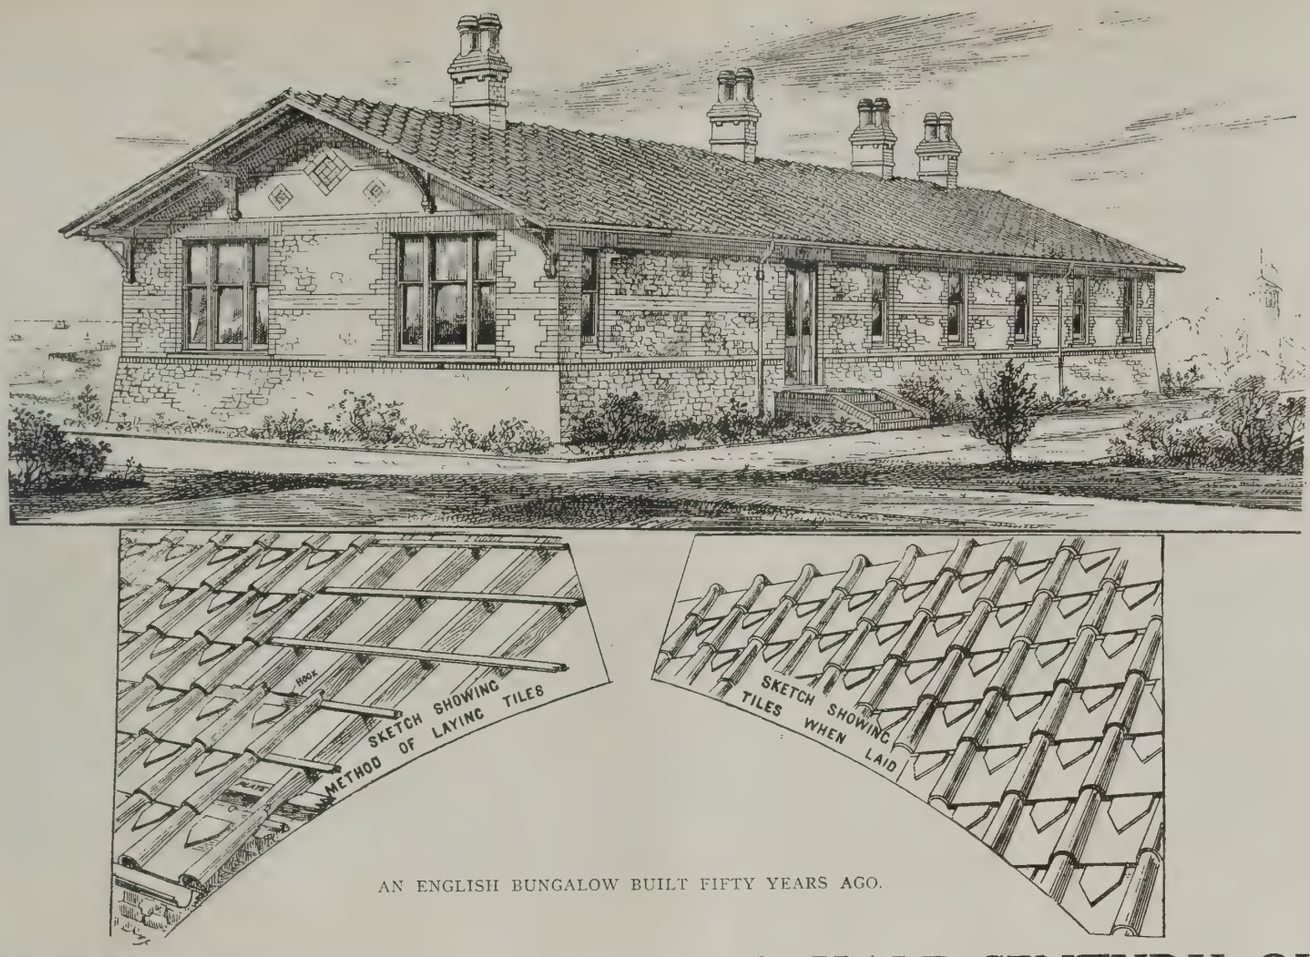
SKETCH OF DINING ROOM



GROUND PLAN

SKETCH OF CORRIDOR

AN ENGLISH BUNGALOW BUILT FIFTY YEARS AGO.

AN ENGLISH BUNGALOW OVER HALF CENTURY OLD

THE plan perspective view and details of the bungalow shown in the illustrations exhibit a very roomy and complete building, and though built many years ago, for Professor Erasmus Wilson, embodies many things in its makeup that would prove useful and convenient at the present day,, and would bear imitating with profit. The Professor, in speaking of it, says: "I find everybody is charmed with my bungalows, and I believe if there were many bungalows there would be many buyers. The house is a novelty, very convenient, fitted for a single family, and easy as to price. The idea of bungalows seems to take people's minds immensely: they are novel, quaint, and pretty, and perfect as to sanitary qualities. The best sanitary house for a family is a bungalow."

Such praise, which we believe to be thoroughly merited, particularly the portion in italics coming from such an authority upon sanitary matters as Professor Erasmus Wilson, will, we doubt not, induce our readers to consider well the various points which are elucidated in our illustrations.

THE PERSONAL APPEARANCE OF THE SMALL CONTRACTOR

By BEN JOHNSON

Well, that depends on whether he is going to labor some as well as boss. If he is going to work on the job, he will need overalls. If he is going to do nothing but boss, he will not need to wear them.

To begin with, I think a contractor, whether he is a large or small one, should be mechanic enough to pick up the tools and do any pieec of work on the job. This calls to my mind a circumstance in which the writer figured as contractor, and is in favor of the overalls. My men were not much of mechanics, but what we call good, handy men. Well, some wise people tried to make trouble for me, by talking about things which did not concern them, as some people do. One party, a "wood butcher," told my customer that I did not have a mechanic in the gang. My customer told me of this and in reply, I said, "No I have not, and I could not get one in this town, for they are scarce around here," but, I said, "What my men can't do, I can." Well, I completed the job and my customer was well pleased. Now, in such cases as the above, I do not think the contractor would care to wear better than overalls.

Now, I wish to say that if a contractor has many men to oversee, let them be good or poor mechanics, he will have enough to do without working with tools.

Now, I think a contractor that does no work on the job should dress neatly and look respectable, but it should not be overdone. Clothes do not make the man, neither do they denote prosperity. I think the contractor should act as one of the boys while on the job and not as if he thought himself so much better than most people. The men will think more of him; they will do more work, and better work.

Now, as for my part of the contracting business, I will say that I do not contract on a very large scale. I contract and furnish everything, or take it by the day. I get all I can do, get my own price, employ some men, and then I have to turn off some jobs. I usually take the place of foreman on the job, and lay out most of the work. I do not dress much different from the other men, when on the work, but try to keep reasonably clean for one in my position. I always have my chest on the job, and when I can and have the time, I work along with the men. I enjoy working with tools.

I once knew an old contractor who would be working hard at ripping lumber, or doing some other hard work, while his men would be standing looking on. I am not that way. If there is any looking on to be done, I will do it.

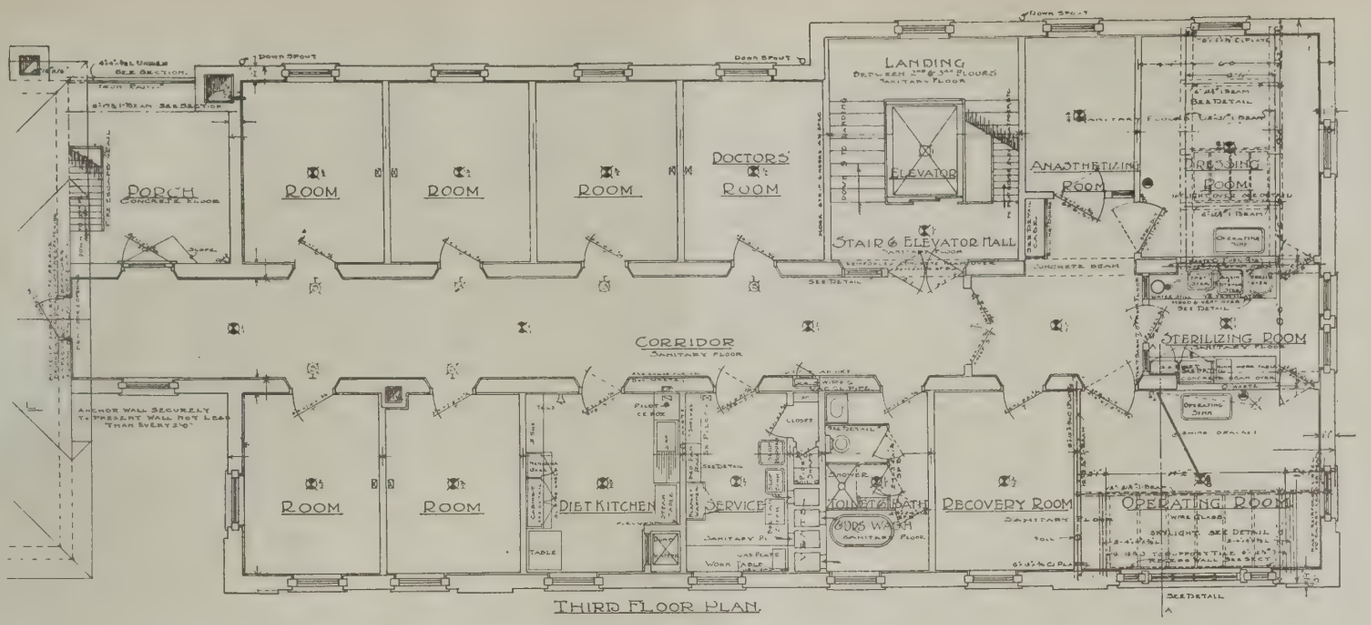
ADDITION TO HOSPITAL, MONMOUTH, ILL. MEYER J. STURM, ARCHITECT.

HOSPITAL DESIGN AND CONSTRUCTION

ON THESE pages we show the floor plans and a photographic view of an addition to the hospital at Monmouth, Ill. As the ideals of hospital design, construction and operation are closely connected with the ideals in home building, as well as with other lines of civic institutions, we believe careful study of the plans will be of material benefit, not only to the architect, but to the builder and owner as well.

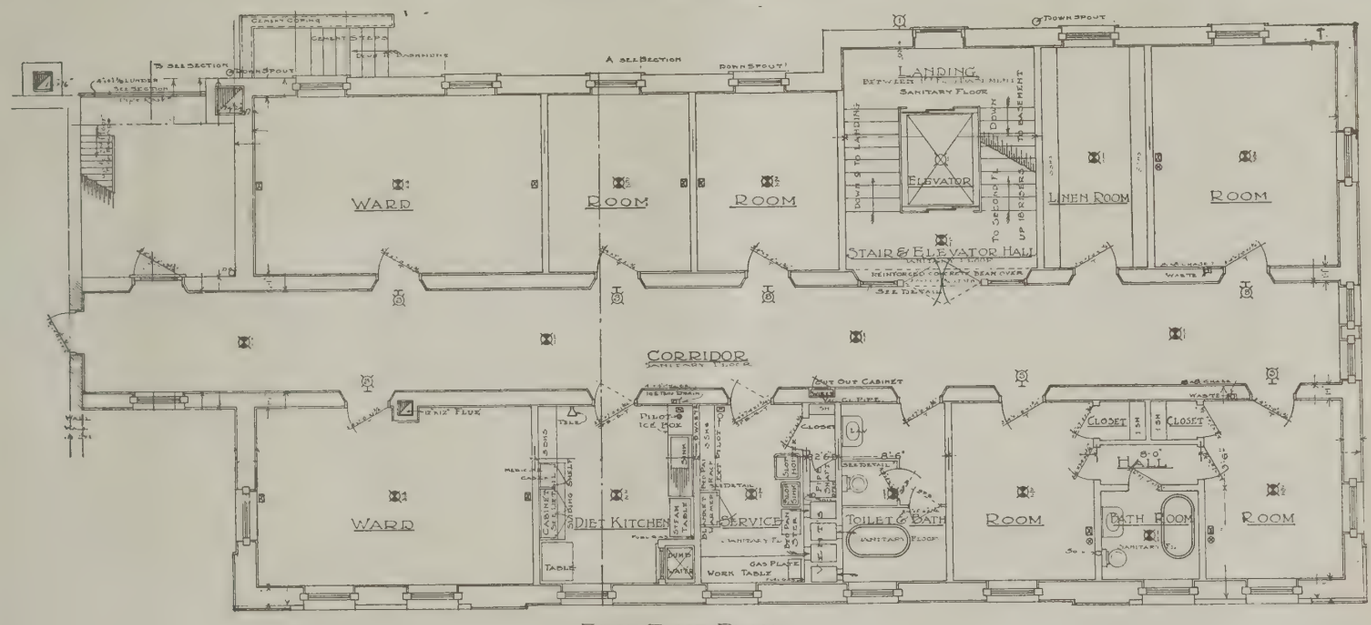
Although an addition to an already established hospital, the present building is practically complete in itself. The basement contains the regular service equipment, the main kitchen, dining rooms for the nurses and help, the laundry, stores, etc. It will be noticed that the stairways and elevator are in a shaft, separated from the rest of the building by fireproof walls and doors.

The upper floors are practically alike except that the third floor contains the operative room with its attendant offices. Each floor is, to a great degree, entirely independent of the others so that the necessity for going from one floor to another is almost entirely eliminated. As many of the patients are on special diet, these can be cared for without going to the main kitchen.



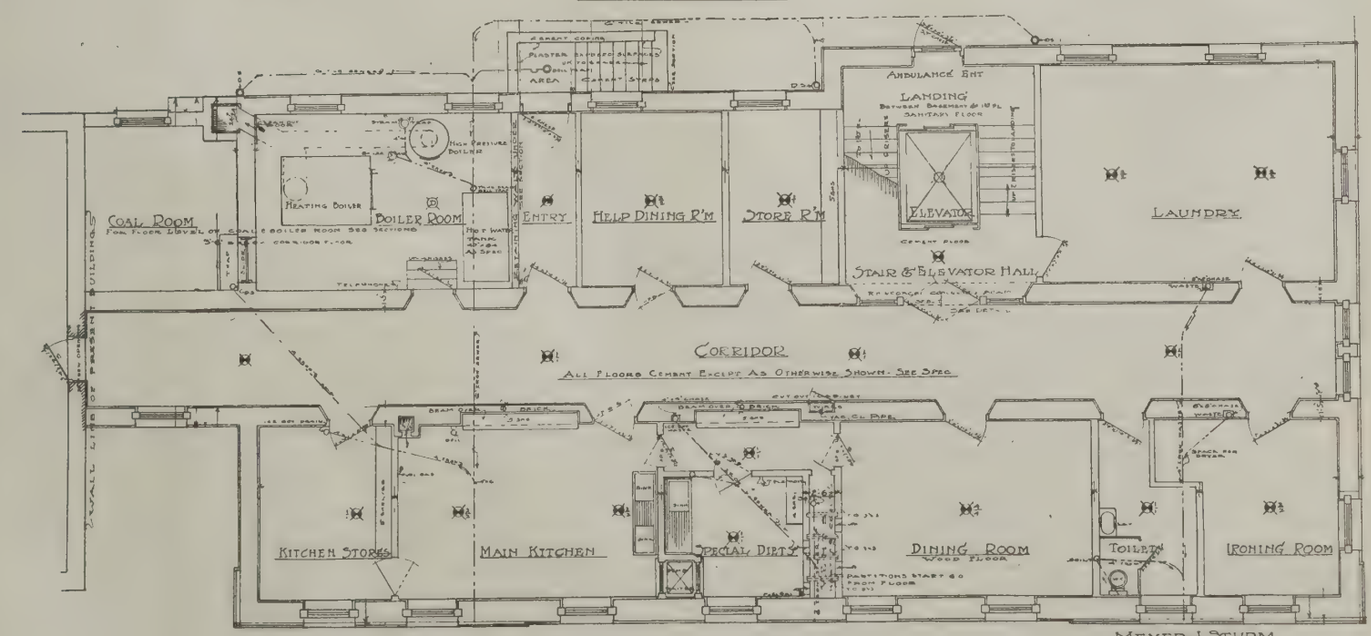
Needless to say, the entire addition is fireproof, the floors are concrete or sanitary with a covered base of the same material. The details of the woodwork is plain with rounded corners to lighten the labor of cleaning and prevent the harboring of the malicious germs. Throughout the building the idea has been to economize in maintenance and still have every facility for the special purpose for which the building is designed.

Designers of public or semi-public buildings, such as hospitals, have long been accustomed to the well-developed style of "monumental" building. Could the architect but divide his estimate, showing how much of the cost would come under the head of ornamentation and how much for necessary construction, it is probable many buildings would lack the cut stone "trimmings," gables, fancy roofs, carvings, which add nothing to the utility and much to the cost of the building. A certain amount of ornamentation, such as stone sills and lintels, brick piers laid to a design in a contrasting mortar, adds little to the cost of a building purely utilitarian, and saves much in maintenance.



In the present building, it is apparent that the simplicity of the exterior is a real benefit to the interior, as the saving over a more elaborate front is enough to permit an additional story.

The fundamental principle in home building is protection, for preserving the good health of the occupants. When houses were simple and widely separated, this meant mainly protection from the elements. With the increase in population and complexity of building requirements many new dangers arose. Light and air were cut off, perfect ventilation was not secured, and all the evils of overcrowding were problems to be met and solved. How well this has been done is shown by the census reports, the statistics showing that the cities are becoming healthier than the country. This is largely a result of ventilation, sanitation, pure water supply, drainage, etc. About one-half of the death rate of the country is directly attributable to bad air diseases, i. e., bad ventilation, and therefore preventable. Many of our farming communities are notoriously deficient in preventatives, and almost criminally careless in their lack of precaution against the spread of contamination. Laws have been made by the cities compelling the farmers to observe many sanitary rules before their milk will be permitted in the city, and it is due to such laws that the health of the cities is maintained.



Wherein lies the similarities and differences between modern hospital construction and the better class of private residences? Each must be complete in itself, the one designed to restore health, the other to preserve it. The well-ordered household has facilities for heating, lighting and ventilating, probably as complete as the hospital, and the kitchen and dining rooms are as necessary in one as in the other. In the residences, however, there is every convenience for enjoyment of life and society, with the opportunity for the meeting of the entire family and guests in one room. In the hospital, the main idea is to restore health of those who are

THIRD FLOOR PLAN.

FIRST FLOOR PLAN.

BASEMENT FLOOR PLAN.

MEYER J. STURM.
HOSPITAL ARCHITECT

ill or injured and who require isolation and quiet rather than otherwise. Special diets are required instead of course dinners, and careful sterilizing takes the place of ordinary cleaning.

Where operations are necessary, there must be furniture and equipment entirely foreign to the ordinary household and the surgeons with their attendants and nurses require special rooms and facilities not generally found outside established hospitals.

The danger from infection and contagion, present in even the simpler ailments, can best be reduced to a minimum in hospitals on account of the simplicity of the construction. The prevailing idea in home construction permits many lodging places for dust and germs; carpets, rugs and lace curtains are notorious collectors, and by eliminating these, the work of destroying the germs is greatly simplified.

When it is understood that germ life has no means of locomotion, their destruction becomes a matter of preventing their being distributed by mechanical means. Dusting and sweeping are probably responsible for as much spread as any one thing and when this is done by a vacuum process with proper provision for disposing of the dust, the germ danger is greatly reduced.

Flies and insects are well known as distributers of germs, as they require little space for entrance, and from numbers, are hard to combat. By properly screening the danger from this source is brought within safe limits.

There is, in hospital work, one important factor which is rather less in the private residence. This is the cost of maintenance. Every additional step necessary to perform the work in a hospital adds to the maintenance charge, and this is a constant expense which frequently makes operation costly. The ideal hospital is that one which gives the greatest amount of serviceability at the lowest cost consistent with a first-class structure, and at the minimum fixed and maintenance charges for the maximum work to be done.

It will be readily seen that the same principle applies in our household affairs, and the high cost of high living is easily raised when to the necessary operating expenses there is added the cost of keeping up unnecessary rooms, lights, grounds, etc., all of which are refinement demanded by appearance only and add nothing to the comfort of inmates or guests. On the contrary, the cost of keeping up these unnecessary luxuries must be deducted from the operating fund, to the real detriment of the service.

So it will be seen that by following the example of the hospital in reducing the danger from the harboring and spread of germs, our homes can be made more sanitary, and by the careful planning to permit relative isolation with good heating and ventilating, the need for hospitals will be less, for the health will be better preserved and better able to resist the mild attacks of the simpler diseases.

THE MOST DURABLE PAINT

By A. ASHMUN KELLY

(Continued from February, 1912.)

The finish never is any better than the foundation, which is the first or priming coat. If a paint is to prove durable on the surface, the coats under it must be right. There is a certain way to apply the priming and other coats, and a special method of mixing the coats. This is why ready mixed paints fail to please the expert painter; it is made to fit one coating, and cannot fit all. That is, it will not serve both as a primer and finish. This is why painters prefer hand mixing, in spite of the time and labor involved.

The durability of an exterior paint depends upon the oil incorporated with it. The best oil for this paint is pure raw linseed oil, and this oil has no successful substitute. The more oil that can be incorporated with a paint without making it too thin for covering properly the more durable the paint. The oil alone will not give as good protection as when combined with the pigment. The oil is not perfectly waterproof, but the addition of lead increases its water resisting power. In fact, the addition of any pigment will do this, by making a denser compound.

No paint can be durable, when exposed to the weather, that contains an oil other than pure linseed oil. Rosin oil will make it dry sticky, and the paint will crack and become like an alligator's skin. Petroleum oil will cause paint to peel. Fish oil will act much like rosin oil. Cottonseed oil and all oils of its class fail to dry.

Paint For Salt Water Exposure

Seashore painting is, perhaps, attended with more unsatisfactory results than painting under any other exterior conditions. The salt laden air, more especially during misty or foggy conditions, is very destructive to ordinary outside paint, and the matter has been well discussed by leading master painters, both those who do painting at the seashore and painters from interior parts of the country. Of course, it is the man who deals with the subject in a practical way, right on the spot, that can tell most about it, or whose ideas will be worth something, all else being merely theory. By the way, there is no lack of theory regarding paint and painting, and while very good in its way, yet valuless unless backed up by practical experience.

Painters tell of success and want of success, in the matter of seashore painting, and, of course, both conditions may easily exist, it depending upon the man and his method of dealing with the problem. But it seems to have been pretty well established that a paint composed of white lead and zinc white, mixed with raw linseed oil, will give the most satisfactory results as to wearing and holding color. The amount of zinc proposed varies with painters, some placing a few pounds, say ten, as the limit, whilst others will go from that on up to one-third or more. My impression is that the painter who did the great pier at Atlantic City used a lead zinc compound paint. And if my memory is not at fault I may say that he is an earnest advocate of lead and zinc mixed paint for the seaside. Nevertheless, there are many painters who decry the use of any zinc with white lead, whether at the seashore or in interior parts. The effect of the zinc is to make a harder paint than lead alone will make, and so the harder surface is thought to afford more protection against the wind blown sand, and misty and always salt laden air of the ocean. Just what effect salt has on paint I do not know, but think it is the dampness it causes that injures the paint.

It would seem, to resort to theory now, that the harder the surface of a paint the better it would wear against salt and sand. If, therefore, assuming this to be correct, we should add some good hard copal gum varnish to the paint, as we do in some cases, as when seeking to make a damp resist paint, it would seem that greater durability could be secured. Linseed oil itself is not proof against moisture, a well known fact, hence even though protected by the pigments of the paint it will fail to stand well excepting under average good conditions. Zinc white will, as previously stated, make a harder paint, but then it also tends to produce a surface so inelastic that cracking or scaling may follow. To avoid this we would simply reduce the amount of zinc to one that would not unduly harden the paint. Lead, even in the form of the carbonate, is a soft substance, and white lead paint is inclined to chalk or flour off, when it loses the oil binding it together. In one respect this is desirable, as it leaves a good surface for repainting on. But the addition of, say ten per cent of zinc, would, I believe, greatly improve the quality of a paint for seaside exposures. And no doubt a composite paint, as it is called, or one containing certain proportions of white lead, zinc white, barytes or finely pulverized and floated silica, with whatever pigment might be desired for coloring, and the necessary amount of raw linseed oil, or equal parts of raw and boiled oil, as some advocate, would prove a good paint.

Great things are claimed for China wood oil by some paint makers, and no doubt when it is properly prepared for use in paint in connection with linseed oil good results will follow. It seems to stand against many things that linseed oil paint goes down before. In varnish I have seen it perfectly unaffected by boiling water, hot irons, and strong acids. Leaving a slat coated with it in boiling water for a time had no effect even upon its luster. Alcohol did not affect it. Why, then, should it not prove serviceable for seaside painting? The oil may be bought now, in proper condition for mixing with paint, and hence any painter may try it out anywhere, and so determine for himself at least its real value as a salt water resister.

METAL ROOFING—TILE

By H. M. SANDERS

IN OUR last article we took up the subject of metal shingles, which are made of tin, galvanized sheet metal and sheet copper. Metal shingles, so called, are presumed to supercede the use of wood shingles on the cheaper class of our buildings, more especially residences with steep roofs.

Metal tile roofing is another phase of this subject, but in its use and in applying it to buildings, its general features of construction are the same as those of the metal shingles. It has the same

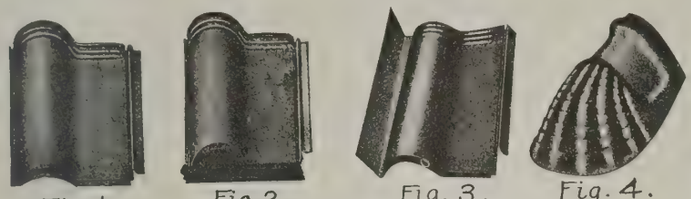


Fig. 1. Fig. 2. Fig. 3. Fig. 4.

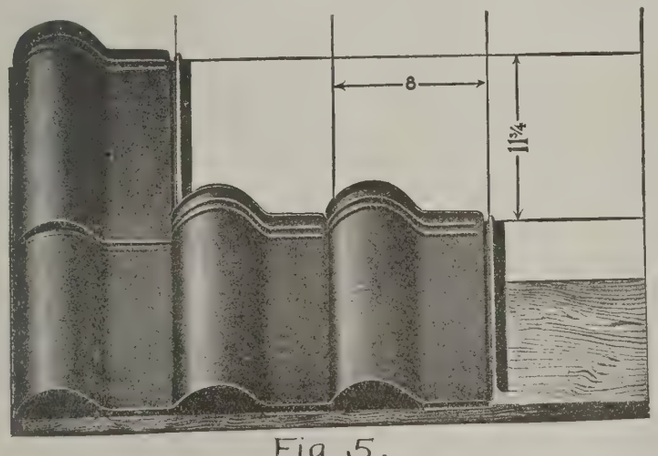
interlocking seam at the side of the tile extending its full length, as in the side of the metal shingle, as shown in Fig. 11. The top and bottom ends of the tile have the same finish with beads, etc., and lap the same as the shingles. It differs in general form from the shingle, which is comparatively flat. One-half of the tile is flat, while the other half is pressed into a circular form, and herein lies its conformity to the shape of the "Spanish tile," from which it is named.

Sheet copper is the ideal metal for tile, as its ductility permits it to be worked or pressed into almost any shape without cracking or breaking.

The illustrations here given of this copper tiling represent the Spanish tile of the boldest type that is now on the market; that is, in outline finish with slight variations in detail as regard the interlocking of the side, vertical or upright seams.

Fig. 1 shows one of the tile which forms the body of the roof, with both ends open. Fig. 2 is the same tile as Fig. 1, except that the lower end is closed. This is why it is called the "starter." This tile lies along the eaves as shown in Fig. 5, hence the lower end needs to be filled in with copper, as shown, and locked to a copper strip nailed to the eave with an edge turned out ¾ of an inch to



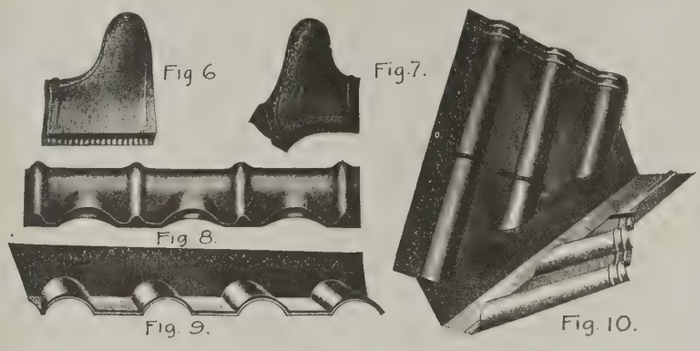


Fig. 5.

receive it. The tile at the left in Fig. 5 are gable end finish, turned down over roof boards and nailed to the end gable. Fig. 3 represents a tile where the roof flashes up against a side wall. Fig. 4 is the hip starter; that is, it is the bottom finish to the hip mould and the first piece to set when starting the hip roll, as shown in Fig. 12. Fig. 6 is a gable end finish for a ridge roll, and Fig. 7 is the finish where two hips intersect the end of the ridge course. Fig. 8 is a section of the top ridge, the same practically as shown in Fig. 12. Fig. 9 is a section of the tile finish where the top of the roof finishes against a brick wall.

An important feature in these tile roofs is where there are valleys to be flashed into. This is shown in Fig. 10. The end of the tile where it locks into the valley or that portion of it which rises above the roof line must be closed in with metal and soldered to the valley. This valley is the same as for the metal shingles where the roof shingle locks into it.

In laying tile, commence at the lower left hand corner. But first lay off the roof, as shown in Fig. 5, for securing straight lines for each course across the roof and to hold right position vertically. Where these starting courses at the eaves lock into an angle piece

of metal nailed to the eave, either as a strip nailed on to receive them or by turning them out ¾ of an inch of the back of the gutter at the top, the woodwork itself along the eave must be true and level.

Fig. 11

Fig. 11 is one form of interlocking device used on the sides of the tile, the same as adopted for the metal shingles.

The nailing of these tile to the roof boards is through the flange of the lower tile, as shown in Fig. 11, practically at the same point as for the metal shingles, one nail near the top, one in the center and one 2½ or 3 inches from the bottom of the tile. Copper nails should be used on the copper tile. The barbed wire nail is more serviceable than the cut wire nail, as it is not so soft, and less likely to bend when driving.

Chimneys, scuttles, skylights, and other openings through the roof are finished at the bottom with a flashing similar to Fig. 9.

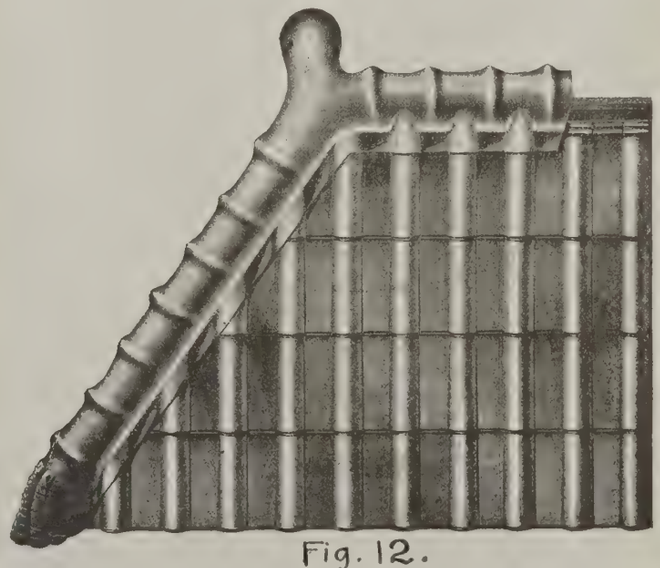

Fig. 12.

At the sides, a flashing similar to Fig. 3 to meet the run of the courses is used. At the top or back of the opening, the saddle boards are covered with copper and the tile roof locked into it at the valleys created by the intersection of the boards with the main part of the roof. The bottom end of the tile toward the chimney; that is, the projecting round end, must have a head soldered in, the same as shown in the valley, Fig. 10. After the roof is put on, give it a good coat of linseed oil.

BUILDERS' REFERENCE TABLES

By J. GRANT ROBINSON, Architect

(Continued from February, 1912.)

To find the thickness of the plate we will use the formula, for cast iron $t = .03\ P\ \sqrt{load}$;
for steel $t = .0137\ P\ \sqrt{load}$.
(t equals thickness of slab.)

P is the projection on one side of girder, and the square root of 250 (the load per square inch on the concrete footings, in this case), is about 16 in., so we have $.03 \times 2 = .06 \times 16 = 96/100$ of an inch thick; call it 1 inch; therefore the plate will be 1x 6x12 inches; steel plate will be $.0137 \times 2 = 274 \times 16 = .4384$ of an inch, or 44/100 in., say, 7/16 in. thick. A stone plate will be two times P or $2 \times 2 = 4$ in. thick.

WOOD COLUMNS.

Wood columns may be calculated from two different formulas. In the first the length of a column in inches divided by the least side of a rectangular, or the least diameter of a round column, equals twelve or less. In the second the ratio is usually more than twelve. The first is from tests made by the Forestry Division of the United States Department of Agriculture, and the second from tests on full size timbers at the Watertown arsenal. Both formulas are given in simplified form but are correct and absolutely safe. Either can be used, but the second method is the most convenient and adaptable to any condition, therefore preferable for general use.

First Method: The tables on plate 3 give all the sizes and length that will be ordinarily met with in general practice, their maximum safe loads, and the dimensions for their shoes or base plates. The formula is based on the ultimate strength of the different woods, and this ultimate strength is called the coefficient, or "C," for each wood.

The formula used is: $\text{Safe load} = \dfrac{\text{area of cross sections} \times C}{\text{factor of safety}}$

The value of C for the various woods is as follows:

Long leaf or Georgia yellow pine.....5,000
Short leaf and Texas yellow pine and Oregon pine.....4,500
Norway pine and oak.....4,000
White pine, spruce and California redwood.....3,500

Use a factor of safety of 5 with the above values.

Example: To find the safe load for a 10x10 spruce column 10 ft. 0 in. long. 10×10 equals $100 \times C$ (3,500) equals 350,000, divided by 5 equals 70,000 lbs., which is the safe load. If required, any other factor of safety may be used. Where inferior material only can be had, it is sometimes advisable to use a factor of safety of 8 or 10. Note that in the tables the length divided by the least dimension equals twelve.

Second Method: The safe carrying capacity of long columns is determined by first dividing the length in inches by the least side in inches, the ratio found being expressed as $\frac{l}{d}$.

The safe loads for the different woods have the following values per square inch of cross section:

A Long leaf yellow pine.....$1{,}000 - \dfrac{10 \times l}{d}$

B Short leaf, Texas yellow pine and Oregon pine..$850 - \dfrac{8\frac{1}{2} \times l}{d}$

D Norway pine and oak.....$750 - \dfrac{7\frac{1}{2} \times l}{d}$

E White pine, spruce and California redwood....$625 - \dfrac{6 \times l}{d}$

Example: To find the safe carrying capacity of an Oregon pine column 10x10x12 ft. 6 in. long. Twelve ft. 6 in. equals 150 inches, divided by 10 equals 15. Now $15 \times 8\frac{1}{2}$ equals $127\frac{1}{2}$, deduct this from 850 equals $722\frac{1}{2}$ pounds per square inch. The area of the column is 10×10 equals 100, and with $722\frac{1}{2}$ lbs. equals 72,250 pounds as the safe load for the column. This system applies to any value of l/d for any wood.

The following table shows the safe carrying capacity per square inch of section for any value of l divided by d, the letters A, B, D and E referring to the woods in the previous table:

$\frac{l}{d}$	A	B	D	E
8	920	782	690	577
9	910	773½	682½	571
10	900	765	775	565
11	890	756½	667½	559
12	880	748	660	553
13	870	739½	652½	547
14	860	731	645	541
15	850	722½	637½	535
16	840	714	630	529
17	830	705½	622½	523
18	820	797	615	517
19	810	688½	607½	511
20	800	680	600	505
21	790	671½	592½	499
22	780	663	585	493
23	770	654½	577½	487
24	760	646	570	481
25	750	637½	562½	475
26	740	629	555	469
27	730	620½	547½	463
28	720	612	540	457
29	710	603½	532½	451
30	700	595	525	445
31	690	586½	517½	439
32	680	578	510	433
33	670	569½	502½	427
34	660	561	495	421
35	650	552½	487½	415
36	640	544	480	409
37	630	535½	472½	403

The safe load for any size or length of column can be readily computed by the use of the table of the values of 1/d.

Example: To find the safe load for a 10x10 spruce column 22 ft. 1 in. long. Twenty-two ft. 1 in. equals 265 inches, divided by 10 equals 26½; now look in table under column E; at 26 you will find 469, so 26½ would be about 466. The area of the column is 10 × 10 equals 100, gives 46,600 as the safe load.

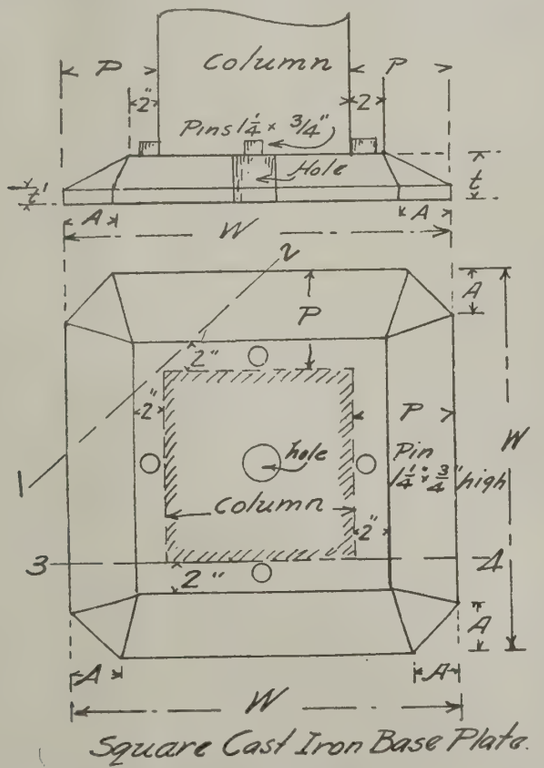
Another example: Take an 8 in. by 12 in. by 16 ft. 0 in. oak; now the length (1) is 192 in., the least side is 8 in., the ratio 1/ gives us 24. On this line, under column D, we find 570 pounds per square inch; $570 \times 8 \times 12$ equals 51,840 lbs. as the safe load.

To compute the loads on columns, we will assume a three-story and cellar warehouse, 44 ft. 0 in. wide, with two lines of columns spaced equally each way, assuming the cellar wall to be stone, 24 in. thick, the first and second stories 16-in. brick, the third story 12-in. brick, and the heights of the stories to be: cellar, 8 ft. 0 in.; first floor, 12 ft. 0 in.; second and third stories each 10 ft. 0 in. Therefore the spacing of the columns in the width of the building will be determined on the first floor which will be 44 ft. 0 in. less walls, divided by three equals about 14 ft. 6 in. center to center. This will make spaces between posts, and posts and walls very nearly the same. We will assume the live load on the second and third floors to be 250 lbs. pr sq. ft, and 330 lbs. for the first floor, and the roof 40 lbs. per sq. ft.; the dead load on roof will be 25 lbs., second and third floors 30 lbs., and first floor 35 lbs. (See January number for notes on live and dead loads.)

Beginning at the roof, as each column will support 14 ft. 6 in. by 14 ft. 6 in. of roof or floor area, the column on the third floor will have a load of 210 square feet times 40 plus 25, or 65 lbs. equals 13,650 lbs. We will select a spruce, 5-in., round column, which will have 33 square inches in area; 10 ft. 0 in. or 120 in. divided by 5 equals 24. Looking for the value of 1/d in column E, we find this post stronger than required.

The column on the second floor will carry the 13,650 lbs. of the column above, also 210 square feet of the third floor by 250 plus 30 equals 280 lbs., making a total of 72,400 pounds. We will take a long leaf yellow pine square post. Assuming 1/d equals 13, this column will carry 870 pounds per square inch;

Table giving the safe carrying capacity of wood columns when the length in inches, divided by the shortest side (or diameter of a round column) equals twelve.



Also the size, thickness and other principal dimensions of cast iron, steel and stone base plates or shoes, for the different loads, figuring the loads on the footings at 250 pounds per square inch.

divide 72,400 by 870 gives about 84 square inches, or a little over 9 inches square, but a 10x10 column should be used.

See table of value of l/d, for the use of columns in which the length is more than twelve times the shortest dimension.

The column on the first floor will have to carry 72,400 lbs. plus 58,800, total 131,200 lbs. We will use a square long leaf yellow pine post with a value of l/d equal to 12, with a safe load

Square Cast Iron Base Plate.

of 880 lbs. per sq. in.; divide 131,200 by 880 gives, say, 150 sq. in., which would require a post 12x14 inches, although if the timber was particularly good a 12x12 would probably be safe enough.

The load on the column in the cellar will be 131,200 plus 70,350 lbs., or 201,550 lbs. As we used a column 12 in. on the least side on the floor above we will do the same in the cellar, of long leaf yellow pine; now 8 ft. 0 in. or 96 in. divided by 12 gives the value of 8 for l/d. We find in column A and in line 8, 920. Divide 201,550 by 920 and we have 220 square inches, which would give a column 12x18⅓, in which case it will be safe to use a 12x18 in. In practice the weight of the girders, floor joists, and all items of dead loads should be carefully computed.

CAST IRON BASE PLATES.

The holes in the plates should be from 1½ to 3 in. in diameter, according to the size of the plates and should be in the center, as a hole anywhere else weakens the plate.

The angles "A" are cut off, but their area is added to the size of the plate.

The lines where fractures usually occur in cast iron and stone plates are shown at 1-2 and 3-4. For cast iron and stone these lines are generally straight.

FORMULA FOR SHOES OR BASE PLATES.

Pr = permissible pressure on footing, for Portland cement equals 250 pounds.

L = load on column in pounds per square inch.

A = area of plate in inches.

B = least side of plate in inches.

D = diameter of round or side of square plate in inches.

a = area of base—area of column.

p = projection of plate from edge of column.

t = thickness of plate in inches.

Then

$$A = \frac{Pr}{L}$$

$$B = \sqrt{A}$$

$$P = \frac{B - D}{2}$$

$$t = \sqrt{\frac{Pr \times P \times a}{D}} \div 80 \text{ for cast iron.}$$

or $.30P \sqrt{\text{load.}}$

$$t = \sqrt{\frac{Pr \times P \times a}{D}} \div 220 \text{ (for steel).}$$

or $.0137 \times P \times \sqrt{\text{load.}}$

t = 2 × P (for stone).

Example: What is the safe load on a long leaf yellow pine post 8 in. by 8 in. by 8 ft. 0 in. long? 8 × 8 = 64 × 5,000 = 320,000 ÷ 5 = 64,000.

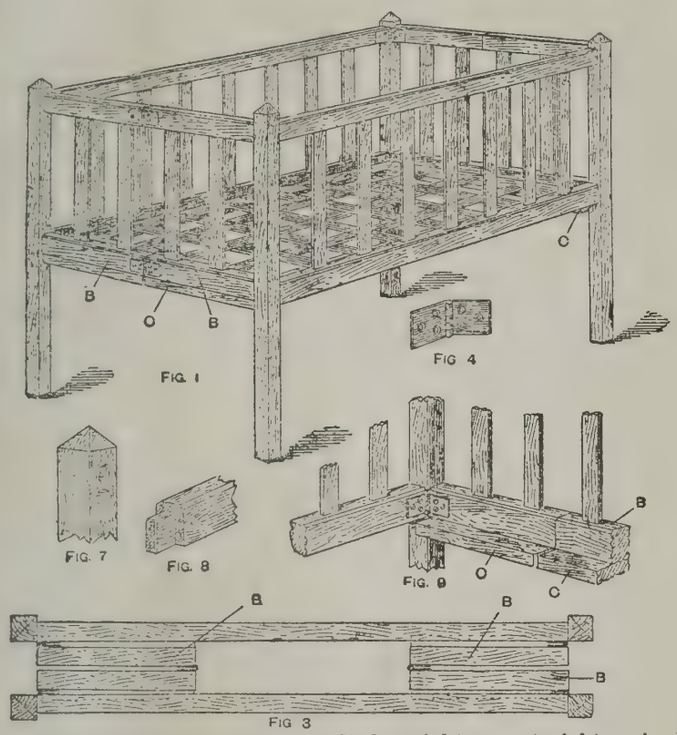
To find the size and thickness of a cast iron plate for an 8 in. by. 8 in. y. p. column carrying 64,000 pounds.

L (64,000) ÷ Pr (250) = 256 sq. in. plus angles A (12 sq. in.) = 268 sq. in.

B = √268 = 16½ square.

P = 16½ — 8 ÷ 2 = 4¼ in.

t = .03 × P √Pr (250) = .03 × 16 × 4¼ = 2.04, say 2 in. beveled at edge as shown.



(To be continued.)

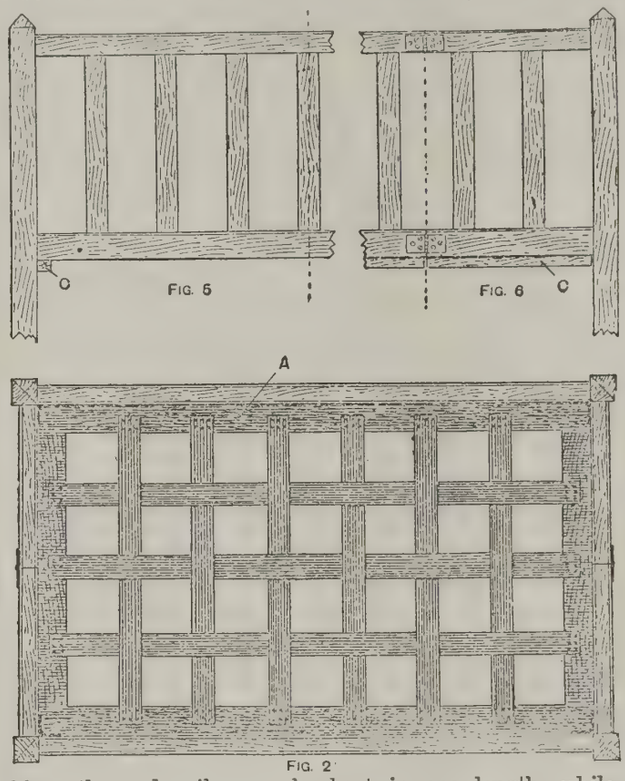
Design for St Luke's Church

MAKING A CHILD'S COT



By J. D. B.

THE child's cot illustrated in Fig. 1 is very simple in construction, and merely requires the ability to dress stuff to width and thickness, and to mortise the legs and form tenons on the ends of the side rails. When not in use the cot can be folded up and placed against a wall. The bottom of the cot (see A, Fig. 2) serves to keep the cot open as in Fig. 1. When the bottom is lifted out, the hinged ends B (Fig. 1) are folded inwards as shown in the plan Fig. 3.

As the cot has to carry very little weight, any straight-grained wood free from knots may be used, such as pine or poplar, varnished or French polished. But for good appearance, mahogany finished with French polish is recommended. To save expense, iron flap hinges (Fig. 4) 1¼ inches wide, may be used, but brass hinges will look better and will not rust. To insure accuracy of working, it is advisable to make full size drawings of the plan (Fig. 2), also of half the side elevation (Fig. 5), and half the end elevation as in Fig. 6. These figures are drawn to the scale of 1 inch to a foot. The dimensions of the cot are: Length, 3 feet 6 inches; width, 2 feet 3 inches; height to top rails, 2 feet 6 inches; height to top edges of rails B (Fig. 1), 1 foot 4 inches; legs, 1⅝ inches square; top rails, 1½ inches wide and 1⅞ inches thick; lower rails B, 2 inches wide by 1⅛ inches thick; balusters, 1½ inches wide and ⅜ inch thick. In the framing of the bottom of the cot the side rails and the ends rails are 2 inches by 1⅛ inches.

In making, first dress up all the wood to width and thickness, and shape the upper ends of the legs as in Fig. 7. The upper edges of the top and the lower rails are chamfered as in Fig. 8. In marking the legs for the mortises, place all the legs side by side, and draw the lines across with the aid of a square. The same method should be used in marking the tenons on the side rails. It will be seen that the end rails have no tenons, and to facilitate

working, the end rails may be kept in one length, while the balusters are fitted and glued together. Then they may be cut in two parts, and the hinges fixed as shown in Fig. 1. The various positions of the hinges are shown in Figs. 1, 2 and 3. To provide support for the bottom framing of the cot, strips of wood C (Fig. 9), 2 inches wide and ¾ inch thick, are fixed with screws to the under sides of the end rails. In folding the ends as in Fig. 3, the strips C (Figs. 1 and 9) slide under the side rails. To allow for the free working of the strips, the bottom edges of the end rails should be about 1-16 inch below the level of the side rails. The bottom framing A (Fig. 2) may now be mortised and tenoned together, and then fitted into position, so that it can easily be dropped in or lifted out. When the framing is polished, the webbing may be tacked on as in Fig. 2. A suitable webbing is that used by upholsterers for chairs.

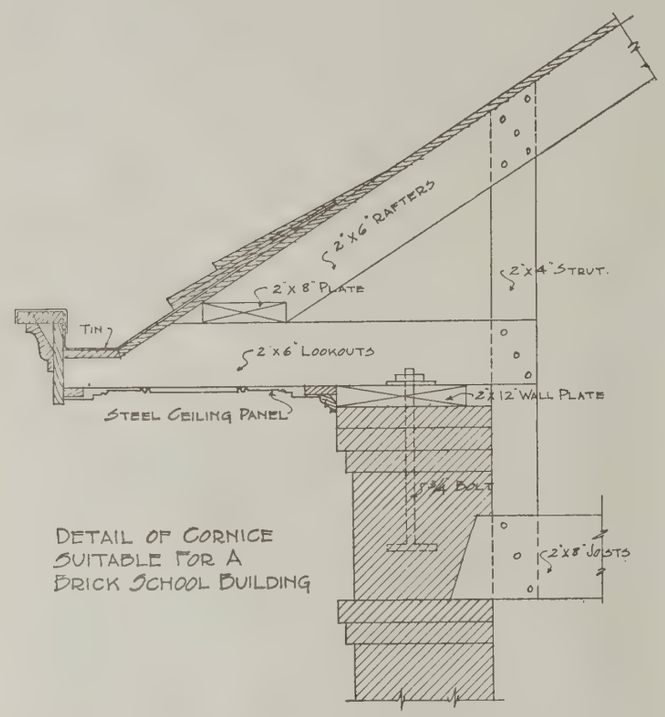
STREET PAVEMENT

They took a little gravel,
And they took a little tar,
With various ingredients
Imported from afar;
They hammered it and rolled it,
And when they went away
They said they had a pavement
That would last for many a day.
But they came back with picks and smote it
To lay a water main;
And then they called the workmen
To put it back again.
To run a railway cable
They took it up once more;
And they put it back again,
Just where it was before.
They took it up for conduit
To run the telephone;
And then they put it back again
As hard as any stone.
They took it up for wires
To feed the 'lectric light;
And then they put it back again,
Which was no more than right.
Oh, the pavement's full of furrows,
There are patches everywhere:
You'd like to ride upon it,
But it's seldom that you dare.
It's a very handsome pavement,
A credit to the town;
They's always diggin' of it up,
Or puttin' of it down.

—Washington (D. C.) Star.

"Ma'am, here's a man at the door with a parcel for you."

"What is it, Bridget"



"It's a fish, ma'am, and it's marked C. O. D."

"Then make the man take it straight back to the dealer. I ordered trout."

CORNICE FOR A BRICK SCHOOL

By I. P. HICKS

OUR illustration shows in detail a heavy cornice suitable for a brick school building or other similar work where a heavy looking cornice is desired. In the drawing the brick work is projected out to form the frieze. A 2x12 is bolted to the brick wall with ¾-inch bolts extending well down in the wall, one bolt at each corner and one every 4 feet thereafter. Next comes the 2x6 lookouts upon which is run a 2x8 plate for the foot of rafters to rest upon. The lookouts extend 4 inches past the inside of the wall, and then a 2x4 upright is spiked to the rafter, to the lookout and the ceiling joists below, thus tying all together in a very strong and substantial manner, so that nothing short of a cyclone could unroof the building.

DETAIL OF CORNICE SUITABLE FOR A BRICK SCHOOL BUILDING

A special feature of this cornice is the plancier, which is made as follows: A 1x3 strip is nailed to the lookouts next to the brick wall and a 1x2 at the outer end next to the fascia and the lookouts are cut past the right length to take a steel ceiling panel so that the bed mold will make the finish next to the brick. A regular stock pattern of steel ceiling 24x24 inches can be used for the plancier and it makes a fine looking job.

The fascia crown mold and cap pieces are of wood. The gutter is to be lined with tin.

The cost per lineal foot for this kind of a cornice is about as follows:

The metal ceiling, per lineal foot	20c
The tin gutter	17c
Fascia	3c
Crown mold	2½c
Cap piece, per lineal foot	2c
Sheathing in gutter, per lineal foot	3c
Furring strips, per lineal foot	2c
Bed mold, per lineal foot	1½c

LABOR.

Putting on metal ceiling, per lineal foot	5c
Furring strips	2c
Bed mold	1c
Crown mold	2c
Fascia	2c
Gutter boards	4c
Cap piece	2c
Total estimated cost, per lineal foot	60c

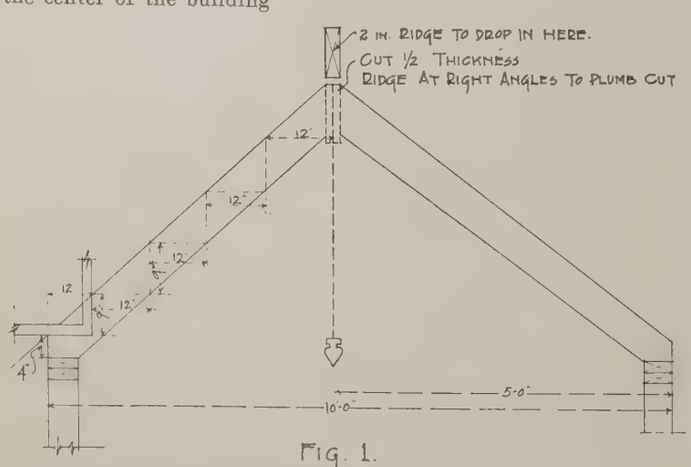
Thus, it will be seen that this cornice figured in a conservative manner is worth 60 to 70 cents per lineal foot; and the above figures do not include the bolts, lookouts, plates, or any of the rough frame work. After all, considering everything, it makes a very good cornice and is not high in price for the proportions of it. It projects from the building all told about 2 ft. 5 in., which is sufficient to look well on the average building of this kind.

FRAMING HIP ROOFS

By A. L. HIGGINS

I have been asked many times how I framed hip roofs and especially as to getting side bevels and lengths of jack rafters. I always use the steel square, which I consider the most reliable.

To illustrate: If I have a roof—plates, say 10 feet x 20 feet, to make it easy, I first select a good straight stick for a pattern for my main rafter. I may want, say four (4) inches on my plumb cut above the plate. My pitch is, say 9 inches to the foot run. The sketch will illustrate. With 12 inches on the body, and 9 inches on the tongue of the square, I measure in on the rafter to the center of the building



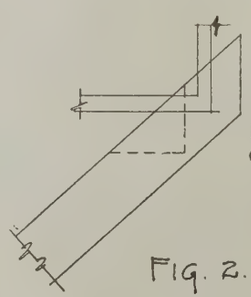


FIG. 1.

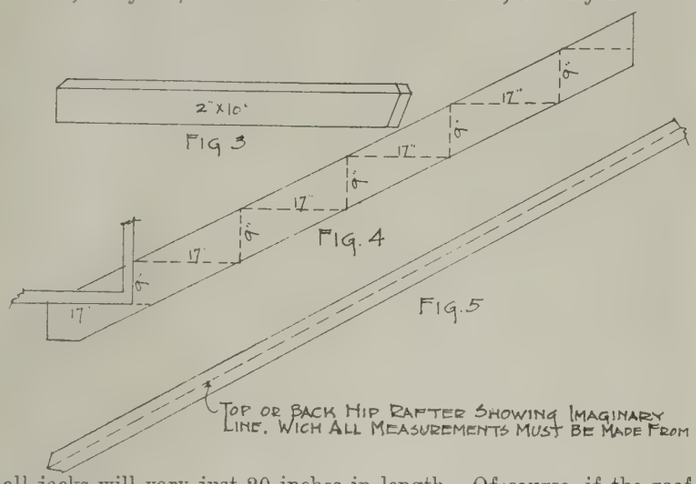
Next, I select my ridge, which should always be two or more inches wider than the stock for the main rafters. Subtract the width of the building from the length, and add the thickness of this ridge, which will give the length, which in the example herewith is 10 feet 2 inches. Then I space this ridge and get the required number of main rafters, allowing for two mains at the ends and openings for dormers, etc. The next comes the hips.

FRACTIONS OF FEET IN WIDTH OF BUILDING CAN BE OBTAINED IN THIS WAY.

FIG. 2.

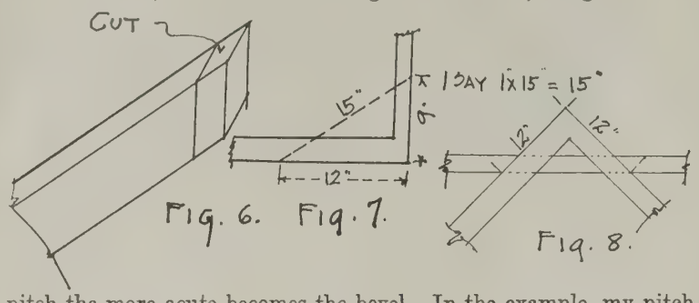


Down here we never "back" the hips as we think it is labor for nothing. Half the width of the building being 5 feet, I take 17 inches on the body of square (17 inches being the hypothenuse of 12 inches base and 12 inches up) and the rise of main rafter (9 inches) and run in five times to center, as in Figs. 3, 4 and 5.

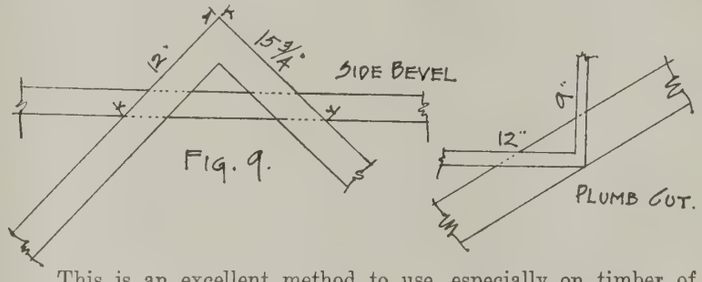
After cutting bevel on upper end of the hip, which bevel must center on the imaginary line, I then cut off one-half thickness of ridge, which must be parallel with top of the ridge when in place, viz.: Fig. 6.

Next is the jack rafters. First we must find the length of each set, which, of course, must be mated or paired. If my roof, as in this case, is 9 inches pitch, I measure across the body of the square at 12 inches, and the tongue at 9 inches, which in this case is 15 inches. See Fig. 7.

Now, if my main rafters are 12 inches on centers, my first set of "jacks" will be that hypothenuse, or 15 inches shorter than the



main rafter, and each following set 15 inches shorter than the first, and so on. If my mains are 18 inches on centers, or 1½ feet, I say 1½ times 15 inches = 22½ inches, and my jacks accordingly will be so much shorter than the mains. If the mains are 16 inches on centers, I say 1 1/3 times 15 inches = 20 inches, and my first and



all jacks will vary just 20 inches in length. Of course, if the roof is 6 inches to the foot, I measure across square at 12 inches and 6 inches.

Now, with regard to cutting side bevels for jacks on the hips. There are several ways, but I have never seen any way used in any books, or by builders, although it may be. We all know that if our hips, mains and jacks lay flat upon the floor, 12 inches and 12 inches on the square or a mitre would make us an exact fit. The following would be it. See Fig. 8.

Now raise the rafters 1 inch to the foot and throw the tongue over on the stick to 12 5/12 inches, always holding the body of the square at 12 inches, and for every succeeding inch to the foot pitch, add an extra 5/12 inches to the tongue. Of course, the greater the

pitch the more acute becomes the bevel. In the example, my pitch being 9 inches, I say 9x5/12 = 45/12 or 3¾ inches. The bevel in this case would be 12 inches on the body and 12 + 3¾ or 15¾ inches on the tongue, viz.:

This is an excellent method to use, especially on timber of variable thickness.

SIZES and QUANTITIES, SIGNS and SYMBOLS

By JOHN UPTON

WE ARE frequently puzzled by things that we do not understand because we have never become acquainted with them in the technical dress. This is true in speaking of the terms used in lumber and then there is apt to be confusion because some one does not quite understand what some one else wants or the man who does may not be just sure himself what or how much he wants.

Let us suppose that we want flooring for a room 12x15. How much should we order?

That will depend on the width of the material and also somewhat on its length and whether it is end matched so that almost none need be wasted or whether it must be cut to fit the joists and so waste more or less. First, as to width. A board eight inches wide in the rough after being planed and matched will lay or cover seven and one-fourth inches and there would be the same amount of loss on each board in narrow stuff, so that for four-inch material we will need to make twice as much allowance as for the eight-inch. So, we may figure it out, that to cover one hundred square feet with lumber of various stock width would require as follows:

8 inches	110 feet.
7 inches	112 feet.
6 inches	115 feet.
5 inches	118 feet.
4 inches	126 feet.
3 inches	134 feet.

These figures, however, are sufficient only where there is absolutely no waste besides the matching. If there is any other, even the slight amount for end matching, ½ inch on each piece, we must allow a little more; 5 per cent would probably be sufficient to allow for end matched material, but if it needed to be cut on joists there would be a chance to waste a few inches on some half the pieces, so we should add some 10 per cent to the above figures.

For siding, that is, clapboards, there is less apparent but more actual waste, for while the difference between the trade size, the amount paid for and the actual width, is only one-half inch, there must be a further allowance made for the lap in laying so that a board figured as six inches wide will cover only five inches and the same for narrow ones. Then the waste by sawing for use may be considerable, as they are generally cut to bring joints over the studs and of course must be cut between the casings.

It will generally be safe to allow for covering one square, with six inch, 130 feet; five inch, 140 feet, and four inch, 150 feet.

All other matched stuff as ceiling, barn siding, coping, figure as the same flooring.

Finishing lumber will be only seven-eights or three-fourths inches thick instead of a full inch, owing to having been planed, and shrinkage. There will also be a slight shrinkage in width.

And right here let me call your attention to a little matter which some might learn only by experience. You know that corner boards, water tables, outside base, outside window and door casings are all inch and one-eighth lumber? Yes. Well, did it ever occur to you that the frieze board for gables should also be one and one-eighth inch, but that which goes under the eaves is only seven-eighth inch?

When it comes to ordering sash, some of us are like the man who wanted a dozen of a certain article, so he ordered one tailor's goose and eleven others. He knew what he wanted and told it so that the other men knew also. Suppose you had a window frame or opening 28 inches wide and 24 inches high. If you gave the order incorrectly you might get a sash 24 inches wide and 28 inches high or you might get one with the glass 24x28, the 24 for width and the width of the sash added to these figures. If you order this sash to fill an opening 28x24, or with glass, 24x20, you should get what you desire.

For the rules to be remembered are to give width first, then length, then thickness and number of lights to the entire window, whether it is one sash or two.

The symbols S1S, S2S, S4S and D4S mean dressed, one, two, or on four sides.

Lumber is graded as clean and select, or as No. 1, 2, or 3. Clean means that there are no defects, as knots, sap stains, etc., or defects made by machines; in fact is supposed to be so good that all of it can be used for even the best work.

Select grade comes next, and may contain defects which can be cut out without much waste.

No. 1 grade may contain a few very small knots and some light sap stain.

No. 2 grade may have considerable stain, small sound knots, and machine defects.

No. 3 grade contains stain, several knots, and small defects, but should not waste over ten per cent in any piece.

These rules apply to stuff up to four inches wide. Wider stuff may have more defects as it is more difficult to get stock which is free from defects.

OUR READERS' PAGES

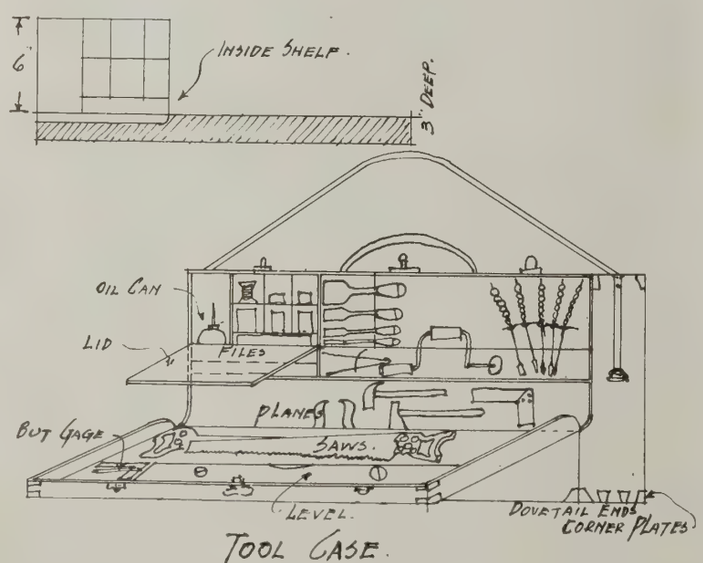
ANSWERS

BROKEN PLASTER CEILING.

From "Plasterer," St. Louis, Mo., replying to "General Reader," Midletown, N.Y.:



I would not advise placing Compo board on surfaces of broken plaster, for practical reasons. First: The nailing up of the Compo board will crumble the old plaster to such an extent that it will fall and lodge on the upper side of the Compo board, and sooner or later will find its way into the rooms below, and will also hide the ceiling joists to which the Compo board must be nailed. You can, however, tear off the old plaster, thus exposing the joists to view, and the lathes will form a background and stiffen the Compo board.

If, as you say, the plastering has been on the walls for fifty years, there is no reason why a new job of the same kind of plastering should not last just as long, and I would advise you to have the old work examined by a good plasterer who will recover the old lath with either lime mortar or any good brand of hard plaster, as the cost of such a job is insignificant as compared to the quality of good work.

SUIT CASE TOOL BOX.

In reply to L. D. G., Calgary, Alta.:

Here is a tool case, on the order of a suit case in every respect. This is one of my own make, of which I have been using for two years. This case is 2 ft. 8in. long, 18 in. high, 7 in. wide. In

TOOL CASE.

the lid of this case, as you can see by diagram, you can place your level, 1 Stanley butt gauge and two saws, 1 rip and 1 cross-cut, directly over each other. The teeth should be up next to level. In the back left-hand corner you see a divided box for oil can, oil stone, line, chalk, wax, brads and screws. Under this box you see a small space for files, saw set and so on. To your right, brace bits, chisels, compass and such stuff as you may desire. In the bottom your planes hatchets, hammer, tri-square and a Nicholl's take-down square.

TIMBER FRAMING.

From "O'Gee," Edmonton, Sask., Canada:

If Jas. McL. will write Department of Agriculture in the province or state of Saskatchewan, he will receive a budget of excellent pamphlets that will give him a lot of information regarding timber localities, rising towns, railways and other matter. Address "Minister of Agriculture, Edmonton, Sask., Canada."

A BRICK CISTERN.

From "Bricklayer," Montclair, N. J.:

"J. B.," Lancaster, Pa., might make his cistern about ten feet deep in the clear. A four-inch wall built of good hard-burned bricks, well backed and puddled with clay, or strong loam, would do very well but the foundation of the whole bottom must be good and solid. I would much rather have a nine-inch wall—well backed. Proportion of cement for inside finish would do very well, with one and a half sand and one of cement. Lay bricks in same cement. Plaster same as ordinary work. Couldn't give you an estimate of the cost, not knowing price of labor or materials in your neighborhood.

BONDING NEW BRICKWORK TO OLD.

From "Bricklayer," Montclair, N. J.:

C. V. L. of Indian Springs, Tenn., does not say to what part of the old work he wants to connect the new. If it is to a corner, the matter is quite simple, as the bricks on the old wall may be taken out or "toothed"—latter may be taken down in blocks, and "stepped" so that the new wall can be built in "step by step," which will make a good solid connection. If the junction is to take place on a flat wall, the proper plan will be to cut "chases" or grooves in the old wall, about 18 inches or two feet long, and the same distance apart, on the ends. The chases to be one width of brick wide and half a brick deep in the old wall. This will give you a good chance to work in your new wall without showing a break. Care must be taken to allow for settlement of new wall, so that it will not press too heavily on the old walls wherever it happens to rest on them.

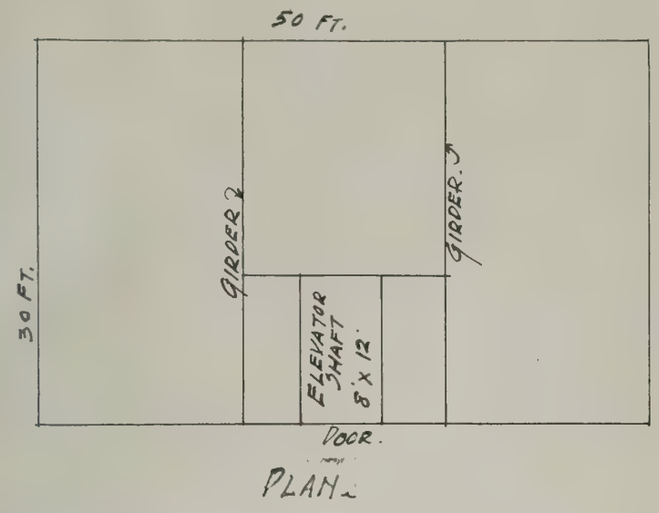
From W. A. T., Weedsport, N. Y.:

I wish to call attention to the error in the design of a truss shown in your February issue, submitted by "Builder" of Green Bay, in reply to question of A. B. C. of Marcus, Wash. In the truss mentioned, the second strut from each end should run from the bottom of the vertical rod to the top of the next rod. As shown, it would become loose at the first loading, and of course, would become useless as a strut. I also note that it is suggested that the girders could be built up, using six 2x12 planks laid flat on top of each other. This method would make a very weak girder. The deflection would be very great even under no load except its own weight. In using built up girders, the plank should always be placed on edge to carry a load, and on the flat only when it is desired to resist pressure.

Editorial note: It is apparent that "Builder" meant that the truss should be built up or assembled on the ground and so laid flat. The planks would then be on top of each other.

QUESTIONS

From H. A. C., Cleveland, Ohio:



Can plaster be considered unsatisfactory if it cracks in places, although it is solid and does not drop off? What is usually the trouble when plaster cracks and what will remedy this trouble?

Is it reasonable to ask any sash and door company to make good or replace any windows that cracked due to the action of the wood?

DETAIL FOR SHOP ELEVATOR.

From Lloyd S., York, Pa.:

Here is a concise plan of a blacksmith shop. Can I get some information from your paper as how to erect an elevator directly

PLAN.

inside of the door? Must run by hand and carry not less than 2½ tons. Height of shop to square is 18 ft., is to have a peak roof, or will it be necessary to erect a dormer in roof? Please advise what material to be used. There are no posts on first floor.

From C. B., Medina, Ohio:

I am about to build a grandfather's clock, above the dial of which I wish to carve an inscription. Will some reader please give me a suitable one for the purpose. I request, however, that it be only a sentence containing no more than twenty-five letters.

From P. C. S., Chicago:

I have two makes of hand scrapers and each one always jumps while in the act of scraping. What is the reason and what is the remedy?

From C. G. L., Marshall, Tex.:

I am preparing plans to remodel an old brick building and expect to let the walls remain. The walls have been painted a number of times with, I suppose, lead and oil paint. The paint is scaling off badly and it looks hardly possible to make a good job by repainting the old surface, as I fear the paint will scale off again, especially over the mortar joints, as the worst part of the wall seems to be over the mortar joints. Please give me your idea as to the best treatment of the old wall. Will it not be best to burn off the old paint, or remove it in some other way? The mortar in some of the joints is rather inclined to be soft, that is, it is not hard but seems to be more in the shape of a powder or dust.

ARCHES.

From "Beginner," Chicago, Ill.:

I began learning to be a "bricklayer" a year or so ago, and have noticed a lot of good examples of brickwork in THE NATIONAL BUILDER, and have learned a good deal from them, but I have not seen many examples of arches for small openings, as ordinary doors and windows; and, as I am interested in that kind of work—flat, elliptical, circular and other forms, I would like to see published in this department of the paper, examples that can be used in every day work. My first attempt at laying bricks, was on the Blackstone Hotel, this city.

ROOF PAINTING.

From "Carpenters' Wife," Duluth, Minn.:

Our tin roof over a back shed, leaks, in some small spots, and we cannot discover where the defects are. The holes must be very small and I wonder if a coat of good thick paint, or two, would stop up the little holes or cracks so as to prevent the water from getting through? The roof has not been painted for over ten years, what kind of a paint should I use? The old paint seems to have been a sort of oxide and is coffee colored.

NAILING ON ARTIFICIAL PLASTER BOARD.

From "Jack-o-All-Trades," Newark, N. J.:

I have several seaside cottages to build this coming season, and at my suggestion—influenced by several of your editorials on the subject—the owners have decided to make use of some one or other, or more—of the artificial covering boards, advertised in THE NATIONAL BUILDER, instead of plastering the walls according to the old way. I would like to know something about fastening the material on the walls and ceilings, and what preparations are required to prepare the grounds to receive the coverings?

ROOF FRAMING

By A. A. STAFFORD

In my illustrations, it has been my aim to show what can be done in roof framing with a common pocket rule and a square. As to getting lengths and cuts at this time I wish to call some attention to the trouble some people have getting the length of a common jack rafter. The way I reason this, the jack travels or lies in exactly the same direction as a common rafter, so why should

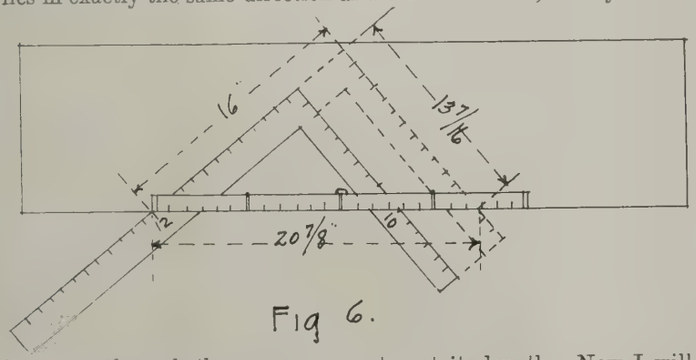


Fig 6.

it not go through the same process to get its length. Now I will take the same 10 in. rise to one foot run that I have been using on a 12 in. rise. I could measure across from corner of square 16 in. less 16 in. and get length of jack spaced 16 in. on centers, but for any pitch off 45°, I take the method of getting difference in length of jacks, shown in Fig. 6. Lay square on good straight edge of board as shown in cut. For 12 in. less 10 in., pitch 12 in. run to 10 in. rise, mark along 12 in. side. Now, if you have jacks spaced 16 in. on centers slide square along the mark till 16 in. is the reading instead of 12 in.; look on the other arm, at the edge of board and you will find it reads 13 7/16 in. Now, if you measure across to 16 in. you will read on your rule 20⅞ in., it being the length of jack. Why? Because when you slide the square on one foot run up to 16 in., the spacing of the jacks, you still retain pitch line from 10 in. up to 13 7/16 in., where it would intersect with hip line. Now take common rafter length less 20⅞ in., and besides this enough to allow one-half thickness hip rafter, and you have the length of longest jack. From this one take 20⅞ in. for next jack, and so on. Or, if you wish to start from the shortest jack, fit the first jack where you want it, then add 20⅞ in. to each one. This rule works on any pitch. Be sure and lay square 12 in. one side all the time and mark and slide on this side up to jack space, no matter how many inches on the other arm of square is always the pitch, and , as per slide in illustration, gives reading on rule what difference jack lengths are. Then, of course, you must allow side cut, and what is above plate edge. A very good way for young framers and some older heads, too, to get this roof work well in their minds is to take some 2x4 S4S and build a small hip roof, say 4x6 feet plate, and 10½ in. pitch. That will give you a chance to think when you measure across the corner of your square. Set your plate level, and have it up on something, and at your home where you can be by yourself to work and study on it. You can divide and make two different pitches on the same plate if you wish or put a deck in one end. These methods will give you a chance to lay the square on the work after it is up, and illustrate just the idea you want. This may look foolish, but by the time you have built all you can on the top of your 4x6 ft. plate, you will know more about roof framing.

BUILDERS' MILL WORK

THERE have been a number of changes in the mill work industry within the past few years that demand notice by everyone interested therein, and there are developments that are worthy of consideration.

These changes not only embody a difference in the styles, the finish and the character of the stock used, but have included as well other changes that are in reality more marked on account of the essentials making possible the change. In other words, they have demanded a certain specializing which has increased until the advent of what we might call the mill work specialist, and he has in reality become a need and a fixture. His place has been made for him, in a way, without his knowledge and his being able to fully grasp it. For this very reason, he must come to a fuller understanding of its importance in the building industry.

If we are to define this term, "mill work specialist," it refers to an operator who is able to anticipate the desires and needs of the building industry, or who can put into execution ideas conceived by others that embody feature designs. The fact that both the interior and exterior of buildings have undergone changes, and many of these important and radical, is conceded by every thinking operator in this line. But just what the changes constitute is the important detail that must be mastered by either the man who manufactures or who places mill work in position on the structure. Both have their bearings on the development of the industry, and each must acquaint himself with the matter in a way that will serve him best in making possible a greater development.

Let us take, for instance, the matter of doors and windows. The styles and sizes have become vastly different from those of a generation ago. The designs are changed, the sizes more general, and the finish has become so diversified that there is no room for comparison with the styles in vogue a few years ago. Further than this, many people today want something that is in a number of respects different from what they have noted elsewhere. They have grown so accustomed to seeing styles copied that they are ever seeking something that will make their structure different from others in this respect. This is applicable to other portions of the building as well, and the matter of interior finish has become one of many varying styles. New patterns are wanted, and coupled with these are requests for something new in the design of the finish.

Some plants have undertaken this newer feature of the industry and are today advertising themselves as manufacturers of special designs and odd sizes, as wanted by the architect or contractor, but they are able to submit designs that are entirely of their own conception. These have a special value in themselves. They not only fill the demands for new designs and odd sizes, as wanted by the architect or the builder. They make a study of the changes that are going on in all sections of the country, and with a modern plant and skilled workmen are in a position to take care of orders for unique designs and odd specimens of both exterior and interior finish.

They have been keeping in touch with the whole situation, seeing ahead as it were, and being able to foretell what would prove of value as an artistic pattern for those who were in the market for something out of the ordinary run of mill work to which many plants now devote their attention.

There was a time when the doors, window sash, blinds, and other mill work were confined to a comparatively limited number of sizes and designs. Any special design or size was made a special order, and was paid for accordingly. The number of such cases was rather small, and it did not pay an operator to arrange in advance for such demands. He could make up any amount of customary sizes in the same stock, and could be reasonably certain of selling them. There was no likelihood of the stock becoming a burden, or that it would become a loss from storing it. He knew pretty much what was wanted, and in this way he was able to utilize considerable stock and fill up the dull hours of the winter months. He could operate his plant for a long period in this way. This was a sensible move on his part, because in this way he was able to keep his usual force at work all the year, and on the other hand was ready to meet the demand when it came.

To a great degree this condition has undergone a change, and the man who gives all his attention to the ordinary sizes in made up mill work is running a risk that may prove costly to him later. Where formerly there was a demand for mill work that varied in no great particular as to size, style and quality, now the orders are so general as to often require a special design for much of the work that is to be turned out, and he will have on hand only a limited supply of those kinds that are known to be staples. For ordinary house construction, the styles and sizes are much the same as they have been, and there will still be a limited demand for them. But the growth of special lines has become such a factor of late that the industry has advanced along new lines, and the conditions will have to be met by the operator who wishes to increase his business.

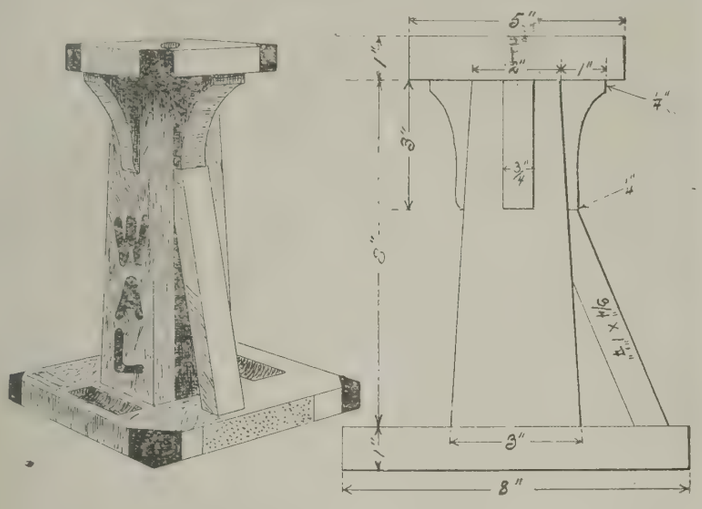
There are other considerations in mill work than new designs and sizes, and that is in the quality of the stock. People are becoming more particular as to the finish of the stock, and to the value of the same as well. Green lumber or inferior kiln dried stock are things that must be avoided by the mill work man and the contractor. The stock must be up to the highest standard, where an order demands the best, and the finish must be given as much care as possible. A special design demands special care in the workmanship, and this cannot be had without the greatest painstaking on the part of the operator. This necessitates able workmen who appreciate the position in which they are placed. An inferior workman can spoil more stock in a day than a good man would in a year. So this is a feature that must be looked after carefully by the man who is going to specialize on mill work.

Veneers are now entering largely into the finish of much of our modern mill work, and the selection of the veneer has much to do with the finished job. If an operator is to do his own veneer finishing, that is, if he is to glue up his stock and do the part of the work that is sometimes done by the veneer plants, then he must be able to understand the importance of the work, and in this way avoid many serious errors. He will require for this certain equipment and intelligent help, so that his efforts will be fruitful and his labors count for more than experiments. It is sometimes a safe plan to have this work done by the veneer plant, because this is a branch of the mill work industry that rightfully comes under a separate head and should be done in a way that will not prove a series of costly blunders.

INJURIES FROM FALLING SCAFFOLD

By W. J. STANTON

An experienced painter in the employment of a contractor was ordered, with another painter, to paint a porch ceiling, and they erected a scaffold by resting a plank on two stepladders placed 12 or 15 feet apart. There was considerable bending and springing of the plank due to the weight and movement of the men upon it. In 20 or 30 minutes the stepladder placed by plaintiff tipped over and plaintiff was thrown to the floor and injured. A rope was attached to the legs of the stepladder to prevent them from spreading beyond a certain distance, but no appliance to prevent the legs from coming together. The ladder did not break or give way in any part. The testimony showed that some stepladders, when being used as this ladder was being used in a scaffold, "walk" or "creep"—that is, the motion of the plank resting on the ladder will cause the legs of the ladder to work together. If the ladder is standing on a smooth floor, the weight upon the plank causes the legs to slip apart again; but on a rough surface the legs may gradually approach until the ladder falls. The porch floor was cement. The plaintiff did not know the tendency of the ladder to creep. The defendant did not direct the use of this ladder on the porch, and was not present while it was being so used.



The supreme court of Minnesota held that the facts did not show any negligence on the part of the defendant causing plaintiff's injury. The court says: "A stepladder was the usual and proper support for this kind of a scaffold. It is a simple appliance, understood not only by painters, but by every person of ordinary experience. The condition of this ladder was apparent to plaintiff. There was no concealed defect in its construction. Neither under the rule applicable to simple appliances, nor under the rule requiring reasonable inspection from time to time, would these facts show that plaintiff's injury resulted from a failure on the part of the defendant in any duty owing to plaintiff." The court also says: "He had knowledge of the exact condition of the ladder, a simple appliance, and had an opportunity to observe its action while being used on this floor. The accident resulting to plaintiff, if not attributable to ordinary care on the plaintiff's part, is due to a risk assumed by plaintiff in using a simple appliance in its then obvious condition."

MISSION CANDLESTICK

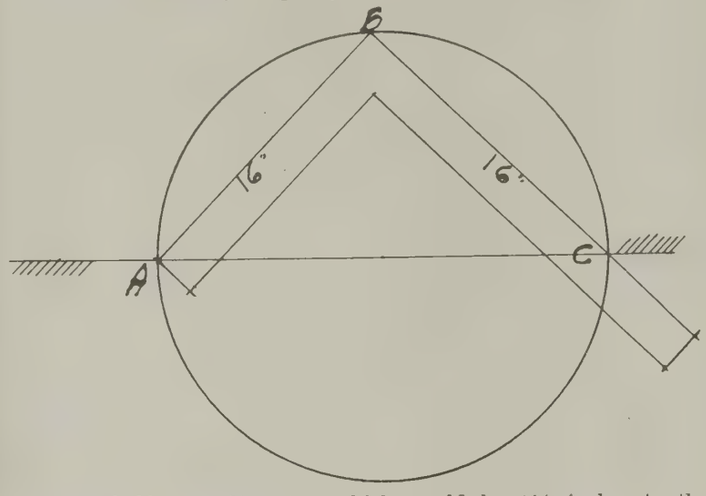
By E. C. LANE

THE lines of this candlestick are very simple, yet when properly constructed it is a pleasing bit of handicraft. This one is to be made of oak in a dark shade and waxed. The corners are of thin pieces of copper, and at either side of the base are deep grooves for holding matches. At the back is glued a strip of sandpaper on which to strike the match.

One's initials, or if preferred, monogram, may be cut from thin copper and securely fastened down one side, as shown. Small

screws are best for the fastenings, as they hold well and are not objectionable in themselves.

A candlestick is always useful, and possesses a quaint, old-time charm. For a young girl's own room, where the furnishings are all in one color—say a soft leaf green, this candlestick could be made of plain wood, stained the required shade, and the corners and initials of brass, and pure white wax candles used.



For a boy's room, it should harmonize with his own furniture, and a soft, deep crimson-colored candle would brighten his mind and serve as a beacon to draw him closer to his "Ain Fireside."

OPPOSITE POINTS ON A CIRCLE

By N. E. DUFFY

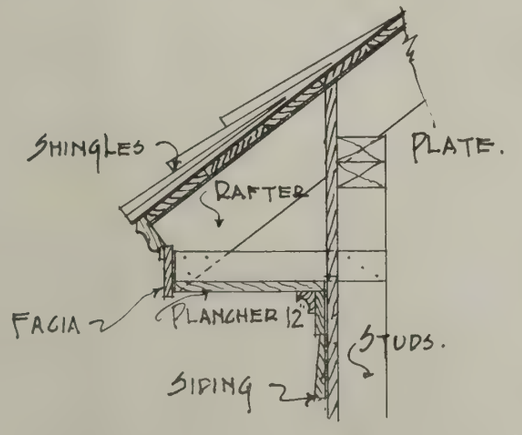
The following illustration shows a plain and simple method of getting directly opposite points on any circle, column, pipe or pulley, and the diameter of the same.

Lay square on pulley or circle, and when the distance on blade is the same as tongue you have your direct center, as for instance, the distance on the tongue is 6 inches and 6 inches on blade, you have the center of your pulley, which is 8½ inches in diameter

and one-half your diameter, which would be 4¼ inches to the center of shaft or circle. If your pulley or circle or pipe is 8½ inches on tongue and same on blade, you will have a pulley, pipe or circle 12 inches in diameter.

The same principle can be used in getting any number of points by shifting the square from A to B, when the distance at C will give you D. Any mechanic who knows the figures in inches can use it.

I have seen three machines and three men standing idle while the measurements of a pulley were taken and the methods pursued took almost one-half hour, meaning one and a half hours for three men and three machines. Try it in the mill and on the job and see how many men can give you the opposite center of a nail keg.



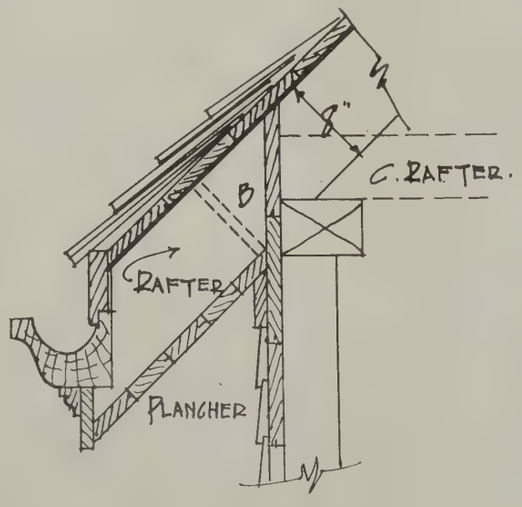
CORNICE DETAILS

By J. BARRY

BOX CORNICE WITH PLANCHER OR (PLANCIER) LEVEL.

The principal object in designing the eaves of a building (as in the projection and finish of the same) is a watertight job, also provision must be made for carrying off rain and snow.

In the two sketches I send you, No. 1 represents what is known as a "Box Cornice," the ends of the rafters being boxed in, the plancher being nailed up to short pieces of ceiling joist, nailed from studs to rafter ends, as shown in Fig. 1, care being



taken to nail facia straight after those short joists have been cut off to line.

I have omitted gutters in this cornice, although galvanized iron troughs can be used on iron brackets, screwed to facia.

Be sure and have such gutters well below projection of shingles so that snow may slide over.

SHOWING INCLINED PLANCHER.

In sektch No. 2 I have shown the plancher nailed to bottom of rafters as ⅞-inch stuff, one board being shown, or tongued and grooved stuff can be used. One-half-inch ceiling can also be used to advantage, or plancher may be dispensed with altogether by nailing a board tightly between rafters as shown at B. A cover or bed moulding should be nailed up tight along inside edge of plancher.

The wooden gutter shown in sketch is quite common in the eastern states, being made of cypress, specially cored, the cores being used for downpipe.

Tin must be used up under the shingles a couple of feet in order to make a good job.

NOTE—While these figures are appoximately correct at the time of preparing, the continual fluctuations and shifting of prices make it necessary to advise our readers to consult local price lists when making up tenders.—ED.

BUILDING TRADES INTERESTS IN THE COURTS.

Payment on account of the contract price of certain painting is not necessarily evidence of acceptance of the work.—Schweitzer v. St. Leo's Catholic Church of Irvington, 78 A. (N. J.) 400.

Interest is properly allowed on the penalty of a contractor's bond, where the penalty is less than the amount of the damages caused by breach of the bond.—Rowe v. Town of Peabody, 93 N. E. (Mass.) 604.

A contractor, agreeing to remodel houses to the "perfect satisfaction" of the owner, must perform the work in such a manner that the owner, acting as a reasonable man under the circumstances, must be satisfied with it.—Tobin v. Kells, 93 N. E. (Mass.) 596.

While a building contractor is not the owner's agent so as to bind him in all respects, the principle on which he binds the owner's property, to the extent of the market value of materials furnished, is that of an implied agency for the owner.—O'Neil Lumber Co. v. Greffet, 133 S. W. (Mo.) 113.

Where a contractor to paint a church failed to procure an architect's certificate, which the contract made a condition precedent to his right to payment of the contract price, and did not otherwise show that the work had been accepted, defendant in an action for the price was entitled to a nonsuit.—Schweitzer v. St. Leo's Catholic Church of Irvington, 78 A. (N. J.) 400.

In determining the percentage to which each of several subcontractors claiming a mechanic's lien is entitled, the amount of unpaid bills for labor and materials for which no liens have been filed, or, if filed, have been abandoned, must be excluded, since the owner is not liable therefor.—Frohlich v. Ashton, 129 N. W. (Mich.) 18.

A subcontractor guaranteeing the performance of the original contract, and directing the making of payments to the principal contractor, is estopped from enforcing a mechanic's lien, and the fact that subsequent to the decree in the trial court denying relief to him the owner has acquired the subcontractor's lien does not affect the question.—Frohlich v. Ashton, 129 N. W. (Mich.) 18.

Where a contractor to remodel houses informed the owner that, since he was unable to obtain money from a third person for use on the work, he would have to abandon the contract unless the owner modified the terms thereof as to payments, a modification agreed on by the parties was supported by a good consideration, and was valid.—Tobin v. Kells, 93 N. E. (Mass.) 596.

Judgment against a husband for building material furnished on his and the contractor's credit, and used on his wife's property, and against her enforcing the lien, is proper, though the contractor be not a party to the judgment, where the debt was contracted by the husband as undisclosed agent for his wife; he being ostensibly owner of the property.—O'Neil Lumber Co. v. Greffet, 133 S. W. (Mo.) 113.

Upon default of a contractor, the sureties upon his bond undertook the completion of his contract, and to borrow money from a copartnership executed their joint note. Even though one of the sureties, a member of the firm to which the note was given had agreed to indemnify the other sureties against loss, a consideration for the note passed to each signer. Nor is any such surety signing the note entitled to be considered merely an accommodation maker."—Noyes v. Ostrom, 129 N. W. (Minn.) 143.

Where, in an action by an architect for making plans for a dwelling, it appeared that the original agreement called for plans for a dwelling not to cost more than $3,000, but that subsequently the cost limit was abandoned by defendant notifying the architect that he wanted a house which would suit, no matter what the cost, the architect was entitled to recover, though he admitted that his original plans called for a house costing more than $3,000.—Bowell v. Draper, 129 N. W. (Iowa) 54.

Where, in an action by an architect for making plans for a dwelling, the evidence showed that he should receive 2½ per cent on the cost of the building, and that the original agreement provided that the building should not cost over $3,000 and the verdict was limited to a recovery of 2½ per cent on $3,000, defendant was not prejudiced by reason of the fact that the plans called for a house which could not be completed for $3,000.—Bowell v. Draper, 129 N. W. (Iowa) 54.

Where, in an action by an architect for compensation for preparing plans for a dwelling, the parties did not agree as to what should be included in the plans, defendant contending that they were to be for a dwelling house complete, including foundation, while the architect testified that the foundation was eliminated by express agreement, the architect was entitled to rely on the elimination without pleading a waiver by defendant of the failure to prepare plans including the foundation.—Bowell v. Draper, 129 N. W. (Iowa) 54.

Where an architect employed to make plans for a dwelling delivered plans to defendant who took them away with him and subsequently, returned them and stated that he could not use them because it would cost too much money to build after them, and subsequently, defendant changed his mind, after giving his directions to the architect regarding the plans and placed his land in the hands of an agent for sale, the architect was relieved from making a tender or from doing anything further in the matter.—Bowell v. Draper, 129 N. W. (Iowa) 54.

The statute gives a lien to any one contracting with the owner of land or his agent for materials furnished or work done in repairing or improving a building thereon, and where the owner rents his property to another and stipulates in the lease that improvements may be made on the property by the lessee and the expense thereof deducted from the rentals to be paid by him, the lessee may be regarded as the agent of the owner and those doing the work and furnishing the material for improving the property will be entitled to a lien on the interest and estate of the lessee and the owner.—Potter v. Conley, 112 (Kans.) 608.

BOOK NOTICES

Notice.—All books noticed in these columns may be obtained from this office at Publisher's prices. All postage or express prepaid. Money and address must accompany all orders.)

THE CHILDREN'S LIBRARY OF WORK AND PLAY.—Ten volumes, published by Doubleday, Page & Co., Garden City, N. Y. Price, complete, $17.50.

This work forms a complete library for young folks—of both sexes—who wish to know how to make, mend or create things, such as may be required about a house, stable, barn, garden, lawn, fences, walks, and similar works. The book also contains simple instructions for housework of all kinds, needlewoork, and for making many kinds of those dainty things girls take a delight in making. We cannot, for lack of space, give anything like a fair idea of what the contents of the books are; but we can assure our readers that every page covers something of value. The fallowing titles of the ten volumes, may help somewhat to convey an idea of the intention of the work: "Carpentry and Woodwork," "Mechanics—Indoors and Out," "Working in Metals," "Housekeeping," "Needlecraft," "Home Decoration," "Gardening and Farming," "Indoor Sports and Games," "Electricity and Its Everyday Uses," "Out-Door Work."

The following are the names of the authors, many of whom are well known to the reading public:

John F. Woodhull, Charles F. Warner, Edwin W. Foster, Mary Rodgers Miller, Ellen Eddy Shaw, Charles C. Sleffel, Claude H. Miller, Fred T. Hodgson, Elizabeth Hale Gilman, Effie Archer Archer.

The books are well and handsomely bound, and the paper and print are all that could be desired. The library can only be obtained in complete sets—ten volumes—and may be purchased from the office of publication, or from this office by remitting the price, $17.50.

HAND-FORGING AND WROUGHT-IRON ORNAMENTAL WORK.—By Thos F. Googerty, instructor of forge work at Stout Institution, summer school of forging. 208 pages. 122 illustrations. 12 mo. Printed on a special grade of book paper and bound durably in extra cloth. Published by "Popular Mechanics," 318 West Washington street, Chicago, Ill. Price, postpaid, $1.00.

Like all books published by this firm, the handbook before us is about as practical as it is possible for a book of this kind to be made, and we are sure that manual training instructors, students and all who are interested in technical progress, will welcome this work, partly because of the need of just such a work, but more because of its real practical utility and understandable nethods of presentation—an inportant matter in all manuals intended for the training of young minds. It is written so that the amateur can readily understand all the points involved, and is in no sense a theoretical treatise, but a practical working handbook; the stimulation of original work being the one aim of the author.

As for equipment for doing the work, the ordinary forge shop and tools are all that are necessary. The manner in which the book is illustrated is especially helpful in explaining the text; the correct positions of holding the tools when working the materials being clearly shown. Scarcely a page is without one or more illustrations.

HILL'S REFERENCE GUIDE FOR LAND SEEKERS, TRAVELERS, SCHOOLS, TOURISTS, EMIGRANTS AND GENERAL READERS.—Including description and outline maps with new methods of quick finding locations, in each state, of any city or village of 200 population or more. An original book containing history of each state, climate, irrigated regions, opportunities for new settlers, shape and position of all countries, with location and 1910 population of 23,664 cities and villages of the United States. Maps of states prepared, countries numbered and all states described. By Thomas E. Hill, author of "Hill's Manual of Social and Business Forms" and other reference works.

"Back to the land" has been a familiar cry for some years. Easy to say, but how difficult to do, for the available land is fast being taken up and the city dweller does not know how to reach land within his prices. Farm life requires a certain training, just as vigorous as bookkeeping to make a success. Farming is now fast becoming a science, with the farmer students studying the composition of the soils, percentages of cream, and following a definite rotation of crops with a fixed purpose, laid out for years in advance.

It is an interesting study, to plan for years and working see the plans materialize. In this work, the author, who has spent a long lifetime in the study of economic conditions, shows where the farms and farming land are available in the various states, the crops generally grown, and a fund of information along the same lines. The book is equally valuable to the young merchant or mechanic planning to settle in some new country, as it shows the resources and possibilities of every state in the Union.

This work can be obtained from this office, at the price of $3.50 for full morocco, or $2.50 for silk cloth.

A HISTORY OF ARCHITECTURAL DEVELOPMENT.—By F. M. Simpson, architect, professor of architecture in the University of London and Liverpool, Royal Academy travelers' student, etc. The renaissance in Italy, France and England. 268 illustrations. 359 pages. Well bound in fine English buckram cloth. Vol. III, published by Longmans, Green & Co., New York, N. Y. Price, postage paid, $6.00.

This is one of three volumes and forms part of "The Architect's Library," which is being published by the well-known publishing firm of Longmans, Green & Co., of 39 Paternoster Row, London, England. The previous volumes, I and II, being devoted to (Vol. I) "Ancient Early Christian and Byzantine Architecture and Art," with 100 illustrations. Vol. II, to "Mediaeval Architecture and Art," with 257 illustrations. Vol. III being devoted to "Renaissance in Italy, France and England," with 268 illustrations, paper, binding, press work and illustrations are all exceptionally good, the illustrations being much above the average, clear and nicely presented. The subject matter is given to readers in a very artistic and concise style and the subjects are dealt with in a masterly manner. While somewhat on the same lines as the works of Ferguson and Sturgis, it has some new features and much new matter of importance is introduced that will be of interest to the architectural student, and is quite a valuable addition to architectural literature.

THE CHICAGO HARDWARE SHOW.

It is a good sign where the largest exhibition hall in a city like Chicago is crowded to the doors with exhibits of hardware, and visitors are glad to pay to see what is new in the hardware lines.

Such was the condition in Chicago on February 13-16. It was a pleasure to wander through the aisles and see the familiar names and faces, familiar to our readers as well as ourselves.

The Alabastine Company gave exhibitions of the practical value of their goods, showing how the walls and ceilings could be made beautiful, at the same time sanitary at a slight cost.

E. C. Atkins & Co. passed around miniature many-colored buzz-buttons of interest to the children (and older folks as well) while impressing on everyone that Silver Steel was the "Finest-on-Earth."

Geo. H. Bishop & Co. displayed to advantage not only their "Grey Hound" saws, but a full line of other saws, as well as plasterers' trowels and other tools.

Bommer Brothers, the spring hinge people, had more kinds of hinges on exhibition than the average hardware man knew existed, and the Diamond Expansion Bolts were fastened so securely to a block of concrete that none were picked up for souvenirs.

Russell Jennings Bits of various styles and sizes were seen in action; piles of nice clean chips marking the progress of even boring.

The Ford Augur Bit Company and the Rehm Hardware Company had a spirited unofficial boring contest which bid fair to exhaust the supply of lignumvitae, but just who won could not be learned, although it is rumored that the Evil One himself was seen backing the Rehm outfit.

A large crowd seemed interested in an immense Simonds circular saw, but the slow speed prevented anyone touching the edge "to see if it was going."

We spent a little time with the Stanley Rule & Level Company, looking over enough fine tools to scuttle a ship, and we promised to speak a good word for the Stanley works, but every carpenter knows

how good they are and what a complete line they make, from ball-bearing hinges with non-rising pins to corrugated T-hinges and screen door fasteners.

Some interesting "lines" were displayed by the Silver Lake Company, and the Samson Cordage Works were also present with a fine line of "Spots," so familiar to the carpenter and contractor.

One of the busiest men in the place was Mr. Chas. Luther, the grinder man, and we never did find him, but we found a nice resting place with the Simmons Hardware Company. Their large booth was a finely appointed rest room, for they figured they couldn't show all their goods, anyway, so didn't show anything. Their catalogues were handy, but were not used near as much as their cigars and easy chairs.

MATERIAL HOISTS.

"More Brick," cries the bricklayer on the fourth story front. The hod-carrier is not always to blame, for lack of hoisting facilities delays the work; runs the cost up; and annoys architect, owner, contractor and mechanic alike.

It is hard to realize a building of any size being erected today without the use of power hoists. The cost of the entire plant is so low no contractor can afford to be without one, provided his jobs are two or more stories.

A well-designed hoist can be erected in the regular elevator shaft or on the outside of the building, if necessary, keeping the hoist and

its frame entirely separate from the building. In this way, even the furniture for an office building or hotel can be taken up before taking down the hoist.

The Universal Hoist & Manufacturing Company, 180 State street, Cedar Falls, Iowa, make a hoist for contractor's use which seems to meet the requirements in excellent shape, as it is adapted for building materials, ice, coal, ore, etc., and takes the place of an expensive elevator. As will be seen from the illustration, the machine is mounted on a heavy frame, permitting easy moving and setting up. The engine can be used for other purposes when desired, such as operating a concrete mixer, stone crusher, saws, etc.

Some contractors are in doubt as to the possibilities of a machine of this character, and to all such the Universal Hoist & Manufacturing Company will be glad to describe more fully their equipment.

NIAGARA HARDWARE SPECIALTIES.

There are a great many small items about the modern building very necessary to good construction, but costing little in themselves. Among these we have wall ties, for use in binding brick walls, whether for a veneer facing, or for strengthening a wall where there is danger of cracks or openings occuring from faulty foundations, imperfections in laying brick or other conditions. With concrete blocks, their use adds greatly to the strength and permanence of the buildings, for the hollow blocks frequently need reinforcement to be permanent.

When a brick wall must be furred for lathing, etc., another problem confronts the builder. Either he must build in wood blocks, decreasing the strength of the wall or he must "plug" it with wood plugs which, to be effective, must be large and driven in so as to take the entire load of the wall. This method is more exact but more expensive than the first. The ideal way is to build in galvanized wall plugs at the proper places. These occupy only the space of the mortar joint and when once in cannot become loose. A nail driven into them holds far better than into end wood. These plugs should be used wherever it is necessary to fasten anything to a masonry wall, and they are especially valuable for base, chair rail, mouldings, window and door frames, etc.

When cement mortar is used it is almost impossible to get a nail into the wall unless a plug of this character is used.

The Niagara Falls Metal Stamping Works, Niagara Falls, N. Y., manufacture a complete line of specialties for the builder, among them being wall ties, plugs, sash chains, metal numbers, etc. This catalogue, 54-56B, is of interest to every contractor and builder.

CHICAGO TECHNICAL COLLEGE.

Books are often impractical, or lose their value to the beginner by being too theoretical. If the architectural student, for example, can examine all the plans, details, specifications, contracts, etc., for a large office building, he will acquire a vast fund of information not obtainable in any other manner. Purely academic drawings are valueless to the mechanic and have little more value to those who must prepare drawings and instructions for the mechanic. The drawings showing work actually carried out are of far greater value than theoretical sketches.

The Chicago Technical College aims to teach those who want instructions in practical work in Architecture, Civil and Mechanical Engineering, and its allied branches. Although designed for a resident school, with day and evening classes, a complete correspondence course is prepared for those unable to come to the school.

The demand for capable men in these lines is never filled. The growing country is calling for engineers, architects, and draftsmen who have a solid foundation of knowledge. The courses of the Chicago Technical College would indicate a thorough preparation for work in these lines. A catalogue showing the courses, requirements, etc., can be obtained from the Chicago Technical College, 655 Athenaeum Building, Chicago, Ill.

THE ATTIC STAIRWAY.

Is it not a fact that in planning the arrangement and size of rooms, halls, etc., for the ordinary dwelling, the space required for an attic stairway is usually needed to fill out a room or closet? There often seems no place when the attic stairs may be placed without great inconvenience to some of the other rooms.

The attic in a modern home is a real necessity, however, and would be used as much as some of the other rooms were it as accessible.

The Bessler Movable Stairway was designed to fill the need in such cases as above mentioned. It consists of a well built stairway in one flight from floor to ceiling, but so arranged that it is easily raised to the attic, showing only a nicely finished panel in the ceiling of the hall or room below. This allows the free use of the room or hall except when the stairs are used and at the same time provides stairs when and where wanted.

There is nothing complicated about the Bessler Stairway, and an ordinary mechanic can easily install it in new or old buildings.

The Bessler Movable Stairway Company, Akron, Ohio, are placing this stairway on the market and will be glad to send their circulars giving their very reasonable prices for this excellent invention.

HIGH STANDARD PAINT.

An animated discussion between two hod-carriers concerning the purpose of the mortar they carried. One argued it held the brick together while the other was equally sure it held them apart.

Concerning the purposes of paints and varnishes, these may be discussions but the purpose remains the same. The paint may cover up a multitude of sins on the part of the carpenter and millman, and a good varnish brings out all the good there is in the various grades of mahogany, red gum, cypress and pine. The use of preservative coverings is imperative in cases when permanence is desired, and adds marvelously to the appearance even when temporary results are desired. The Lowe Brothers Company, 473 E. Third street, Dayton, Ohio, have been in the paint business since 1862 and since 1872 have been making "High Standard" Liquid Paint, although many in the industry believed it impossible to successfully market a good prepared paint.

The success with which their enterprise has been rewarded is due to persistent efforts to steadily improve their products as fast as scientific research and severe out door tests showed improvement possible.

When the Lowe Brothers Company started to make varnish, they decided to keep the same high standard which their liquid paints held. The same custom held with their flat paints for interior walls, concrete, plaster, etc.

The "Little Blue Flag" which has been adopted as an emblem of quality by the Lowe Brothers Company is now seen on a complete line of liquid paints, varnishes, enamels, etc., for almost every purpose imaginable.

With the intention of aiding the home owner to make proper color selections and arrangements, the Lowe Brothers Company has prepared several books of which "Common Sense About Interiors" and "Attractive Homes and How to Make Them" are especially interesting. We understand these books will be sent to our readers on request. They should be in the hands of everyone before the spring painting begins.

WANTED.—Speculative Builders that are actual mechanics, to erect a large number of good working men's homes, on a large tract of land in the heart of New York City. Ten miles from City Hall; 5 cent fare zone; two stations on property. We have the land, building loans and the buyers for moderate priced one and two-family houses. Reply at once, giving references to the Seatuck Realty Company, 1161 Broadway, New York City.

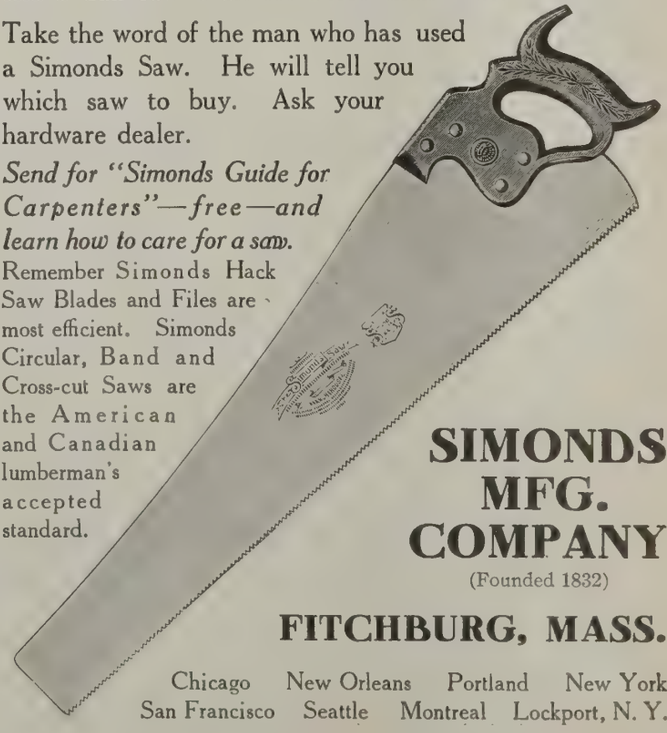
"I Tell You, It's a Great Saw!"

When you get hold of a Simonds Saw you **feel** that you can "do things" better; and you **can.** A Simonds Saw cuts true and fast and easily. It has the right "hang"—and its glistening blade and polished handle are a constant pleasure to its owner.

Besides saw-making skill and "know-how" it is Simonds steel that makes a



SIMONDS SAW (Pronounced Si-monds)

the most satisfactory one to own. We make our own steel, and our exclusive tempering process gives the teeth a toughness and hardness which enable them to hold their quick-cutting edges under long, hard usage. You can't keep saw teeth sharp if they are not tempered right, and a dull saw is almost worse than none.

Take the word of the man who has used a Simonds Saw. He will tell you which saw to buy. Ask your hardware dealer.

Send for "Simonds Guide for Carpenters"—free—and learn how to care for a saw.

Remember Simonds Hack Saw Blades and Files are most efficient. Simonds Circular, Band and Cross-cut Saws are the American and Canadian lumberman's accepted standard.

ART of PRACTICAL WOOD CARVING

By Fred T. Hodgson

PRICE: 12MO, CLOTH $1.50—HALF LEATHER $2.00

THE lessions given in this new book lead the young workman by easy steps until he is able to turn out work of a creditable character. The use and care of carvers' tools are given and explained and the tools described and shown by illustrations, with methods of sharpening and honing the tools. All kinds of appliances are shown, described, and illustrated, for holding the work, and for preparing the tools and finishing up the carvings. The various styles of carving are fully described, such as Flat Carving, Chip Carving, Incised Carving, Scratch Carving, Figure Carving, Carving in Relief, Round Carving and Jewelry Carving.

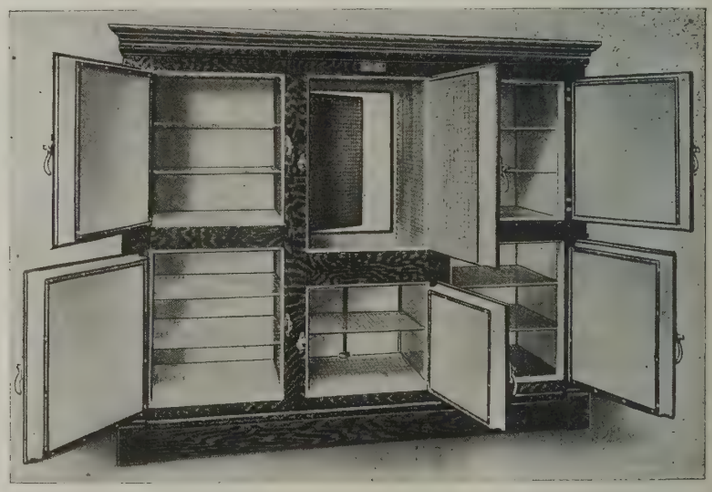
CONCRETE MACHINERY.

Concrete has come to stay, but not all concrete stays. Poor materials, incompetent workmen and imperfect or insufficient machinery quickly reduces the possible strength and permanence of what would otherwise be of the greatest strength and endurance.

Who is to blame? Certainly there are enough good cements made; good stone, sand or gravel are found everywhere and a little care in selection, washing and screening furnishes an abundance of material. The contractor is himself incompetent who permits any but the best workmanship on the job. In the selection of the necessary machinery the contractor or builder has a wide range of reliable concerns which he may patronize. Concrete is now so prominent a building material that many of them devote practically all their shops to the manufacture of concrete machinery. Among these no concern enjoys a better reputation than the Northwestern Steel and Iron Works, 1029 Spring street, Eau Claire, Wis. Their products include practically everything needed by the concrete contractor or builder, such as mixers operated by steam, electric, gasoline or hand, block and drain pipe machines, gasoline engines, saw rigs, etc.

The Northwestern Company have perfected a waterproof compound which they claim renders concrete absolutely and permanently waterproof. The advantage of such a substance is readily apparent to every one familiar with concrete.

Their catalogue shows in great detail the construction of their machines and the class of work which they will do, as well as a great deal of information for the concrete worker. This catalogue is sent free on request, and they should receive a request from everyone interested in better work with concrete.



MODERN RESIDENCE REFRIGERATORS.

Under the present customs, very few modern houses are planned without providing for a refrigerator. Homes in which the refrigerator was formerly considered a luxury now use them as a necessity, and as such they are entitled to even more consideration than the interior finish or other furniture, for as they serve health, convenience and economy, are they not more necessary?

Few people recognize the great advance made in the detail construction of a modern refrigerator, and also in other articles used in the home for health and comfort, so that instead of the old style ice box practically without insulation or circulation, we now have the luxurious and sanitary icing refrigerator built on scientific lines.

The only consideration formerly given a refrigerator was to merely provide standing room for it. The result was the refrigerator or "ice box" was frequently stored in the basement or on the back porch for several months of the year, causing the appearance and usefulness to be greatly injured. Today it is possible for the woman of the house to point with pride to the refrigerator as a piece of furniture free from mould or taint, keeping the food in the highest state of preservation and a sanitary storage for the most delicate foods.

The advance in the scientific construction of ice boxes and refrigerators has been such that it is folly for the contractor or builder to think of building one himself and doing all the insulating, etc., necessary. The cost in this way would be far in excess of what a first-class ready-made refrigerator would be, and would more than

pay for a built in refrigerator as made by the best manufacturers, and the appearance would in no way compare with the finish which can be given them by those in the business.

Architects, designing the better class and even the low-priced bungalows and cottages, recognize the sanitary importance of the refrigerator and are providing spaces designed to have the refrigerator built in place, thus providing it with proper connections to the sewerage system and eliminating the places where dust or rubbish can cling above or under it. Many houses are, therefore, provided with means of putting in the ice from the outside, so that there is no occasion whatever for the iceman to come into the house

The Herrick Refrigerator & Cold Storage Company, Waterloo, Iowa, have been manufacturing high grade refrigerators for twenty years. While their refrigerator catalogue shows a great many styles of refrigerators, they also have a special department to assist architects and house owners in the preparation for the installation of refrigerators. We show on this page one style of built-in refrigerator having a door in the center for the ice, opening both on the outside and inside.

The Herrick Refrigerator & Cold Storage Company will be glad to send their catalogue to those interested and assist the house owner, contractor and architect in every possible way to secure a sanitary and economical installation.

Glidden

M. P. Durable Interior and M. P. Durable Floor

There is only one reason why you should specify Glidden's M. P. Durable Interior in preference to any other interior varnish on the market, and that reason is Quality. If there were any other interior varnish made so light in color, with such wonderful flowing and brushing properties and such remarkable elasticity and durability, the one real reason would not exist.

When you specify a floor varnish, write into your specifications Glidden's M. P. Durable Floor, for the one real reason—Quality. Its hard and quick drying properties, its elasticity and its incomparable durability make it the essential floor varnish—the floor varnish that is impervious to water—the floor varnish that will not mar—the floor varnish that will not scratch white.

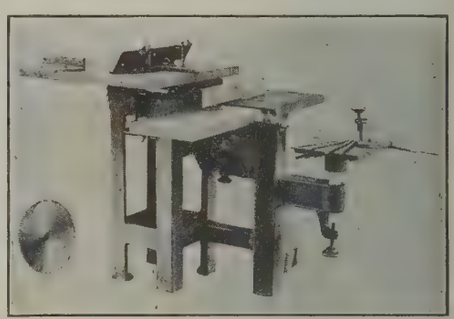
STEEL TAPES.

Accuracy is demanded in modern construction as much as skill and rapidity. The foreman or mechanic who can measure once, and be sure of his dimensions, is just twice as valuable as one who must go over his work twice.

To insure accuracy in measurements, the rules, tapes, etc., must be extremely accurate, and free from any chance to become otherwise. The use of a steel rule or tape overcomes any tendency to error due to the tape stretching, or the figures becoming illegible.



How much better it is to have a dependable tape than one which must be used only in fair weather. If a measurement is to be taken, why not get it accurate?

The Lufkin Rule Company, Saginaw, Mich., make a line of steel tapes such as contractors and builders require. Their catalogue No. 12 describes in detail their large line, and should be found in the catalogue file of every contractor and builder.

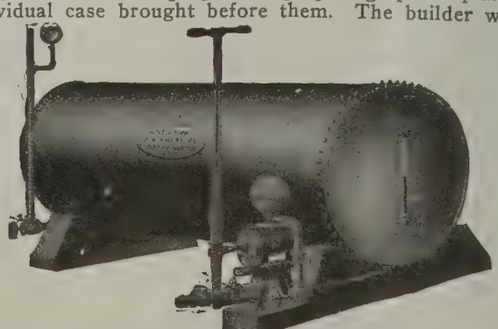
THE TANNEWITZ TYPE "C" WOODWORKER

The time has come when the individual contractor can be practically independent of the planing mill. Heretofore it has been necessary to run to the mill for every little sash and for every little piece of moulding. In case the mill happens to be around the corner, it is very convenient, but when it is a mile or more away a loss of time occurs, which would soon equal the cost of a machine at the work.

The Tannewitz Type "C" Woodworker is one of the machines calculated to save the contractor time, money and material. By the use of a machine of this character a great deal of waste material can be worked up into moulding, bridging, nailing blocks, furring, etc. This is a double saving, as it reduces the waste and saves the expense of new lumber.

Tannewitz Type "C" Woodworker.

A machine of this character must be, adaptable to a great variety of work. It must be equipped with satisfactory cross cut and rip saw blades, jointer knives, gauges, bits, etc. Where a considerable amount of work is required, it must also have some sort of power provided, gasoline or electric. Above all, the machine must be self-contained, adjustable and portable.



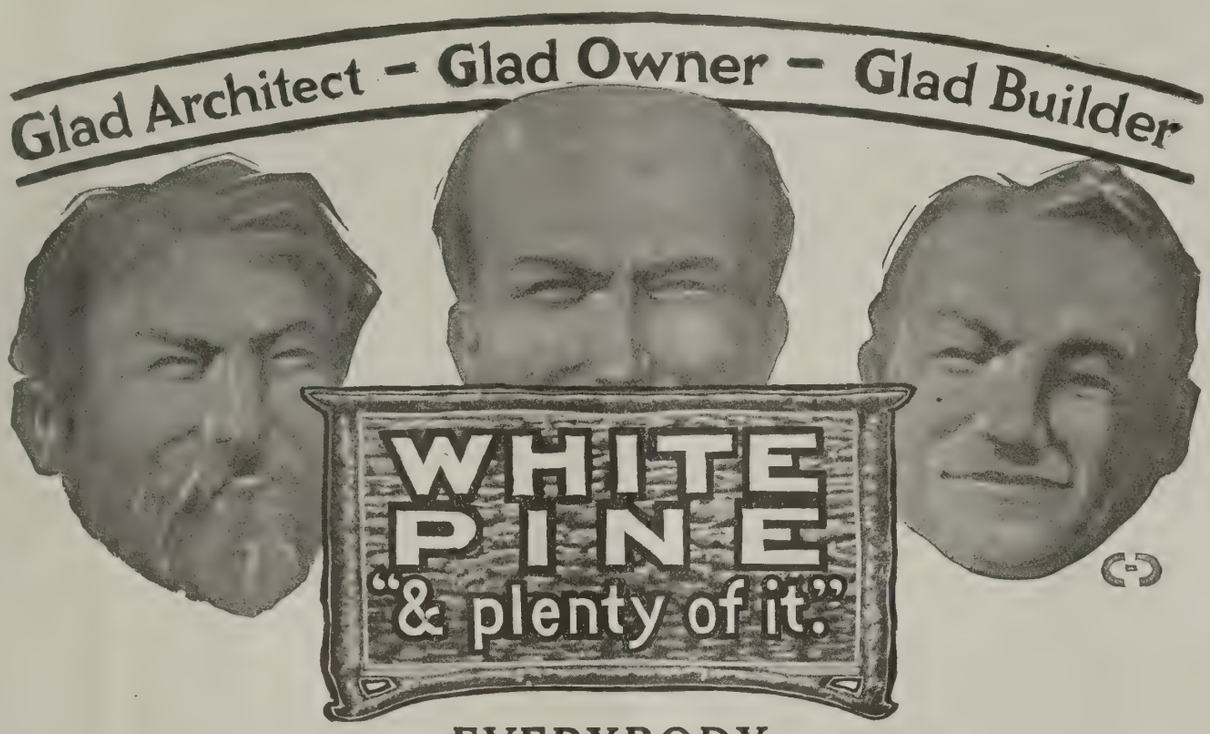
The Tannewitz Works, 41 S. Front St., Grand Rapids, Mich., believe that their machine is ideal in all these respects and that this woodworker gives the contractor a complete mill and a reliable power plant at very little cost. Their catalogue describing this outfit and other working machinery will be sent upon request.

SANITARY ENGINEERING

A modern household must be a complete arrangement with many improvements not found in the old-time houses. In the cities, the problem is simpler than in the country, for we have water, gas, electricity and sometimes even steam and hot water brought to the doors; in the country districts, however, all of these must be provided for by the owner himself independent of what his neighbor has. The designs of the systems for furnishing water, heat, etc., are a matter for careful study by a competent engineer in order to have them all work harmoniously.

The Andrews Heating Company was formerly organized to supply heating plants for isolated buildings. The great demand, however, for improvements in all lines has led to the establishment of special facilities for assisting the contractor, builder, carpenter, etc., to install not only heating plants, but plumbing, gas, light and sewerage disposals.

In the engineering department of the Andrews Heating Company are employes for the sole purpose of preparing special plants to suit each individual case brought before them. The builder who writes



Pressure tank with hand pump.

to the Andrews Heating Company is assured of individual attention, which is the only way the problems can be satisfactorily settled. In this manner, the builder is able to install complete plants, which are sure to do the required work.

Contractors and builders who are estimating on a complete structure should secure reliable estimates and plans for this class of work, and we believe no company is better able to prepare reliable plans and estimates than the Andrews Heating Company.

A request for information on these subjects should be accompanied by detailed information regarding the exact conditions under which the plant must be operated, and it is suggested that intending builders write to the Andrews Heating Company, 1240 Heating Building Minneapolis, Minn., for information regarding the best manner of getting estimates and plans.

EVERYBODY
CONCERNED IN BUILDING

— for himself, or for others — now, or sometime later —

IS PUT IN A FINE GOOD HUMOR

by simply discovering the agreeable *and profitable FACT* that

WHITE PINE and its half-brother NORWAY PINE

E. B. SHELDON & CO., 321 N. May St., CHICAGO

THE DIAMOND GROUND CLAMP

One of the most important items in installing a telephone system or a system of electrical call bells, door bells, etc., is the necessity for proper grounding the wires. The Diamond Expansion Bolt Co., 90 West St., New York, place on the market a clamp which greatly simplifies the work of forming a permanent ground. As will be seen by the accompanying illustrations, the clamp is extremely simple. The pipe is cleaned to insure a proper contact and the clamp is then placed around the pipe.

The screw driver and pliers such as a lineman always carries with him are all the tools required.

The telescoping sides of the "Diamond" Ground Clamp permit of a greater take-up than the ordinary clamp, and is limited only by the length of the screw used. As the take-up is in a direct line with the strap, a very powerful grip on the pipe is secured and the grip is easily tightened or loosened by the use of the screw driver.

The Diamond Expansion Bolt Co. also manufacture a number of other specialties for use in electrical work, and we understand that circulars will be sent upon request.

A COMPLETE PLANING MILL.

One of the most perplexing problems of the contractor—that of choosing suitable machinery—has been solved by the advent of the FAMOUS Portable Universal Woodworker, a machine which permits many different kinds of work to be done, and which can be moved around from place to place without any trouble whatever. It is mounted on a wheeled truck so that, when it is desired to move it, a horse is hitched to the truck and the whole thing carried anywhere. "A Planing Mill on Wheels" seems about the best way to describe the proposition.

This machine is a combination of a Band Saw, Jointer, Reversible Shaper, Saw Table, Borer, Tenoner and Mortiser, Knife Grinder, Emery Grinder, 10-inch Power Feed Sander, Disc Sander, Power Feed Planer, Dadoing Machine, and Panel Raising Machine. Either attachment can be operated independently of the others, and the construction permits of several men working at the same time.

The power is constituted by a three-horse-power gasoline engine, complete with batteries and belts, so that the machine is entirely self-contained and independent of outside power. To show how good and durable it is, the builders guarantee it for life.

Such a machine is a fine investment for any contractor as it enables him to get work out on time, without having to rely upon local mills, and without their high charges. There's no reason on earth why the contractor should not do his own millwork and save the profits he pays somebody else. The FAMOUS is built in various sizes and styles so that large and small requirements can be met with equal satisfaction. All of our readers who wish to cut down or eliminate planing mill bills should get full particulars of the FAMOUS Universal Woodworker from the builders, The Sidney Tool Co., Sidney, Ohio.

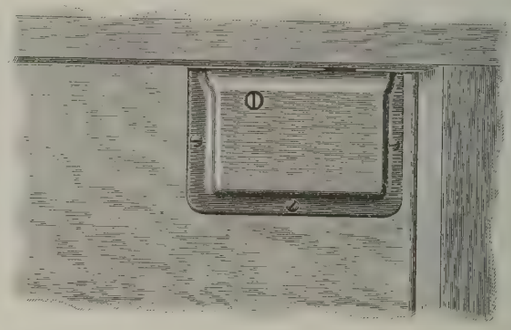
THE WATROUS No. 18 SAFETY SASH HANGER
EASIEST AND QUICKEST TO SET



Won't blow off or be dropped off by children or careless servants. Can't be set wrong. The best of them all. Only sash hanger on the market with gauge lugs which make it impossible to set it in any way but the right way. Nine-tenths of the trouble with sash hangers comes from their being set wrong. The Watrous No. 18 is ALWAYS right. Full directions with each set.

E. L. WATROUS MFG. CO., Des Moines, Iowa

PIVOT CHECK FOR DOUBLE ACTING DOORS

How often we see a double acting door in which the oscillation is not at all pleasing? Instead of coming to a stop quickly and quietly, we see the door swing violently to and fro before it finally comes to a rest. This is especially disconcerting where the door is subjected to much use, as it frequently disturbs the next person coming through.

To obviate trouble of this character, the Standard Manufacturing Co. of Shelby, O., have designed a pivot check for double acting doors. This check is designed to be applied at the top of the door and is used in connection with the regular double acting spring floor hinge. It is claimed that with the use of this check and double acting spring floor hinge at the bottom, the same result is obtained as with a double acting check hinge. The check can be used on doors where the double acting floor hinges are already applied, and it is desired to control the swing of the door, and can be used with any make of

double acting floor hinge, as it can be set in position to bring the pivot in line with the hinge post of the bottom of the door. The various makes of floor hinges have these pivots set at slightly different distances from the floor style, so that accommodation of this kind is very necessary.

The checking principle is liquid carefully compounded so as not to be affected by extreme heat or cold. The pressure in the check is so confined to the center that there is no pressure against the joints, and, as a result, there is practically no damage or leakage.

The Standard Manufacturing Co. will be glad to supply any further details of this new pivot check, a cut of which is shown above, and we would suggest that contractors and builders be posted on this check, as there are many cases where its use is advisable and necessary.

HOUSE MOVING MACHINERY

Prosperity affects so many of our citizens that the buildings in which they reside soon becomes too small for people in their station. At such times the problem becomes, whether the old house should be remodeled at the same expense as a new one, whether they shall build a new house and sell the old one, or whether from attachment to the ground and location, they shall rebuild on the old homestead site. This means that the old house must either be torn down or moved. In the former, little or no price can be obtained for the old building; by moving it to another lot, however, its value remains practically the same, and the owner has the satisfaction of knowing that no property has been uselessly and ruthlessly destroyed.

But there are inconveniences associated with the moving of a building. In many old buildings, the timbers are more or less decayed and the transportation is over ground not well adapted for moving. It may be a hill, or the house may be required to turn completely around.

To those who are confronted with this proposition, the moving apparatus manufactured by the La Plant Tool Company is of the

greatest interest. As will be seen by the cut herewith, it consists of three trucks of eight wheels each, on which the house rests, on exactly the same principles as the best carriage or automobile construction, reducing the danger of rack and damage to a minimum.

With these trucks, house moving becomes a mechanical item, easily and quickly accomplished.

The La Plant Tool Company, 900 E. Nevada St., Marshalltown, Iowa, manufacture exclusively house moving tools. Their catalogue No. 2 shows in great detail the construction and pattern of the various trucks and other tools, as well as a great deal of information useful to house movers. Their catalogue should be in the hands of every contractor and builder who has house moving or repairing to do.

COLOR PLANS and designs for decorating any room in any home, office, store or church with Alabastine, will be supplied by our art department free of all expense to architects, carpenters and builders having charge of such work.

Beautiful cut stencils for carrying out the decorative work now so much in vogue will be furnished by the Alabastine Co., to be used in connection with

Alabastine

THE SANITARY WALL COATING

Where the merit of Alabastine is known there it is used. Any architect, builder, decorator or property owner who comes to know the advantages of Alabastine, becomes an advocate and user of it. We want you to know about Alabastine and to feel that you are doing your customer a favor when you recommend its use.

WHAT IT IS

Alabastine is a water color, fine in texture, artistic in tint, for use on all interior surfaces, whether plaster, brick, cement, wall board or canvas.

It is a dry powder in white and many tints and colors, that may be used as manufactured, or combined and intermixed to produce any color desired.

Alabastine is ready for use by mixing with cold water. It is put up in 5-lb. packages and specially packed in bulk for large jobs where desired.

It is durable, sanitary, artistic and economical. Write us for more detailed information.

WHY IT IS BEST

Alabastine is best because it is durable, by that we mean that when once applied to a suitable surface, it can later be retinted and redecorated, putting succeeding coats of Alabastine over the old ones without the necessity of going to the expense or passing through the disagreeable experience of washing the walls.

Should you ever desire to wash Alabastine from your wall it can be done, which is not the case with paint once it commences to scale off.

An Alabastined wall can be re-coated when soiled at less expense than to wash a painted surface.

FOR NEW BUILDINGS

Alabastine is the ideal material for all new buildings because, unlike kalsomine sold under various names, when once on the wall it forms a perfect surface for any future treatment. Paper can be applied over Alabastine, a new coat of Alabastine can be put on or it may be painted. Many people desire to allow their new building to stand until it is through settling and all cracks have shown. Instead of living in a building with white, glaring walls, soft Alabastine tints may be put on and afterwards treated in any way desired without removing this Alabastine. Alabastine for an ordinary plastered surface or on wall board will not, when purchased at retail price, cost for regular tints to exceed 1½c per square yard for material. The cost of applying would be extra, but it costs no more to apply Alabastine than the cheapest kalsomine.

OVER WALL BOARD

Alabastine makes the only suitable material for use on the various wall boards. It costs much less than paint, is too superior to be compared with any kalsomine as it is durable and may be re-coated. The surfaces of these boards vary, some of them will take a coat of Alabastine with no preparation, others will work by giving them a coat of varnish or shellac size. If interested please write us.

A POCKET MITER BOX

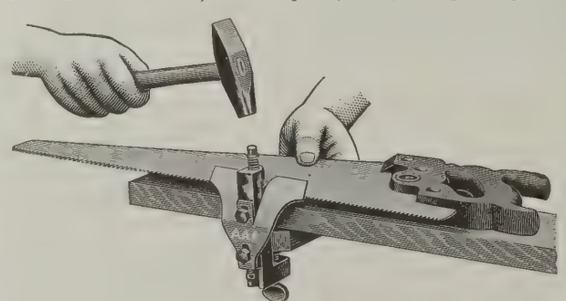
No amount of machinery can do away with the necessity for a great deal of hand work in the erection of buildings. This is particularly true in regard to fitting small mouldings, base, picture moulding, and various other work which requires close fitting miters. Bay windows and angles must be very carefully worked around, and this requires accurate work on the part of the carpenter.

The old-fashioned miter box, which required some time to make on the job, was cumbersome to carry around and work with. The later style patterns were excellent for work in the shop or on the bench, or where a large arount of cutting could be done at one time.

The nature of buildings, however, is such that the fitting must be done directly in place and for that reason the small portable miter tool is of the greatest value.

The Parsons Tool Manufacturing Co. of Parsons, Kan., is manufacturing a tool which is of great use to the carpenter in this class of work. As will be seen from the cut, the tool is made of aluminum and wood and is, therefore, very light and easily carried. It is small enough to fit into an ordinary pocket and so can be carried on to a scaffold or up a ladder without inconvenience. The tool is brought directly to the work and the cutting is done with any kind of saw. This makes it particularly valuable in places where a miter box cannot be carried or used, as it can be used for making joints or cutting off work already in place. The tool is adaptable to a great number of angles and accuracy is insured by the use of special machinery used in its manufacture.

The Parsons Tool Manufacturing Co. will be very glad to hear from all carpenters and builders with regard to this tool, and we would add that their circular in regard to it will interest any of our readers.



ATKINS NUMBER 5 SAW SET

The use of tools assumes that to secure the best work they must be kept in first-class condition. Various tools require different treatment to secure best results. In the use of saws, the teeth must be carefully formed and as carefully set in order to secure the best results with the least effort on the part of the workman. A large set can very easily double the labor.

E. C. Atkins & Co., famous as the "Silver Steel Saw" people, are placing on the market a new hand saw set which embodies several new principles of merit.

Through the use of a plunger, the hammer blow reaches the saw teeth at a uniform angle, insuring an accurate set. There is no danger of snapping off the teeth, and as the amount of set can be regulated, a perfect job is sure to result.

The E. C. Atkins Co., Indianapolis, Ind., are placing these sets

on sale through the local dealers, but will be glad to send further information with regard to them direct to carpenters and builders, advising them of the nearest place where they may obtain them, or selling direct where they cannot be obtained otherwise.

ORNAMENTAL IRON AND BRONZE

From the earliest times the use of wrought bronze and iron have been used in places where the highest standard of art has been required. In the forms of gates, grilles, hinges and even complete doors the craftsmen of the various ages have expended their best thought and effort. The workman of today, however, has facilities much greater than those in former times, as the use of improved machinery, furnaces, etc., gives him a degree of skill unattainable by the earlier workman.

The Dow Iron and Wire Works, Louisville, Ky., have just issued the Catalogue "F," a folio of photographs and sketches in which the idea is not so much to show the number of established designs which can be furnished as to demonstrate what has been done and is being done, and suggesting to their clients methods for producing results which are both gratifying to themselves and satisfactory from a mechanical standpoint to the manufacturers.

The intrinsic value of bronze and iron work of high grade is such that the expense of special designs is a small part of the work. At the same time, the designs have been standardized for a great many pieces, and so can be obtained without delay.

The catalogue as issued represents a great deal of time and thought in the selection of the designs shown and will be of great value to anyone contemplating work of this character. It contains a great variety of wicket designs suitable for bank and office furnishings, the use of which adds dignity as well as protection to any office. Several pages of office and balcony railings are shown, as well as doors, name plates, etc.

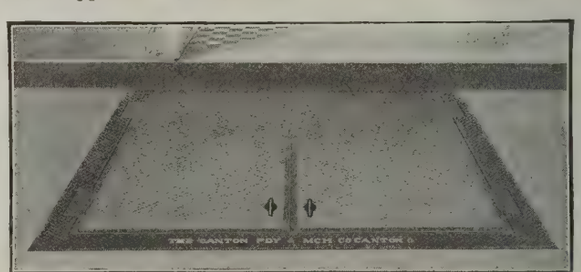
In many places guards are required as a protection against intrusion and injury; in many places these can best be made of wrought iron, and a simple pattern is used in places where ornamentation is neither required nor desired. The catalogue shows many designs of this character.

Country estates frequently require ornamental gates and fences similar to those made by this company. Area ways, stairways to basements, etc., should be protected by pipe and other rail.

We understand the Dow Iron & Wire Works send this catalogue to all those who are erecting work of this character on request.

"TOXEMENT"

A great many constructions are entirely waterproof and tight against the water. Under normal conditions, an ordinary basement wall may resist the dampness of the wall with which it comes in contact. The ordinary wall may shed the water which normally runs down the outside, but there are conditions under which the surface must resist water under pressure, and it is in places of this character that only the best work is satisfactory.



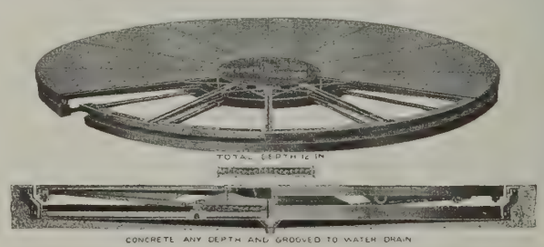
"Toxement" is a powder intended to be added to Portland cement, mortar, or concrete, under which circumstances the resulting mixture is absolutely waterproof. This material has been used with most satisfactory results for walls, cisterns, tanks, concrete blocks, stucco, etc.

"Toxement" is handled by the Garden City Sand Company, 709-711 Chamber of Commerce Building, Chicago, Ill., who will be very glad to answer questions regarding the use of "Toxement" for specification purposes where a waterproof concrete or brick surface is required.

SELF-LOCKING BURGLAR PROOF COAL CHUTES

How many architects and designers spend their chief energies on the decoration and ornamentation of the first story rooms and front, leaving the basement, which is often the working part of a building, to get along as best it may?

Few places are erected that do not necessitate taking the fuel and other supplies into the basement. This is sometimes accom-



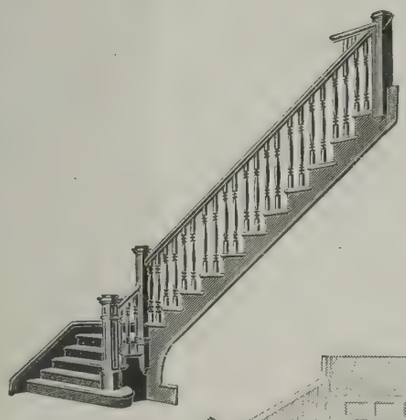
SIDEWALK DOORS.

plished laboriously by carrying the material down the stairs, and sometimes through the kitchen and first floor rooms. At times the coal is shot into the basement through a window at the risk of breaking glass, damaging the sash and scattering the coal around the yard.

The Canton Foundry & Machinery Co., Canton, O., have just issued their catalogue, "B-5," which shows a variety of coal doors and other accessories used in the well-appointed building.

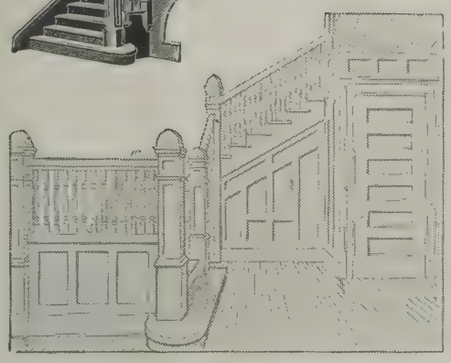
We show one style of sidewalk doors which finish flush, and are provided with guards when open, to prevent accidents.

AUTOMOBILE TURNTABLE.



The Canton Foundry & Machinery Co. also manufacture a great variety of cast and ornamental iron work for use in buildings, stables, garages, etc. Their automobile turntables are designed upon novel lines, so that the weight is supported at a comparatively few points, making it extremely easy to turn.

Any of our readers having work of this character to install are requested to write to the Canton Foundry & Machinery Co. for booklet "B-5," and for such information as they require.



We Celebrate "Economy Year"

By Slashing Prices

Right and Left on all Building Materials

In all our successful years, 1912 stands out the brightest. For this is "Economy Year." We have termed it thus because we have *lowered more prices this year* than ever before. It is economy year for our customers. We share this happy prosperity with you by cutting building material prices down to the roots.

For Example Look at These Slashed Prices on Stairs

Here's just one leader. These amazingly low prices will give you an idea of our other bargains. Send for new big catalog of 5,000 bargains. See coupon below. A flight of stairs that formerly cost from $75 to $90 can now be bought from us, complete and ready to set up for from **$40 to $50**

Absolutely Sterling Quality

We have *specialized* on stairs for many years. We put the best into them and still sell them from 25% to 50% cheaper than you can buy them anywhere else. ¶ Stock well seasoned and can be shipped within a week. ¶ Stair orders not machined and set up can be shipped same day we receive the order. Stairs complete and machined can be shipped within a week. Special packing by experts. Every part reaches you in apple pie order. Shipment *guaranteed* safe. A wonderful assortment can be chosen from our

BIG FREE CATALOG

This money saving volume has added thousands upon thousands of good dollars to the bank balance of American carpenters and builders. It tells in detail—in plain English—how we save you money on all building materials. How we have saved for others by actual figures. Tells how promptly we ship, the small cost of freight to different points. It challenges comparative prices on any and *all* materials. Send for it now. Use coupon. If you wish big book of house and barn plans whose value is $5,000 reckoned by prices an architect would charge for less practical plans, send 10c to cover postage and mailing. See Coupon.

Quality, Safe Delivery and Utter Satisfaction Guaranteed on Doors, Windows, Moulding, Lumber, etc., or Your Money Back

That statement is final. We don't care so much about selling you this first order as we do for your **future** businers. We, therefore, **must satisfy** you.

References, Scott County Savings Bank, Davenport, Ia.; Iowa National Bank, Davenport, Iowa; Bankers National Bank, Chicago, or any bank in America. Look us up in Dun's or Bradstreet's. **Clip Coupon Right NOW!**

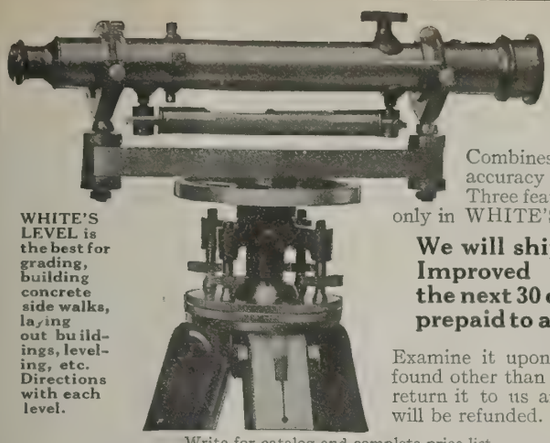
PORTABLE DERRICKS

The story is told of a hod carrier who told how easy his work was. He had only to carry up the brick and mortar and the bricklayer did all the work.

In modern buildings, a good part of the work consists of getting the material to the places where the mechanics can use it. This is accomplished in various ways. In small buildings, runways can be constructed so that the material is wheeled direct to the place; in

others, the use of heavy boom derricks is necessary, such as placing the stone and iron work. The hod and wheelbarrow hoists operated by power will care for a large amount of material such as brick, mortar, tile, concrete, etc., but there are many things about a building which are not easily transported by any of the above methods. For instance, window frames are usually too large to get up in the ordinary hod elevator, the lumber and flooring is in entirely too long pieces, and the placing and fitting on the elevator consumes a great deal of valuable time. It is for purposes such as these that the Taylor Portable Steel Derrick was especially designed.



In the accompanying illustration, the first shows the derrick in the shop being tested. In these tests, a block of concrete weighing approximately a ton is lifted from the floor and swung over a complete circle. This capacity is far greater than the ordinary load which will be placed upon it in ordinary use. The second illustration shows a unique use for a derrick of this character. As will be seen, this is the New North American Building located at the corner of State and Monroe streets, Chicago, Ill., and is one of the finest type of skyscrapers. On this building two Taylor derricks were used to hoist window frames, lumber, flooring, etc. The cut shows the two Derricks, one at the 10th floor and the other on the 19th floor. The adaptability of the Taylor Derrick to work of this character makes it especially valuable as a small platform can readily be built outside the window and the material swung in through the window with little effort.

The Taylor Portable Derrick is designed to be handled by one man if necessary, and one man can carry the Derrick up a ladder to place it in position on the building.

The Taylor Derrick is also made to be fitted upon a gondola railroad car for the purpose of unloading and loading supplies and machinery. How often we see the contractor employing eight or ten men to load heavy goods where by the use of a derrick of this character the same work could be accomplished in less time by two or three men.

The uses of a derrick of this character are so many that the manufacturer, Mr. John L. Taylor, 1034 W. Lake St., Chicago, is anxious to send his new catalogue to every contractor and builder. A postal will bring it, and it is valuable in showing the great variety of work which can be accomplished.

THE USE OF WATERPROOF FLAT FINISHES FOR COMPOSITION WALL BOARDS

By Frank P. Foster, Jr.

In view of the fact that composition wall boards are gaining a vogue everywhere among builders, it is of more than ordinary importance that architects, builders, contractors, interior decorators and painters should become acquainted with the best means of finishing such materials to the greatest advantage. In this connection it is interesting to note that the Glidden Varnish Company of Cleveland, Ohio, has devoted unusual attention to the development of special materials for the perfection, protection and decoration of modern structural work, including concrete and steel structures and that among the numerous products evolved as a result of their laboratory research and exhaustive practical tests are a series of special waterproof flat finishes especially adapted to composition surfaces, such as wall boards, which are rapidly becoming more and more popular. The finishes in question are made in light blue, light pink, pearl gray, cream, medium buff, golden yellow, light green, medium green, green toner, yellow toner, red toner, brown toner, and also in white, which may be tinted in any shade desired. Besides being of special value for use upon wall boards and other composition surfaces from a protective and decorative viewpoint, they are also used to great advantage in interior work on old or new plastered surfaces, whether rough, smooth or sand finished, or for metallic ceilings and wainscotings. They produce a beautiful, soft flat finish and one that is perfectly sanitary, inasmuch as it may be washed repeatedly without injury.

A sand finished surface treated to one coat of Glidden's Waterproof Flat Finish over a coat of Glidden's Alkali Proof Wall Size has been found to produce very good results. On the highest class work it is advisable to use two or three coats and to allow from two to three days between coats, according to weather and temperature conditions. These waterproof flat finishes have been found to have excellent brushing properties and covering capacity and to flow out with a full, even surface, free from brush marks. When they are applied over the alkali proof wall size on interior wall work they produce especially beautiful effects. Under ordinary conditions their covering capacity is approximately five hundred square feet to the gallon.

In applying these waterproof flat finishes they should be brushed well out over the surface so as to obtain uniform covering properties and it is essential that the surfaces over which they are applied should be dry, clean and well seasoned. Where an inexpensive yet satisfactory job is desired, it is well to use for the first coat a mix of half Alkali Proof Wall Size and half Waterproof Flat Finish in the desired color, followed by a second coat of straight waterproof flat finish. When the waterproof flat finishes are applied upon rough or sand finished plaster the material should be worked well into the pores of the surface. Upon smooth white plaster finish a priming coat composed of three parts of alkali proof wall size and one part of the color of flat finish to be used, gives good results. Where two or more coats are desired, one should use a flat finish just as it comes from the package, allowing plenty of time between coats for thorough drying.

A large, soft, black, stock brush should be used for applying the wall finishes, and the material should be well incorporated by thorough stirring before application. When applying these finishes to wood and metallic surfaces no priming coat is required. All that is necessary is to use the material as it comes from the package, after having taken proper precautions to insure the surface upon which it is to be applied being dry, clean and free from rust, grease and other foreign matter. Before applying the wall finishes to woodwork, one should see that all knots or sappy places are given a coat of pure white shellac. These flat finishes have also been used over colored wall paper with excellent results—two coats of waterproof flat finish over one coat of alkali proof wall size. Pure turpentine is used for reducing purposes.

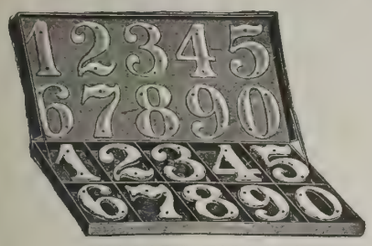
All walls that are to be tinted should first be washed clean with soap, all cracks and crevices filled with plaster of paris. When mixing the plaster it is well to add a small amount of vinegar to the mix in order to prevent its setting too rapidly. As soon as the wall is dry, after washing, it is ready for sizing.

To prepare walls that have been painted with kalsomine or water paints of any kind they should be washed with warm water and made thoroughly clean. The most satisfactory method of accomplishing this is by means of a large paste brush or calsomining brush, for wetting the surface, and then sponging the walls after they have been thoroughly soaked. After the walls have been thoroughly cleaned, in the manner described, is the proper time to fill all cracks and crevices with plaster.

The proper treatment for walls that have been whitewashed, in order to prepare them for tinting, is to scrape off all whitewash by means of a steel brush, and, after the wall is perfectly clean, it should be well sanded and one coat of vinegar applied. After this all cracks and crevices should be filled with plaster of paris, after which the walls are ready for sizing.

New walls frequently require special treatment, as they are often very hot, having a strong absorbent tendency that practically amounts to suction. In cases of this kind, if one will see that the surface is given a strong coat of vinegar before proceeding with the sizing, no further special treatment will be required.

CORTRIGHT METAL SHINGLE ADVOCATE



The February issue of the Cortright Metal Shingle Advocate has just arrived. This little Magazine is issued by the Cortright Metal Roofing Company, 50 N. Twenty-third street, Philadelphia, and is brim full of information for those intending to build or remodel their buildings.

It has a circulation of 35,000 each month, all sent free, the only qualification necessary for you to receive it regularly each month is to write to the Cortright Company stating that you are interested in knowing more about roofing and building problems and they will be glad to add your name to the list—do it now before you forget it.

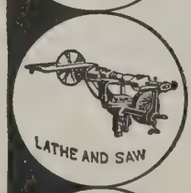
30 Days Free Trial

Foot and Engine Power



A Bigger and Easier Day's Work

Keen tools make money. When your tools are always in perfect edge you do more work, and do it easier. The way to keep tools always keen is to make it easy, quick work to sharpen them; and here's an outfit that makes the most difficult tool sharpening amazingly simple, easy and quick, as you can prove by 30 days' free trial on your own tools.

Luther Shop Tool Grinder

All steel and iron—bevel gear shaft drive in dust-proof housings—dust-proof bearings—mechanically perfected and runs easy as a sewing machine. We will send complete shop outfit consisting of grinder and 14 sharpening attachments and accessories for 30 days' free trial—no money needed, no red tape. Seventeen extra attachments, such as forge, jig and circle saws, force feed drill, lathe, etc., enable you to get full shop equipment at many times less the cost of machines to do the same work as these low-priced attachments.

Dimo-Grit Wheels Cut Steel as Emery Does Copper

Wheels of the new artificial diamond abrasive, Dimo-Grit, peel steel away in tiny shavings, instead of wearing it away like emery wheels or grindstones—no need of cooling with water, no danger of drawing temper. Twenty-five times faster than emery, 10 times more efficient than emery. Carborundum wheels also furnished. Grinding wheels make 4,000 revolutions per minute—takes but a few minutes to do grinding that would take an hour any other way. Tool rests and patent attachments give perfect bevel to twist drills, chisels, and other tools.

Write for 30 Days Free Trial Offer

Let us send you our liberal Free Trial Offer and 40-page free book telling the interesting scientific story of artificial diamond abrasives, giving points on tool sharpening, fully illustrating and describing Luther Grinders and attachments. Write today.

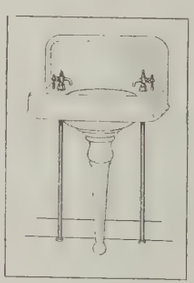
REGAL BRAND SASH CORD

Regal Brand Sash Cord that has been on the market now for some time was recently submitted to the government for test, and this test of the government, which is understood to be most severe on the sash cord, was submitted to the Puritan Cordage Mills under date of January 27 with the accompanying letter:

Puritan Cordage Mills,
Louisville, Ky.

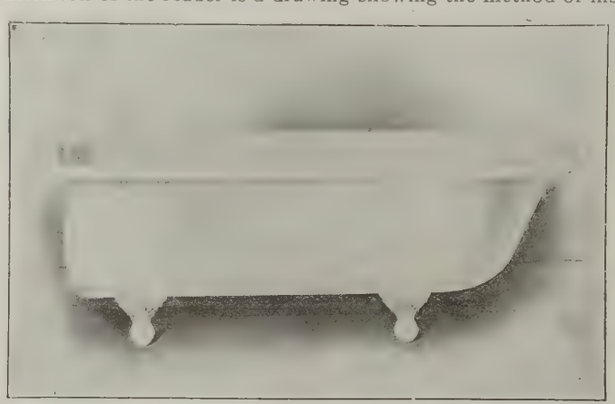
Sirs: Referring to your communication of the 11th ultimo, transmitting sample of your "REGAL Brand No. 8" sash cord, for test, I am directed by the Quartermaster General to enclose herewith copy of report of test of this material made by the Bureau of Standards.



From this report of test it would appear that the sash cord in question is of good quality, and is acceptable under the specifications of this office.

Respectfully,
(Signed.) E. W. CLARK,
Captain and Quartermaster, U. S. Army.

The Puritan Cordage Mills, 1560 Story Ave., Louisville, Ky., would be glad to send a copy of this test, with a sample of the cord, to all readers of this publication. In addition to this government test, which is of course the safest guide for the consumer, this cord has been tested in many other ways, all of which tests will be as gladly sent if desired.



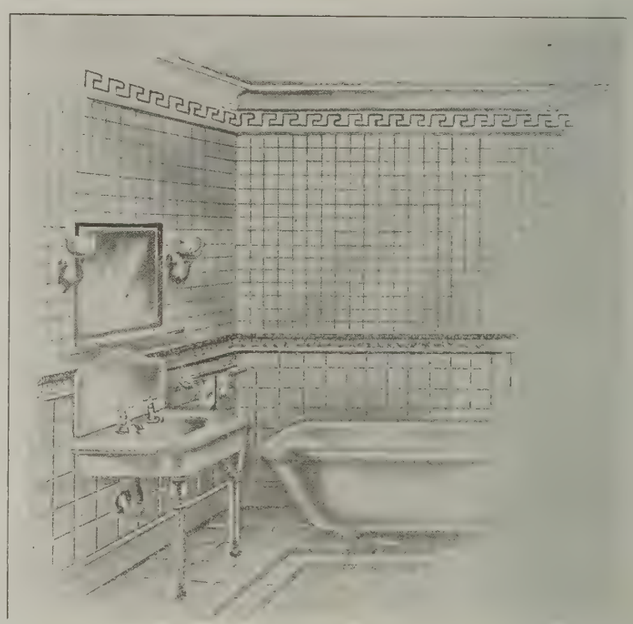
WATER AND STEAM SUPPLIES

For years past one of the most difficult things for the contractor or home owner to buy was plumbing supplies. People outside of the actual trade had not been educated to know that the installing of a bath room outfit or a complete water system could be done successfully by the average man who cared to work his brains a little. While it is true, of course, that an experienced plumber or mechanic can do better work in his own line than the average person who tackles a job for the first time, yet it is also true that there is a certain class of buildings being constructed where the owner wants all the comforts of a bath room and hot water heating. These would be entirely out of his reach if it were not for the better class of concerns which are today selling these supplies. These concerns publish catalogues which show in the plainest manner how their materials are to be installed. They are glad to give every assistance in making up sketches and lay outs for the contractor or builder who needs it. They sell goods that are just as represented, and they sell them at prices which gives the man of limited means a chance to make a better and more comfortable home for his family.

The Missouri Water & Steam Supply Company, 931 S. 6th St., St. Joseph, Mo., is one of the better class of concerns which is now selling plumbing goods, heating and lighting plants, pumps, windmills, etc., direct to the man who wants to buy.

This company issues a catalogue 12x9 inches and contains over 175 pages with over 800 illustrations. About the first thing to attract the attention of the reader is a drawing showing the method of installing supply pipes and fittings for a one-story building, using the Missouri air pressure water system. This drawing also shows the sanitary way of installing the soil pipe and fittings for the same building.

No. 23. High-Grade Roll Rim Cast Iron Enameled Iron Bath Tubs.

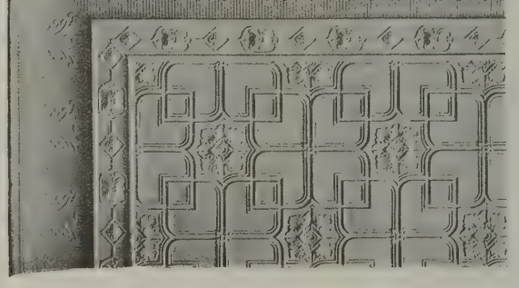


Following this is a plan along the same subject of a two-story house, and page after page of illustrations of plumbing goods, heating plants, water systems, etc. The illustrations of the bath room outfits are 7x6 inches. In fact, all through the book, the illustrations are of unusual size and clearness. Besides this large catalogue the Missouri Water & Steam Supply Company also issue a 16-page catalogue entitled "The Heating Question—What You Should Know," also catalogue No. 11 of 24 pages, entitled "Water Works for Country Homes," and a 12-page catalogue on Windmills. All of these shows prices plainly marked and at prices which will be appreciated by contractors and builders. They can be had by writing the Missouri Water & Steam Supply Company, 831 S. 6th St., St. Joseph, Mo.

ORNAMENTAL STAMPED METAL WORK

Modern machinery enables the mechanic of today to do vastly more than under the old system of handwork. A few years ago the use of stamped metal work meant making special designs by hand and stamping the work out by slow, laborious processes. On account of the cost of making dies, etc., few manufacturers had the facilities for doing the highest grade of work, and even the best were limited in the number of designs which they could supply. The builder was, therefore, confronted with the problem of either using designs not entirely adapted to the building or of paying exorbitant prices for the work.

The manufacturers, however, who persisted upon the highest grade of art metal work are meeting with success. As the result of their efforts, stamped or pressed metal ceilings of today are executed according to the highest principles of art and are made with an accuracy believed impossible a few years ago.



The Northrop, Coburn & Dodge Co., 30 Cherry St., New York, in their Catalogue No. 10, show a very extensive line of the highest artistic effects in stamped metal work. These goods are extensively used in hospitals, churches, schools, theaters, lodge rooms, halls, business offices, warehouses, stores and private residences. They meet the demand for a durable, incombustible surface and at the same time have a high decorative value.

The embossed surface of the metal adds greatly to the accoustic properties of the room, breaking up the echoes which are usually found in practically smooth walls and ceilings. It is hardly necessary to add the advantages of steel ceilings over wood and plaster. They eliminate the expense of repairs and the danger of annoyance of falling plaster. Their fireproof properties alone give them considerable value and the insurance rate is lowered where they are used.

One of the latest ideas as developed by this company is the use of wall decorations, as shown in the cut of the bathroom herewith. This renders the room perfectly sanitary, as it can be readily washed, cleaned and repainted.

The Northrop, Coburn & Dodge Co. have a particularly interesting catalogue, as it gives careful instructions for ordering and installing the work, as well as showing the great variety of designs. Special designs are a matter of correspondence and our readers who are interested in this work should obtain their catalogue No. 10 before placing their orders.

Amatite ROOFING

Why the Buyer of Amatite Never Complains

WHEN a man buys ordinary ready roofing he usually neglects to paint it and after three or four years he comes back to the dealer with a protest. It is human nature to neglect painting roofs.

When a man buys Amatite Roofing he lays it on his building and in three or four years it is still as good as new and does not need any paint. He forgets he has such a roof but no harm is done by that.

There is nothing to neglect in the case of Amatite. Amatite has a peculiar surface—a sort of plastic concrete made of pitch and mineral matter.

This surface is plastic enough so that the material can be rolled up into handy rolls in the usual manner and handled just like any other ready roofing. When unrolled on the roof and nailed down it presents to the weather a continuous surface of mineral matter and pitch. On this surface wind, rain, storm, heat and cold have little effect. Year after year it looks up to the sky undisturbed and unaffected. It costs nothing to maintain and relieves the owner from all responsibility.

Dealers can improve their business by selling Amatite and buyers make a good bargain when they buy it. The price of Amatite is less than that of most painted roofings of less weight and durability.

Sample and further information on request.

How One Builder Makes Money

¶ There lives in a little Indiana town about one hundred miles from Chicago, a builder whom we will call Jim. Jim has gained for himself a reputation for good work and honesty which gives him many a contract for a house, barn or a big roomy farm residence at a price nearly always higher than the other bids.

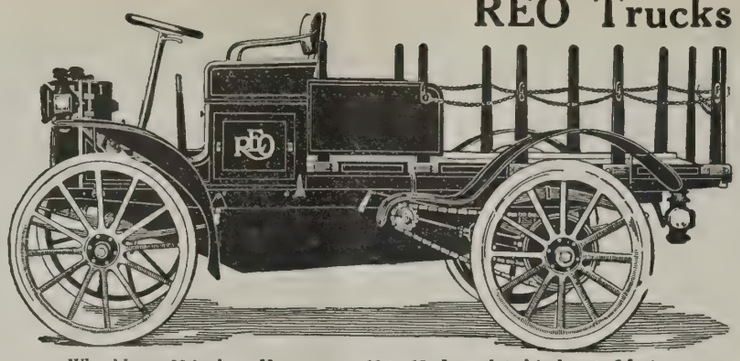
¶ He did not gain that reputation in a day or a week. He lost quite a lot of work at the start on account of his estimates being higher than others, but now the reputation for good workmanship, fair treatment to his customers and honesty in specifying building materials needed, are just that much capital for him. One thing that has made Jim stand out strong in his home town and locality has been his ability to tell those who are planning to build what materials to use. He has always been a close reader of the advertising in THE NATIONAL BUILDER. He has made it a point to post himself on all new materials, and to keep in touch with the better established materials as well, all of which are being specified and used extensively.

¶ Jim knows that THE NATIONAL BUILDER does its best to carry only reliable advertising. He also knows, however, that no matter what the material is, the manufacturer places in his selling arguments the best side of a subject. This is only natural. He knows also that no matter how good a material may be, it can be so placed or used that it cannot possibly live up to its specifications or claims. Therefore, he has made it a point to secure samples and catalogues of all the different things used in his trade. He has even taken the time to go through a factory or two where he has had the chance, and do a little investigating and finding out just how things were put together. All of this makes Jim able to tell the property owner what is best suited for his needs. It is such men as Jim who have made the builders' word on building subjects respected and more relied upon even than the dealer's.

¶ Thousands of dollars worth of orders for building materials, heating, lighting plants, etc., are swung from one manufacturer to another merely by the reliable up-to-date builder saying to the property owner whom he might meet on the street or be actually figuring with him on a job, "Oh, yes, I would use wall-board there instead of plaster," or "Why, yes, I suppose that 'Quick Burn' furnace you ask about might be all right, but Mr. Jones has used for years one of those 'Good Outfits' advertised in THE NATIONAL BUILDER and it has kept him warm all this cold winter—better look up the 'Good Heater' before you put in a 'Quick Burn' furnace."

¶ And so it goes, and who is there that really should know better than the man that has to put in the material, who has to know all about everything to make the best kind of a job. The builder's word is as much an authority as the architect's specifications. He should make it his business to know who are the most reliable manufacturers in everything he uses. Then there would be no mistake should the old-style dealer who never carries advertised lines try to substitute.

¶ A short time ago a property owner decided to put a new roof on his home, and having been posted up on a certain kind of roofing through the advertisements in his paper, decided on a certain kind. When he asked his dealer for it, what happened? The dealer didn't have any of that roofing, although it was an easy matter to get it. The dealer stated that the particular kind of roofing was awfully hard to find, and that he didn't know anyone who did handle it. The dealer went on to explain that even if he did carry that roofing, the buyer would not be able to tell whether it was that kind or not.



¶ All this kind of talk was handed out by the dealer simply in order to put in some other kind of roofing, which he had on hand and which the customer did not want. In this particular case, the customer decided to let his roofing job go over until the next year, thus killing an order for any kind of roofing, and also cutting some builder out of a job.

¶ So we say to our readers, Get posted on the different tools, building materials, heating plants, etc., advertised in THE NATIONAL BUILDER. When the prospective home builder asks you about the things he believes you are posted on, you will be in a position to tell him correctly.

¶ The up-to-date manufacturers are glad nowadays to educate the builders upon their materials. They realize that it is a paying investment to send out catalogues that are often really books fit to place in any man's library. Through these catalogues and the samples which are often mailed with them, every builder can be thoroughly posted. The longer that tools, materials, heating plants, etc., are advertised in THE NATIONAL BUILDER and other good papers, the more they should be specified, ordered and bought. Everyone knows that the most reliable and best things for the building trade are, with very few exceptions, those that have been and are still being advertised month after month and year after year. Advertised goods must live up to their reputation under at least ordinary conditions or disappear from the market, so get posted. Do it by starting now. Take an hour or two off and make up a neat bookcase for filing all your catalogues. Have a drawer or two for samples. Always have clean, new samples and catalogues on hand to show prospective builders. It will be easier for you to land the job. The more and better jobs you get, the better your reputation as a builder, and the more money you will make.

REO Trucks

Wheel base, 90 inches—Horsepower, 10 to 12—Length behind seat, 6 feet—
Capacity, 1,500 pounds. Front seat top, $25 extra.

Only $750

And Built by R. E. Olds

Please mark that price, and note this truck's capacity.

Most trucks which do what this truck does, cost from $1,200 up.

We are building trucks on a business basis—at a dray-wagon profit.

They are built in a separate factory, with a capacity of 5,000 trucks per year.

And they are sold through the thousand dealers established on Reo cars.

To pay more than we ask for a truck like this is rewarding inefficiency.

The Famous Designer

It goes without saying that R. E. Olds knows how to build a truck.

The dean of designers, with 25 years of experience. The builder of myriads of pleasure cars. The creator of Reo the Fifth.

Mr. Olds should be—and he doubtless is—the best qualified man in the business.

Mr. Olds' method of perfecting this truck was to put hundreds of them into use.

They were operated in city and country, on hills and plains, in all sorts of business service.

One loaded truck ran from New York to Oregon. Two carried the baggage in the Glidden Tour, from New York to Jacksonville.

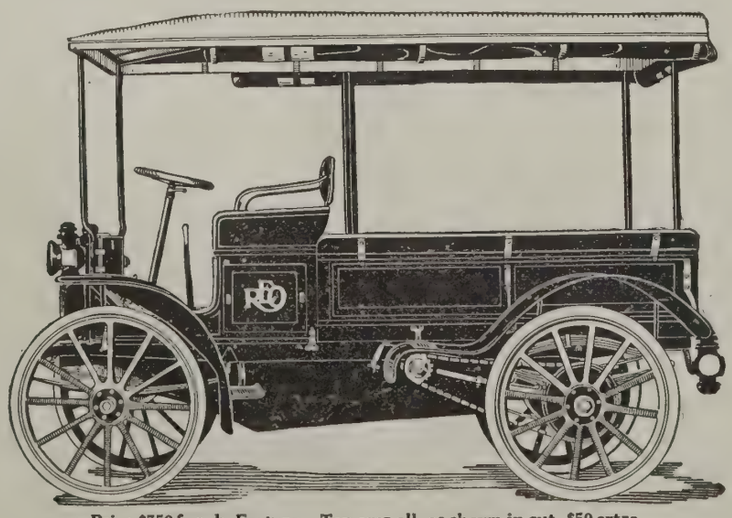
These tests have now covered two years. And never has a truck of this size and capacity shown better records in service.

50 Cents a Day

This truck is built so a 12-year-old boy can drive it. There is nothing to get out of order—nothing to do but steer.

It is immensely economical. On a six months' test, covering 4,553 miles and making 3,773 stops, the cost for gasoline, oil and repairs averaged 50 cents per day.

The average of many accurate tests shows the cost of delivery by Reo truck to be 60 per cent the cost of delivery by horse.



It does five times the work of a one-horse truck, and does it three times as quick.

It is always ready—never gets tired. Nothing can feaze it—heat or cold, rain or snow.

The Reo dealer—right in your town—will demonstrate the truck. He will teach your men to run it. And he is always there to take care of it.

Write us for information.

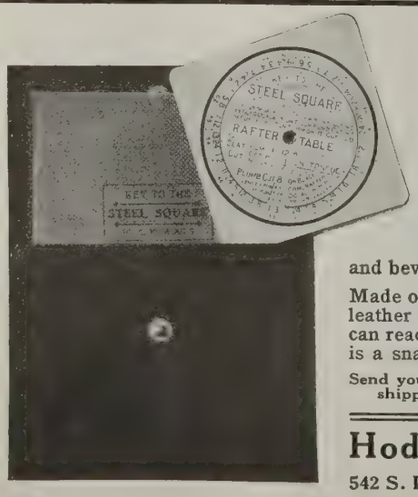
ANOTHER CONTEST

We want every one of our readers who are interested in **Remodelling Houses** to pay particular attention to this notice.

On May first we will give a Prize of ***Ten Dollars*** to the writer of the best article on what he has done in the way of remodelling houses, barns or other buildings. Some builders make a business of making over old houses. Some do the work when they have to for a good client. What are the requirements for success in this line, and how well does it pay?



If you have photographs, before and after, or between times, send them along. Write the kind of story you like to read, and you stand a good chance for the prize. About 1000 to 1500 words will be about right for length, and as many photos or drawings as you can supply.

Only one prize will be given, but any others we can use we will pay for at our regular space rates on publication.

Get your manuscript to us by May 1st, 1912. Winner's name and article will appear in June number. **Literary Contest No. 3.**

Are The Houses You Build Really Better Shelters Than This Framework?

After all is said, isn't it true that the single word "shelter" completely covers the purpose for which any house is built? Whether you're building a detached house or an apartment, its primary requisite is that it be a **shelter**—(1) from the **public view,** (2) for the **safe-keeping** of your personal effects, (3) from the **wind, rain and snow,** and (4) from **heat** and **cold.**

(1) Curtains and blinds, (2) strong doors and locks, (3) solid walls and roofs—all do their work well. But how about **heat** and **cold?** Come, let's be frank—are your houses **really** shelters from **them?**

LINOFELT
Linen-Felt made from Flax Fibre

the walls you build will keep cold on one side and heat on the other just as a solid black curtain keeps light and dark separate. Clapboards, sheathing, brick, hollow-tile —no matter of what material or how thick you build the walls—they **don't** insulate against heat and cold.

This glimpse at the scientific side of it means enthusiastic customers and clients for you. To stop the passage of heat and cold demands a substance containing a countless number of microscopic sealed **dead** air-cells, with the cells separated by material of the lightest possible specific gravity.

Flax fibres meet this condition better than any other substance capable of use in building. Linofelt is a quarter-inch quilt of specially treated flax fibres bound between two sheets of building-paper—rosin-sized or waterproof. In resisting the passage of heat and cold Linofelt is **much** more effective than **38** thicknesses of building-paper.

There's the brief scientific fact. It shows you why Linofelt, used in walls and roof instead of building paper, will cut 40 per cent off your customer's coal bills every winter—and keep his house cool in summer as well.

That means **real shelters** from heat and cold. Linofelt comes in rolls 200 feet long and 3 feet wide It will never add more than one per cent to the cost of building, and **need** not add anything.

Build with Linofelt, and make your houses faithfully serve their primary purpose; make them **genuine shelters.** Write for our special booklet and complete information today. Call upon our staff of draughtsmen for any specifying you wish. There's no corner-coupon here; we want to get into **personal** touch with you. Write us fully **now.**

TREATISE on the PRACTICAL USES of the STEEL SQUARE

By FRED T. HODGSON, Architect

Two Vols., Cloth Binding.....$2.00 Single Vols., Part I, Half Leather $1.50
Two Vols., Half Leather Binding.. 3.00 Single Vols., Part II, Cloth..... 1.00
Single Vols., Part I, Cloth..... 1.00 Single Vols., Part II, Half Leather 1.50

NEW and up-to-date. Do not mistake this edition for the one published over twenty years ago. This is the latest practical work on the Steel Square and its uses published. It is thorough, accurate, clear and easily understood. Confounding terms and phrases have been religiously avoided where possible, and everything in the book has been made so plain that a boy twelve years of age, possessing ordinary intelligence, can understand it from beginning to end. It is an exhaustive work, including some very ingenious devices for laying out bevels for rafters, braces and other inclined work, also chapters on the Square as a calculating machine, showing how to measure Solids, Surfaces and Distances—very useful to builders and estimators.

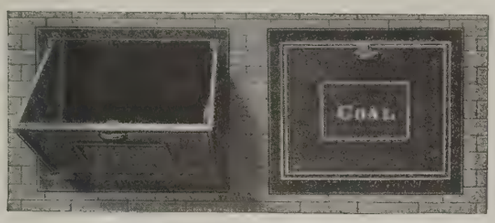
Be the man who gives orders



If you aspire to be one of the men who do things, to rise above the poorly paid class, and to be independent, you must have special training. You have the ability, but it is latent, it needs developing. By our practical and complete correspondence courses we can positively teach you to become proficient in DRAFTING—

Estimating, Plan Reading, etc., by Mail

in full or partial courses to fit your individual need. The courses cover every conceivable branch of the building trades. Conducted by a large and successful firm of Chicago architects—your lessons are supervised by them. Blue prints of buildings actually being erected in Chicago to study from. Courses are especially prepared for contractors, bricklayers, carpenters and all men in construction work. Low tuition, easy terms. No text books to buy. Send for instructive folder.

CHICAGO TECHNICAL COLLEGE, 655 Athenaeum Building, Chicago, Illinois

We also teach these same courses, including architectural, mechanical and structural drafting, at our Chicago School. Day and evening classes. If interested in the resident course ask for Catalog y.

Canton Self-Locking Burglar-Proof Coal Chute

Locks automatically on being closed, and can be opened from the outside only by the key shown in the cut.

Save glass, battered sash and frames made of glass, no parts to lose. In three sizes.

Let the coal man know where to put the coal. He might dump it through the wrong window into the laundry.

Write for Booklet "B-5" containing a list of building accessories of interest to you.

YOU Can Rise to a Position of Power

To hold a position of power you need to know more about your particular business than the men who work beside you.

The secret of power and success is to **know everything about something.**

Right along these lines the International Correspondence Schools train men for Positions of Power.

Unlike any other method of special training, you do not have to wait until you graduate before you can advance. Your rise in position comes step by step as you gain in knowledge and qualify for more and more responsible work.

The I. C. S. gives you "concentrated" knowledge—specialized training—that enables you to master easily and quickly everything you need to know to work up to the Position of Power.

By the I. C. S. method you do not have to read through volumes to pick out the essential facts. Everything is given to you in a concise manner—no more, no less than you need to become an authority in your chosen line of work.

If you can read and write, the I. C. S. can help you to succeed in your chosen occupation. To be convinced of this, just mark and mail the coupon and you will receive detailed information as to just how you can become qualified to hold a high position.

Marking the coupon involves no obligation on your part.

Mark and Mail the Coupon TODAY

FOR PERFECT MITRES

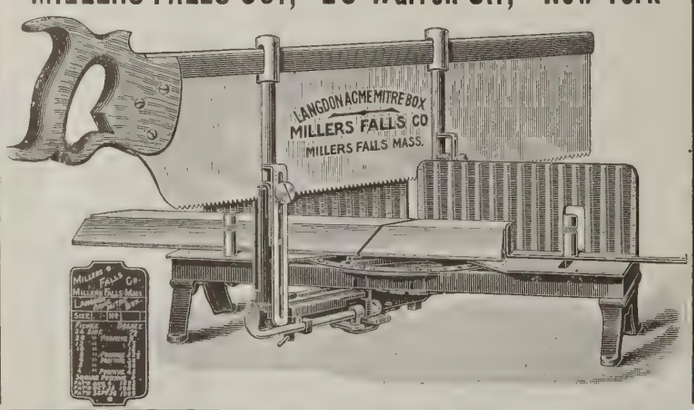
LANGDON ACME MITRE BOX

Langdon Mitre Boxes, when supplied with back saws fitted by ourselves, are warranted to give better service than any similar tool on the market.

Some of the advantages over older models are: In longer guides, which hold the saw steadier, and these guides are provided with elevators to hold the saw stationary, when desired, above the work.

In a graduated arc showing the various angles commonly used.

In supporting guides, to hold the work in place.



In an appliance for quicker adjustment of extension lever.

In a length gauge for duplicate lengths.

These boxes are made in three sizes and put up with varying sizes of saws, ranging from 22″x4″ to 30″x5″.

Send for the FREE book, "Tool Practice."

GREYHOUND HAND SAWS

SPEED & EASE

TRADE MARK.

The more you know about hand saws the more you can appreciate "GREYHOUND" hand-made hand saws, with their easy-running and rapid cutting qualities and wonderful durability. This saw will be imitated by others—but not equalled.

They are made from Bishop's Refined "GREYHOUND" Steel—a material which leads everything yet produced for use in hand saws. The purity of the steel, the toughness, the even and accurate temper, gives a saw that is the most suitable for particular work, and the most practical for ALL work where a hand saw is used. Made in both straight and skewback, also narrow patterns. Specify which you desire. Remember our warranty accompanies each saw. And the warranty means that if 30 days' trial does not convince you that the "GREYHOUND" saw is the best for your use, you get your money back.

EVER GET STUNG

with a furnace? Did the man tell you his was the only, only, **best** furnace—that it would heat you up to eighty in 40 below zero weather—on three tons a winter—and did he separate you from your dollars before you had a chance to test it; and then didn't you wish you had your money back?

We won't sting you? We don't want your money till you are satisfied with our furnace, **after a test.**

HERE ARE THE TERMS

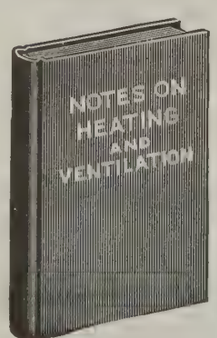
We will ship you a furnace, with all pipes, registers, etc., made to fit your house, first submitting complete plan for your approval.

We will **Prepay Freight Charges** to your station.

When the outfit arrives, check it up and pay your local banker the purchase price. He will hold it till **January First,** subject to your test. You set up the equipment, and use it and test it till that time. If it doesn't work according to our guarantee—if you think it isn't worth our price—or more—send it back (we pay freight both ways) and the banker will return your money. We send full plan and directions for setting, also all tools, if you need them,

There's no trick about this offer. It has been in force for years and it means just a **Square, Straight Deal,** direct between maker and user,

We make a splendid furnace—welded steel—gas and dust tight, economical, simple and all that. We describe it fully in a 48 page book which we send free. Ask for one, and read it, before you buy anything in this line.



You'll buy comfort and save money.

HESS WARMING & VENTILATING CO.

Notes on Heating and Ventilation

Price, $2.00 delivered

By *John R. Allen,* M. Am. Soc. Heating and Ventilating Eng.; Junior Professor Mechanical Engineering, University of Michigan, Ann Arbor.

Second Edition; Bound in Cloth, 6¾x4¾ in.; 200 pp.

This book is a resume of lectures delivered to classes in heating and ventilation at the University of Michigan. It is written primarily for the steamfitter and designer of heating systems It presupposes a knowledge of the construction and operation of the simpler forms of heating systems. Reduced to as brief a form as possible, so that readers can readily find notes or data desired.

Contents—Theory of heat and measurement of temperature. Heat losses from buildings; rules for determining heat losses in different constructions. Different forms of heating systems; their advantages, disadvantages and relative economy. The design of a direct steam heating system. The design of an indirect heating system. Steam boilers and steam piping. Carrying pipes underground, etc.

Bovee Furnaces

At Manufacturers' Prices

Will Save You One-Half the Price and One-Half the Fuel

The Bovee is the Only Furnace That Has a Perfect Ventilating System for Every Part of the House

Don't compare our prices with small, cheap furnaces that do not have one-half the capacity. Measure the firepot, measure the combustion chamber, measure the compound circulating radiator. Note the long travel of heat before reaching smoke pipe. See why the Bovee Furnaces **last longer, use less fuel** and **cost less** in comparison with other furnaces of equal size and capacity.

SPECIAL PRICES

Three-Run Heating Plant for Residences

Including Pipe-Registers and All Fittings

40-inch Furnace

20-inch Firepot, 28-inch Combustion Chamber. Heats 10,000 feet. Price **$65**

These furnaces will carry from 5 to 8 pipes, which can be added at small cost whan desired.

Store, Church and School Furnaces

One large run directly over furnace and two cold-air plates, including pipe-registers and fittings.

54-Inch Furnace

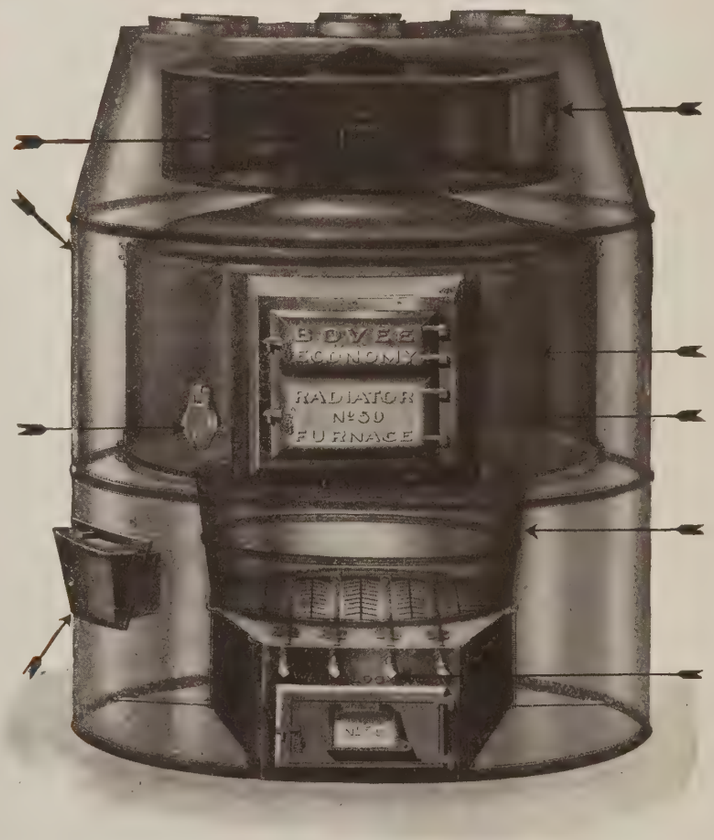
32-inch Firepot, 40-inch Combustion Chamber. Heats 40,000 feet. Price, **$95**

Horizontal Furnaces, with equal heating capacity, when desired. More heating pipes can be added at small cost. Prices on larger furnaces for any kind of buildings furnished on application.

Many Thousands of Bovee Economy Furnaces Sold

and not a single complaint of lack of **Heating Capacity** during all of the past severe winter. The Bovee Furnaces have the greatest heating capacity for the size of the firepot and **Fuel Consumption** of any furnace sold. **Examine Carefully** the construction as shown by the **X-Ray Cut** and see for yourself why the Bovee Furnace requires less fuel than other furnaces; see the large size of the **Combustion Chamber** and long travel of the heat into and around the large **Circulating Radiator,** which has six complete heating surfaces that conserve the utmost amount of heat from fuel consumed. We make the radiating chambers of our furnaces as large as it is possible to do in comparison to the firebox or the fuel-consuming parts.

SPECIFY AND INSTALL BOVEE FURNACES



and keep the heating plant profit in your own pocket. Besides you will give the property owner a splendid heating plant at a very reasonable cost and one he will be well satisfied with.

We ship everything **Cut to Fit** and **Ready to Install,** with directions so plain that you can't go wrong.

SEND FOR FREE CATALOGUE

IT WILL BE WORTH YOUR WHILE

Two Famous Silver Steel Saws

We want to call particular attention to the two Saws shown in the pictures below. Both blades are of SILVER STEEL—both are Taper Ground—both are genuine ATKINS SILVER STEEL SAWS—BUT the handles are constructed on entirely different principles.

No. 53. Genuine Perfection Handle

No. 51. Old Style Handle

"Pay Your Money and Take Your Choice"

ATKINS No. 53

The picture to the left shows ATKINS No. 53 SILVER STEEL SAW equipped with ATKINS Genuine Perfection Handle and illustrates plainly why this type of handle is easiest on the saw arm. While it may feel strange to the beginner—a few days use will demonstrate that the Perfection Handle is the most *scientifically* constructed and much easier on the saw arm than any other style.

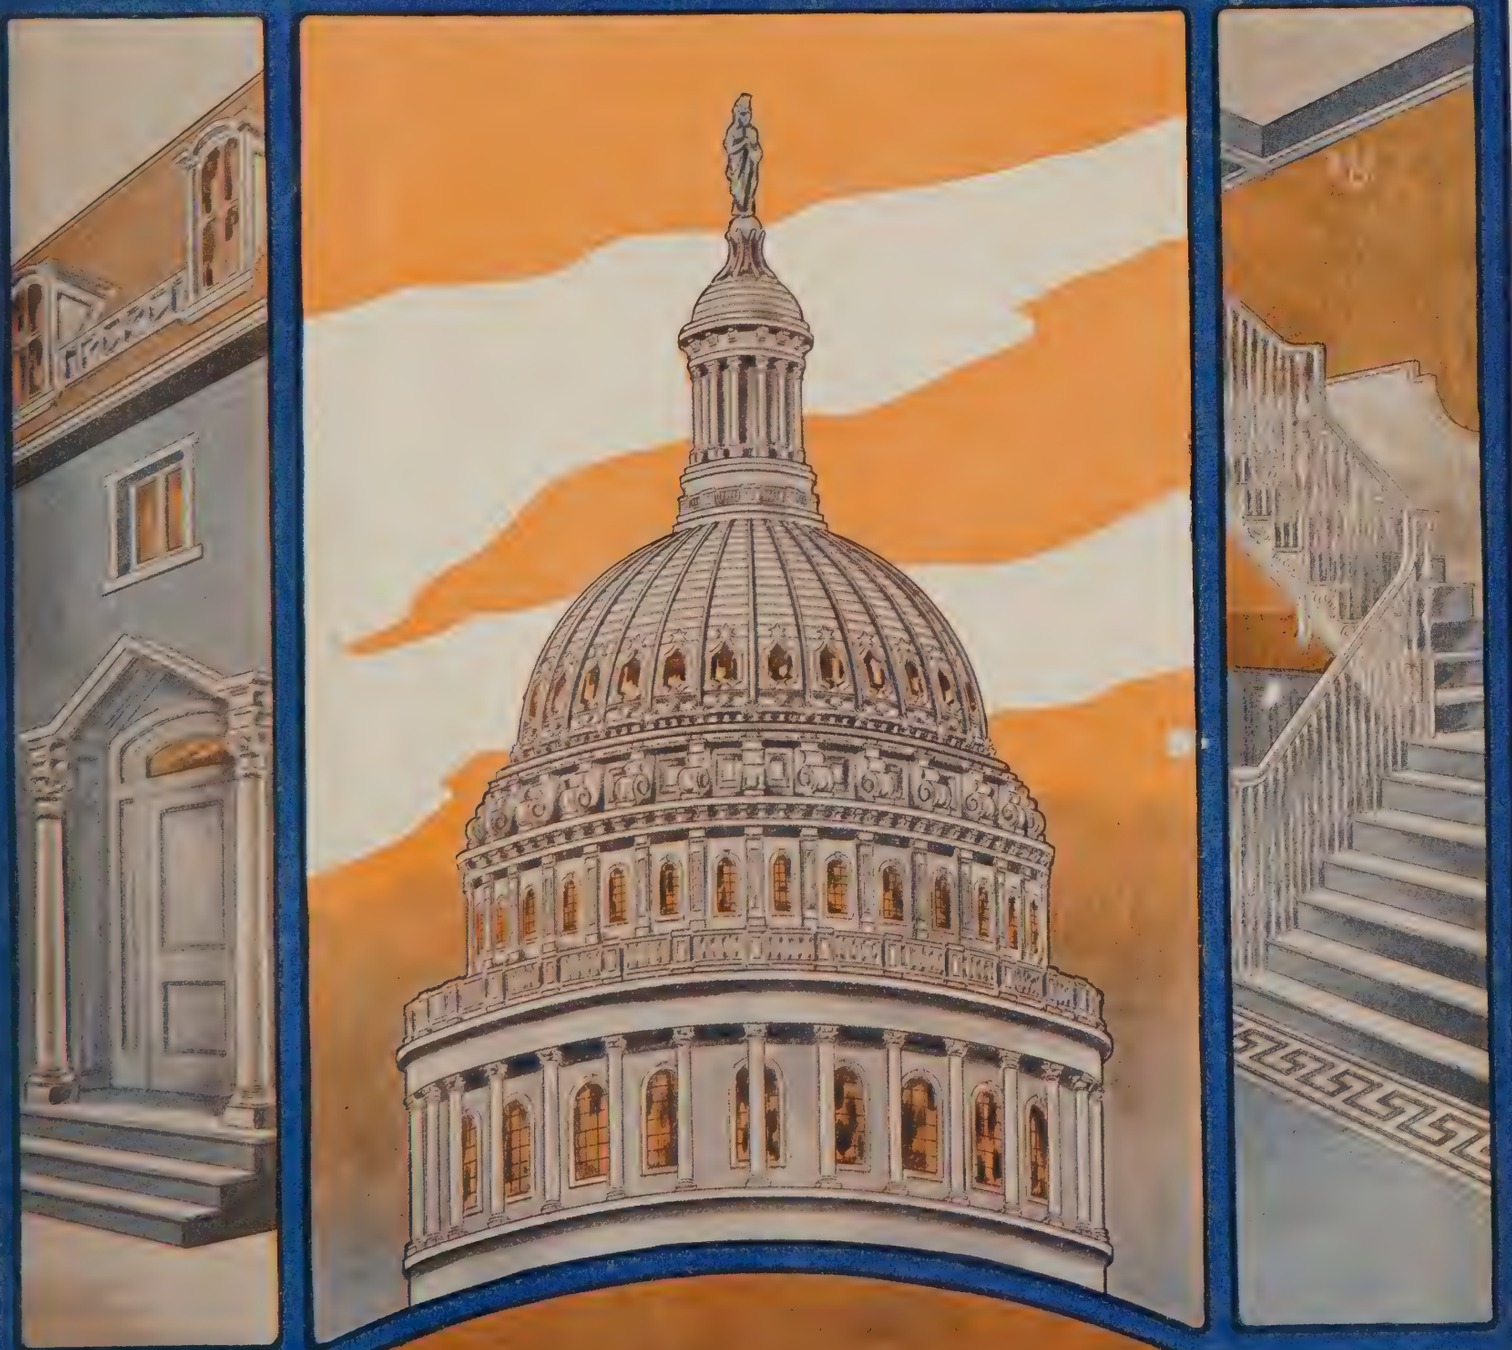
Note the line running through the saw arm straight through the blade to the cutting edge. See how every ounce of power is directed to the point of contact. Observe the wrist and saw arm, how easily and naturally the blade drops into its work without pressure.

ATKINS No. 51

If you are under the impression that all ATKINS SAWS are made with the Perfection Handle, we wish to particularly call your attention to the saw shown to the right. This handle is similar to the old straight across handle that you may have been using heretofore. Note the saw arm in this case and see that the pressure back of the saw arm is *not* directed on the cutting teeth, but rather to the back of the saw. Notice this wrist and see how it is necessary to push downward in order to secure proper contact. But even with this old style handle, the No. 51 is superior to any other, because the blade is made of genuine SILVER STEEL (our own exclusive formula) and is Taper Ground, which enables it to run free and easy, even in wet lumber, with but little set.

If you do not wish to try the Perfection Handle, then try the No. 51. Either of these saws or any of our other popular numbers may be purchased through your regular dealer, who should order for you from his wholesale house in case he does not carry them in stock. If he will not order for you, let us know and we will see that you are taken care of. Be sure to see that our name, E. C. ATKINS & COMPANY, and the words, "SILVER STEEL," are on the blade. None other are genuine.

OUR FREE OFFER



We are securing the names of high class mechanics who appreciate fine tools and if you will send us ten cents in stamps to pay postage, we will mail you one of our fine carpenter's nail aprons, Saw Sense Book, Time Book, and a great deal of useful information on the purchase and care of saws. Write today and learn "Who's Who" in the saw world.

DISSTON TRIUMPH SAW-SET

Patented Oct. 31, 1899.

SPECIALLY ADAPTED FOR HAND SAWS, CROSS-CUT SAWS, CIRCULAR SAWS AND ALL SMALL SAWS.

THE IDEA embodied in this Saw-Set is one that will commend itself to every user of a saw-setting tool. The principal feature is the use of two plungers operated by the two levers or handles; pressure on the lower lever forcing plunger "D" against the body of the saw, thus holding it rigidly in position and preventing slipping, whilst a continuation of the pressure on the upper lever operates plunger "C" in setting the tooth.

In action it is easy and powerful, and while it will perfectly set wide and heavy saws, it is also particularly adapted for narrow blades, such as web saws, narrow band saws, etc. If the gauge "B" is properly adjusted, the result will be a uniformity of set that cannot be obtained by any other hand set.

Another important point is the head of the Set is made open, enabling the operator to quickly adjust the Saw-Set to the tooth, the work being in plain view at all times. The gauge "B," for regulating depth of set, has a wider bearing than in most saw-sets, thus doing away with the tendency to incline the tool to one side or the other, which would give an uneven set to the teeth. The anvil "E" is fitted with four bevelled surfaces, suitable for different sizes of teeth.

IN OPERATING First adjust the anvil so that the bevel most suitable for the size tooth to be set is brought into position, hang the Saw-Set on the saw so that the gauge "B" rests on the teeth; adjust this gauge for the depth of set to be given, by the use of set-screw "A." Use care not to go too deeply into the body of the tooth, as all of the set should be in the point itself. Taking too deep a hold is liable to distort the body of the blade or break out the teeth. The top of plunger "C" should be in line with the top of tooth to be set.

We claim this to be the best Hand Set ever put on the market, and a trial will convince any one of its superior merits. If the instructions as to adjustment are carried out the results will be entirely satisfactory to the operator.

The **Triumph Saw-Set** is manufactured in three sizes, the smaller size, No. 28, being suitable for Hand Saws, Back Saws, Web Saws, narrow Band Saws, etc.; the medium size, No. 18, for small Circular Saws, etc., and the large size, No. 8, for Cross-cut Saws, Circular Saws, etc.

Made only in POLISHED FINISH.

Bishopric Wall Board Used in Finest Institutions

Beautiful and sanitary interior of hospital made with Bishopric Wall Board. Any of the handsome wall effects so popular for schools, churches, colleges, public buildings, etc., can be obtained with Bishopric Wall Board. It is especially successful in panels

Send for Big Free Sample—New Book of Home and Building Plans—Special Proposition to Contractors and Builders

Applied Dry, Winter or Summer

Shows Construction of Bishopric Wall Board.

Bishopric Wall Board is the sensation of the building world. There seems to be no limit to its uses.

It makes the finest walls in Hospitals, Schools, Churches, Public Buildings, Theatres, Hotels. As well as the finest Residences, Cottages, Bungalows, Apartments, Offices.

It is the handsomest and most durable wall for Offices, Garages, Amusement Buildings, Boat and Bath Houses, etc.

In fact the Contractor or Builder who acquaints his clients with Bishopric *develops* no end of new business.

Better Than Plaster—Costs Far Less to Apply

The old fashioned plaster wall does not excel Bishopric Wall Board in smoothness. It does not compare with Bishopric Wall Board in durability,—air proof, moisture proof, vermin proof and fire resisting quality.

Takes Any Finish—Paint, Paper, Burlap or Wall Textiles

You can finish a room in any style with Bishopric.

Any man who can drive nails can apply it in any kind of weather.

And it is *at once* ready for the decorators—no waiting for setting or drying.

It is the 20th century wall—

The Only Wall Board Stiffened by Laths

Bishopric Wall Board is made of Asphalt-Mastic (toughened asphalt), in which laths are imbedded. Surfaced with high grade, sized card board. Asphalt-Mastic does not burn. It thus makes a fire-resisting wall.

Bishopric Wall Board is the only wall board stiffened by laths. Positively cannot warp, swell or crack. Laths hold it perfectly rigid and flat, making spirit level walls and ceilings for all time. Don't have a Wall Board that has no laths to keep it from swelling, warping or drawing away from the joints.

A Score of Jobs Await Bishopric Wall Board in Your Community

Bishopric Wall Board can be used to remodel any house—make a new room anywhere—no mess—no bother to family.

Close up your attic and make a comfortable room with it. Make a new partition with Bishopric Wall Board. Finish the porch—ceil and wall the cellar with it. Make a warm, comfortable workshop in any building.

The "ABC" of BEAVER BOARD Construction

The fourth of a series of twelve monthly talks to carpenters about the practical use of Beaver Board, the pure-wood-fibre wall and ceiling material that is durable, economical, artistic; has none of the disadvantages of lath, plaster and wall paper; and is appropriate to any type of building, new or old.*

Beaver Board is essentially a proposition for carpenters and builders.

CHAPTER IV

Beaver Board for Attics and Cellars

Take the man with the seven-room house.

He needs more room—wishes he had it—can't get it—a new house is out of the question—so is an addition, for either his pocketbook or his lot is too small.

"See here," you say to him, "Let me build two or three new rooms *within* your house. With Beaver Board.

"I'll make you in your attic a bedroom, or two of them; a study; a billiard room, a maid's room—whatever you want.

"Down cellar I'll build you a store-room, laundry, summer kitchen, toilet—whatever you want.

"All out of Beaver Board—and attractive, warm in winter, cool in summer, dry and cheerful.

"Cost? Only a trifle."

You Can Put Up Beaver Board; Any Carpenter Can

Beaver Board's application to walls and ceilings is simply a case of hammer, nails and ordinary intelligence.

In old buildings nail it over the lath and plaster or, if the studding is exposed, directly upon it. In new buildings, of course, the studding is always exposed.

There's no trick in *Beaver Boarding;* and no perplexing list of rules to follow. We only advise a few precautions, of which these are samples:

Don't fail to work out your panel arrangement.

Don't nail *Beaver Board* closer than ⅜ of an inch from the edge of the panels.

Don't place nails at edges more than 3 inches apart.

Don't place *Beaver Board* where it will absorb moisture before using.

Don't put up *Beaver Board* until all necessary headers and furring strips have been set in between the studs and rafters.

Don't paint *Beaver Board* until it has been well sized.

We'll Help You to Avoid Mistakes

We maintain an expensive Architectural Department for your benefit. For the asking we'll plan the whole job for you and give you estimates also.

Your problem, if it is only that of *Beaver Boarding* a 10x11 corner in an attic or cellar will be given just as thorough attention as the other fellow's 12-story office building job.

When an attic is *Beaver Boarded*, it is no longer cold in winter and unbearably hot in summer.

When a cellar or basement is *Beaver Boarded*, it ceases to be a cold, damp, repellant vault.

Just glance at the photographs at the right. They best tell the story.

Beaver Board Arguments for the Carpenter

Beaver Board is economical. It suits any kind or sort of building. It retards heat, cold and sound. It doesn't crack, check or deteriorate with age.

Beaver Board, while not fire-proof, is fire-retarding.

There's no muss or litter in applying *Beaver Board.*

**These chapters began in the January number. If you have missed any of them, write us and we'll send you back chapters.*

Beaver Board's endless possibilities for all kinds of uses are fully described in our free booklet, "*Beaver Board* and Its Uses," with many pictures of different interiors. Write for it today.

FIVE THOUSAND CARPENTERS HAVE ASKED FOR AND RECEIVED SAMPLES OF

UTILITY WALL BOARD

A large majority of them are using Utility Wall Board in the houses and other buildings that they are putting up. Every wide-awake carpenter and builder appreciates the convenience and economy of Utility Wall Board. It appeals to him because it is so easy to put on—so tough and durable—so easily adapted to every type of building—because it does away with all the muss and bother and delay of lath and plaster—because it gives universal and lasting satisfaction wherever it is used.

Utility Wall Board is moisture proof. It does not warp or crack. It is put on directly over the studding—or over old plaster. It will stay on as long as the building lasts.

If you haven't had your free sample, write for it today.
Also for the illustrated book.

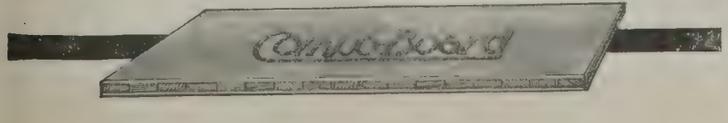
How This Contractor Got the Job at Highest Price



There's a money-making suggestion here for you.

"I commenced a job this morning which I got although I was the highest bidder. My bid was accepted on account of being able to complete the work fifteen days sooner than the other contractor, because I am using Compo-Board * * * Here is what happened on another job. Compo-Board delivered yesterday at 3 p. m.—put up at 11 a. m. today, papered at 2 p. m.—and the room will be occupied tonight. I have used Compo-Board on cold, damp walls and it has given entire satisfaction." John B. Walls, Philadelphia, Pa.

You can afford to specify or recommend only a wall board that will give the greatest satisfaction. You're safe in recommending Compo-Board. It's not only impervious to heat, cold, moisture, vermin, not only fire-resisting and non-warping, strong and durable, but it has several exclusive features. Can be papered, painted or kalsomined just as satisfactorily as a plastered wall, with or without panels.

Send your name on a postal card for free booklet and sample. Learn why the government and others who know prefer Compo-Board. It may be the most profitable postal card you ever wrote.

UNCLE SAM SPEAKS ANOTHER GOOD WORD FOR

"THE WOOD ETERNAL" **CYPRESS** *"THE WOOD ETERNAL"*

Department of Agriculture, Forest Service, Bulletin 95, Page 44, issued June 30, 1911, says of *Cypress:*

"The properties which fit it for such wide use are the freedom of the wood from knots and other defects . . . and the *long period which the wood may be expected to last.* To this might be added handsome appearance, which frequently has much to do with popularizing a wood."

Further on CYPRESS, the same Government Report says: "The wood contains little resin and thus affords *a good surface for paint,* which it holds well . . . It is a popular wood where it is subjected to dampness and heat. It shrinks, swells or warps but little . . . For the parts of houses exposed to the weather it serves equally well."

Both quotations above are from Bulletin 95 (page 44), U. S. Dept. of Agr. (Forest Service), June 30, 1911.

"The Money You Don't Have to Spend on Repairs is ALL PROFIT."

When planning new improvements or repairs to old ones, just remember—*"With CYPRESS you BUILD BUT ONCE."*

WRITE TODAY for VOLUME ONE of the CYPRESS POCKET LIBRARY, with Full Text of OFFICIAL GOVERNMENT REPORT. *Also Full List of 31 Other Volumes.* (FREE on request.)

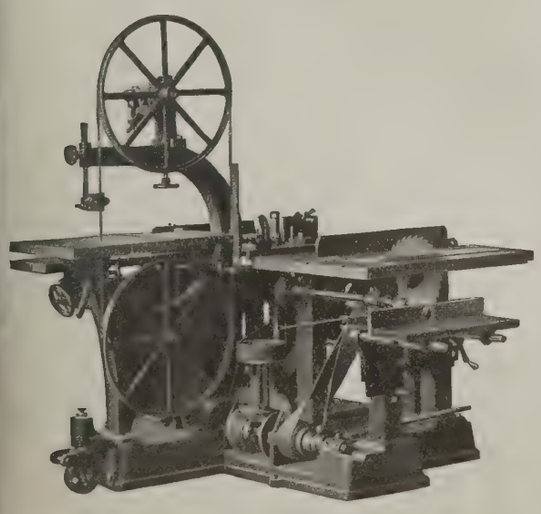
See How Easily Four Men Can Work on The No. 51 Crescent Universal Wood Worker Without Interfering With Each Other

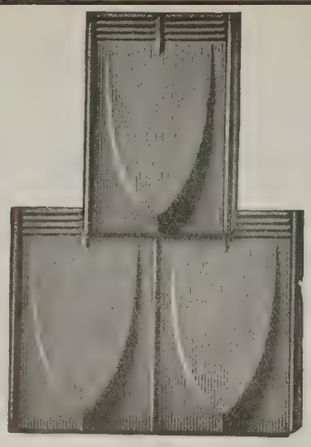


EACH man has absolute control of his own machine, independent of any other. He can start or stop it at will and he can handle his work without hindering his fellow workmen.

Your competitors are investigating the merits of this splendid machine, because they are looking for a machine that will enable them to cut down the cost of their work and increase profits. The No. 51 **CRESCENT** Universal wood worker is the machine that will accomplish this.

Keep in advance of competition and put in this tool, as it will enable you to turn out a greater variety of work than anything you have ever had offered to you. It has special features of construction that make it impossible to compare the machine with any other combination wood worker on the market.

With a machine of this kind in his shop or out on a job a contractor is sure to increase his profits. The machine is better built than any variety wood worker or any combination machine you have ever examined. Each part has its own independent adjustments. The fundamental principle of each machine is identical with larger machines of the same kind.



When you buy this machine you have a complete planing mill instantly at your command. If the combination machine you bought does not come up to your recommendations, look into the merits of this tool. It will please you. If for various reasons you have not investigated the merits of combination machines, send for the circular anyway. You will find something of interest in it and besides we want you to know all about the tool.

If you are interested in our general line ask for catalogue of band saw, saw tables, shapers, jointers, variety wood workers, planers swing saws, disk grinders and borers.

BIGGER PROFITS WITH AN

"AMERICAN" CONTRACTORS' PORTABLE VARIETY WOOD-WORKER

Here is the machine you have been waiting for, Mr. Contractor—a simple, sturdy, reliable little planing mill that you can take from job to job, right on the work—**at a price that brings it within the reach of every one.**

In the American Variety Wood-Worker you really get three machines—each capable of a great variety of work—each independent of the other—each so arranged that a man can work at it without interfering with the men on the other two machines.

Note that last feature particularly—the "American" is a three-man machine, with three times the capacity and usefulness of any mere saw bench.

As a matter of fact you can frame, build, trim and finish an average house with the "American" Wood-Worker and save enough on that one job to more than pay for the machine. Here are the capabilities of the "American:"

On its saw table or bench you have a rip saw, cut-off saw and mitre saw, a dado and gaining machine, a grooving machine and a rabbitter. So much for the rougher class of work.

At one side of the table is a 6-inch jointer and planer; matcher bits and moulding cutters can be inserted for all shapes. A sander drum can be substituted for the jointer head; and a disc sander can be mounted on the spindle. An emery wheel is furnished, for grinding tools.

The boring table has a 6-inch feed and a vertical adjustment of 3½ inches. For grinding or disk sanding it supports the work.

And remember that all these functions are combined in a solid, compact, self-contained, durable machine, with power built in (gasoline engine or electric motor), easily moved anywhere, ready for work at a moment's notice, right on the job.

You are after the big profits of building. You want a reputation for rapid work and good work. An "American" Variety Wood-Worker will help you to realize all this. You will find it a permanently profitable investment.

You should have the "American" Circular.

President Weber Mfg. Co.
661 71st Ave., West Allis, Wis.

How Would You Feel

If you paid twice as much for a floor scraper as your competitor and his machine worked just as fast and as perfectly as yours? And then because your machine had more frills on it that got out of whack, while his being of simple construction was always ready for work—wouldn't you get sore?

I Am Talking About FLOOR SCRAPERS

Most of them cost you from $45.00 to $90.00. That's too much. You are paying for the frills. **It's the knife that does the work**—and when you have a good knife in a well-balanced, smooth-running body—that's what you are looking for.

Only the Other day I Tried to Persuade

a very busy contractor to get a new scraper. He had bought one from us seven years ago. "What's the use," he said; "mine is first-class in every way and does the work." He has a Fox Scraper. I couldn't sell him another, because he's satisfied.

The Fox Floor Scraping Machine

is built of the very best material and will last a lifetime. It is so perfectly balanced that when in operation, 85% of the weight is resting on the blade. It will not chatter or leave waves. **It does the work, and the price is only $25.00.**

The Knives Are Made From the Best Quality of Steel

tempered by our own process. A set of 8 with each machine.
Shipped freight charges prepaid on a week's trial; return it if it is not satisfactory.

Mechanical Requirements of a perfect Floor Surfacing Machine:

ADAPTABILITY:

a—For use on old, varnished or new floors.
b—For use in large or small rooms.
c—For use in buildings under construction and not equipped with power.
d—For both scraping and sandpapering.

ADJUSTABILITY:

a—OF THE SCRAPER HEAD—
1—For the reversible shear cut.
2—Up and down to fit every angle that a scraper edge may be turned to.
3—To scrape corners and close to baseboards.
4—To use entire edge before resharpening.
5—For simple, quick and easy resharpening, without removal of blade.
6—For sandpapering attachment.

b—OF THE OPERATING HANDLE—
1—To an easy working position according to height of the operator.
2—For use in very small rooms or halls.

c—OF THE WEIGHTS—to conform with any size of scraper edge that may be required—for light or heavy cutting—to prevent waves on all kinds of work—to do the work in the easiest practical way.

EFFICIENCY:

a—In Weight to insure a smooth wide cut.
b—In Motive Power to insure ease of operation, great capacity and A-1 quality of work.

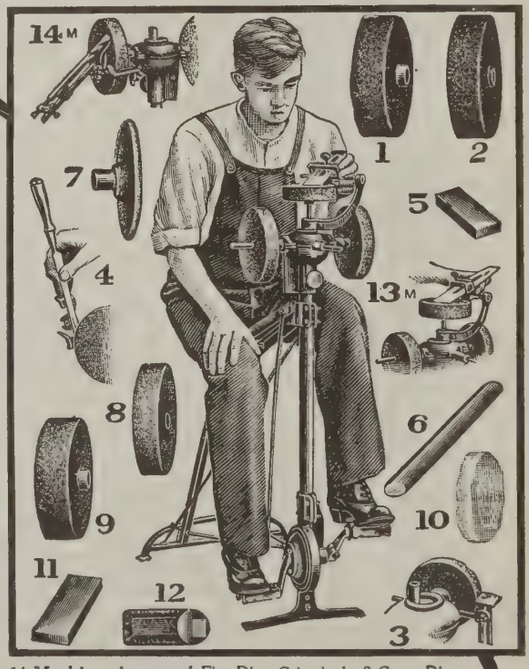
The handiest machine in the shop—30 days free trial

The new Luther Tool Grinder is a workshop in itself. Extra attachments convert it into 17 different machines, such as turning lathe, force feed drill, jig and circle saws, forge, etc. The low price of these attachments enable you to get a full work-shop equipment at a tremendous saving of what it would cost you to buy separate machines to do the same work.

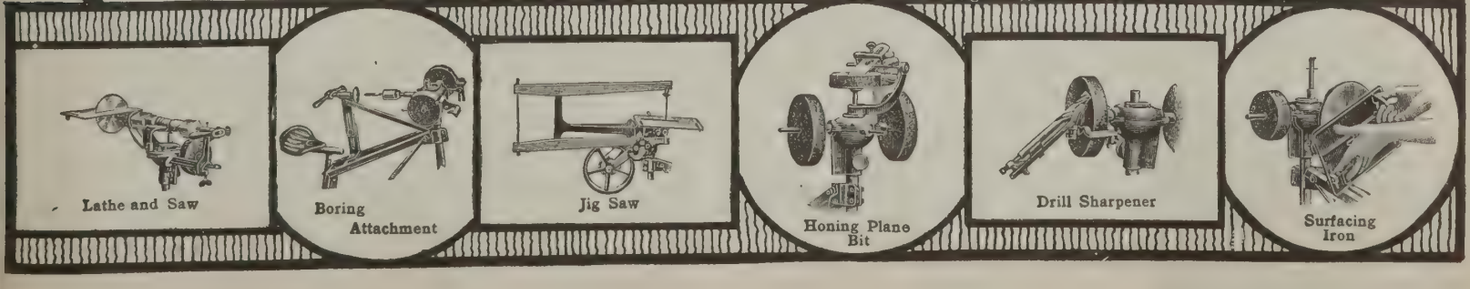
Dimo-Grit wheels cut steel as emery does copper

Wheels of the new artificial diamond abrasive, Dimo-Grit, peel steel away in tiny shavings instead of wearing it away like emery wheels or grindstones. No need of cooling with water, no danger of drawing temper. Carborundum wheels are also furnished. Grinding wheels make 4000 revolutions per minute—takes but a few minutes to do grinding that would take an hour any other way. Tool rests and patent attachments give perfect bevel to twist drills, chisels and other tools.



Luther Shop Tool Grinder

foot and engine power



All steel and iron—bevel gear shaft drive in dust-proof housings—dust-proof bearings—mechanically perfected and runs easy as a sewing machine. Stanley Tools

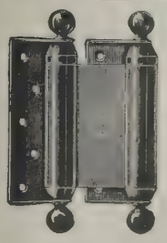
In the well known "BED ROCK" Plane as now constructed, we offer the user of high-grade tools a Plane that is the strongest and most perfect in adjustment of any Plane ever manufactured.

The design of the sides, which is a new and distinctive feature, adds greatly to the strength and attractiveness of the Plane, as will readily be seen from the illustration.

The new method of fastening the frog to the seat permits of the frog being adjusted either forward or backward without moving the lever or the cutter.

The shape of the knob has been changed, the new shape permitting a much firmer and easier grip than before.



The high grade of material used and the great care taken in their manufacture, enables us to guarantee these Planes in every respect.

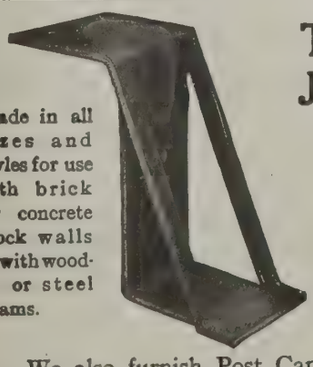
ELEVATORS FOR INVALIDS



"The Sedgwick Machine Works,
130 Liberty St., New York.

Gentlemen:

In my house we had no elevator and my daughter had to depend on our man to carry her up and down stairs. If she wished to let the man have an evening off, she had to go upstairs right after supper and stay there. Now the man could be dismissed so far as carrying her in the house is concerned. She is entirely independent, goes up and down by herself, can run the elevator with one hand, and she goes up and down as often as she wishes and when she wants to. The elevator is a great comfort to us and we shall be glad to have anyone needing such a thing come and see it, or write us about it. There are many invalid ladies and men who toil laboriously upstairs who, if they knew of the Sedgwick Hand Power Elevators, would not be without one."

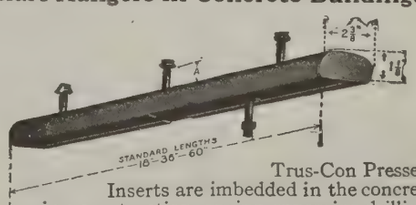
The above unsolicited letter was written to the Sedgwick Machine Works by a well known New England Judge who has had a Sedgwick Hand Power Invalid Elevator in his house now for nearly five years. The Sedgwick Machine Works, 130 Liberty Street, New York, will furnish his name and address upon request, or will send catalog and full information as to their Hand Power Elevators and Dumb Waiters free on request. Judge B——purchased his elevator through his local carpenter.

Sedgwick Machine Works
130 Liberty St. :: :: :: :: New York

Made in all sizes and styles for use with brick or concrete block walls or with wooden or steel beams.

TRUS-CON JOIST HANGERS

Avoid cutting away and weakening of timbers and walls—save labor, time and money.



Trus-Con Joist Hangers are made from open hearth steel plates, and are proven by actual test to be the strongest on the market. Note the bulb-shaped reinforcement at upper angle.

We also furnish Post Caps, Post Bases, Wall Plates and Base Plates made in rolled steel, malleable iron, or cast iron.

Write for catalog and prices.

SHAFT HANGER SUPPORTS *for* CONCRETE BUILDINGS

Trus-Con Pressed Steel Inserts for Supporting Shaft Hangers in Concrete Buildings.

Trus-Con Pressed Steel Inserts are imbedded in the concrete during construction, saving expensive drilling after completion of the work. The long slots allow a wide variation in position. Special washers prevent bolts turning in the slots. Write for details and prices.

GET THE DOUBLE CLAW HAMMER

It Saves Cost Continually

¶ The labor and material to produce it is threefold. But it is well worth while. ¶ It starts a nail *high* over your head and draws the nail *up* instead of rolling it out. No danger of smashing your fingers. It is a pleasure to work with it.

SAVE TIME, LABOR AND MONEY. Your main thought in fulfilling a contract is to get it done in the quickest possible time, in the best possible manner and at the lowest possible cost.

THE DOUBLE CLAW HAMMER with its better ideas, material and workmanship helps you do all these things. It does more and does it more easily. ¶ The price, $1.50, is justified because of its superior service and the fact that it costs three times as much to make this hammer. The difference in price is insignificant—you lose many times more than this difference in time and labor, lost by working with the old style hammer. The price is nothing compared to its earning power.

REMEMBER it is the user who makes the continual profit. Get the DOUBLE CLAW HAMMER.

16 OZ. HEAD } WHICH?

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

"Every contractor certainly ought to own a rig like that!"

"Then he could put more of his men's time in on the bigger work, and make his contracts pay a whole lot better profit"

"RIPPING hard pine and oak stuff by hand takes a lot of time. So do boring in hardwood—sanding—dadoing—and many other things that come up on every job a contractor takes. Get an 'Eveready' saw rig and you can save a big share of this lost time. It rips, cross-cuts, miters, jig-saws, sands, dados, joints, grinds tools, etc.—nice clean-cut work—in just about *one twenty-fifth* of the time your best man can do it by hand. And all it costs to do this is *2 cents* an hour. Can you beat it? The

TRADE MARK OSHKOSH

'Guaranteed for Life.' **Eveready** *'Guaranteed for Life.'*

SAW RIG

can be loaded into a cart by two men and taken right out on the job. There you can swap it around from cellar to garret—anywhere the work is.

"Its frame and skids are of best air and kiln-dried maple. They'll never warp a particle. The engine's a beauty—a 4 h. p. of the latest design out. And it's mighty easy to run. Give her a spin and she's off—for ten minutes or all day. Any bright boy can operate it.

"You wouldn't be without the Eveready a day if you had the least idea of the time, money and back-breaking labor it saved!

"Why—you'd mighty soon gain enough in extra profits to make up the little you paid for the rig.

"Contractors—and even the smallest carpenters—are making the Eveready a part of their regular outfit. It's a whole planing mill in itself and they find it just as necessary—yes, a great deal more so—than any machine they own."

All These Attachments Free

JOINTER HEAD—Works on exactly the same principle as an up-to-date planer. Produces a smooth, even job with no deep cut as the material leaves the jointer head. 2½ inches in size.

BORING ATTACHMENT—Guaranteed absolutely accurate. Extra long boxes insure easy, long-running qualities on the guides. Bits, standard size.

JIG SAW—Not a cheap one, but the best 13 inch jig we can make. All joints reinforced with steel, equipped with brass bushings.

SANDER—The best one yet. A great time and money saver over old methods in change and economy of paper. Our method of holding paper will not blister. 10 inches in diameter.

SAW GAUGE AND MITRE DEVICE—Saw Gauge of best gray iron, 18 inches long, adjustable to any bevel. Mitre Device adjustable to angle and can be used as a cross-cut gauge.

DADO HEAD—Our own special design. Does smooth, even work with or across the grain.

EMERY WHEEL—A 6-inch wheel for grinding tools also furnished with this rig.

Try One Six Days Free

Then—if you can get along without it—return it at our expense.

You'll never get a fairer, squarer chance than this. And if you keep it, it is actually **guaranteed for life.**

Spring is just the time when everybody is getting ready to build. Get in shape to bid lower than anybody else—on good, profit paying work. The Eveready will help you do it by cutting down your men's time.

A few strokes of the pen and a few drops of ink bring the whole proposition before you. Why not write today for full details?

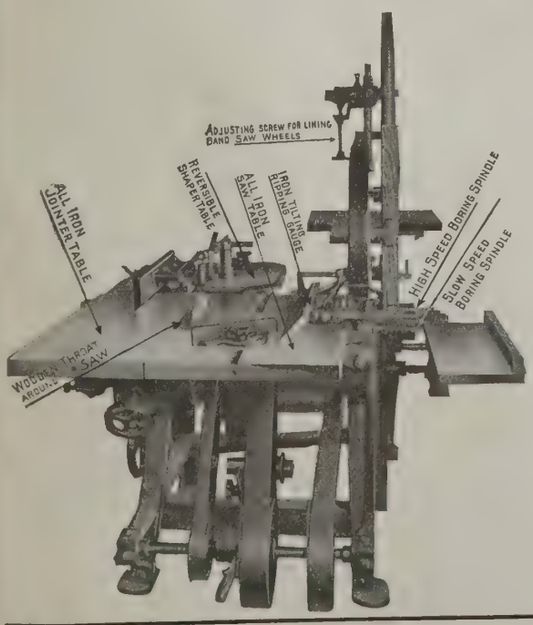
the Saw-Table on the FAMOUS Universal Wood-worker is Made of IRON!

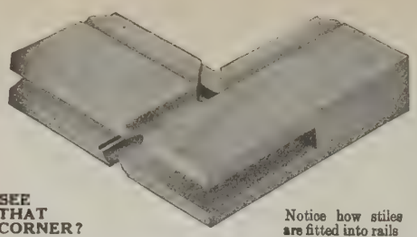
—so is the ripping gauge. This substitution of iron for wood furnishes another example of *Famous* durability, and our determination to **maintain** the prestige of the *Famous* Universal Woodworker as the **unquestioned leader.**



Over eleven hundred (1100) FAMOUS Universal Woodworkers are in use today. You are not experimenting—or taking risks—when eleven hundred carpenters and contractors have proved that, as an investment, the FAMOUS has no equal in woodworking machinery. Eleven hundred machines of one type is **proof positive** of efficiency and satisfaction.

Look at this woodworker proposition from any angle—Strength, Durability, Adaptability, Working Conditions, Simplicity of Operation, Price—the FAMOUS has **no competitor.** Study the strength—the FAMOUS is all iron and steel; others are not. Consider the durability—the FAMOUS lasts a lifetime because we unreservedly guarantee it; you cannot get that kind of service from others. Look at the adaptability

—the FAMOUS does **sixteen** different kinds of work; far more than the next best could ever hope to. Think of the working conditions—the FAMOUS permits four men to work at one time; can any other machine excel that? The simplicity of operation means that any machine hand can operate the FAMOUS without any previous experience. The prices are so low, and so easy to pay, that every contractor or carpenter can easily afford one.



The FAMOUS Universal Woodworker consists of: 27 inch Band Saw; 12 inch Jointer; Saw Table (with raising or lowering arbor); Single Spindle Shaper, Borer, Pony Planer, Tongue and Pole Rounder, Hollow Chisel Mortiser, Single End Tenoner, Drum Sander, Disc Sander, Knife Grinder, Emery Grinder, Band Re-Saw, Spoke Tenoner, Rim Borer and Wheel Equalizer, Adjustable Felloe Rounder—a total of sixteen.

Notice, by the accompanying illustrations, how practical they are arranged and how easy they are to operate. Then write for catalog and full particulars.

OAK FLOORING

Increases the Renting and Selling Values and Attracts a Better Class of Tenants

Builders and *owners* will find it a clinching argument to say "It's floored with OAK FLOORING." It is the biggest single feature to look for in any house or apartment building. It imparts an air of *refinement* and *elegance. It is the modern flooring.*

OAK FLOORING ⅜" thickness by 1½" or 2" faces can be laid *over old floors* in old homes or over cheap sub-floors in new homes *at a very low cost.* It is *cheaper than carpets* or *pine flooring.* When laid it has all the appearance of heavy flooring.

There is a *solid satisfaction* and *lasting pleasure* in the *substantial* and *dignified appearance* of OAK FLOORING. Contractors and carpenters find it very *profitable* to lay ⅜" stock over old floors in old homes during the winter season.

A little *canvassing* is all that is necessary to *secure jobs.* A carpenter or handy man can lay OAK FLOORING successfully.

For *durability* OAK is the best. OAK FLOORING laid thirty years ago, after very hard use, is still in good condition.

Write us for catalog.

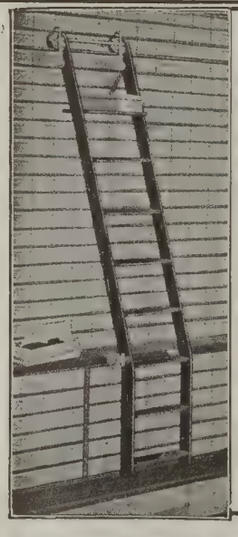
THE OAK FLOORING BUREAU, 872 Hammond Bldg., Detroit, Mich.

CUSTOM MADE FLY SCREENS

Our work is far superior to the usual output of local mills and has a style and finish not obtainable from those who do not make a specialty of FINE SCREENS

Our screens are made from kiln dried lumber and have waterproof coped joints and the frames are weather-proofed before the finishing coats are applied.

Best grades of Wire Cloth, Enameled, Galvanized, Genuine Bronze, fastened by most approved methods.



Our new "Ironwood" Screen is the cheapest good Custom Made Screen yet produced.

Intending purchasers may have free by mail sample of woods, finishes, wire cloth and a copy of catalog. Agencies in nearly all large cities. Agents wanted in smaller cities.

Special Terms to Contractors and Builders. Delivered prices will be quoted. Goods laid down at your railway station

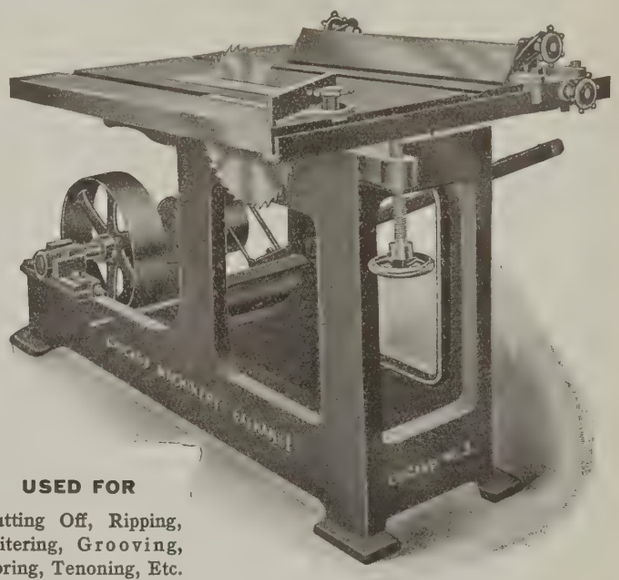
THESE TWO MACHINES FOR $170.00

Read What Contractors Think of Our Machines.



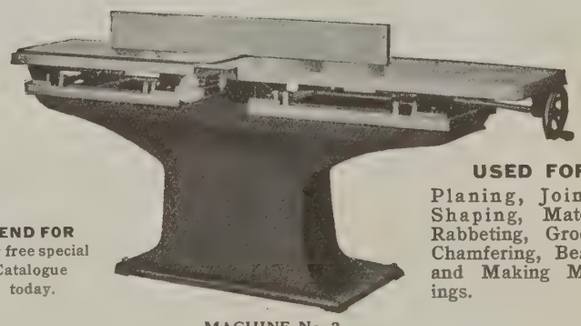
Charleston, Ill., July 13, 1911.

Chicago Machinery Exchange, Chicago.

Dear Sirs:

Your saw table which I bought of you last fall is a complete success, the best I ever saw for the money, and I worked in a good mill for ten years. You can refer anybody to me in regard to your saw table No. 5. Yours,

CLARENCE B. MUCHMORE.



USED FOR

Cutting Off, Ripping, Mitering, Grooving, Boring, Tenoning, Etc.

MACHINE No. 1
Chicago No. 5 Combination Saw Table

These two machines are always ready for work without any changing. They are a big bargain at $170.00. This price includes belt for saw arbor, countershafts, one 12 in. rip saw, one 12 in. cut-off saw, five boring bits—¼ in., 5-16 in., ⅜ in., ½ in., ¾ in.—and 1 pair of jointer knives. Ask for price on one if you cannot use both.

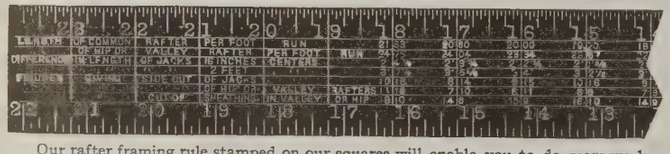
METAL TILE WITH RIDGE AND HIP FINISH

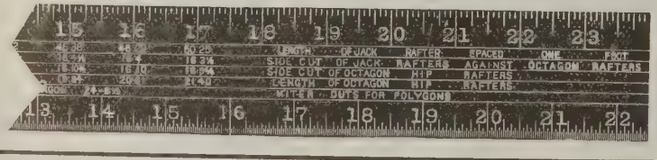


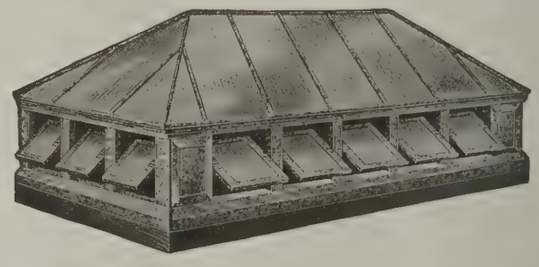
Would You Invest the Small Amount of ONE CENT

In a Subject that in time would net you HUNDREDS OF DOLLARS

If so—

invest one cent in a postal card. Send it to us asking for one of our little books telling you how to get the lengths and cuts of Common, Hip, Valley and Jack Rafters for seventeen different pitches of roof.





Our rafter framing rule stamped on our squares will enable you to do more work—faster work—better work—and more accurate work, therefore, obtain better wages.
It's a big step toward being the contractor instead of the laborer.

We manufacture the only practical **Take-Down Square,** guaranteed to remain true. **Don't be a jack-knife carpenter.** Send today for this little book.

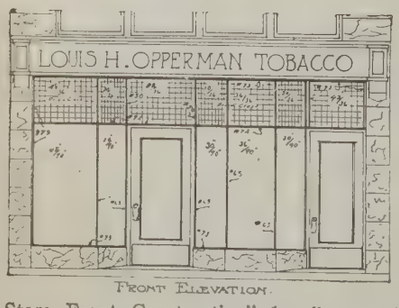
Willis Self-Installing Sky Lights

From Factory to Builder
No Other Labor Necessary

Willis Skylights are constructed so that any person handy with a hammer or screw driver can install them. It is not necessary to have a soldering outfit or tinners' tools.



They are shipped knocked down after being set up and tested in the factory, are watertight without the use of putty and designed to give the greatest amount of glass area. The ridge and gutter bars cannot sag, buckle or spread.

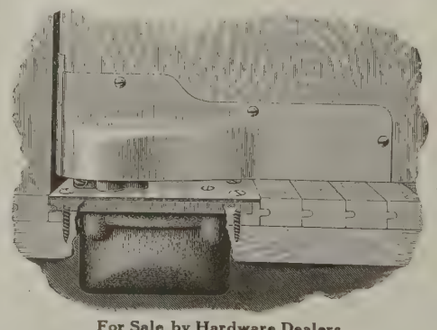
Send us your plans or a rough sketch with dimensions and we will furnish working drawings and an estimate. **You can install it yourself.**

Catalogue No. 6 gives our large line of other Sheet Metal Building Material. Send for it.

WILLIS MFG. CO., Galesburg, Illinois

You Can Feel Safe with Petz Bars

FRONT ELEVATION



The architect, contractor or builder who wants to feel absolutely sure about the construction of his modern store front, will specify Petz Bars, and see that he gets them. Then he will have no need to make excuse afterward to his customer.

Petz Bars have style, strength and safety, with no danger of breaking glass. Petz Bars are easy to install, and cost no more than inferior bars.

Our booklet on "Modern Store Front Construction" describes our bars in detail, and gives the experience of prominent users. Write for a copy today.

Standard Checking Hinge

For Sale by Hardware Dealers

A Checking hinge for double-acting doors between dining room to pantry or kitchen, etc.

It is a door check and hinge combined.
It automatically closes the door without a slam.
It prevents children from being knocked down.
It prevents injury to hands if caught when door is closing.
It stops door exactly at center.
It holds door open automatically when desired.
It renders the action of door absolutely noiseless.
It will outwear three of the spring hinges now in common use.

Speaking of Storm-Proof Roofs

Here's a letter from one in your own line that will interest you, Contractors and Builders:

Patricksburg, Indiana.

CORTRIGHT METAL ROOFING CO.

Gentlemen: * * * The roofing which I did last year with your Cortright Shingles is all O.K. I am highly pleased with them. They are absolutely *stormproof*, and I can't praise them too highly. Yours respectfully,

F. W. POPE, Carpenter and Builder.

SEE HOW

CORTRIGHT METAL SHINGLES

overlap and inter-lock with each other. They're just as easy to lay as wood shingles. They'll give your customer more satisfaction, and you more profit and less trouble, for it's hard to get wood shingles now-a-days. The solution is ***Cortright Metal Shingles.***

Write for our proposition to Contractors and Builders.

Shingles, Slate and Tile become loose and blow off—

Certain-teed Roofing

Quality Certified—Durability Guaranteed

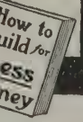
is tighter than tight—sold under a 15-year guarantee —costs *less* money—put up in rolls or shingles

YOU know and we know that wood shingles warp in the sun and rain, become loose and blow off—that the quality of wood shingles is not what it used to be. While tile makes a handsome roof, it is heavy and expensive—it will not stand sudden changes in temperature, and as a consequence the repair expense, on account of the cracking and breaking of the clay tiles, is something enormous. Tin roofing is expensive to apply, requires constant repair of broken joints and rusts out completely in a short time. Corrugated metal roofing, because of the poor galvanizing used today, requires constant repainting, and in spite of this will soon rust out and go to pieces.

General Roofing, U. S. A.'s Largest Manufacturer of Roofing and Building Papers.

Certain-teed Roofing is put up in both rolls and shingles, and guaranteed for 15 years

Save money and get a better quality of roofing. Ready roofing—Rubber, Mica or Gravel finishes—on account of small expense of application, *low cost*, really wonderful durability (having been tested on the roof for twenty years) will save you money and insure your getting a *better* quality of roofing.



Millions of rolls of _Certain-teed_ Roofing now giving satisfaction on the roof. Remember we are not coming to you with an untried, experimental roof covering—***Certain-teed* Roofing** is weatherproof—millions of rolls are in actual use on the roofs all over the world today. There was a time when ready roofing was an experiment—but that day was passed years ago with us.

When you buy ready roofing from your local dealer see that the ***Certain-teed*** label shown on the roll to the left is pasted on each roll and you will be protected from paying double what the roofing is worth and be assured of getting roofing of maximum durability.

Try _Certain-teed_ Roofing at our risk. The fifteen-year guarantee protects you in every detail. ***Certain-teed* Roofing** means quality certified and durability guaranteed. So you really are trying it at our risk. See your local dealer today—insist on this guarantee on every roll.

At Least Investigate

—every far-sighted person can see the wisdom of knowing about this wonderful, modern product which saves money, time and labor and is indestructible. So send in this coupon for our book **"How to Build for Less Money"**—it is free for asking—and it will tell you all about this roofing.

Free Book Coupon

Without obligation on my part, please send me your book, B-S-1 **"How to Build for LESS Money,"** and I will read it. This book is to be sent to me postpaid and absolutely free.

LEARN MORE AND EARN MORE

Don't be satisfied with merely pushing a saw and driving nails. Learn to PLAN as well as to work—to use your BRAIN with the **same skill** that you use your hands. Learn to fill a BIG SALARIED job—the kind of a job that hundreds of other men, with no more natural ability than you, are filling with ease and success.

AN HOUR A DAY WILL DO

An hour a day spent in careful study will enable you to MASTER EVERY DETAIL of your line of work. EVERY BRANCH of building construction, EVERY ANGLE of architecture and carpentry. You can have the knowledge and experience of over FOUR SCORE EXPERTS at your command ready for instant use whenever you want it—can fit yourself to **fill any first-class position above you that you desire**—simply by allowing us to place in your hands this great ten-volume set, **without your sending us one cent in advance.**

THIS CYCLOPEDIA OF

Architecture, Carpentry and Building

is the most exhaustive, comprehensive and practical work on the building trades that has ever been published. It covers every detail of building construction from foundation to roof, from common carpenter work to reinforced concrete and steel, from masonry to heating and ventilation; from specifications and estimates to building laws and superintendence. It covers all the PRACTICAL things that you WANT TO know, all the things that you've GOT to know if you're going to be a success. It contains over 4,000 drawings, full page plates, diagrams, etc., has 4,760 pages, is bound in handsome half morocco and printed on sjecial paper in large clear type. No CARPENTER, CONTRACTOR or BUILDING OWNER **can afford to be without it a single day.**

Get these books FREE and see for yourself

just what they are before you send us a single cent. Look them over carefully at your leisure, keep them for seven days before you decide whether you want them or not, and then if you don't believe that each volume is actually worth more to you than the price of the **entire set, send them back at our expense and the transaction won't cost you one penny.** If you do decide to keep them, our charge will only be $24.80, spread out thin in easy payments of only $2.00 a month. We don't ask you to buy these books from our description of them. We don't ask you to trust our judgment. We simply ask you to get the books and see for yourself. We'll send the entire set, express prepaid.

Free with every order received before May 1st, 1912

With each set is included a year's Consulting Membership entitling you to the advice of our business, engineering and law experts free. This will give you practical help in handling working problems which are too specific to be taken up in detail in the cyclopedias. There will be no limit to this service. A single problem solved for you might be worth more than first cost of the books. Order the books now.

NATIONAL BUILDER DESIGN No. 352

Lewis E. Russell, Architect, Chicago, Ill.

For Floor Plans and Elevations, see Supplement of this Number. Estimated Cost, Architect's Fees Not Included, $2,932.55

THE MONROE RESIDENCE

DESIGNING a house for a narrow city lot has its disadvantages, not alone from the constructive problem, but from the requirements to bring it within the limits of the city building and health rules. In this house, however, the architect has provided the comforts of the city, while the owner has the entire house to himself, and in a measure the isolation of a suburban home. The compact design indicates economy in housekeeping, compatible with the low cost of the finished building.

Estimate of Monroe Residence*

By I. P. HICKS

Total estimate	$2,932.55

EDITORIAL NOTES AND COMMENTS

There is no economy in having your workshop cold. Men always work better and more satisfactorily when they are comfortably warm.

* * * * *

The loss of five or ten minutes by each workman, warming up, if there are many employed, would mean a considerable loss in a week's time, more, by a large percentage, than would cover the cost of extra fuel.

* * * * *

There seems to be a steadily growing demand for the use of French, or casement windows. We hardly approve of this departure from the old and long tried system of the English hung sliding sash window. The casement sashes may answer very well in the milder climates of the South, and middle states.

* * * * *

The hinged sash, has, of course, some advantages, but not many, and where there is an advantage, it should be embraced by the architect or the builder. They can be used often in basement windows or for cellars, as they can be made to open inwardly or outwardly, and may sometimes be used as glass door openings on to a balcony, or on to a stoop or veranda where there is not head room enough to admit of a lower hanging sash to raise sufficiently high to admit of persons passing from the room to the outside without being obliged to stoop. Some of the objections to these windows have been overcome by a number of patent devices where metal has been introduced to prevent wear of the parts that are likely to cause openings. These French casements should never be less than 1¾ inches thick when finished. The meeting stiles should be double rebated or hook jointed, the hanging stiles tongued into the jambs, and the top and bottom edges throated. Double tenons should be used at the meeting stiles, and the front edge of the threshold tongued into the stone or concrete sill. When water-bars are used they should be sunk into the jambs at their ends. We show, in another column, a correct method of making these casements "wind and water" proof.

* * * * *

A subscriber living in Minneapolis desires to learn something of faience, tiles, and other glazed materials used in the building trades. The term faience is now used to represent all architectural glazed ware, other glazed bricks and sanitary goods, which of recent years has come into extended use. Glazed surfaces are of course, hygienic and reflect light. In towns glazed ware is most suitable; it reflects the much needed light, and keeps clean, what little dirt that does collect being easily washed off. Furthermore it affords means for adding the much needed relief of gorgeous color to the streets. For interior work, of course, colored tiles have been used from time immemorial. Glazed terra cotta and wall tilings are now frequently combined, with very beautiful and effective results. They possess the great advantage over all other decorative methods in that the only cleaning they ever require is wiping over with a damp cloth. Under fair conditions, both are practically imperishable, except by effects of fire.

* * * * *

Faience is manufactured of the same materials as ordinary glazed tiles, but it must otherwise be treated exactly the same as terra cotta. Shrinkage must be allowed for in working details. The glory of a tile is its color, and the pattern is comparatively unimportant, except as a peg to hang the color on. The pattern should therefore be conventional. The design of colors can only roughly be suggested in a drawing, for the conditions of manufacture so vary that it is almost impossible to get the exact same tint. Dead flat colors should be avoided as they look too machine made. It is natural for one glaze to run slightly into another on a flat surface in firing, and this gradation of color forms a distinctive and most beautiful feature. If desired to keep colors apart, the forming of cloisonnes seems the most appropriate method.

* * * * *

Why should the walls of public schools, hospitals, homes and other institutions be bare and cold? Why should not such walls be decorated, relieved of their gloom by appropriate paintings? Of course the answer is—expense. In England, however, a committee of artists, art patrons, critics and philanthropists has been formed for the purpose of promoting mural painting in schools, churches, hospitals and other institutions. Young artists and students are to be invited to submit designs and to decorate such wall space as may be offered, for very small pay or without any pay at all, in order to get useful experience. The idea is to submit all designs to intelligent criticism and accept only truly artistic work. Contributions are solicited, but much free work is expected.

* * * * *

Is not this plan excellent from every point of view? Would it not promote art as well as public appreciation of mural painting? Why should not American artists and lovers of beauty start a similar movement in this country? The Hull House Theater offers a good example of appropriate mural decoration, and thousands have admired the painting as well as the subjects. Why not follow this example? We know of instances in Canada, where one or two public buildings have had walls decorated with mural paintings by local artists, with subjects of early Canadian history, and they have proved quite effective from an artistic and historical point of view, and in a measure are instructive and elevating.

* * * * *

The contractor and builder, especially in the smaller cities and towns, has a most important relation to the growth of the town. By the exercise of his knowledge of materials, construction, and even design, he is able to advise the prospective home owner regarding the style house he should build, as well as to keep the cost within the necessary limits.

The average householder builds a home but once. No amount of spare time study can fit him to design, specify, superintend or construct the erection of his home. His experience has not been along those lines and his ignorance puts him at the mercy of an unscrupulous contractor, even as his false ideas embarrasses an honest one.

But the aggressive contractor is not alone concerned in the actual erection of the building. His work should begin before the owner's idea of beginning. He should know those who are able to own their own homes, and show them the economy of being a home owner, as well as the pleasure of possession.

Many a young man would build a modest cottage if he were urged, and frequently by joining with several others, a little colony can be established in which each would have a relatively important part in keeping up the good appearance of yards and streets.

There is a class of people who would never build a house anyway. But the up-to-date contractor can frequently build the house in the desired neighborhood, and behold, he has a buyer. A home is acquired without the annoyances of building, and the contractor has built a house in record time, partly because there was no owner to consult, change and delay the progress. By knowing his man, the contractor can really build him a house without his knowing it.

The American banking system comes in for a good deal of abuse, for which it is not always to blame. The contractor knows how to arrange the loans, and can take a load of care off the shoulders of the clerk, mechanic or laborer who is not familiar with banking customs. By arranging all this for the prospective client, the way is smoothed out, and the usual objections disappear. The contractor to do this work must have an unquestioned reputation with the bank, as well as with the material dealers.

It frequently happens that one house built leads to a number more. The hearty house-party at the opening of a new home, the first enthusiasm and a convenient vacant lot nearby makes the opportune presence of the contractor seem like an act of Providence. The house suits everyone. Of course he will build another, and yet another, at the same price.

When the contractor reaches this stage it is sometimes advisable to own a tract of land or parcel of lots, to better control the class of houses which go on it. When every land owner has the right to build the style house he pleases, the contractor is wise to sell the lots, with the houses on it, making thereby a profit on both lot and house.

FLOOR PLAN

A MODEL BUNGALOW

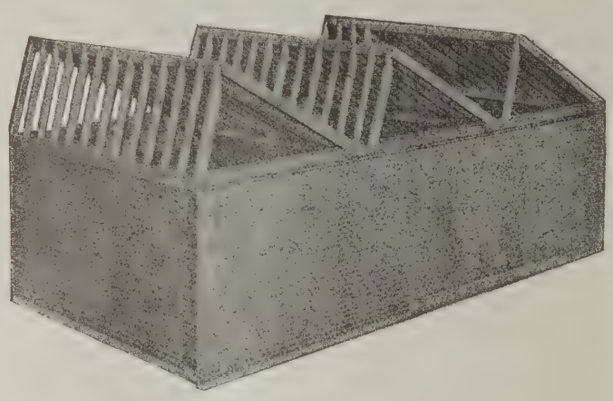
By JUD YOHO

A BUNGALOW bargain is found in this commodious and attractive home, costing less than $2,000. There are five rooms on the ground floor, in addition to front and rear porches, and bath room. There is a small staircase to the attic, which is fitted for children's sleeping rooms with a small sleeping porch overlooking the rear entrance. A full concrete basement contains other rooms, including a servant's room, completing a compact little residence capable of accommodating as many as a seven- or eight-room house.

The house was built this summer in Seattle by Architect Jud Yoho of that city. The exterior is of heavy siding covered with cedar shakes, laid 12 inches to the weather and stained a silver gray. The trimmings are white, with green window sashes, dark brown latticework and braces. A single timber supporting the front arch over the porch, rests on a pyramid column of cobblestones. The fire-place chimney is of pressed brick, light gray in color, and interspersed with cobblestones.

The interior includes a living room off the porch, containing, among other attractive features, a tile mantel with opening for a three-foot log. On either side of the mantel are small, mission-framed windows of art glass. The woodwork of this room is of slash grain fir, stained a delicate brown. The beamed ceilings are of the same material in eight by eight-inch beams. The walls are tinted a gray tinge, corresponding with the exterior stain.

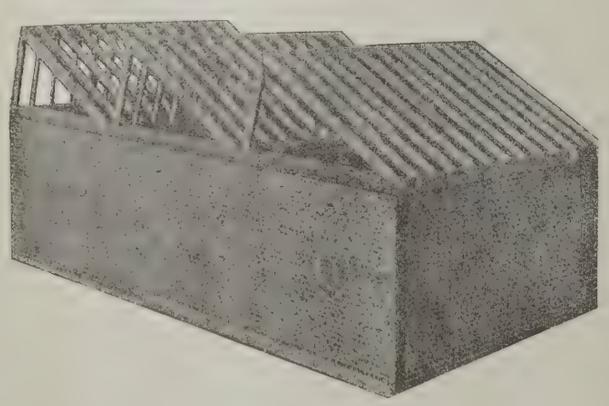
From the living room into the dining room is an opening about six feet wide. The demi-partition is panelled on the living room side with rotary-cut, three-ply, veneer panel fir, and on the dining room side is used for a china closet. It supports two massive looking columns of the same wood on either side, extending to one of the ceiling beams which are carried into the dining room. This room is panelled as high as the plate rail on all sides not taken with the leaded glass closets for china and glassware. Mission fixtures for lighting are in use throughout. The floors are all of oak, with a wax finish. This room is slightly smaller than the living room, with the kitchen a bit smaller than the dining room. Back of the kitchen is a good-sized lattice porch which can be used in the summer as a breakfast room.



This bungalow has a frontage of twenty-six feet and a depth of forty-five feet, including porch, and has been built complete, including plumbing, heating, electric lighting and painting, for $1,938.

ROOFING WITH THE STEEL SQUARE

A SAW TOOTH ROOF

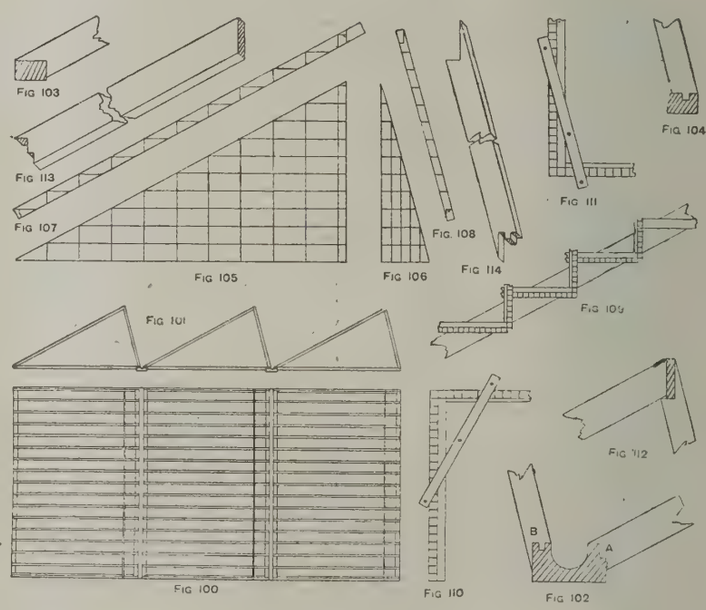


A SAW-TOOTH roof is one in many districts is quite unknown, while in others it is very common. It is constructed, as a rule, for covering weaving sheds, engineering shops, and similar buildings, when it is very useful, as owing to the size of these it is necessary to take the light from the roof, and the upright sides of this kind of roof form a ready means of doing this without the risk and expense of skylights. In some cases the whole of the upright parts of the roof are formed of rough plate-glass, but in others certain portions only are so formed, the glass being inserted in lights hinge at the top, thus forming a very efficient means of ventilation.

In the ordinary methods of roofing, the ridge runs parallel with the longer way of the building, but with the saw-tooth roof

this is not so, the series of roofs running across the width of the building, as in the plan, Fig. 100, so that the intermediate plates will have a comparatively short bearing. However, if the building is a large one, these would be supported by a series of columns. The intermediate plates take the form of gutters, as shown in the plan (Fig. 100), the section (Fig. 101), and the sectional detail (Fig. 102), and if the building is a large one, the necessary columns may well take the form of iron pipes to carry away the water from the roof. If this is done, the plates may be fixed level, the pipes being sufficient to drain them, but if not, a certain amount of fall must be arranged for, so that the gutters will empty themselves in the usual way.

Fig. 100 is the plan of a saw-tooth roof consisting of three spans, and covering a building 36 ft. long by 18 ft. wide. The outside eaves are finished level, so that the outside and inside



rafters come practically alike as regards finish, but they will require varying slightly for the sake of strength; thus, while the outside rafters on the left of Fig. 100 will fix to the plate as Fig. 103, the corresponding rafters on the other two spans will fix to the gutter plates as Fig. 102 (A). The upright rafters on the right of Fig. 100 will fit to the plate as Fig. 104; those in the other two spans will fit as Fig. 102 (B). These are simply details, and do not affect the length of the angles of the rafters in the least.

To obtain the pitches shown in the roofs, a going of 10 ft. 3 in. is found on the left, and of 1 ft. 6 in. on the right, the height being 5 ft. 6 in., which gives practically a rise of 5⅜ in. in each foot of going for the long rafters, and a going of 3 in. full to each foot of rise for the short rafters. These latter being practically upright, it is more convenient to work them this way than the other.

The section of the roof as set out in squares is as Figs. 105 and 106, the going in the latter being marked in alternate squares only. The scantlings, with length and angles of the two rafters marked on, also the successive stages of the squares, are given in Figs. 107 and 108, and the successive positions of the square on the longer rafter are shown in Fig. 109. This latter shows the square in use without gauges, but it is best to use the gauges mentioned previously, especially in the upright short rafters, and these are shown fixed on the square in the correct position for both long and short rafters, in Fig. 110 and 111 respectively.

The bottom ends of the intermediate long rafters should be cut into the plates, as at A (Fig. 102), the latter either being notched to take them, or rebated throughout the length. If this precaution is not taken, the roof will be very weak at this point, and the rafters will be liable to split at the throat.

The short rafters should be tenoned into the plates, both outside and intermediate, as shown in Figs. 102 and 104, this

adding greatly to the strength. If, however, this is not done, they should be fixed by nailing through the lip into the edge of the intermediate plates, the outer ones, of course, being nailed at the top.

The long rafters will be cut with a plain bevel at the upper end, but the short ones should be cut with a bird's mouth to fit under the ridge, as in Fig. 112; thus, the long and the short rafters when cut will be as Figs. 113 and 114 respectively.

The various lips and tenons at the ends of the rafters are all parallel with, or at right angles to, the main cuts, so that they can all be obtained without difficulty with the square, and as the rafters will not vary in length from point to point, no confusion need be caused by the different form of feet.

The two outer spans of a saw-tooth roof should be provided with ties, preferably iron rods, at the usual intervals, but the intermediate spans should not need these, the thrust from either side preventing any tendency to spread after the complete roof is on. Temporary ties during erection may be needed; in fact, they should be used for the sake of safety to the works.—Building World.

MAKING YOUR SHOP HELP OUT

By J. CROW TAYLOR

"THE FIRST THING I am going to do," said a carpenter and contractor, who has a shop, but up to this time had never installed any power-driven machinery, "is put in a foot-power mortiser and make up a lot of my old sash and odd frames.

"I find that it is often more trouble and expense to get odd frames and old sash now and then than it would be to make them. They not only cost extra at the planing mill, but there is delay in the time involved in running after them and I have concluded this is a good way to make my own workshop help out.

"I can do quite a lot of the work myself on rainy days and dull days, and when busy season comes on I believe I will have enough of these odd jobs to keep some old fellow, who is a good all-round workman, but is not very lively at climbing around on buildings, busy in the shop.

"I am going to start with a foot-power mortiser, so that I can get sash stuff, which I will have run through the sticker at the mill in any length the lumber comes in and then can cut up myself, make into cellar sash, transoms and attic sash, and other odd sash that I have a call for now and then and that sometimes are missed in the regular order. Some of them are overlooked, but more of them really come from changes and alterations when work is in progress, These call for special sash here and there that I can make up easier than I can get made at the mill.

"Not only that, but there is the cellar frames, for example. They are the first thing I want and generally it is hard to get them on the job from the planing mill until the regular list of frames comes, and these are generally plain, box frames that we can often get material for out of our left-over stock.

"Then there is screening, the making of door and window screens, which I can have for a sort of knitting job in the shop. The main thing I need to help out and make the thing practical is a mortising machine, and I think I will start with a foot-power mortiser and make my own shop help out a lot in convenience and save me enough money to more than pay for one man at work there."

This is the man's idea for the beginning, but the chances are it will be only a start and as soon as he makes this start he will find it worth while to add some power-driven machinery, either a rip-saw or combination woodworker of some kind, including a band saw or a jig saw.

There is no question but what the man with a little machinery equipment can make his own shop help out considerably. It is not so much a matter of taking the place of planing mill work proper. The standard planing mill work can generally be bought cheaper than it can be made. At least until a man has a pretty thoroughly equipped machine shop of his own.

But one can make a little machinery in his shop help out a whole lot. He has generally quite a lot of left over stock from every job, odds and ends that will become worthless ordinarily and be piled up and used for scrap.

Yet, lots of this stock can be worked into frames, odd sash, and now and then some short length trim worked out of it for special purposes, and by taking care of it and using a little ingenuity one may make his own shop help out enough to turn the balance decidedly in his favor during the busy season.

It is an excellent plan to start modestly, as this man was figuring on, and not get wild and buy too much equipment at once, because it is hard to tell in advance just how much equipment you will need or what will work in best. It is by getting one thing at a time and gradually developing this work of making the shop help out that you are best able to determine the right machines for your own particular work. Once you get at it, though, you will find the game interesting and that one thing will suggest another and the whole business will grow up gradually and almost unconsciously and it will aid you materially in not only doing your regular work, but it will put you in the way of developing a lot of special work that heretofore you have not thought worth bothering about or have not been in position to supply.

PAINT FOR WET OR DAMP PLACES

By A. ASHMUN KELLY

THE main difficulty with paint used in damp locations consists in the poor adhesion of the paint to the surface to which it is applied. It is not so much a question of paint as of adhesion. If the material to which the paint is to be applied is not perfectly dry there is bound to be trouble, the paint either will not stick, or it will soon deteriorate. If possible, therefore, get such parts dry. It often occurs that the dampness comes from the season in which the painting is done. In this case it is far better to wait until the dry season sets in. Very little damage will be done to a building by standing without paint for a few weeks. Perhaps none, while at the same time great good will be accomplished in withholding the paint, which would certainly go wrong.

The paint for a naturally damp situation, as in the vicinity of a body of water, a river, lake, etc., can be made by using a harder body than for other places, where the air is dry and mild. I would particularly recommend a composition paint, such as most paint makers now prepare, and in which enter some sinc oxide, white lead, earth pigment, and some inert substance, like floated silica or barytes. Then I would advise some spirits of turpentine with the oil, as tending to produce a harder paint than oil alone will give. Also not too much driers, notwithstanding that the paint is to meet damp conditions.

In the foregoing I have had in mind the painting of wood only. Paint for metal in damp places will call for little different from that demanded by wood, only the first coat and the preparation of the raw surface will be different, as metal, meaning here iron or steel, is likely to rust under paint unless carefully prepared beforehand. First, the surface must be made perfectly clean, with wire brushes, after which a priming coat or red lead paint may be given. For priming iron this is the best paint known. Upon this priming coat may be placed the usual paints, or about what has been indicated for wood in damp situations.

For walls, brick, stone or concrete, in damp place, there will be necessary the water-proofing of the surface, and, if possible, the prevention of the drawing up of moisture from the earth. This is not easy to do. Some use coal tar to coat the surface for a distance above the earth, but no paint will do well on tar. If a foundation could be built upon loose stone, instead of mortared stone-work, the drawing of dampness by the wall would be next to none at all.

There are what is known as damp-resisting paints, but such would be out of the question with ordinary painting of buildings. A carefully prepared ordinary house paint is about the best we can get for damp or dry places. There is no paint that can be recommended as proof against dampness. Sooner or later the paint will yield to the silent but powerful influence of H_2O, but as stated, with care a paint may be given that will last the maximum of time, provided that the work and conditions are right.

Another trouble with paints subject to dampness is mildew, which is caused by a fungous growth, the result showing in blotches of greyish-black, greatly disfiguring the surface, and in time causing the paint to fail. There is no preventative, and the only cure is washing it off, only to see it reappear in time. Mildew occurs not only in damp situations, but wherever the sun does not get at the paint, as on the north side of a building, and under porches. It occurs in its most aggravated form where certain pigments are used, ochre being particularly liable to mildew, and in fact most of the earth pigments will. There might be a paint devised that would resist this disease, if I may call it such, but there is none that I am aware of.

The paint for damp situations would do better if mixed carefully, strained carefully, and applied evenly and thin, brushing it out well. Allow each coat to dry perfectly before giving the next coat. Four coats would be better than three, and three much better than two. The linseed oil should be raw and of the very best quality. As previously stated, a certain proportion of turpentine, depending upon the amount of dampness present, should be used. A hard, non-porous paint is what is required for the painting of surfaces subject to dampness.

BUILDING CONTRACTS

By W. J. STANTON

PRELIMINARY to the execution of contracts for buildings or other works, an estimate is frequently made of the amount of materials to be furnished, to be submitted to prospective bidders for the work. The contract does not, when entered into, usually refer to such bill, but requires the work to be completed as a whole according to certain plans and specifications. Though such bill is used by the bidders in estimating the amount of their bid, there is no implied agreement on the part of the builder that the bill of quantities is correct, and in case such bill is incorrect, the contractor is not entitled to compensation, as for extras, for additional work and materials necessary for the completion of the work.

Whether a working contract is entire or divisible depends, of course, upon the intention of the parties and the terms and subject matter of the contract. If the contract is for the construction of an entire work or structure for a fixed compensation, it is considered as entire and not divisible, especially where it is stipulated that the compensation is not to be paid until the work or structure is completed. So, though the contract calls for the performance of several items, if the compensation is not apportioned among the several items, but provides for a fixed sum for the work as a whole, the contract is regarded as entire. If the contract is for a work as a whole, it will not be rendered divisible by the fact that the compensation is payable in installments as the work progresses, as where payments are made periodically on an estimate of the amount of work done, or as the work reaches certain stages of completion. As a general rule where a working contract requires the performance of several separate and distinct items, the price for which is apportioned to each item, or where the price is clearly and distinctly apportioned to the different parts of but one item, it will be regarded as severable.

In the absence of any provision, therefore, in the contract the builder has the right to demand that the contractor shall permit modifications and alterations of the agreement. Working contracts, however, frequently expressly provide that the builder shall have power to make alterations and modifications and require the contractor to assent to such alterations and modifications. The contractor and builder may, of course, by subsequent agreement modify the original contract and authorize or require deviations and alterations therefrom. The architect or engineer under whose supervision the work is being performed has no implied authority to modify the contract and authorize deviation therefrom by the contractor; but the builder may confer on his architect or engineer the power to agree to modifications of the contract.

Where the deviations and alterations are made by agreement of the parties, the builder is liable for any increased cost resulting, the provisions of the special contract governing as far as possible, and it is sometimes provided that where the deviations lessen the cost of the work, the contractors charges shall be decreased proportionately; but if the alterations are made at the request of the builder and without any agreement for a reduction from the agreed compensation, the contractor is not obliged to allow a deduction, although the deduction lessened the cost of the work. Slight modifications and alterations made in a working contract with the consent of the parties do not abrogate the entire contract and the rights and obligations of the parties thereto, but the original contract continues in force, except as altered by such modifications. If, however, the original contract is deviated from in material respects so that the work cannot be reasonably recognized as that originally contracted for, the original contract should be treated as abandoned.

As in case of other contracts, a building contract may be rescinded and terminated by mutual agreement of the parties, but to show a rescission by mutual consent of the parties the intention to rescind must be apparent or clearly shown by implication. The fact that the builder, upon the wrongful refusal of the contractor to complete the work, has the work done under his own supervision does not show a rescission or termination of the contract by mutual consent. If the builder wrongfully prohibits or prevents the continuance of the work, he is liable in damages to the contractor for breach of the contract. Fraudulent representation on the part of the builder will, as in other cases of fraud, authorize a rescission by the contractor. The builder may by his acts waive his right to rescind the contract for failure of the contractor to properly perform his contract. Thus, where the builder accepts the work in an incomplete condition and makes use of it, he waives his right to rescind the contract for failure entirely to complete the work.

The law recognizes as valid provisions in working contracts that the builder may, at his option or on certain contingencies, stop further performance of the work without incurring any liability to the contractor for damages, or that the builder may rescind and annul the contract upon the failure of the contractor duly and properly to perform the work, or allowing the builder to annul the contract if the contractor is not doing the work to his satisfaction. So provisions that upon the failure of the contractor, in the opinion of the architect in charge of the work, to proceed with the work with proper speed and in a proper manner the builder may rescind and annul the contract are valid, and in the absence of fraud or bad faith on the part of the architect his decision upon such question is, as a general rule, conclusive upon the contractor. His decisions may, however, be impeached for fraud or bad faith. In order to authorize the builder to rescind and annul the contract under provisions therefore in the contract he must comply with the requirements of the contract as to the exercise of such right. Thus, the builder must procure the required certificate of the architect and must give the required notice of his intention to terminate the contract.

The builder may, of course, waive his reserved right to rescind and annul the contract, and if, after the cause for termination, he fails to declare a termination of the contract, and acquiesces in the continuance of the work, he waives his right to terminate the contract for such cause. Thus, where the right to annul and rescind is dependent upon the failure of the contractor to proceed with the speed required to complete the work within the required time, the builder, by acquiescing in the continuance of the work after the specified time waives his right of rescission.

Building contracts providing for payments in installments frequently provide for a retention by the builder of a certain percentage of the value of the work done until the full completion of the contract, and for a forfeiture of such percentage in case of an annulment of the contract for failure of the contractor duly and properly to perform. While such provision are upheld and enforced, the right to retain such percentage must be clearly brought within the provisions of the contract.

(To be Continued.)

THE MISSION OF THE MOTOR TRUCK

PUTTING the automobile to work has been the result of investigations carried on by manufacturers of automboiles and the users of them. The good results obtained by men such as architects, engineers, salesmen, manufacturers, etc., who have to cover a large field in the course of a day, has resulted in the adaptation of the automobile in the form of motor trucks for various lines of industries to follow up these men with the delivery of supplies.

Only a few years ago motor trucks were an experiment. Today the large manufacturers and dealers have resorted to their use to cut down delivery costs and widen the field for the delivery of the output of the factory. A circular issued recently by one company showed that they had supplied motor trucks to at least eighty-three different lines of manufacturing. This shows the rapid growth of the motor truck business and the quickness with which manufacturers are beginning to grasp the opportunities that allow them to operate their factories more economically. An investigation of the motor truck by factory managers who have hitherto held aloof, would doubtless result in great economy in the delivery of the factory output or the prompt securing of certain supplies, etc., required for the plant.—Pacific Builder and Engineer.

THE MITER BOX

By J. E. TRUITT

'TIS an old saying that "the best workmen use the simplest tools." However this may be, the mastery of a few fundamental facts and basic principles would render useless a lot of hard-to-remember and senseless rules. And so we come to the consideration of the uses—the wide range and possibilities of the miter box—not the ordinary wooden affair made of three pieces of board in the shop or on the job, seldom accurate, limited ordinarily to two cuts, one forty-five or square miter and one square cut, quickly worn out and useless—but the modern, up-to-date, strongly modelled, accurate, durable, and above all, scientifically constructed box. I say "scientifically constructed" because such is really the case. It is taken for granted that every mechanic knows that a square is an angle of ninety degrees, or the fourth part of a circle. In the full circle, there are, of course, 360 degrees. On this basic fact, hence scientific, is constructed and arranged the miter box of this article.

Huxley says that an unverified theoretic conception is but a figment of the imagination, but Mr. Huxley does not say there are no verifiable theoretic conceptions, and any bright boy is capable, with a good miter box and saw, of verifying with an accuracy equal to the best geometrician many and various theories and problems. In fact, it will give invaluable "first aid" in the solution of a vast number of cases, often puzzling to even experienced workmen, and nothing in the whole list of carpenter's tools conduces more to neat and accurate work than a good miter box. The figures herewith show that while it is thought to be helpfully suggestive, it is little more than just a hint. However, "a hint to the wise is sufficient."

Figure 1 shows the general arrangement of the bottom of the box (the back is not shown). The "Saw Line" simply shows the position of saw to cut the triangle, shown at A in Figs. 1, 2, 3 and 4. It will be noticed that triangle A in Fig. 1 and triangles in Fig. 2 are exactly the same slope and are perfect equilateral triangles, and are horizontal plane figures with no bevel.

The triangles shown in Figs. 3 and 4, it will be noticed are longer and sharper, owing to the "Pattern Board" being elevated on upper side in miter box by being placed on blocks cut at the desired angle. In Fig. 3 (marked B), it is shown as 30 degrees, while in Fig. 4, it is shown as 45 degrees. It will require two of these little blocks upon which to rest the "Pattern Board" while being sawn. Of course, if one side of the "Pattern Board" is elevated and sawn through (no matter at what angle except right angle) we will have a beveled edge. Some would call this a compound miter, but the writer prefers the term, "Beveled Miter." Figure 7 shows the bevel for triangle in Fig. 3. Fig. 8 shows bevel for Fig. 4. Figures 5 and 6 are simply suggestions.

In conclusion will say, get the boys a good miter box and let them experiment and demonstrate.

Don't let me miss this month's issue as I am anxious to get it. It is the best builder's paper I ever saw on the subject of carpentry and building.

LOUIS H. STAGNER,
420 Bighill Avenue, Richmond, Ky.

DICKINSON, N. D., November 16, 1911.

I am a builder here and could not get along without your paper now, after having kept it for one year.

OTTO HONSEY,
Seventh Avenue West, Dickinson, N. Dak.

WHAT IS FIREPROOF

By H. B. McMASTER

AGITATION of the subject of saving our created resources is not complete without directing effort to the determination of the properties of buliding materials by some medium through which can be formed an absolutely impartial judgment.

When the committee or commission that may be formulating the building code of a city or state is pursuing its work, they are throughout their deliberations besieged and besought by salesmen and representatives of the various manufacturers of building materials, each with his evidence all built up to convince one that his material should be given preference, or at least a recognition, and this a competitor may later dispute.

This competitor will apparently have a case as strong as his rival—and so the "merry war" goes on, but the men who are building the code are confused and often with all integrity back of their conclusions, will take action that is the result of good "salesmanship" rather than of a presentation of facts.

Much that is offered as evidence of the fire-resisting quality of materials is not based on scientific data and, in fact, it is doubtful if absolutely unbiased conclusions in these investigations will be found except they come from tests or experiments conducted by a Bureau of the Government. Many of the problems now confronting insurance engineers, constructing engineers, architects, city and state governments and others would be solved were investigations to ascertain definitely and scientifically the properties of building materials, particularly as to their fire-resisting qualities, to be pursued by the Bureau of Standards. This bureau, with a limited appropriation at its disposal, has begun work of this sort but as yet has not been given facilities to demonstrate the relative fire-resisting values of the different materials that go into buildings.

With delay in having this important research made by this bureau, which is the one best equipped for that work, there will be continued waste of effort and futile endeavor on the part of states and cities to fix standards.

The prime thing in favor of having the Bureau of Standards carry on this research is that it would undertake to learn just what various materials will do under all conditions that might be created in a conflagration, and their findings would be free from prejudice as between the manufacturers of competing materials.

This matter is deserving of agitation that a sentiment shall be created which may result in this very important work being taken up by the Bureau of Standards and through that medium have settled for all time what materials can best be depended on to retard a fire.

This data is very much needed by those who say what shall be used in buildings and a manufacturer of building material who would object to the development of facts along the lines proposed might be suspected of a want of confidence in his material, or a lack of integrity.

If this project could have the support of the several trade journals whose columns are devoted to all that will promote engineering, architecture and building construction generally, it would soon crystalize into a definite movement which should result in legislation and appropriations commensurate with the importance of this work.

CUTTING ROOF HOLES

An old, but perhaps not the best, method for laying off a hole for an upright round pipe in a slanting roof is to stand the pipe upright on the roof as shown in Fig. 1, and then by means of a steel square, or even a straight strip of wood, mark a number of points in the outline of the hole. It is evident that the heel of the square will rest upon that point of the roof through which the part of the pipe against which the straight-edge is placed would pass, and by marking a sufficient number of these points and drawing a line through them we can mark out the shape of the hole with great accuracy. By using a ruler, with a pencil

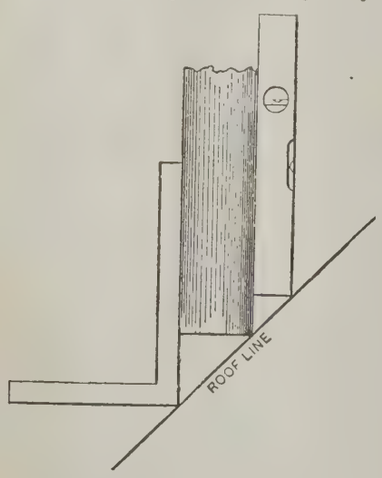

FIG. 1

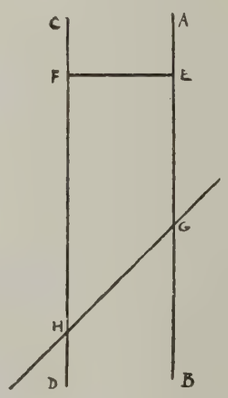

FIG. 2

or scriber fastened to the lower end, the process is somewhat simplified; but even then it requires two persons to perform the operation—one to hold the pipe plumb and the other to guide the ruler—the work being done on the unsteady footing of the roof.

The following is, to my mind, a much better plan; this can be carried out by a single person and all the fine work be done at the bench or on a table.

Every student of geometry or mechanical drawing knows that when a cylinder or round pipe is cut square across, the cross section is a true circle; but when the cut is oblique or bias, as the ladies call it, the cross section is an ellipse of which the diameter of the cylinder is the shorter or minor axis, and the extreme length along the slope is the major or longer axis; and these two measurements are all that are necessary to enable us to describe the ellipse accurately. To apply this in practice proceed as follows:

Stand a plumb-rule on the roof and by means of a bevel get the exact slope. Next draw on a board or stiff paper (common sheathing paper is as good as any) two parallel lines at a distance apart exactly equal to the diameter of the pipe. Let A B and C D, Fig. 2, be the lines representing the pipe; E F, a line drawn square across these two lines will be the minor axis, and G H, a line drawn across the two parallel lines at the same slope as that of the roof to the plumb line, will be the major axis of the ellipse; then on a piece of stiff paper or thin pasteboard draw two lines square with each other, as A B and C D, Fig. 3, and

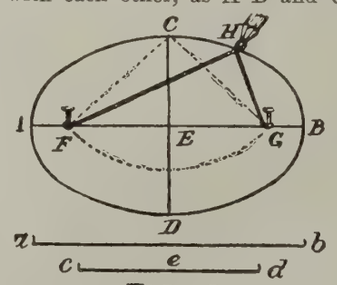

FIG. 3

let A E and E B be each equal to half the longer axis and C E and E D each equal to half the shorter axis. With C as a center and A E or E D as radius, describe arcs cutting A B in F and G; F and G will be the foci. The ellipse may now be described by various methods, one of which is to use the steel square as a sort of trammel, but the simplest method is to drive three fine wire nails, one at C, one at F and one at G, and tie a thread around them as shown in Fig. 3. The thread should be linen, of a kind that will stretch as little as possible, and it is well to wax it before using it. Then place the point of a pencil in the loop at H and move it around the curve, keeping the thread taut. The pencil will mark out an ellipse which is the exact shape and size of the hole you require. Cut the ellipse out of the paper or pasteboard and you will have a template by which you can mark out on the roof the outline of the hole. One advantage of this method is that you can move the template about so as to get the best position on the roof.—Albert Fair, in **The Operative Miller.**

VENEERED BRICK CONSTRUCTION By B. F. YOUNG

THERE are some good and some bad features about veneered brickwork on houses, but the bad features can be entirely eliminated by the proper construction of the work in all its details.

On concrete buildings, this is an economical finish, as it is very expensive to make and set forms to get a good smooth finish on the exterior of the building.

On frame houses, this method is also economical, in that the completed structure has the appearance of a brick house at a greatly reduced cost.

In veneering a frame house the framework should be sheathed with either lap joint or tongue and grooved sheathing, jointed and well nailed on every bearing, to make a tight job and substantial fastenings for the anchors of the brick.

After sheathing, the building should be covered with a good

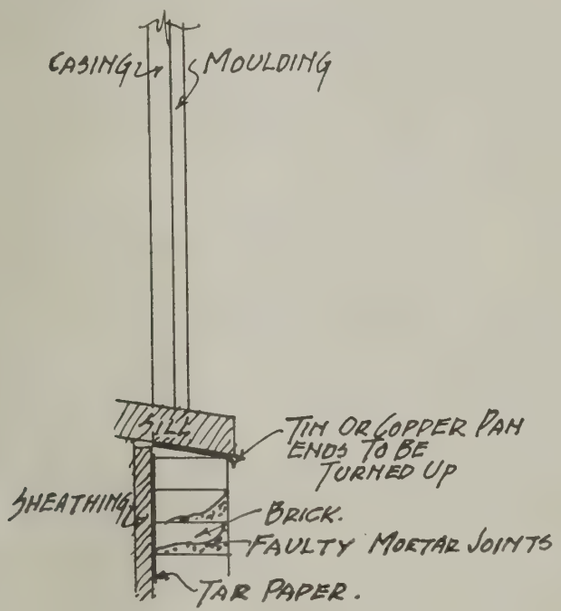

FIG. 1.

grade of tar paper (waterproof), well lapped, because every precaution should be taken to protect the sheathing from leaks and dampness.

In setting the window frames, we come in contact with the principal part of our work, and the cause of many of the evils of veneered brickwork. Too much care cannot be taken in having the window and door frames properly tinned or flashed. The bottom of the window sills should be grooved about three-quarters of an inch deep on the sheathing line or back edge of the casing, to admit of a tin or copper pan being inserted up into the same, and then the pan should be wide enough to extend out over the edge of the brick about one-eighth or one-quarter of an inch, to prevent the water from driving under the sill. This is not extremely essential where the brickwork runs to the ground, but in case brick are carried on a girder spanning a room below with a roof adjoining the same it is then desirable to throw off the water from each individual window and prevent it from running down between the brick and the tar paper. For detail see Fig. 1.

On the sides of the window frames the flashings should come under the outside case moulding, and then be bent back against the sheathing, the outer edge being bent or turned over on itself about a quarter of an inch, not flattened out, but left a little open so that the water in running down the flashing cannot spread out,

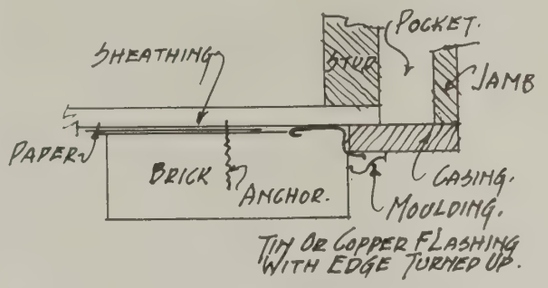

FIG. 2.

but will be guided down to the sill pan below, and carried out beyond the fact of the brickwork. See detail Fig. 2.

The tar paper should by all means be neatly lapped down over the window cap to prevent any leaks from gaining access through the head of the window frames, and on the sides of the windows the paper should be under the side flashings of the window casings.

I think I have covered all the principal details that can be mentioned regarding the carpenter and tinner, and the rest is now up to the bricklayer to lay up a tight wall, properly anchored to the sheathing, and resting on a good solid foundation. A water-tight or pressed brick is preferable to any of the soft porous brick. A great many leaks come through faulty laid brickwork, the joints between the ends not being properly mortared, which leaves the top of the joint with a thin point of mortar and is easily accessible to the elements of nature and the cause of many bad leaks. See detail Fig. 1.

I was called upon recently to inspect a brick veneered building for leaks, which had cost many dollars for needless carpenter and tinsmith bills. The worst thing about this building was that the brickwork came down on a girder spanning the rear of a storeroom, the rest of the rear being tin roofed.

The water always leaked through this girder into the room below. I came to the conclusion that there was either no tar paper on the buildings, or the tin roof did not come up under the brickwork and tar paper. Now, to repair this property was an expensive

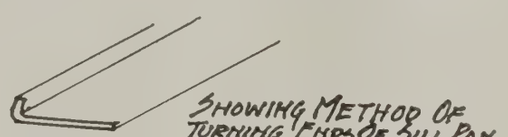

FIG 3

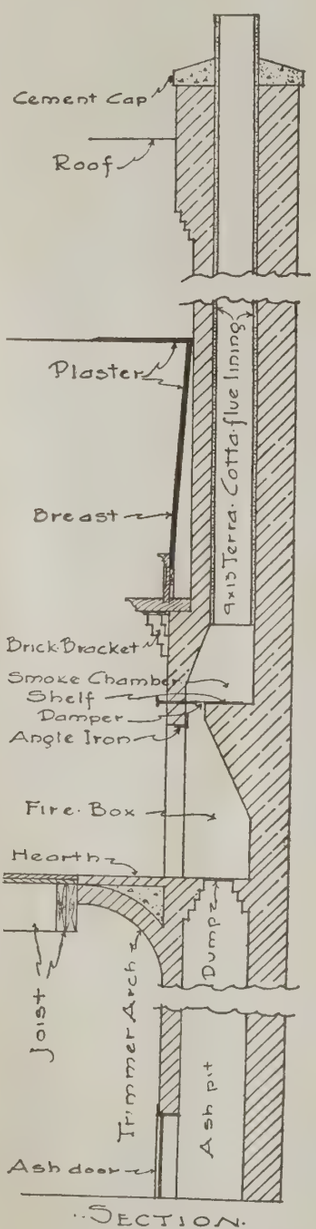
job, so I set out to find how the leaks came behind the brick, which I soon found undoubtedly came through defective mortar joints, which had opened up at the top edge of the joint between the ends of the brick. The brick were repointed, and the treatment has apparently fixed the leak.

GEORGE'S DECISION By N. E. DUFFY

GEORGE, a youth of seventeen summers and the son of a retired builder, had spent the greater part of his time at school, with the understanding that on his seventeenth birthday he was to decide upon his future occupation.



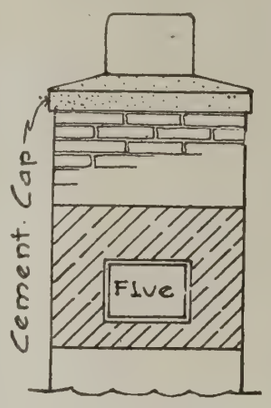
His education was as nearly perfect as could be obtained in common and high school branches, and while his father had allowed him to decide for himself, his wish was that he would take up one of the professions. He agreed to furnish him with the means for any course he should care to pursue, or tools for any of the trades, should he thus decide.

The time had come, and George, who had been doing considerable thinking, decided to become a builder and learn the carpenter trade; he had always been a lover of tools and a close observer of plans. The tools required were furnished and George was requested to examine them, which he did, while his father stood by and looked on. The boy stood still in deep thought for a moment and his father inquired if there was anything missing. George answered, "Yes, Father, there is one thing I want that I have often heard you say every carpenter needed and should have, the NATIONAL BUILDER." And he got it.

HOW TO BUILD A CHIMNEY

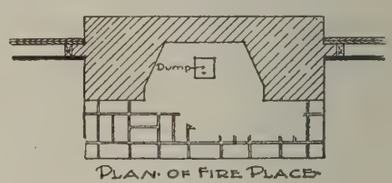
By DONALD FOLSOM

FIREPLACES and chimneys have been in use for over three hundred years, says Donald Folsom, in The Country Gentleman, and yet we usually build them in a hit-or-miss way that relies chiefly on luck for success. The result, nine times out of ten, is either a big fire and no heat, or a smoldering pile of logs and a room full of smoke. A little care and thought given to the design and the construction would banish these objectionable features. The properly designed fireplace should throw the maximum amount of heat into the room and the minimum amount up the chimney, and should carry all the smoke up the chimney. It should also be an ornament to a room and should be made safe against fires.



·SECTION·

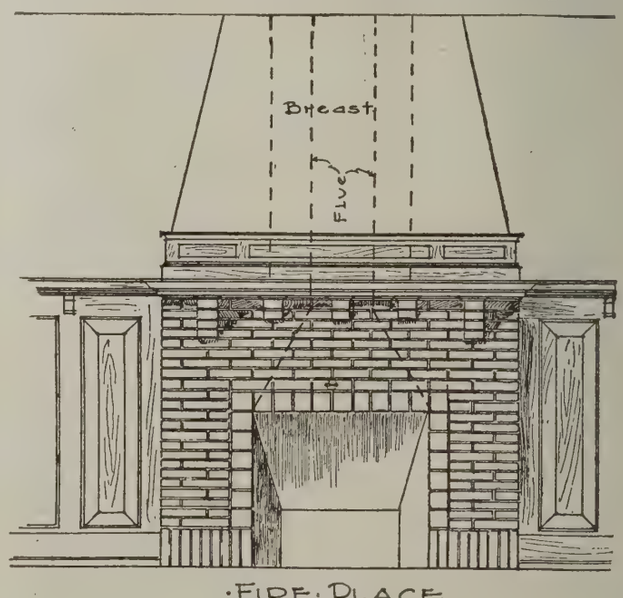
One of the illustrations shows a fireplace the design of which is along the most modern lines, and those generally accepted as mathematically correct. It has a simple brick front with a wooden mantel shelf, supported on corbeled brick brackets. The only attempt at ornament is the line of half-bricks or "bats" round the opening of the firebox, and the bricks on end at the base of the jambs. This front, of course, may be elaborated or the character changed to suit the architecture of the room in which it is to be placed or the individual tastes of the owner, or it may be built of stone or other material; but the principles involved in its construction would be the same.



For practical purposes the opening of the firebox should not be over three feet wide and from two feet six inches to three feet high. The depth should be one-half of the opening; and the width across the back, two-thirds. The flue should have an area equal to one-tenth of the area of the opening of the fire box if wood or bituminous coal is to be burned, but it may be reduced to one-fifteenth if anthracite coal is used.

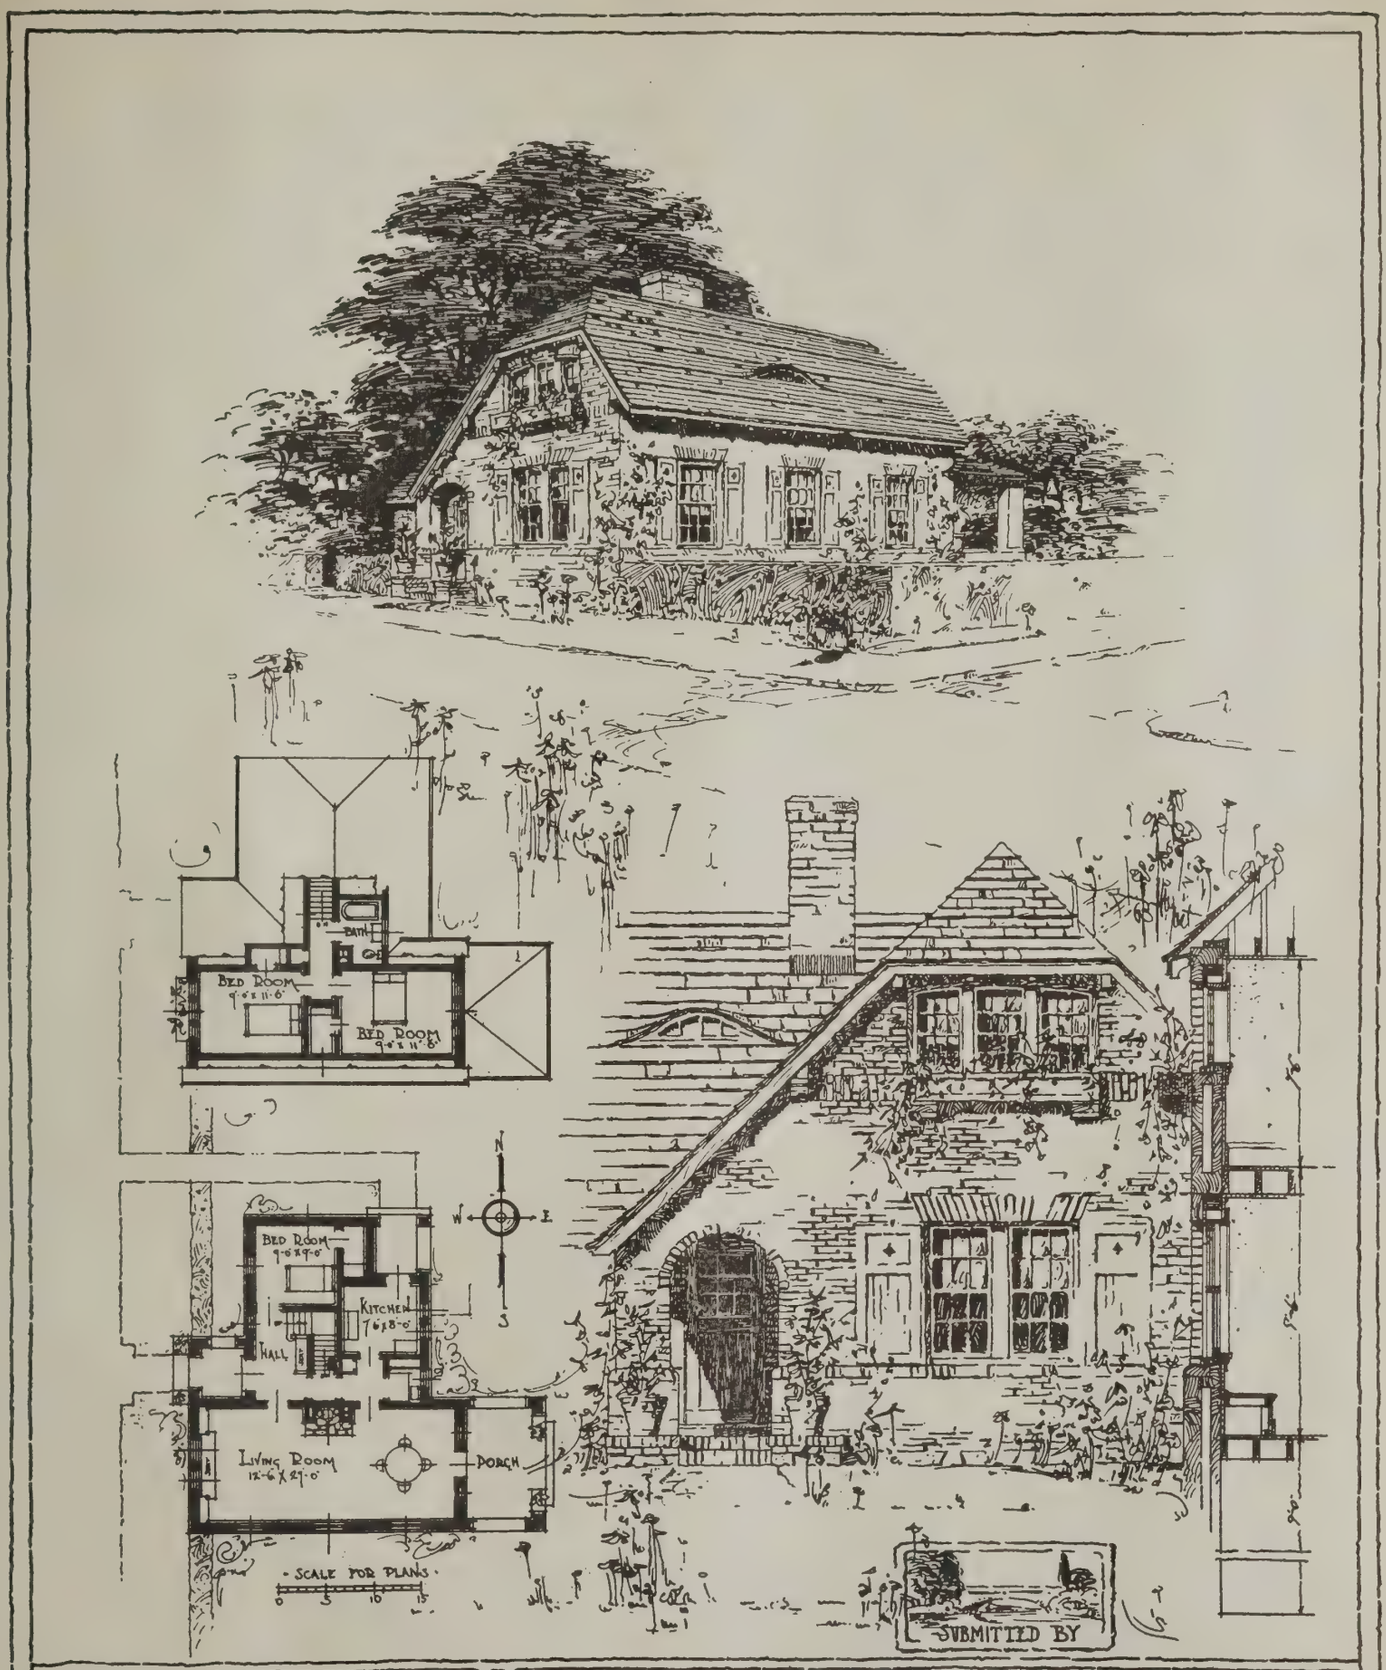
The ash-pit is a very convenient though not an essential part of this design. In a fireplace that is frequently used it will be found to be a great saving in time and labor, since the pit will have to be emptied but once or twice a year and then from the cellar. The piers on each side of the firebox, known as the jambs, must of course, begin at the cellar bottom. These jambs and the back wall form the sides of the ash-pit. The front is a four-inch brick wall and at the bottom of this is placed the ash door for removing the ashes. At the top the sides of the pit are corbeled out toward the center to support the hearth. An opening six inches square should be left in the center for the ash dump. From a point below the floor line the trimmer arch is turned against a specially prepared framing of joists, and the space above the arch is filled with concrete and leveled up to receive the hearth. By this arrangement it is almost impossible for the fire to come into contact with any woodwork. A hearth set directly upon a wood joist is very dangerous.

When the ash-pit is finished and the trimmer arch is in place the really important part of the construction begins. The illustration shows the opening to the firebox three feet wide so that the depth should be one foot six inches and the width across the back two feet. Beginning at the three-foot opening, we extend the side walls straight back for four inches, or the width of one brick. This saves grinding the brick. They are then carried back at an angle to the two-foot width at the back. These angles by reflection increase the amount of heat thrown into the room. The back wall rises vertically for twelve inches, and then slopes forward to a point two inches above and four inches back from the inside of the top of the opening. This forms a throat or smoke outlet four inches wide.



·CHIMNEY·

PLAN OF FIRE PLACE



The sloping out of the back is sometimes accomplished by corbeling or "stepping" out the brick. This will give, however, a series of sharp edges that are likely to become chipped and unsightly. A better way is to tip the brick to the angle of the slope, and thus form a smooth surface. Even when a flat arch is used the brick across the top of the opening should be carried on a small angle iron. For a segmental arch or a stone lintel this iron will not be necessary. The shelf extends back to a point directly under the back of the flue. The space just above the shelf is the smoke chamber, the front and sides of which converge toward the top at an angle of not less than sixty degrees until they meet the flue. To determine the size of our flue we shall have to find the area of the opening of the firebox. The opening is three feet wide and two feet eight inches high, and so would have an area of 1,152 square inches. The area of the flue must be one-tenth of this, or 115 1-5 square inches. A nine-by thirteen flue will give us an

·FIRE·PLACE

area of 117 square inches and will be the size used. The shelf and the smoke chamber are of vital importance in fireplace construction. The shelf serves to deflect the descending currents of cold air outward to meet the ascending currents of hot air at the throat, thereby preventing the smoke from being forced into the room by "down draft," while the chamber allows the smoke to accumulate and roll easily round until it finds its way out of the smaller flue opening.

The flue should always be started directly over the center of the firebox to insure an even draft, but if necessary may be deflected to one side after going straight up for two or three feet.

BRICK HOUSE TO COST $3000
BRICKBUILDER COMPETITION

A PRIZE WINNER. The competition of the Clay Products Exposition brought out a great many interesting and artistic designs for a $3,000 brick bungalow. Mr. L. J. Batchelor of Boston was awarded the first prize and the bungalow, from the plans shown above, was erected at the Exposition and was one of the features of the Show.

ROOFING TILES

IN DEALING with tiles as a roof covering, the first thing to be sure of is that the tile selected is capable of excluding all dampness, and that it will withstand the disintegrating influence of the weather.

Roofing tiles are subject to the same defects as terra cotta, namely, if they are burnt thoroughly many of them may twist and warp and will be found to be untrue, and if they are not burnt very hard they are liable to decay.

A good tile should be well tempered, of good color, free from stones, carefully trimmed, should give forth a clear ringing sound when struck, show a clear fracture and fine grain when broken, and take its weathering quickly.

The characteristics of a good roofing tile are density, toughness, homogeneity, and incipient vitrification. Tiles should have this last named quality throughout and not merely on the surface.

The comparative merits of tiles as to their weathering qualities cannot be told from the amount of water they absorb, though this is one of the chief tests. The durability of tiles depends upon their structure and chemical composition, as well as their power of absorption, just as stones and bricks do. These qualities are dependent upon the processes the tile had gone through in its manufacture.

The refractory nature of any clay is due to silica being present in large proportion and alkaline matter in small proportion. Such clays are difficult and expensive to work, but give the best tiles; they require long continued firing, so that they shall be burnt thoroughly throughout. It has therefore become the custom to use less refactory by adding the requisite alkaline matter, which causes the clay to become more easily vitrifiable. Then again manufacturers, for the sake of cheapness, have introduced machinery for moulding the tiles. If this is used properly, no harm will result, but there are difficulties in its use which tend to cause inferior tiles to be burned out. The moulding machines press the clay out through dies in thin sheets, or stamp it into moulds. The former are mostly used, and the thin sheet of clay is cut into shape. The clay is mixed with a certain amount of moisture, and is known as hard, firm or soft, according to its amount. The effect of pressing the clay through the die is to cause exfoliation, the sheets being laminated. This occurs to the greatest extent with hard clays, the exfoliation being insignificant with soft clay on account of its greater plasticity. The hard clay is generally used, however, for the sake of economy, as it requires less fuel in drying to get rid of the moisture, and allows the tiles to be carried in the hands without losing their shape directly they come from the machine, and cast-iron moulds can be used instead of the fragile plaster ones used with soft clay to avoid adhesion, as occurs with cast-iron. To overcome the exfoliation with hard clay considerable and repeated pressure is necessary, and stronger firing to weld the laminae together, but if the pressure or firing is insufficient, as it usually is, water will be absorbed between the laminated layers and the frost will scale the tiles. To save in firing by the more quickly fluxing the laminae together and to prevent the buckling which comes from hard firing, a considerable quantity of alkaline matter is added to the clay, and this gives a semi-glazed surface that looks extremely ugly, and which, with the expansion and contraction caused by alternations in temperature, cracks and crazes, allowing frost to scale it off.

Sanded tiles are the best if well burnt; the slight porosity is not a material objection, and their surface is quickly given a protecting covering by nature. Hand-made tiles fixed on buildings centuries ago are as good and sound as when first laid. The process of making tiles by hand is similar to that of making bricks, the mould being well sanded to prevent the clay sticking. Hand moulding has the advantage over machine moulding of giving a homogeneous tile without lamination. They are as a rule slightly thicker and heavier than machine-made tiles.

Tiles may be obtained of almost any color. When of a bright red or an earthy red color, they should be viewed with suspicion and avoided. Old-fashioned tiles have no nibs or stubs for hanging, and must therefore be kept in situ by means of wooden pins or nails. Tiles with nibs are often nailed only every third course, and on flat-pitched roofs are sometimes only nailed every tenth course. Where tiles are bedded in lime-and-hair mortar the tops only should be bedded, the mortar extending, say, not more than three inches below the head of the tile. Where a roof is close-boarded (and sometimes felted), there is no need for bedding, though, of course, a covering of bedded tiles is less liable to breakage, when a man is climbing about the roof, than would be one of unbedded tiles.

In tiling roofs it is well to cover them with roof boarding and felting before laying the laths and tiles. This should always be done in good work. Occasionally architects are compelled, owing to the cost of work, to eliminate the felting, or covering with 2-ply paper, and lay the tiles on the boarding; but this practice is unwise, as experience shows, and the boards alone do not stop draughts.

Secret gutters should only be used in positions where they will always clear themselves; especially if the building be surrounded by trees.

Ridge tiles should be of such a section as to admit of being pressed or made in one piece. Where an ornamental cresting is required, it should be made as a separate piece entirely detached from the ridge tile proper, the latter being made with a groove to receive the cresting.

The cresting should not be stuck on the ridge tiles by means of semi-liquid clay while they are in the clay state. Such work is more or less defective and unsatisfactory in the end.

Pan tiles should be laid on laths and a good bed of hair plaster in order to secure them to the roof.

Outside brick work should be cut up to the rake of the roof, and so nearly flush with the back of the hanging battens, that the verge, when completed, will have a tilt on its outer edge of at least ½ inch to throw the rain on to the body of the roof, and so avoid rain drippings from the verge. The tiles to be used on the verge should be soaked to saturation, and allowed afterwards to drain, and then be bedded in Portland cement.

Well-formed roofing tiles are straight in their width and hollow in their length that the tails of each course may lie close and tight on the backs of the undercourse. Straight tiles will not clear themselves one over the other, and should therefore be rejected.

Stoneware tiles are useful for chemical factories. They are very hard but brittle, and twist out of shape when firing.

The gauge of tiling is the distance from head to tail minus the lap divided by two; thus a 10½ inch tile laid to a 2½ inch lap will only expose 4 inches of its length to the view when the work is completed.

Pan tiles are the commonest class of tiles and are very cheap. They hold moisture a long time, and require extra strong roof timbers. They are best laid to a slope of about 24 degrees, and are mostly used for covering sheds, barns, and buildings which do not require a plastered ceiling. Glass tiles are made of this shape to give light in lofts where there are no windows.

Plain tiles are smaller than pan tiles, but, being laid with more lap, are heavier per square. They can be laid to any slope from 25 degrees to 60 degrees.

Roman tiles were trapezoidal trough shaped, and the joints were covered with round tiles.

Fancy roofing tiles are similar in many respects to plain tiles, and are much used for external walls of half-timbered houses.

Sizes of tiles—plain tiles: 10½ in. by 6½ in. by ½ in., and weigh about 2½ lbs. each; and 11 in. by 7 in. by ⅝ in., and weigh about 3 lbs. each. Pan tiles are 13½ in. by 9½ in., and weigh about 5¼ lbs. each.

A square of roofing requires 800 plain tiles laid to a 3 in. gauge, 700 tiles laid to a 3½ in. gauge, and 600 tiles laid to a 4 in. gauge; and 180 pan tiles laid to a 10 in. gauge; 164 pan tiles laid to a 11 in. gauge, and 150 pan tiles laid to a 12 in. gauge.

One square of plain tiles weighs about 15 cwt., and one square of pan tiles about 8 cwt.

Pine or spruce tiling laths or battens are 1¼ in. by ¾ in. to 2 in. by 1 in., and oak tiling laths 1¼ in. by ¼ in.

One hundred plain tile laths, 5 ft. long equal 1 bundle.

Twelve pan tile laths, 10 ft. long equal 1 bundle.

One square of tiling requires 1 bundle of laths.

One and one-half hundreds of nails, 1 peck of tile pins, and 3 hods of mortar.

One square of pan tiling requires 1 bundle of laths and 1¼ hundred of nails.

HARDWOOD DOORS AND INTERIOR FINISH

Modern architecture differs from the ancient styles in no one thing more than in the homes for the so-called "middle classes." Given the unlimited means of the Church and State, imposing masses of public buildings rose in the past, but how slowly and how little did this concern the workingman, the farmer, the small storekeeper? The influence of architecture on the home became noticeable only when unlimited quantities of material were found, and when modern methods and machinery placed artistic possibilities and present-day conveniences within the means of the great majority of every-day workers.

The pioneers of the United States found ready for the builder vast forests of the finest lumber; found yellow pine in the South, white pine in the North, and redwood in the West. Millions of homes have been built. While many of these were more like shelters from the wind, many displayed an earnest desire to advance the cause of good architecture. When it could be afforded, expensive woods such as mahogany, rosewood, etc., were used for the doors and trim, but styles changed to walnut and other woods, which enjoyed local favor from time to time. As means were found for correcting the varying qualities of the various woods, each had a certain value.

To secure the best results, the doors and sometimes even the trim is made up of a score of soft pine, while the exposed surface is a veneer of a more expensive wood, or one having a more beautiful figure. In the manufacture of large panels, this feature is of especial value, as the figure can be matched to secure the most pleasing results. Woods for this purpose may be either sawn in thin slabs or cut in rotary machines to give a long "shaving" as wide as the log is long, and the length depending on the size of the log. Veneers of this character are too thin for exterior use, however, and are mainly used for inside wall panels, doors, etc., where they do not come into contact with dampness or hard usage.

The kind of wood used depends on another factor not generally considered. The building field may be divided into three classes; the first, relatively small, want the best and most expensive regardless of cost, the second, a little larger class, want all they can get for their money. With them it is a question of how many rooms they can get and how big a house for how small an amount; for the third class, we have about 75 per cent of the total, for this is the class who want as good as they can afford without aping the rich or building mere walls. For them, the skill of the architect and artist is expended, and the manufacturer makes every effort to please, for in the quantity of millwork of this character turned out, lies the profit. The owners of these houses want to display good taste without ostentation, a modest appearance with moderate cost, and preserving a harmony of exterior and interior in keeping with his entire circumstances. To such, the use of expensive materials is barred by both the cost and lack of harmony.

So, at the start the man of moderate means cannot have much real imported mahogany, but must be satisfied with a cheaper domestic wood. But the walls, trim and doors should harmonize with the furniture if possible. There is a wide range of finish in furniture, as well as in the materials of which it is made, but in general if the wood used is mahogany or a representation of it, the trim will harmonize with the furniture and appear to be a part of a well thought out plan of furnishing.

While several of the softer woods, such as poplar or whitewood, and some grades of pine, are sometimes used to take the place of mahogany, birch is universally conceded to be the one best wood for the purpose. It has in its favor a grain and figure closely resembling that of mahogany, and when properly seasoned is easily worked and holds its shape remarkably well. It can be used in the solid for mouldings, casings, etc., but for panels, doors and similar work, is usually worked into veneers. The greater part of the veneers are made by sawing, making the sheet about ⅛ inch thick, while for outside doors a veneer ¼ inch thick is frequently used.

The prevalence of birch in the northern woods renders this wood adaptable for general use. Its use in furniture is widespread, and as a material for trim and interior finish, it has been a favorite for many years. The great variety of finish to which it readily lends itself makes it popular among the discriminating home builders.

But hardwood finish and doors are sometimes considered to be above the price which the ordinary home builder wishes to pay. Such is not the case. At present prices and under present conditions of manufacture, the difference in cost is slight. A few dollars to each room, or possibly forty or fifty dollars to the entire building will cover the difference between a soft wood trim easily marred and scratched, and a first-class birch job, which will look rich when first finished and continue to improve with age.

There is a real economy in building with hardwood doors and trim, especially when it is proposed to sell the house. Speculative builders have well gauged the demand where they show off their buildings. They realize the demand for fine hardwood doors and trim and provide them, as the extra cost is less than a month's interest on their investment. Landlords, too, know that the prospective tenants are influenced by the appearance of the doors, and a nicely polished birch door, swinging easily in its hinges, presents a play of light and shade in the figure of the material which makes the door seem what it really is, the most used, most moved, and most attractive piece of furniture in the house.

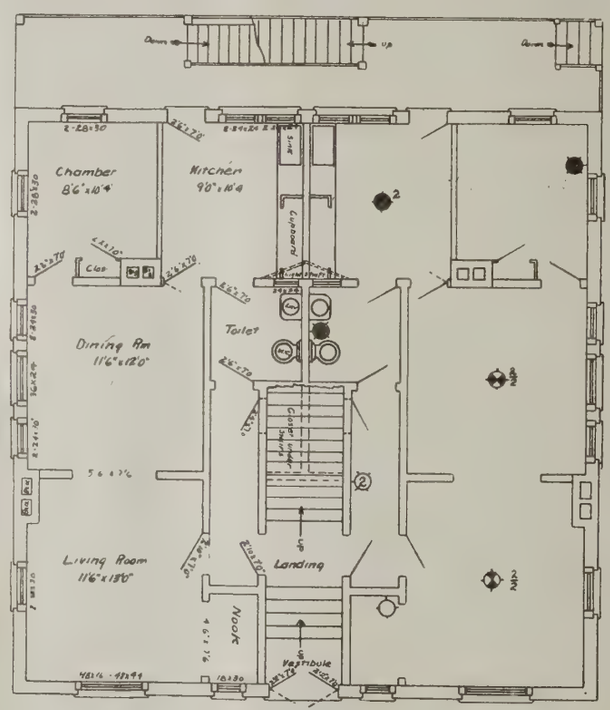
A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.



THE next problem to be undertaken is the drawing of a set of plans for a brick building. It differs but slightly in general plan of treatment from the frame building. We will take for an example a modern four-flat apartment, two stories in height and with two flats on each floor.

PLATE XXXVI.

FIRST FLOOR PLAN.

The student must bear in mind that the building here given is of the most simple brick construction, though it differs but slightly in general from a more pretentious type of structure.

On the first floor it will be noticed that the outside brick walls are thicker than the wooden partitions. They are drawn 9 inches thick, while the wood are but 6 inches, the same as in the former problems. It will also be noticed on this plan, that a different method has been used in illustrating some of the conventions. This has been done to familiarize the student with more of the common

FIRST FLOOR PLAN

practices of the day. The most noticeable of these changes is to be found with the windows, the room dimensions and the practice of giving the dimensions on one side of the plan when they are both alike. This has also been done with the location of the lights.

Notice that there is no front porch; entrance being made through the vestibule into the different flats. Each flat has two chimney openings, there being no furnace or other heating plant. Also pay particular attention to the light shaft and where it is placed. It is shown dotted where it comes down onto the first floor plan because it does not extend to the floor, but only far enough to let light into the toilets; and lastly, notice that no wooden partition is merged into a brick wall, but that a line separates the two.

With these suggestions the student should experience little trouble in working up this plan.

PLATE XXXVII.

SECOND FLOOR PLAN.

Figure 24 is given as a suggestion for room arrangement on the second floor. Notice how it differs from the first floor arrangement, though the principle partitions are directly above those on the first. If the student thinks he can improve upon this arrangement he certainly should on his set of plans, as it is by so doing occasionally that he advances in his study.

A great amount of detail has been left out in this figure, it being done purposely that the student could get some practice in putting it in with nothing to copy it from. Of course the scale for drawing this plan should be the same as upon the first floor, that is, one-fourth inch to the foot.

PLATE XXXVIII.

BASEMENT PLAN.

Figure 25 illustrates the basement plan as it should appear when finished, properly dimensioned. It should be drawn to the same scale as the other plans. The margin on the plate will have to be run out a little in order to get all of the dimensions on.

The wall is of concrete, 14 inches thick, and the partitions are of wood and brick. These latter divide the cellar into four rooms,

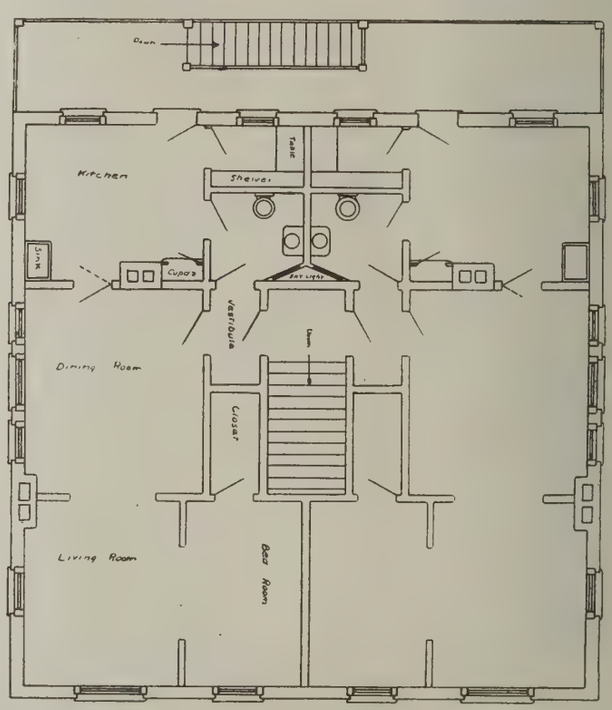


Figure 24

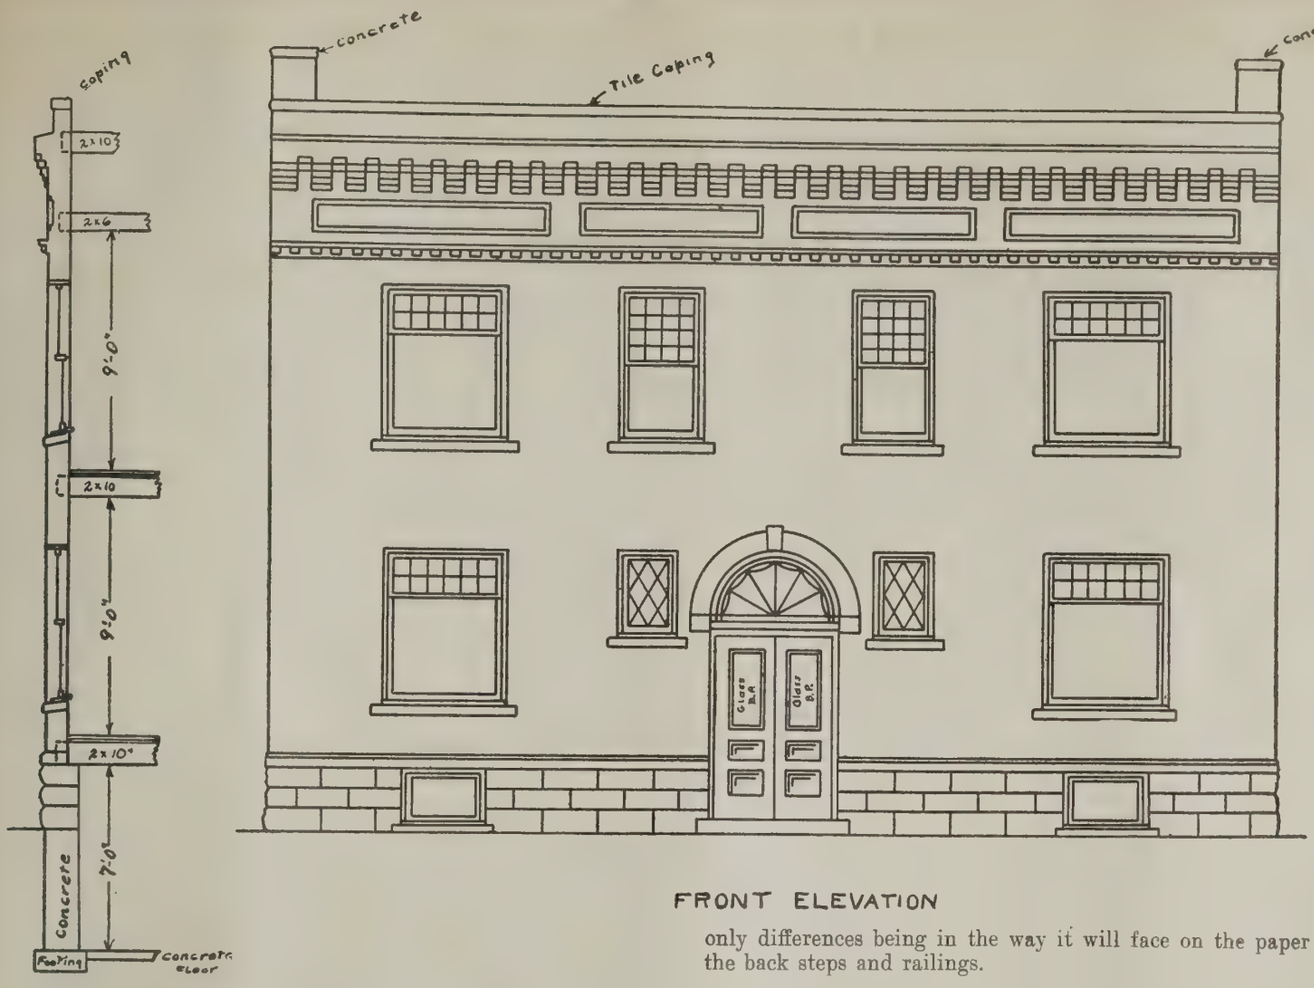
one for each flat, and each has a separate door. It would be well for the student to devise other arrangements by which this could be accomplished.

It is unnecessary to draw a roof plan for this building, as it is an ordinary flat roof with a slope to the rear. This will be clearly shown on the elevations and there is no need for a repetition.

PLATE XXXIX.



FRONT ELEVATION.

This plate shows the front elevation as it should appear in the finished drawing of the student. It is typical of the class of drawing it represents, as it gives, in the simplest manner possible, all of the essentials such an elevation should comprise. Pay particular attention to the section, as it differs somewhat from the section of a frame building.

PLATE XXXX.

RIGHT SIDE ELEVATION.

The only difficulty likely to be encountered in drawing this elevation will be in the slant of the roof. Do not make it too steep and slant it toward the rear. The top of the side wall also slants in the same direction. Be sure to show an arch of headers over

FRONT ELEVATION

every window, also all of the chimneys. The window sizes must be determined from the floor plans and their height from the section.

PLATE XXXXI.

LEFT SIDE ELEVATION.

The left side elevation will be very similar to the right, the only differences being in the way it will face on the paper and in the back steps and railings.

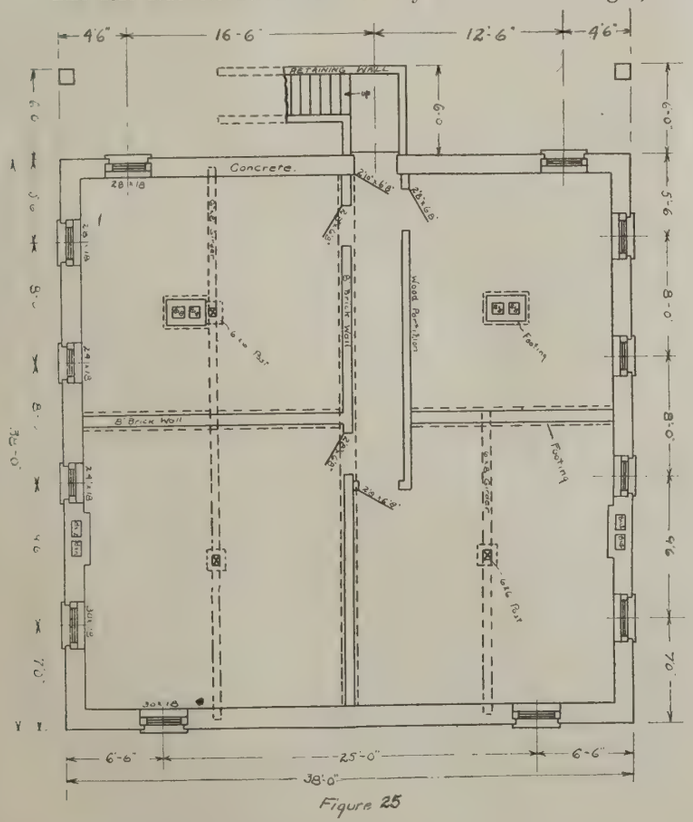


Figure 25

PLATE XXXXII.

REAR ELEVATION.

The rear elevation will be the most complicated to draw, but if the draftsman uses his head in matters with which he is already familiar, he should experience little trouble. Remember that this elevation will show considerable of the roof construction, since the latter slants to the rear. It should also plainly show the skylight.

PLATES XXXXIII and XXXXIV.

DETAILS.

These two plates should give the details of construction and finish used in this building. They should consist in the following, at least: Head casing, base for first floor, base for second floor, and porch trim, all drawn out full size. Also the pantry cupboard and work table drawn to scale.

When this set has been completed it should be shown to some architect or builder of the student's acquaintance for advice and criticism.

CONCLUSION.

If the student has conscientiously worked out the problems presented in a satisfactory manner, he need have no fear of accepting a position as an architectural draftsman in any office in the country. But it would be advisable for him to look up something upon the subject of architectural perspective and work upon it until he at least knows the underlying principles. He should also spend a little time studying the orders of architecture, as it is upon these that all architectural construction is based.

If the young builder that has followed these articles does not intend to pursue his acquirements into the drafting profession, he has at least prepared himself to be a better builder, as he can now read any working drawing without making a mistake. He can also prepare details that the architect has omitted, work up plans of his own and further his interests by so doing.

And, lastly, let me state that if he does decide to go into an architect's office and finds methods of representation somewhat different than he has learned them through this series, he should remember that the ways here shown are typical of one class of architects, and that they have always served their purpose.

OUR PRACTICAL PAGE

To Soften Putty.—Slack 3 pounds of stone quicklime in water, then add 1 pound of pearlash, and make the whole about the consistence of paint. Apply it to both sides of the glass, and let it remain for 12 hours, when the putty will be so softened that the glass may be easily taken out of the frame.—Exchange.

To Imitate Tortoise Shell Paint.—Paint a ground of salmon color; then when dry and smoothed off, coat it over with rose pink, mixed in varnish and turpentine; then with a flat piece of glass press on the surface, and remove the glass quickly, being careful not to push it over the paint so as to disturb the curious figures which the pressure will form thereon. Varnish when dry, and you will find you have a beautiful imitation of tortoise shell.

Varnish or Imitating Gilding.—A French authority affirms that a very perfect imitation of gilding on brass and bronze articles may be made by a varnish of 80 grains gum-lac, 20 grains dragon-blue, 5 grains turmeric largely mixed with alcohol. It is to be applied with a sponge to metal, which is afterwards warmed over a charcoal fire. At first it may have a deadened appearance but afterwards brightens.

To Give a Rich Color to Mahogany.—Ingredients: One pint of cold-drawn linseed oil, ten cents worth of alkanetroot, and five cents worth rose-pink. Put these ingredients into an earthen basin, stir them well and leave them one night; then, having washed the furniture perfectly clean with vinegar, and removed all stains, cover it lightly with the above, on a soft rag. Leave it for some hours, then polish off with linen cloths.

Varnishes for Furniture.—The simplest and perhaps the best is the solution of shellac only, but many add gums sandarach, mastic, copal, etc. Spirits or naphtha can be used with the following: 1. Shellac one and a half pound, naphtha one gallon; dissolve and it is ready without filtering. 2. Shellac twelve ounces, copal three; dissolve in one gallon of naphtha. 3. Shellac one and a half pound, seed lac and sandarach each four ounces, dissolve in one gallon of naphtha. 4. Shellac one a half pound, seed lac and sandarach each four ounces, mastic two ounces, rectified spirit one gallon; dissolve. To darken polish, benzoin and dragon's blood are used, turmeric and other coloring matters are also added, and to make it lighter it is necessary to use bleached lac.

To Clean Marble.—For whitening boards or cleaning marble, take a half-pound each of soda, powdered chalk and powdered pumice stone, stir together in a small quantity of water and then add half a pound of soft soap. Mix it as a paste and apply with a scrubbing brush.—Ex.

For the Pestilential Fly.—Heat a shovel and drop thereon twenty drops of carbolic acid; the vapor will kill flies. One dram bichromate potash in two ounces of water, add a little sugar, will answer the same purpose. The extermination of the common house fly means not only health but life itself to us.—Ex.

To Mix Colors in Oil.—As all colors for use in decoration should dry flat and unshining, substances called dryers require to be mixed with them, care being taken not to mix too much, as this defeats the object. The principal dryers are acetate or sugar of lead, litharge, white vitriol and japanner's gold size. Some of these act injuriously on light and tender colors, as oxide of lead on lake, and the mixture of two, as sugar of lead and vitriol, is often bad, for chemical reasons. The colors are ground in oil and the proper consistence obtained by turpentine.

The True French Polish.—To one pint of spirits of wine add a quarter of an ounce of gum-copal, same of gum-Arabic, and one ounce of shellac, the gums to be well bruised and sifted through muslin. To dissolve the mixture, place it near a warm stove, and frequently shake. Strain through muslin, and keep tightly corked for use.

Bleaching Wood, Ivory, Etc.—It is not difficult to bleach any of these materials and make them beautifully white, but the trouble with most bleaching recipes is that the ingredients used destroy or greatly weaken the texture of the material to which they are applied. This is very apt to be the case when chlorine, caustic alkalis or sulphurous acid is used. Of course, for common work these bleaching agents serve very well, as they are quite cheap, they are used extensively, but for delicate work, such as piano keys, etc., pexoride of hydrogen is greatly to be preferred. It does not injure the material to which it is applied, and it gives excellent results. It is now manufactured so extensively that the price is quite moderate.—Furniture Manufacturer and Artisan.

How to Clean Polished Wood.—An encaustic composed of wax, sal soda and a good soap is excellent for cleaning and polishing at the same time. Shave the wax and the soap and dissolve them in boiling water, stir frequently and add the soda. When the wax and soap are thoroughly dissolved place the mixture in a vessel which can be closely covered, and stir constantly till cool. This mixture will remove ink from polished surfaces and may be satisfactorily applied to marble, brick, furniture, tile and floors.

Care of Tools.—Don't grind tools on dry emery wheels. Use a good grindstone with plenty of water.

Don't get your bevels too long; a 3/8-inch bevel on a new chisel is enough, with a short bevel on edge to strengthen it. In whetting a tool whet on bevel side only.

To keep tools clean and bright rub over with a little mercurial ointment which will form a slight coating resisting moisture, or take six parts lard and one part rosin and heat slowly together until rosin is all melted, then add benzine to thin it down, in about the proportion of one pint of benzine to one-half pound of lard. Rub over tools lightly. This last preparation is what we have used in our own works for years. Tools treated with it will resist rust even when immersed in salt water and left for some time.

Sawdust Concrete Floor.—Sawdust concrete was used in the new Public Library building at Springfield, Mass., as a base on which to lay cork carpet covering the floors. The object of the sawdust concrete was to obtain a layer into which nails could be driven and which at the same time would hold the nails. The company that laid it states that it accomplished both purposes. After several experiments with different mixtures it was found that a 1:2:3-4 mix, three-fourths of a part of sawdust, gave the desired result and 5,000 square feet of this mixture were laid. The thickness of the layer was one inch, and after four months of service indications are that the material is a success.—Cement Record.

Each Had a Way.—"What is the secret of success?" asked the Sphinx.

"Push," said the button.
"Never be led," said the pencil.
"Take pains," said the window.
"Always keep cool," said the ice.
"Be up-to-date," said the calendar.
"Never lose your head," said the barrel.
"Make light of everything," said the fire.
"Do a driving business," said the hammer.
"Aspire to greater things," said the nutmeg.—Exchange.

The Quip Modest.—Mrs. Cobb—"Was the grocer's boy impudent to you again when you telephoned your order this morning?"

Cook—"Yes," Mrs. Cobb, "he was that, but I fixed him, I sez, 'Who the hell do you think you're talkin' to, this is Mrs. Cobb?' "—Ex.

"If a house contains six bureaus, eleven armoires, seven chiffoniers and fifty-three miscellaneous drawers, how many of 'em is the husband entitled to and how many is the wife?" asked the young clubman.

The second clubman laughed harshly. "You are young and have much to learn," he said. "You may as well understand first as last that if there were in your house a mile of bureaus, three acres of armoires and 17,000 drawers, all these would still be stuffed full of veils, ruchings, hatpins, ribbons, silk stockings, petticoats, powder puffs and safety pins, and the best course for you to pursue would be to wrap your own things—your shirts, underclothes and so on—in a newspaper and keep them under the bed."

LAYING SLATE ROOFS ON CONCRETE

It goes without saying that a concrete building should be covered with a consistent roof, says C. A. Lippmann in "Concrete"; that is, the roof with the same characteristics that have made concrete such a popular material. These are durability, fireproofness, freedom from necessity of painting or coating, handsome in appearance, reasonable first cost, and lowest per year of service cost.

These advantages are found in slate roofs. Being non-absorbent, slate does not decay. Being non-metallic, slate does not rust; nor does it burn. It has practically no contraction or expansion; its co-efficient being only .000005.

There used to be an impression that slate was not practicable for flat roofs. But this is successfully contradicted by the excellent record of flat slate roofs which have been in use for upwards of fifteen years. A notable building roofed in this manner is the Arrott building, Pittsburgh, Pa.

In flat slate roofs there is, of course, no "lap." Instead of partly "overlapping" each other (as in pitched roofs) the slates are laid along adjoining edges and embedded as described in the following standard specifications:

First cover sheathing with one layer of sheathing paper, weighing 10 lb. to the square, single thickness. Upon this lay four layers of best all wool felt, weighing 25 lb. to the square, single thickness, felt to be 28 in. wide, with 4-in. lap, and exposed 6½ in. to the weather. As the felt is laid, mop between the sheets the full width of lap with best roofing pitch.

After the felt is laid, coat the entire surface with a composition of 60 per cent pitch and 40 per cent best asphalt, weighing 125 lb. to the square, and embed solidly in the composition while hot, roofing slate. After the slate is laid the joints are to be well filled with the composition.

It is better to omit all cleats or tin ducts, but sometimes during windy weather it is necessary to use tin ducts to hold the felt in place until the slate is laid.

It is necessary to cleat the felt at walls. This is very important. The contractor should build into the brickwork 2-in. by 4-in. wooden blocks about 3 in. above sheathing, so that there will be a good surface to cleat to. Tin counter-flashing built into the brickwork and extending down to and out on roof about 3 in. is necessary to make a complete roof.

In factory buildings, foundries, and other structures where an elaborate finish is not required, the roof frame consists often only

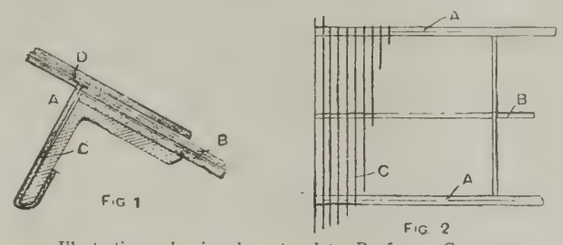

FIG 1 FIG 2

Illustrations showing how to slate Roofs on Concrete.

of a series of trusses, crossed by purlins, and the slate is fastened tight to the latter with soft metal clinch nails. These are clinched around the bottom of the purlin angles, as shown in Fig. 1, in which A is a soft metal clutch nail, B the slates, C the purlin, and D the hole to be punched at the quarry.

When the trusses are spaced more than 10 ft. apart, the general practice is to use jack rafters, as shown in Fig. 2. In this, A is the truss, B the jack rafter (I section), C the purlin, 10½ in. for 24-in. slate.

ROOF FRAMING

By A. A. STAFFORD

In some previous issues of the NATIONAL BUILDER I have tried to illustrate and explain some of the methods of hip roof framing, and I think if the reader will take into consideration just how a rafter sets on the plate. It might be a hip that sets out over the corner, and has its working line from the corner. Although the side of the rafter at the seat and tail cut sets away from the edge of the plate, it must be remembered that the plumb line of the edge of the plate, to the top of hip rafter either to corner or gauge line for backing must be the same as that of common rafters because it must be a line on top, the same as the plate line of common rafter at plate edge, but does not change the working length any.

Now to get valley center at seat just high enough, take valley rafter, and back from the end as far as you want the length of the tail. Lay the square on same as for side cut at top. Mark across both ways so lines cross in center of top edge. See Fig. 7. This cross when rafter is up will be exactly over angle in plate. Square a cross top of rafter at this point from this mark. Make plumb line on side of valley. Measure down this plumb line, the same distance. Common rafter plumb line is at edge of plate, Fig. 7. Use rise and run of valley and reverse square at this measure, and mark seat cut. This cut must extend to plumb lines,

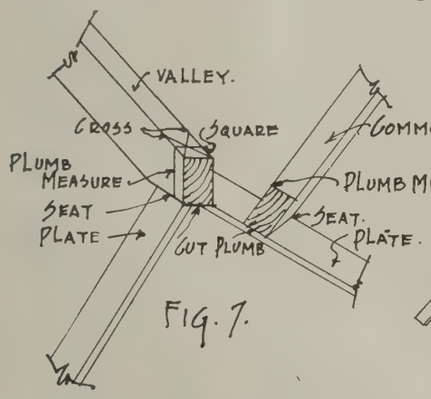

FIG. 7.

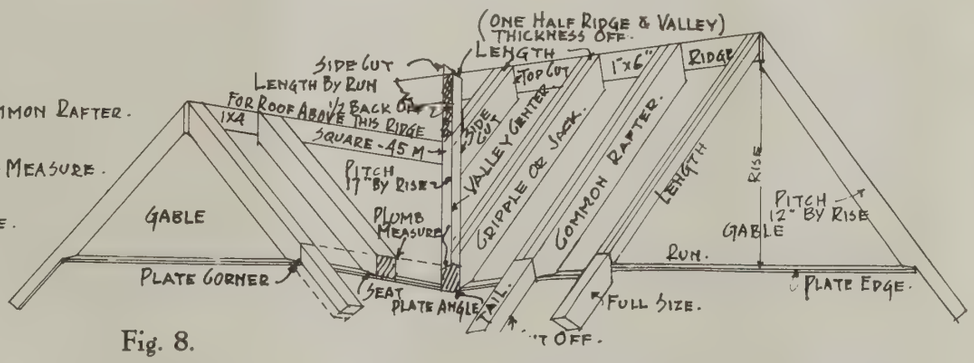

Fig. 8.

The difference from where you measure to where you cut is a line on the bottom. At this time I will illustrate a section of valley roof, with cripples, and endeavor to show how to get the valley rafter to set just high enough in center to form a line with top side of the common rafters. Remember that in the valley problem, the bottom cut of cripples is just like the jack rafter top bevel reversed, and the heel when placed against the valley must be raised up, so the top will line to center on top side of valley rafter.

Now think how the valley sets at the bottom, not like the hip, for the angle of cut is at edge of plate, instead of being away about ⅞ inch. Don't think you have to take away, or leave on, any more at seat cut, to get the length of rafter, as you don't. That is governed at the top by half the thickness of stuff the valley leans against. The difference at the bottom is in thickness of tail, which is made by the seat cut, and governed by plumb from the ends of X lines on top, Fig. 7. If you want the tail, or finish any way to suit.

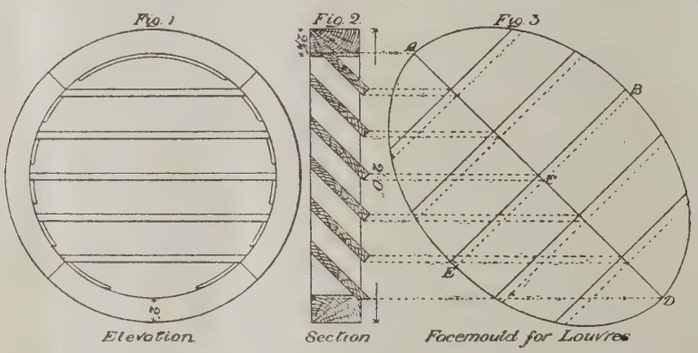
figures for X on top, and exact middle of it is your rafter length, and if you know it, on top of the rafter is the best place to measure the total length, with a tape or pole, taking all plumb and side cuts from the center line.

I think Fig. 8 will show clearly the idea of a valley and two gables, one higher than the other, valley rafter extending to upper ridge, as some men frame them. These drawings are not to scale and does not show full amounts of rafters. It is to show how the different ones set, and how any one can get measurements and cuts. My giving figures in other issues for ten-inch pitch, does not signify that the ideas and principals won't work on any pitch, for they do. The same way of measuring across the corner of your square gets the length of any rafter, then the routine of pitch figures gives all the cuts, and my endeavor is to show the reader how to get the figures and how to apply them by illustrations in the NATIONAL BUILDER.

OUR READERS' PAGES

[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. These columns are open to our readers at all times without charge, and any questions or experiences will be given proper space.—Editor.]

ANSWERS



LOUVRE AND FRAMES.

From "Joiner," Erie, Pa.:

I submit the following for the benefit of "Willis B.," Middletown, N. Y.: It is old, but has been asked for, and given, many times these last 25 years. There are several other methods of solving this problem, but I have never yet come across one that suits me as well as the one I give herewith: A circular louvre frame is a ventilating frame fixed in the wall of a stable or other building where air is required without much light. The fixing of the louvre boards in the manner shown in Fig. 1 prevents the driving rain from passing to the interior, whilst currents of fresh air are directed upwards towards the ceiling and there diffused.

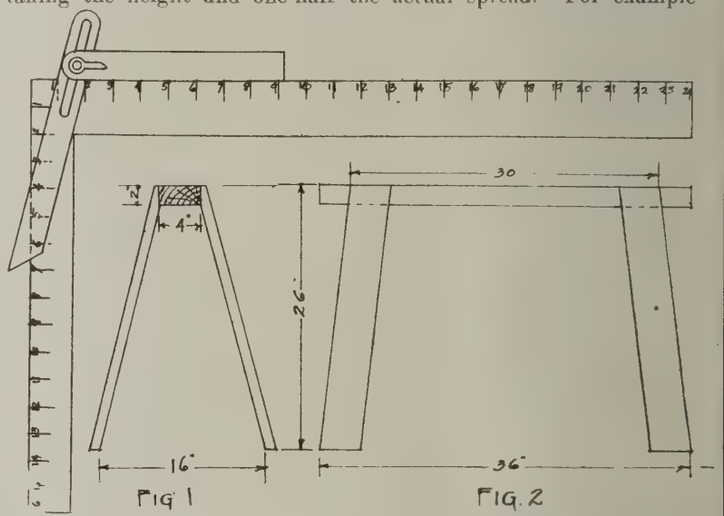
The method of obtaining the outline of the louvres will readily be seen when it is understood that they terminate upon a cylindrical surface, the diameter of which is equal to the distance between the quirks of the beads. By producing these lines, and by drawing the line A C D, Fig. 1, parallel to the sloping sides of the louvres, and intersecting the lines produced in A and D, the major axis of the elliptical section of the cylinder is obtained. The minor axis E C B, Fig. 3, is made equal to the

Circular Louvre Frame.

diameter of the cylinder; the axes bisecting each other at right angles, the outline of the curve may be drawn. In order to find the true shape of any louvre, project its extremities from the section of the frame to the major axis. If, from these points, lines be drawn at right angles to the major axis to meet the curve, the outline of the surface of the louvre will be obtained. A pattern will be required for each side, and both may be obtained by the same process.

BRICK CISTERN.

J. A. B., Fall River, Mass., in answer to J. B., Lancaster, Pa.:



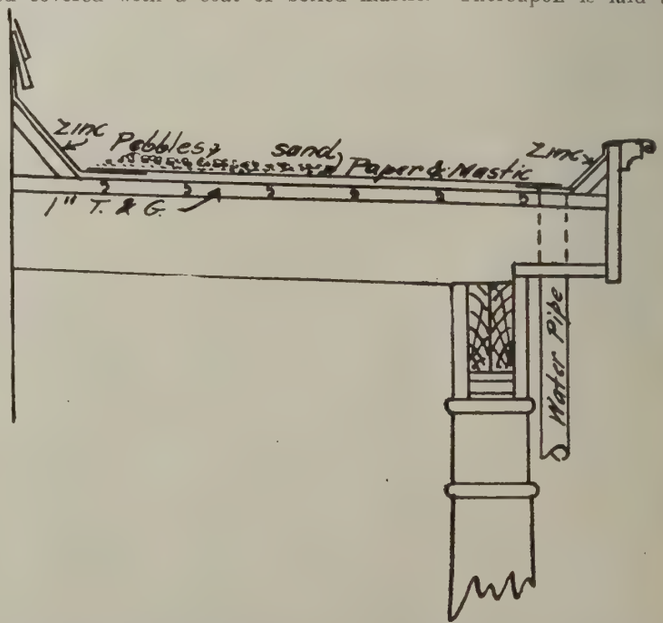
To build a cistern 5 ft. in diameter, build a 9 in. wall 3 ft. deep. Put 4 in. of concrete in the bottom, mixed 3 to 1, and 1 in. finish on top of that, mixed 1 to 1; the same for inside of the wall and on top. That will leave your cistern 2 ft. and 7 in. deep when finished. 675 bricks, 1½ barrels of cement, approximate cost, $12.

BEVEL FOR SAW HORSE.

From W. A. W., Rochester, N. Y., in answer to questions by T. T. D., Wichita, Kan., concerning how to get the bevels for making a saw horse by using fingers on the steel square:

To get the bevel of the top piece for the side spread of legs, take the height of horse to underside of back and one-half the actual spread of leg inside. For example, to get the bevel for 25 in. high 16 in. spread inside with a back 4 in. wide on underside and 2 in. thick. To set the bevel for chamfering the back, take (Fig. 1) 26 in.-2 in. or 24 in. and ½ (16-4) or 6 in. But 24 is to 6 as 4 is to 1. Therefore, 4 in. and 1 in. will give the same bevel as 24 in. and 6 in. Place bevel on square, as shown in Fig. 3, the blade of bevel coinciding with 1 in. and 4 in. and it will give the right spread.

To get the spread endwise, proceed in a similar manner, taking the height and one-half the actual spread. For example



(Fig. 2) take 26 in. and ½ (36-30) or 3 in. But 26:3::8 2/3:1. Therefore, set the bevel as in Fig. 3, taking points 1 in. and 8 2/3 in. This method can be applied to any height and any spread.

FLAT ROOF FOR A PORCH.

From A. S., Bussum, Holland, in answer to J. J. Russel, Kans.:

There are many houses here with flat roofs. To get them waterproof there is laid out four times a bed of paper and every bed covered with a coat of boiled mastic. Thereupon is laid a

bed of sand of about one inch thick and all this is covered with a bed of pebbles of about two inches in thickness, as shown in the illustration. I can add that the construction is very strong and lasting.

PLASTERING.

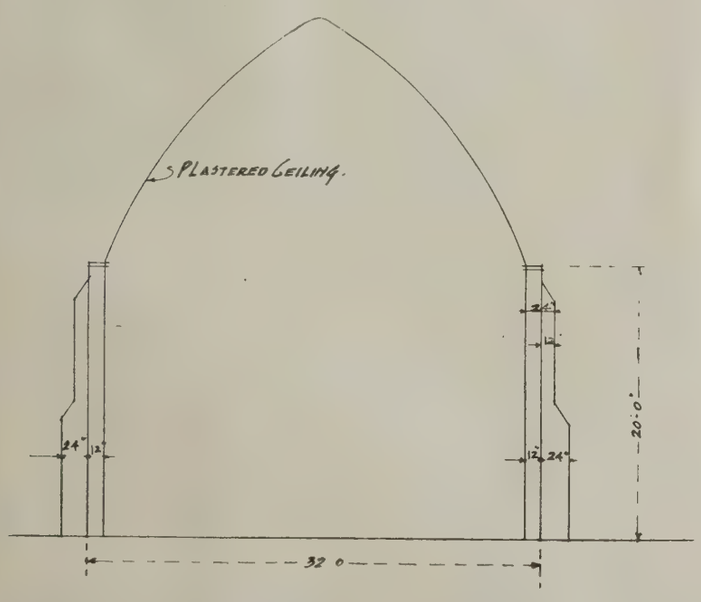
From "Old Hand," Cincinnati, Ohio:

In reply to H. A. C. Cleveland, plastering that is cracked cannot possibly be "good plastering." It may be satisfactory to those concerned, but no good honest architect would pass it. If it is much cracked, it will not be a great while before it will begin to fall off in places. The only sure remedy that I know of, is to take off all the old plaster and do the work over again with better mortar. It would help some to "scratch" the old work, and float over a good "putty coat" made good and strong.

With regard to your other question, it would certainly be unreasonable to ask any sash and door company to make good any glass that was supposed to have cracked or broken because of the "action of the wood." It would be difficult to prove any undue "wood action," and if you could, it would be the joiner, who fitted, or hung the sashes, who would get the blame, not the sash maker.

THAT OLD BRICK WALL.

From "W. T. P." Detroit, Mich.:



The cheapest and best way for C. G. L. to clean the paint from his old brick wall, will be to burn off the paint by using an ordinary paint burner. This will not be difficult to accomplish on a brick wall. So far as the joints are concerned, it would be well to rake out the mortar for a short depth, say three-quarters of an inch, and tuck-point the work with some good hard mortar. This will make a good reliable job, and will look well, if the color of the bricks is uniform. Should the brick work look shabby and speckled when the paint is off, it will be better to paint it over again, first giving the whole wall a generous coat of raw linseed oil, then cover with any suitable color mixed in lead and linseed oil.

QUESTIONS

TRUSS DESIGN.

From T. D., Joliet, Ill.:

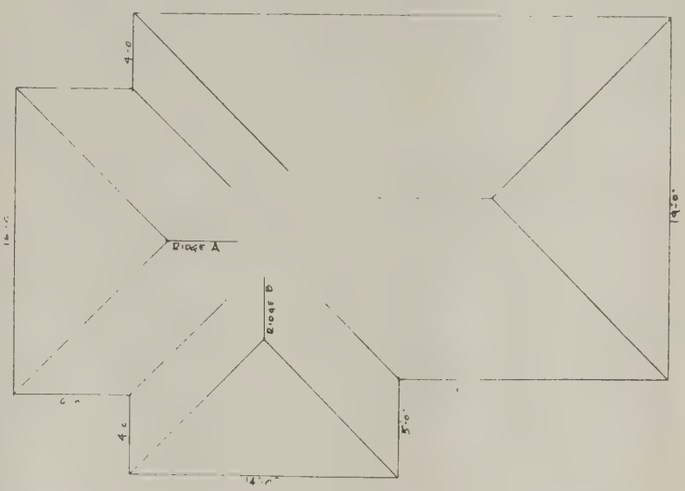
You will find enclosed sketch of a church building which is to be 32 ft. wide with ceiling in as shown. Would you please return sketch showing how the roof can be substantially constructed showing the trusses, purloins and rafters in place on said sketch, and also how far the trusses are to be set apart, and how strong?

VENTILATION ON NOISY STREET.

From J. L., North Tarrytown, N. Y.:

I would like to ask if any reader could advise me how to ventilate windows facing on the street and at the same time keep out noise, which is very trying in cases of sickness. Any suggestions would be thankfully received.

OCTAGON CUTS.



From S. K., Franklin, Nebr.:

Would you give me a method of getting the lengths of an octagon, say 12 ft. across. Please make it as plain as possible.

A ROOF PROBLEM.

From A. D., Sweetwater, Tenn.:

Will some reader be so kind as to finish this drawing for me? I built this house in 1909, but could not make the roof work out without an offset where ridge "A" intersects with ridge "B," so I made a small ventilator to fill up the offset. Can these lines all be run to a point? I will feel very grateful to anyone that will work this puzzle for me.

CORRUGATED SIDING.

From W. A. W., Volga, S. D.:

I would like to know through the columns of THE NATIONAL BUILDER how to fasten V crimp steel, corrugated steel or some other kind of steel roofing at eaves and ridge on a flower house so that no snow can blow in under the ends of roofing.

ACID PROOF CONCRETE SURFACE.

From A. S., Sandusky, Ohio:

The writer has an inquiry from one of his clients in regard to concrete tank of 5,000 gal. capacity for the purpose of equalizing Ohio wine. Can you give any information regarding the waterproofing of this tank that will not affect the taste of the wine or will not itself be affected by the wine. Would water glass be satisfactory and do you know where it can be obtained? There are a number of these tanks used in California, but these wines are not as strong acid as the Ohio wines.

SLATE AND TILE ROOFS.

From "Roofer," Birmingham, Ala.:

I am after information regarding the covering of roofs with slates or tiles, or both. Readers: Please tell me right here in this column, what you know about it and I will say a prayer for you the next time I go to church.

STEEL SQUARE.

From "J. D. V.," Elmvale, Ont., Canada:

I see you recommend two or three different makes of steel squares, but you do not say which you think would be the best for the working carpenter to use, why? Can you tell me which of the "knock-down" steel squares would be the best for general use. Perhaps some fellow readers would be able to say something regarding these "knock-down" squares.

From J. F., Forest Hill, N. Y.—What is the exact weight of one square yard of a 3-coat plastered ceiling on metal lath. That means iron furring 12 inches apart, expanded metal lath and three coats of good plastering. The beams on ceiling are probably six feet apart, center to center.

BOOK NOTICES.

Notice.—All books noticed in these columns may be obtained from this office at Publisher's prices. All postage or express prepaid. (Money and address must accompany all orders.)

How to Make Show Cards.—A practical treatise on the fundamental principles of artistic letter making with pen and brush for retail merchants and their clerks. By Charles A. Miller. Published by the Spatula Publishing Company, Boston, Mass. Stiff paper covers. Price, postpaid, $1.00.

This is a practical book, written by a practical man, and it is intended to be an every-day guide rather than a scientific treatise. It gives concisely all the essential principles of sign letter making, and demonstrates how easily a person of ordinary ability may acquire a facility in making attractive card signs for counters and show windows. The subject is so thoroughly covered that anyone who conscientiously follows the text will need no further assistance. The book is printed on heavy coated paper and is profusely illustrated. A large number of sample alphabets and signs are included and in the last chapter are scores of snappy "catch phrases," that may be used as legends on window cards. Just the book for young draftsmen or others who wish to become good letterers.

Factories and Warehouses of Concrete.—Published by Association of American Portland Cement Manufacturers, Philadelphia, Pa. Price, 50 cents, which is only intended to cover cost of production and postage.

In the preface the compiler of this book says: "Its purpose is to present to those intending to build industrial buildings of any kind, a few of the many hundreds of examples in this country—reinforced and otherwise, and to give important facts concerning these buildings, together with an expression as to their merits by their owners." The facts presented in this book have been gathered from all over the country and are authoritative. There are 235 buildings shown which house 195 industries. Thirty states are represented, as is also the work of 132 architects, 193 engineers and 97 contractors. It will prove a very useful book in every architect's office.

The Kingdom of Dust.—By Prof, J. G. Ogden, Ph. D., professor of physics, Fifth Avenue High School, Pittsburg. 128 pages. 40 illustrations. Cloth cover. Popular Mechanics, publishers, 318 W. Washington street, Chicago. Price, postpaid, 50 cents.

This is rather a remarkable book and is likely to make people "sit up and take notice of things about them." It is not exactly a technical book, nor yet is it a scientific one, but rather a mixture of science, practical matters, theories and instructive technical suggestions. Here are some of the questions dealt with: Can we obtain food from dust? Shall we dispel fog by means of electricity? How shall we deal with the great problems of tuberculosis and typhoid? How many Londons and Jerusalems have there been? Will the wind-driven sands of the Sahara eventually overtop the mountains near the Red Sea and spread into Arabia, carrying ruin and destruction? Shall we solve some of the great secrets that lie hidden within the mighty kingdom of dust? These and scores of other interesting phases of this subject are treated at length in a most entertaining and instructive style by Prof. Ogden, making this book more fascinating than the best fiction ever penned, because it is true and "written so you can understand it."

Street Lighting.—By J. M. Bryant and H. G. Hake, of the University of Illinois, Urbana, Ill. Bulletin No. 51. Published by the university. Paper covers. Price, 35 cents.

This is a well-considered essay on the science of street lighting and contains a large amount of reliable information regarding street lighting, including methods, plants, cost and results. Every person having charge, superintendence, financial management or direction of the generation or distribution of light will find much in this bulletin that will be very useful in aiding the more efficient working of their plants.

The Mechanic.—This is a neat, "chic" little journal published by the H. B. Smith Company of Smithville, N. J., a copy of which will be sent free to any woodworker making an application for same.

The little journal shows and describes all the new woodworking machines made by this firm and also illustrates and describes artistic designs in woodwork suited to the requirements of millmen and other woodworkers.

Die Glasfabrikation von Robert Dralle. München und Berlin, R. Oldenbpurg, 1911. 2 vols. Illus., pl., plans, diagrams, royal 8vo.

Twenty-five years ago the author of the above-mentioned work issued a book on the construction and operation of glass works. The present work was undertaken with the idea of making a revision of the earlier one, but soon developed in scope and contents until an entirely new book has been the result. These two handsome but ponderous volumes constitute a complete treatise on the technology of glass manufacture, by a German mechanical engineer of more than thirty years' experience in his field. He has had the benefit of the assistance of specialists in the preparation of the several sections of the work, which begins with three chapters on the physical and chemical principles of glass production, on raw materials and on fuel, by Dr. Gustav Keppeler of the Royal High School at Hanover. The following four chapters, by Prof. Dralle, deal with furnace and kiln construction, gas producers and other details of equipment. Volume two is largely taken up with the modern machinery and apparatus used in the glass industry, and with processes and principles of operation in its various branches. Separate chapters deal with the manufacture of optical glass, window and mirror glass, wire, cathedral and black glass, ornamental glassware and bottle blowing. An appendix which will interest American manufacturers gives a classified list of German dealers in the various raw materials, machines and apparatus used in the art, as well as a list of German glass works and of manufacturers of glass working machinery. Among the most valuable features of the book, especially to those who are unfamiliar with German, will be the forty-eight large folded plates appended to the volumes and illustrating every phase of the subject. These, together with 1031 illustrations scattered through the text, and executed with characteristic German thoroughness, give a pictorial survey of the present state of an art in which our German competitors have for centuries enjoyed a well earned pre-eminence.

Proceedings of the Seventh Annual Convention of the National Association of Cement Users.—Held in New York City during the month of December, 1910. Edited by the president, and published by the Association, New York, N. Y. Well bound, in cloth, hard covers, and printed on superfine paper.

This is a pretty large work, covering as it does some eight or nine hundred pages, and is profusely illustrated with fine photo-engravings and working diagrams. The contents consist of a series of excellent papers, dealing with cement, the making of concrete and the various uses to which it is applied and the many methods of its application. It also deals with concrete failures, their cause and prevention, and of over-reinforcement, and of almost every phase of the scientific use of cement. If space permitted we would reproduce some of the papers read, in extenso, but this, at present, would be impossible; later on we may do so, however.

To workers in cement and to those having the constructural superintendence of cement or concrete work on an extensive scale, this volume should prove a valuable friend and competent adviser.

PATENTS.

The following list of recent patents and trademarks relating to building interests is especially reported for The National Builder by Wm. G. Henderson, solicitor of American and foreign patents and trademarks, Norris building, 501 F street, Washington, D. C. A copy of any of the United States patents will be furnished by him for 25 cents.

1,008,463. Emergency-exit-door fastener. W. H. Hart and J. P. Holtzhouser, assor. The Stanley Works, New Britain, Conn.

"I Tell You It's a Great Saw!"

Every one who owns a Simonds saw is proud of it—proud of its looks, but a whole lot prouder of its work. You've probably noticed that the

SIMONDS SAW

(Pronounced Si-monds)

you have will keep sharp for many years with ordinary home use. Simonds steel is so tough and hard the teeth hold their sharp, quick-cutting points and do not lose their set. For the professional or amateur carpenter the best tools are the only ones worth while, and the best saw means a Simonds.

Simonds Special Crucible steel is the basis of the extraordinary wearing quality of Simonds Saws. We make and temper our own steel by a special process to get the quality we can guarantee. You don't get it in other saws. That's why so many good carpenters choose Simonds Saws. Ask a good carpenter about them—or your dealer. Send for

"Simonds Guide for Carpenters"—Free
Tells all about filing a hand-saw.

Remember, Simonds Hack-saw Blades and Files are most efficient. Simonds Circular, Band and Cross-cut Saws are the American and Canadian lumberman's accepted standard.

Building Trades' Interests In The Courts

Under Rev. Laws, c. 197, § 3, one furnishing materials for the erection of a building has no lien on such building for the materials, where he, before furnishing them, did not given written notice to the owner that he intended to claim a lien, where the owner was not the purchaser of the materials.—Thornley vs. J. C. Walsh Co., 92 N. E. (Mass.), 1007.

Where defendant contracted to construct a house for plaintiff in accordance with a duplicate, a radical departure from the sample house would not be excused because unintentional.—Nance v. Patterson Bldg. Co., 131 S. W. (Ky.) 484.

A contractor who has been paid all installments so far due under the contract and who refuses to proceed with the work unless he is paid another not yet due, abandons the work without legal cause.—Steiger v. London, 126 N. Y. S. 256.

A building contract provided that, on the certificate of the architect of the default of the contractor, the owner, after notice, could provide the labor or materials and deduct the cost thereof from any money due or to become due, and that, on the architect certifying that the default was sufficient ground for such action, the owner might terminate the employment of the contractor and complete the work under the contract. The contractor abandoned the work without legal cause. The owner gave notice, referring to the architect's certificate of the contractor's default, and then notified the contractor that he terminated the employment and would enter on the premises to complete the work. Held, that the contractor could recover the contract price, less the amount paid, plus the cost to the owner of completing the work.—Seiger v. London, 126 N. Y. S. 256.

THE FIRE DEMON

By WALTER B. SNOW

It is not often that our daily papers have to chronicle the details of a fire involving a loss of more than $1,000,000; but statistics compiled by the various fire insurance companies, boards of underwriters, etc., lead to the belief that there are comparatively few days in the year when the total fire tax in the United States does not exceed the above mentioned figure. The actual loss by fire is supposed to average about $250,000,000 per year. It is certainly within the bounds of probability that the expense of maintaining and operating fire departments and the operating costs connected with fire insurance would make up another $125,000,000.

Innumerable means have been devised from time to time to minimize this loss, involving the use of both automatic and hand-operated devices. It is needless to say that the former are, at the inception of a fire, much the more valuable by reason of the fact that, when properly operative, they act as soon as the fire has made its presence distinctly manifest. As a matter of fact, in many cases, particularly those in which automatic sprinklers have operated, the fire is actually extinguished before it is seen by anyone. In these cases, of course, the automatic fire alarm has brought fire-fighting apparatus to the spot, but in about two-thirds of the cases the apparatus is not called upon to do any work further than what the sprinkler system has already accomplished.

Students of the subject of fire prevention and protection seem to be unanimously of the opinion that the automatic sprinkler is by far the most important of all fire protection devices. As a matter of fact, no instances are on record where a fire starting in a building equipped with modern automatic sprinklers in good operative condition has extended beyond a limited space in that building. Be it understood that when someone has shut the water off the system, or there is an inadequate supply of water, or the system is crippled by an initial explosion, it is not "in good operative condition." Among the strong points in favor of the use of sprinklers might be mentioned the facts that it puts all of its water on the exact place to do the most good; it operates only where it is needed; it works just as effectively in a room full of smoke as anywhere else, and stays on the job when the heat would drive human firemen away.

When we realize that a fireproof building is fireproof in the same sense in which a furnace is fireproof, and that its contents will burn in much the same way as will those of a furnace, it is very apparent that the need for automatic protection to those contents is very great. The $6,000,000 fire in the State Capitol at Albany a few months ago illustrated this fact most beautifully. Many of the documents and records destroyed were absolutely irreplaceable, and yet from the testimony of eye-witnesses who were on hand at the time the fire started a single pailful of water directed at the right spot would have extinguished it.

A reduction of fire losses by means of automatic devices operates really in three ways. In the first place, there is a conservation of created wealth by virtue of the fact that valuable property or records are not destroyed; in the second place, there is, in very many cases, the ability to continue business with, at most, but very brief interruption; and in the third, there is a very definite saving in fire insurance premiums enough, in fact, in the general case to completely pay for the sprinkler equipment in about three or four years. Everything, therefore, points to the great desirability of making an installation which will not only pay for itself in a short period, but probably be worth many, many times its cost in potential saving.

PLEASE ADDRESS YOUR REPLY TO
ARCHITECTURAL
DEPARTMENT

This advertisement is not written by an advertising specialist or expert, but by a varnish man - one who knows his business as you know yours. We must confess that Architects and Builders, as a rule, are considered hard to interest - chiefly because they will not listen. As a rule they are too busy to talk to a supply man.

Did it ever occur to you that without varnish or enamel your work would lack beauty and the finishing touches so necessary to the completeness of the job? We can help you if you will let us. The finish is the first thing one looks at upon entering, and the last thing one looks at when leaving a building, therefore, it is of vital importance and should be given careful attention.

Let us take care of this vital matter for you. Send us a description of just one of your jobs, and we will write the specifications for you. We know how. Isn't it worth a moment's time? We ask for only one job to show you what we can do.

TRADE REVIEW

STAMPED METAL WORK.

Few people realize the extent to which sheet metal is supplanting other forms of roofing, siding, lining, etc. The fireproof sheets have a value not only as a protection against the weather but as a protection against fire as well, so that the use of metal reduces the fire risk and the fire rates.

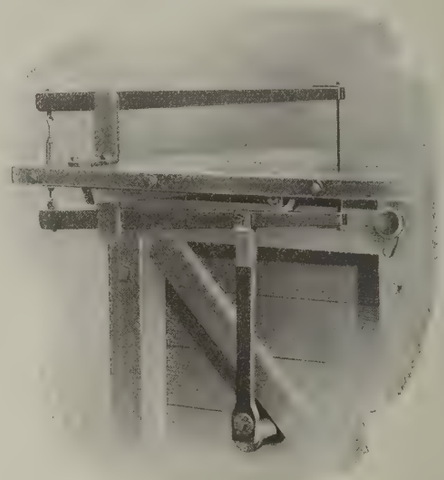
At the recent convention of the Wisconsin Hardware Association, which was held in the Auditorium at Milwaukee, the Milwaukee Corrugating Company had a most interesting exhibit. Their booth was composed entirely of sheet metal products and showed somewhat the variety of artistic forms which could be used in buildings of that character. Not the least interesting was a miniature bungalow, constructed entirely with steel, the roofing and gables being covered with miniature TITELOCK shingles, the outside dimensions of the building being 24x38 inches and 30 inches high.

MODEL HOUSE OF STAMPED METAL PRODUCTS.

The exhibit also showed a full line of eaves trough and conductor pipe trimmings in galvanized steel and copper. It is interesting to know that their CRIMPEDGE gutter was allowed a patent a few days ago, the patent number being 1,020,087.

BOOTH OF MILWAUKEE CORRUGATING CO.

The Milwaukee Corrugating Company, Milwaukee, Wisconsin, is anxious to hear from all those who want a fireproof, waterproof or lightning-proof roof and will be glad to send samples and catalogue "N-B" on request.



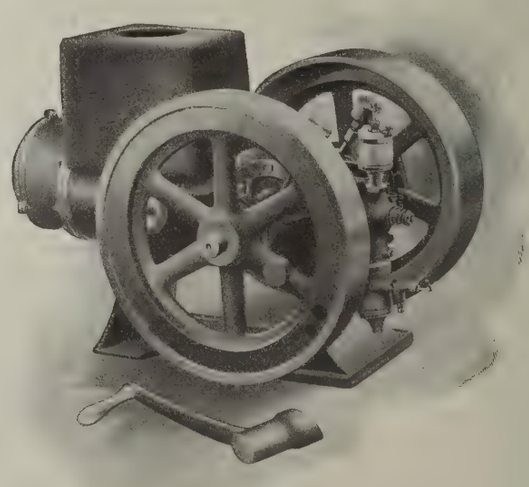
WHY CONTRACTS DON'T PAY.

Many a contract-estimate looks like a payer—on paper—but turns out to be a loser—on the ledger.

The lumber is figured all right—so is the joiner's material—so are the metal work, nails and findings—but the time, that is the rub. How to estimate time, how to anticipate accidental delays, etc., is a sticker. Plainly, any method that will materially save time on a job ought to receive a glad welcome from all contractors.

Sawing seems to eat up most of the carpenter's time. If he had this stuff all sawed and ripped to proper lengths it would cut a great chunk out of his time.

The Oshkosh "Eveready" Saw Rig seems to solve this problem. It is a compact, handy frame and table of very best rock maple, air and kiln seasoned, containing a reliable 4 h. p. gasoline engine of latest improved type. Two men can load it into a wagon. Once on the job, it can be skidded anywhere, upstairs or down.



JIG SAW ATTACHMENT.

The outfit as generally furnished consists of one cross cut and one rip saw with other attachments such as jointer head, boring attachment, jig saw, sander, mitre device, dado head, emery wheel, etc.

This brings a veritable carpenter shop right out onto the job. It is said that with "Eveready" two men can do as much sawing as twenty-five can by hand. This would effect an extremely large saving in a carpenter's time, and make the contract yield a good, solid return, that would soon pay for the cost of the rig.

The engine is easy to understand. Any carpenter can learn to operate it. Just a whirl of the wheel and it's off. It will run, it is said, for only two cents an hour.

THE ENGINE.

The "Eveready Saw Rig" is made by the Oshkosh Mfg. Co., 414 S. Main St., Oshkosh, Wis., and we understand that their guarantee is simply "For Life." This would seem to pretty near make it a safe purchase for anyone having this class of work to do. A catalogue showing further particulars and descriptions will be sent on request, together with their special free trial offer to contractors and builders.

ARTISTIC WOOD COLUMNS.

However much we may talk about the American style of architecture, the fact remains that the dignity of the Greek Orders cannot be surpassed. Try as they will, modern designers can prepare only a caricature when they try to evolve a new "Order."

SARGENT

STORE DOOR HANDLES

For the New Stores of Your City

Do not be satisfied to use the common patterns which make every store entrance look alike, but apply SARGENT Cyclinder Store Door Locks and Handles that will work easily, give absolute security and always prove satisfactory. From the many patterns different designs can be used for the different owners that will give individuality to each store.

You will also receive credit for using good taste and the considerable advantage of having many pleased customers in your neighborhood.

SARGENT

HARDWARE AND LOCKS

by persistent and extensive advertising and satisfactory service have become well and favorably known, but these are not the only reasons for the excellent reputation they have throughout the world. The experience of three generations, the well organized body of craftsmen, the use of right materials, correct construction and care in manufacture, all count in the production of these satisfaction-giving goods.

Sargent Hardware and Locks are obtainable from representative hardware merchants in all parts of the world. The Sargent Catalogue, a large and comprehensive volume, may be consulted at any hardware store.

Special Hoist for Contractors and Builders Lessens operating cost and increases profits. Saves time, money, labor. Easy to operate. Costs little Durable. Does any kind of work that any hoist can do. Saves enough on one job to pay for itself.

Helps you make low winning bids because it cuts your expense at a point that few contractors consider. Sent on 30 Days' Free Trial. Give this hoist a fair trial and send it back if unsatisfactory. **Send for Catalog.** Tell us what work you have to do. We'll send you free catalog and quote you an attractive price on exactly the kind of a hoist you need.

Read This

We have recently finished hoisting material for the new bank building and your Universal Hoist has fully met the requirements. We have saved enough time and expense on this job to more than pay for it and the outfit is still in excellent condition. Blacknawk Construction Co., Waterloo, Iowa.

UNIVERSAL HOIST & MFG. CO. 180 State St., Cedar Falls, Ia.

The bizarre effect attained in art nouveau has no place in prominent refined buildings.

As the orders have for their base the column, it is but proper that the column should be well constructed as well as properly designed in order to display the good taste of the owner. To save material waste and present the best surface to the weather, it has long been customary to build up large columns in six or more pieces, the number being determined by the size of the column. As the entrance of any moisture to the column would cause swelling and opening up, it is necessary that the joints be particularly well made and protected.

The Hartmann-Sanders Company, operating under Koll's patent, have been particularly successful in the manufacture of large columns, and their latest circulars show in great detail their process for manufacturing and contains many ideas useful to the designer.

The Hartmann-Sanders Company also have for distribution Catalogue "D," showing cement, garden and hall furniture; No. 27, showing Pergolas, Sundials and other Garden Ornaments in wood, and No. 40 showing Wood Columns for all purposes.

Anyone interested in these lines can obtain these catalogues by writing to the Hartmann-Sanders Company at 2155 Elston Ave., Chicago, Ill.

ALABASTINE.

The crowning achievement of the builder of the Twentieth Century lies in the beautiful and artistic decorations applied to the humblest residences, as well as to the magnificent palaces and public buildings.

Only a few years ago the use of any decoration would have meant the expenditure of considerably more money than the average householder felt that he could afford. Today, however, we have materials which give results at the minimum of cost, which could not be obtained a comparatively few years ago.

The form of wall coverings has changed greatly, as well as the method of decoration. Where formerly we had only the bare plastered walls, now we can obtain decorations in plaster, stucco, wallboard and stamped metal. The extensive use of the latter for walls, ceilings, beams, etc., has intensified the need for a proper decorating medium. For this purpose, there seems to be no material better than Alabastine, as manufactured by the Alabastine Company of Grand Rapids, Mich. This material has in its favor durability, economy and the refinement of appearance.

To obtain the best results with Alabastine on metal work, it is only necessary to first give the surface a thin coat of oil paint. Over this any tint of Alabastine may be used to get the color effect desired. The finish thus produced is a velvety softness, showing no gloss but reflecting the greatest amount of light and working in admirably with any other decorative effects which may be desired.

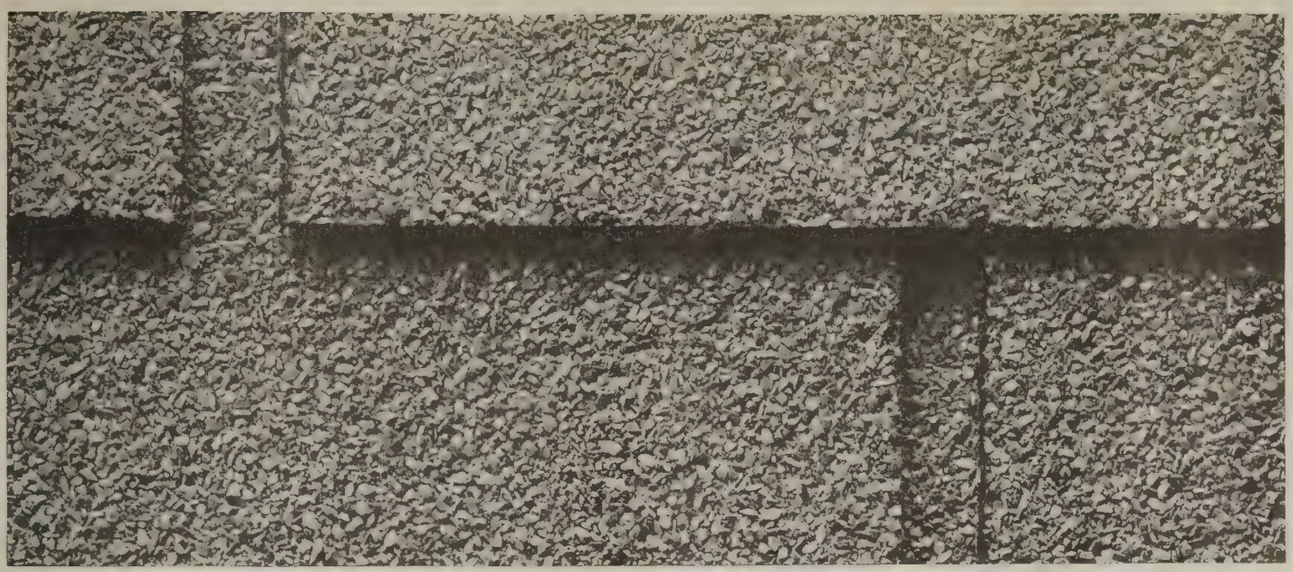
When it is understood that the cost of the material for work of this character does not exceed 1½c per square yard, the economy of Alabastine is apparent.

Some of the largest and best work in this country is being finished in this way and many architects are specifying this method of treatment. It should be noted that to insure the best results the Alabastine should never be applied to the raw metal surface, and even if the stamped metal has been painted at the mill, it is advisable to give it another thin coat before applying the Alabastine, in order that there may be no bare spots.

Alabastine comes in a great variety of tints, which may be further mixed to secure any desired shade. The use of the lighter colors will brighten up many dark corners, thus reducing light bills.

The soft finish is particularly easy on the eyes, as there are no high lights reflecting glaring patches, as is only too common with glossy oil paints.

The various circulars of the Alabastine Company are extremely interesting to anyone anticipating decorating their present rooms or installing new work.



CONTRACTORS' CONVERTIBLE LEVELS.

Accuracy is required today far more than ever before in the building line. There are so many items entering into construction of a building which require accurate leveling and placing that no contractor can afford to take chances in laying out any of his work. From the very start of the job an error of a few inches in depth means a considerable waste of money for exact footings. If not properly placed on the site, there is a still greater expense for correction.

In these circumstances a contractor will do well to investigate the various forms of convertible leveling instruments now on the market. These instruments are so made that they may be used either as extremely accurate levels for doing all the leveling required on a building, or in checking, and for finding a grade from some other building or level point. The instrument is also easily converted into a reliable transit by means of which points in a vertical plane may be quickly found. Given in simple language, the transit is used for finding and checking vertical lines, such as checking the corner of a building, plumbing a column or chimney, or locating points directly over each other, or in line with each other. This enables the contractor to lay down a line of stakes without stringing a chalk line across the site, and insures extreme accuracy, as there is no chance for the wind blowing the line out of place or the stakes being accidently moved. As the work progresses through the building, the transit and level are many times useful. Incidentally in laying out a line of partitions, a center line can be accurately set off in any number of places.

The Iszard-Warren Company, 136 S. 12th street, Philadelphia, Pa., have a factory devoted exclusively to the manufacture of engineering and surveying instruments, and recognizing the value of an instrument of this character to the contractor, have designed the "Sterling" Convertible Builders' Level. This instrument is especially designed to insure the permanency of its adjustment and the accuracy of the work to be done with it. A special lens combination enables the instrument to be used under all weather conditions.

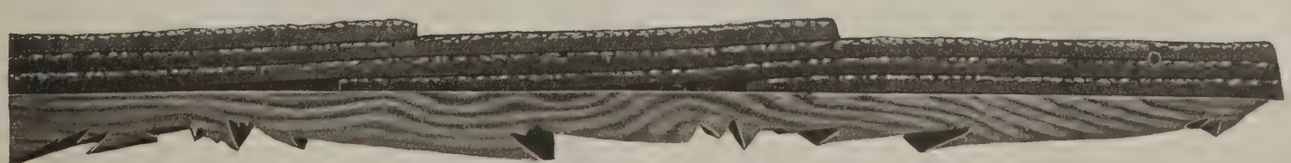
THIS CUT SHOWS THE SURFACE OF FLEX-A-TILE SHINGLES—LIFE SIZE—COLORS ARE DEEP RED, GREEN GRAY, SILVER GRAY AND BROWN

Here is a roofing material that is going to make every builder and contractor and home owner in the country sit up straight and take notice. A material that is as easily and quickly applied as wood shingles, as beautiful as tiling, as durable as the finest slate and surprisingly inexpensive



FLEX-A-TILE
Asphalt Shingles

are made of solid asphalt, into the surface of which is imbedded, so substantially that it becomes an actual part of it, chipped slate and granite. The natural color of this slate and granite gives the coloring to the shingles. There is no paint or artificial coloring of any kind. Shades are rich red, green gray, silver gray and brown—and these colors can't change—they are natural. Flex-A-Tile Shingles are cheaper than wood shingles that have been stained. They are easier to lay—and they will last as long as the house stands. The slate surface makes practically a fire-proof covering for the roof.

COMES IN ROLLS AS WELL AS SHINGLE FORM

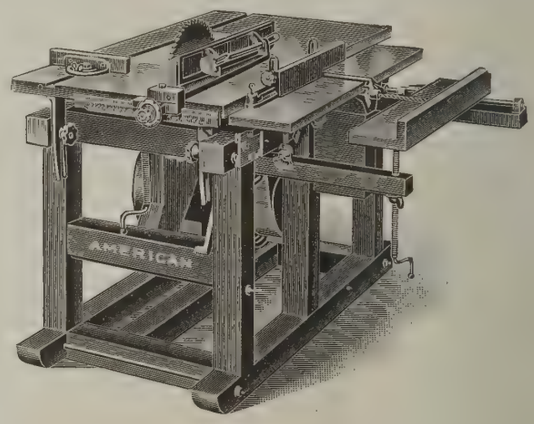
and the graduated circle permits horizontal angles to be laid out or measured entirely without calculation. This is especially valuable to the builder, as the various corners and angles can be quickly found and staked out. The fact that these instruments have found a very large sale would indicate that the principles on which they are made is recognized by the contractors as being particularly adapted to their work.

The Iszard-Warren Company, 136 N. 12th street, Philadelphia, Pa., have an illustrated catalogue of great interest to the builder.



THE "AMERICAN" CONTRACTORS PORTABLE VARIETY WOODWORKER.

One of the most encouraging signs of the times is the disposition shown by the best machinery builders to improve their product, to enlarge its usefulness or to bring out entirely new machines in which the purchaser will find refinements pointing the way to larger money making possibilities.

In many cases the later machines can be had at a price but little if any more than asked for the older and less capable machines so that the customer has no legitimate reason for not possessing the best.

No machine has been more prominent in the making of the contractor than the portable saw bench. This one machine, equipped with a gasoline engine or electric motor enables the contractor to do much of the work formerly done laboriously by hand or in the planing mill. The former was expensive and slow and the latter frequently meant delays and expense in ordering and delivering the material.

The American Saw Mill Machinery Company, 80 Laight street, Hackettstown, N. J., placed a portable saw bench on the market a year or so ago. This machine was built for permanent service with

a view of bringing planing mill facilities right to the building or concrete job. It was early realized that the machine as first made did not embody everything in the ideal contractors machine and a later form, known as the American Contractors Portable Variety Woodworker greatly increases the scope of work possible. This machine is really a miniature planing mill complete in its several details and capable of doing a wide variety of work.

One of the shortcomings of the early saw bench was that but one man could work upon it at a time. In the present machines, three men may work at three different jobs. One may be working on the rip saw, cut off saw or dado heads on the table and another can be joining or planing, while the third may be boring or sanding, all without any change in the machine or its adjustments.

Some idea of the construction and design of the machine may be had from the illustration, although to secure complete information the contractor should write the manufacturer for their latest catalogue, showing the machine in detail and describing the various work which may be done upon it.

As stated before, the machine may be equipped with either a gasoline engine or electric motor, depending upon the source of power available to the contractor. As a general rule, the gasoline motor is more frequently chosen as it is entirely self-contained and required no running of wires, etc., to be made available upon the job.

We would suggest that any contractor not having a machine of this character should write to the American Saw Mill Machinery Company for further information regarding this useful machine.

HIGH CLASS CABINET AND MILL WORK.

Fine interior finish and trim in either soft or hard woods add so much to the beauty of a home or any other building that it pays the architect and contractor to do all they can to point out to the property owner what can be had by careful selection, good workmanship and material.

Property owners who have traveled extensively often see the interiors of fine buildings and decide that they want just that kind of interior finish, but when the work is finally completed by some small local mill, they realize that something is lacking.

In nine cases out of ten the interior finish and trim have been turned out by inexperienced workmen and by a mill that seldom has the opportunity for doing the finest kind of work in this line.

Few cities in the United States have better itnerior finish factories than Chicago. Among those that have a reputation for quality work is the Harty Bros. & Harty Company, 21st Place and Loomis St., Chicago. Having had over twenty-five years of practical experience in millwork manufacturing, having made the interior trim, etc., for many of the finest buildings in the country, and always carrying a large stock of kiln dried factory lumber in pine, cypress and the hardwoods, and employing only experienced workmen, the Harty

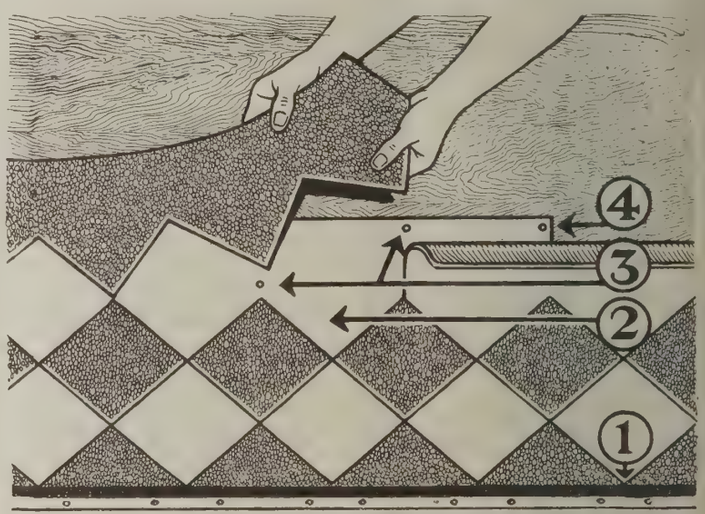
Bros. & Harty Co. are able to produce work which will live up to the most exacting architect's specifications.

Harty Bros. & Harty Company carry in stock window and door frames in the knock-down lumber, ready to put up, and can ship frames very promptly. They also carry a stock of 1¾-inch and 1⅜-inch windows to fit their frames. Their stock of yellow pine interior trim and jambs is complete and they also carry five cross yellow panel doors and birch and oak doors in two and five panels, enabling them to ship the trim for an ordinary flat or residence building complete from their stock on very short notice.

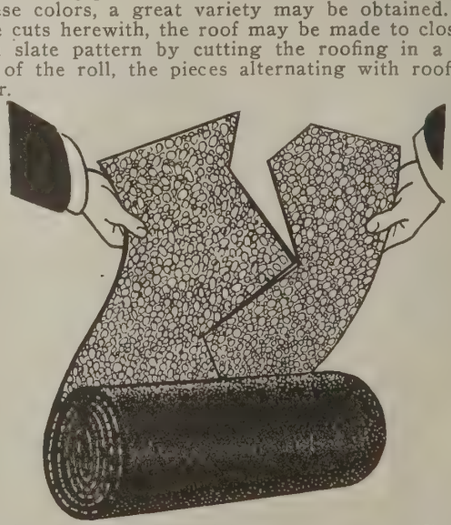
The second floor of this company's large factory building is devoted entirely to cabinet work, which they turn out very promptly, as well as making everything very high grade.

The Harty Bros. & Harty Company pay special attention to out-of-town business, and where plans or lists are sent them, estimates are often returned on the same date of receiving.



Many contractors and builders located in the smaller places have found it a very profitable and convenient proposition to give all their work to the Harty Bros. & Harty Company. In doing this they know that they will be taken care of at all times and that this company can be relied upon to give them high class materials at the very lowest price possible, consistent with quality.

Many contractors and builders make the mistake of endeavoring to divide up their work with three or four different mills. It is a much better thing every way to do business continuously with a reliable, high-class company and be taken care of in the best manner possible at all times.



The Harty Bros. & Harty Company want to get in communication with live contractors and have the opportunity of figuring on their jobs for this year. Their work is well known in Chicago and considered the very highest class, and these statements can be verified by looking the matter up. Their catalogue showing cabinet work and interior finish will be sent to parties interested on request.

PEERLESS ORNAMENTAL ROOFING.

While it is possible to decorate the interior of the house with various finishes in wood, plaster, paper and other forms of ornamentation, the roof of the house as a rule is left in its natural materials. The variety of color combinations possible on the sidewalls of frame or masonry buildings is generally impossible on the roof.

By the use of the Peerless Ornamental Roofing, it is possible to obtain a wide variety of patterns which are both artistic and durable. This roofing is made in several finishes, red and gray slate chips being imbedded in the surface of the slate finishes and gray or gray black finishes being possible in the smooth surfaces. By a combination of these colors, a great variety may be obtained. As will be seen by the cuts herewith, the roof may be made to closely resemble the French slate pattern by cutting the roofing in a zig zag line lengthwise of the roll, the pieces alternating with roofing of a different color.

The Huber Builder's Material Company, 39-40 Vine street, Cincinnati, Ohio, are placing this roofing on the market and the literature which they are sending out shows the best methods of placing it on the roof.

A postal to the Huber Company will bring any desired information with regard to this form of roofing.

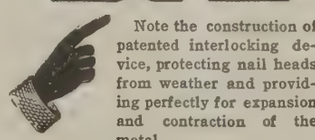
Don't Miss This Opportunity

We Want One Carpenter or Builder in Every Community to Demonstrate, Take Orders for and Apply Our EDWARDS METAL SPANISH TILE ROOFING on a Liberal Commission.

Here is a chance to build up an independent, profitable business for yourself right at home. Many carpenters are now devoting their entire time to selling our metal roofing Others have made big profits **simply devoting part of their time to selling and laying our Metal Spanish Tile.**

Edwards Metal Spanish Tile



Is being advertised in the leading magazines and is now known to thousands of home builders and owners everywhere. Wherever it has been used it has made a decided "hit" because it shows off to good advantage on the roof and has numerous points of superiority over any other style of roofing.

Architects are specifying Edwards Metal Spanish Tile, for they know it will do away with roofing "troubles." Builders like it because of the finished appearance it gives any house on which it is used.

Our Metal Tile are stamped out of the highest quality Worcester terne plate in exact imitation of the most expensive Terra Cotta Spanish Tile. They come either "dip" painted or heavily galvanized, size 10 x 14 inches. Our patented interlocking side lock makes it possible to make a perfectly moisture-proof roof without soldering. Edwards Metal Spanish Tile afford the fireproof advantages of Terra Cotta Tile, but are much lighter in weight, cost but a trifle more than ordinary roofing and will last a lifetime.

WRITE US TO-DAY ABOUT YOUR TERRITORY. Our business is growing so rapidly that it is necessary to have an agent in every community. The territory is going fast. One day's delay may mean that someone else will be given your territory. DON'T DELAY. WRITE TO-DAY FOR OUR SPECIAL AGENTS' PROPOSITION.

Note the construction of patented interlocking device, protecting nail heads from weather and providing perfectly for expansion and contraction of the metal.

AMERICAN BELL & FOUNDRY CO.
NORTHVILLE, MICH.

There are some of the good old building materials so firmly established that in spite of years of continual opposition to their use from manufacturers of other kinds of material and years of continual endeavor to change, still occupy not only as strong a position as ever, but have become even better liked and more extensively used.

This is true of the wood shingle. Every one knows that in every kind of materials, there are two classes of goods manufactured, and the man who makes the very highest class has to stand to a certain extent for the harm done the trade by the manufacturer who puts out the inferior line.

The old Fort Borst Block House, built in 1845. The split red cedar shingles are as sound today as when put on.

All that the architect and contractor has to do to get a well made, reliable wood shingle is to specify and buy the shingles sold under certain brands. These shingles are the output of certain mills. Out on the Pacific Coast, for instance, are a number of shingle manufacturers who have joined hands for the purpose of making and selling Red Cedar Shingles and also letting people know where they can be had.

If any one doubts that red cedar shingles are not a credit to the building field, the best thing for him to do is to write and get

The 350-year old tree on which the dog is standing fell 300 years before Columbus discovered America. It was cut up for sample shingles in 1910.

a copy of a large booklet, entitled "Seattle's Shingled Homes," sent out by these manufacturers, who operate under the name of the Red Cedar Shingle Manufacturers Association. Thirty half tone perspective views, illustrating red cedar shingle residences are shown. These illustrations show beyond a doubt that architects of the highest standing look upon wood shingles as a reliable building material. Not only that, but they meet every requisite for a desirable combination of utility and beauty and give the property owner a better home for his money than he can get from any other material.

Looking over these shingle house views, one cannot help but be struck with their homelike appearance. There is style and beauty to every one. As to fireproofing qualities, the wood shingle manufacturer can point with pride to insurance reports which show that only 2.96 per cent of residence fires in the United States start in shingle roofs.

In point of durability, treated or untreated shingles will outlast every known substitute. Red cedar shingles last a lifetime and need no further attention if properly put on. The matter of nailing is important for only cut iron, galvanized tin, copper or zinc nails should be used. Use the proper nail and enough of them when putting on red cedar shingle roofing and the property owner will never have a complaint to make.

"Seattle's Shingled Homes," showing thirty views of beautiful shingle residences and bungalows from photographs is worth writing for.

Besides these views "Seattle's Shingled Homes" contains a lot of very instructive reading matter on red cedar and as this wood is extensively specified and used by the best architects and builders, it is well to get posted.

NATIONAL BUILDER,

Gentlemen:—In answer to our advertisements in recent issues, so many inquiries have come to us, covering so broad a range of subjects that I deem it best to make this general answer for all readers of your publication.

Can Paper be Put Over an Alabastine Wall?

Paper can be successfully applied over a wall that has been Alabastined. Some practical men may tell you differently, based on their experience with ordinary kalsomines and the fact that they are unaware of the difference between Alabastine and ordinary kalsomine.

Can Alabastine be Applied Over Wall Paper?

Under certain conditions, yes, provided the paper is solid on the wall, that it has no raised figures in gold or flitter, that it is not printed with aniline colors, which will stain through anything. For ordinary papers Alabastine can be successfully used, stripes and figures obliterated.

May Alabastine be Used Over So-Called Flat Paints?

Yes, if the paint is solid on the wall, not scaling or coming off, it makes a good surface over which Alabastine may be applied.

Can Paint be Used Over an Alabastined Wall?

A wall that has been Alabastined can be successfully painted.

How Should New Walls be Plastered to Best Receive Alabastine?

A brown or float coat, what is known as a sand coat of plaster makes a very fine surface for the use of Alabastine. The more general way is to finish with a white, trowel or putty coat and then Alabastine over this. Either surface is satisfactory.

How Many Coats of Alabastine are Necessary?

Never more than two coats if the wall is in suitable condition. Very often, particularly where the walls are sized and Alabastine properly used a perfect job can be obtained with one coat.

What Preparing Do the Walls Require?

New walls tinted for the first time, particularly lime finished walls, are liable to have lime stains and in some cases a great amount of suction. If this be the case, a coat of size—a shellac size or a varnish size—will put them in proper condition. If a rough sand finished wall is so absorbent or hot that the material will not spread, it can be remedied by giving the wall a good coat of soapsuds, wetting it up well with a brush, then follow before the wall is entirely dried out, but, of course, not when it is wet, with a coat of Alabastine.

Is Alabastine Suitable for Use Over Wall Boards?

Yes, ask any manufacturer of wall board and he will tell you that Alabastine is peculiarly adapted to that purpose.

Does Alabastine Rub or Scale Off?

If properly applied to a surface suitable to receive a water color, it will not. If put on over old kalsomine or other materials it will stay on as long as they stay on the wall, if they let go and come off, Alabastine has to come with it.

How Much Alabastine is Required to Do an Ordinary Room?

Different surfaces depending on whether they are rough or smooth, absorbent or otherwise, has something to do with the amount of material necessary. You can figure for the regular Alabastine tints the expense of material will not exceed 1½c per square yard for any ordinary surface. The cost of *applying* is no more than the cost of applying the cheapest temporary kalsomine or white-wash, both being put on with a regular flat wall brush.

Does It Require an Expert to Apply Alabastine?

Like everything else, the better the workman and the better the tools, the better will be results. Alabastine can be applied, however, in the absence of skilled mechanics by any one who will follow directions and can use a brush properly.

J. L. HAMILTON, Manager

ALABASTINE COMPANY, GRAND RAPIDS, MICH.

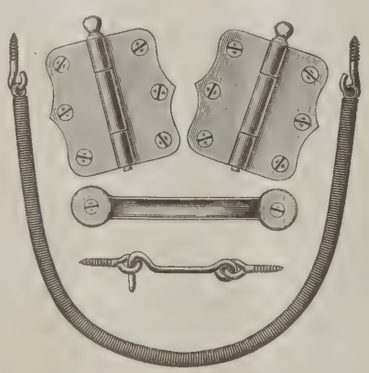
ASBESTOS PRODUCTS.

The clanging fire engine strikes no terror to the heart of a man who has built with Asbestos Products, for he knows that there is no danger of fire in his house. The exposure hazard is well known to be responsible for large portions of the loss by fire and this could be largely prevented by the use of a fireproof wall and roof covering.

Among the many and diversified lines of building products manufactured by the H. W. Johns-Manville Company none is more interesting in its composition nor artistic in appearance than the Asbestos Shingle. As it is made in a great variety of shades and colors, practically any effect can be obtained which is obtainable in either slate or shingles. At the recent New York Cement Show the booth occupied by the Johns-Manville Company contained an excellent example of the use of shingles of this character. As will be seen by the illustration, a number of different sizes and colors were artistically worked into the sample roof.



J-M Transite Asbestos Shingles are made of Asbestos and Portland Cement, compressed under great pressure and their successful use for years on many of the finest houses throughout the country proves that they will stand severe weather conditions.

The same Company prepare their Asbestos in the form of stucco, which may be applied to the walls, furnishing a fire-proof and weather-proof material in any desired color.

The exhibit also showed a large number of other Johns-Manville products, such as roofing, asbestos wood panels, waterproofing liquids, felts, and fabrics, as well as photographs of many of the beautiful houses in which the Johns-Manville fireproof materials had been used.

SCREEN DOOR SETS.

There are few localities so favored that some special protection is not necessary against the entrance of flies, mosquitoes and other insects. Possibly the explorer in the Arctic regions do not feel the need of screens during the winter, but it is a well known fact that the Alaskan summer will breed more mischievous and annoying flies, mosquitoes, etc., than the warmer climates. We who live in a fairly temperate zone, appreciate fully the use of screens and we realize to be at all efficient, the screen doors must work promptly and easily.

Practically all hardware dealers carry Stanley's Screen Door Sets, which at this season of the year, carpenters and builders will find particularly useful as all of the hardware necessary to hang the door is contained in one package. This package or set consists of 3x3 ornamental loose pin butts, a five inch door pull, designed to fit the hand comfortably, and a steel wire spring, together with the necessary hook and eye for locking on the inside and screw eyes and wood screws to hang the door complete.

Coming packed each set by itself, insures the hardware reaching the consumer in good condition, clean and free from rust, and the well known Stanley Trade Mark on the label prevents the substitution by the dealer of inferior goods.

The sets come in various finishes such as Japan, antique copper, dull brass plate or the new Stanley Shepardizing. The last finish is possibly one of the best yet discovered for preventing iron and steel from rusting and is particularly suitable when the hardware is exposed to the weather.

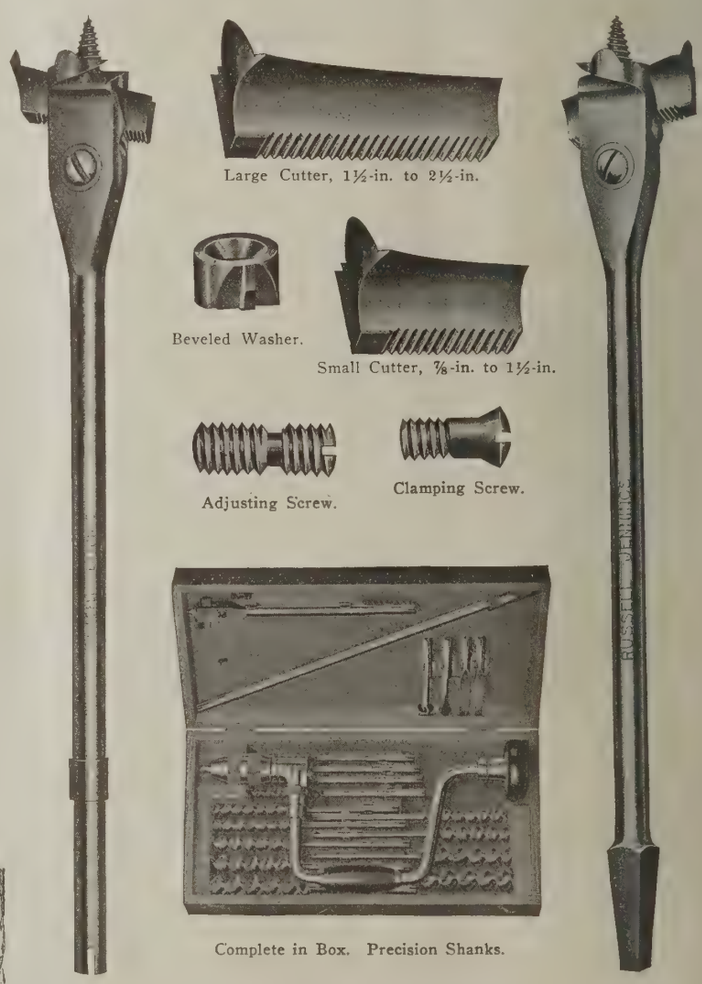
Those of our readers who are not familiar with the Stanley sets should write to the Stanley Works, New Britain, Conn., and obtain circular "N" which describes these goods fully.

CONTRACTORS' EQUIPMENT.

The use of power by the contractor is fast becoming a distinguishing mark of progress. A few years ago the only power used was the occasional hoisting of the material by the horse or team, taken from the contractor's wagon. Today, however, no shop is complete without a power plant and no contractor's plant is complete without several forms of engines and machines. For excavating, a power hoist is of use in getting the material to the street, and a pumping device is particularly necessary to keep the hole dry until the foundations are in. The hoist again becomes a factor in getting the materials up to the various floors and the progress of the building is frequently rated by the facilities of getting the materials to the workmen. One hoist will take up more material than twenty men, and take up much less room.

So the up-to-date contractor is investigating power machinery and is investing in machines to aid him in his work.

The Novo Engine Company, 228 Willow St., Lansing, Mich., have machines for every purpose which the contractors require, such as hoist drilling, rock crushing, pumping, etc. Most of these machines are direct-connected to their celebrated Novo engine, thus forming a complete, self-contained machine for every purpose.



A new catalogue from the Novo Engine Company contains descriptions of various machines, together with a great deal of useful information. No contractor should be without this catalogue, as it may be the means of making a success of the job, which would otherwise mean a loss of time, money and reputation.

A NEW EXPANSIVE BIT.

Every carpenter has at times use for an expansive bit. The more frequent call he has for it, the more apt he is to make sure that he possesses the very best bit made, as, on account of its large size, it requires considerably more power to operate it.

The first expansive bits made were crude compared to those which we find in the stores today. Their life was short at the best and it was not unusual to break a cutter head off or have the bit slip and bind. Possibly no failing was worse than the slipping, especially when a number of holes had to be bored the same size.

The Russell Jennings Company, already well known as manufacturers of bits for all purposes, have recently put on the market an expansive bit, which they believe overcomes many of the faults heretofore found in most expansive bits. The solid head makes it very strong and prevents the chips from choking in under the cutter. The cutter itself is adjustable by means of a screw, one turn of which advances the cutter one-sixteenth of an inch or increases the diameter of the hole an eighth of an inch.

The cutter is further kept from creeping by a clamping screw which prevents absolutely any creeping. The shank of the bit is made in either the ordinary style or the new precision turn shank as is shown in the cuts herewith. The simplicity of the entire bit is shown by all of the parts.

While it is probable that the carpenter can obtain these bits from his regular dealer, the Russell Jennings Co. will be glad to send literature in regard to them on request.

THE ROYAL STANDARD UNIVERSAL WOODWORKER

Is Made to Stand Up Under the Hardest Usage and Do Your Work Right.

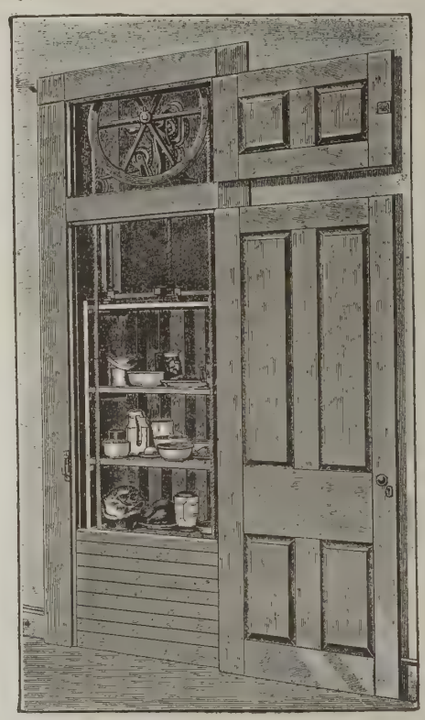
It requires little power. It is an unusually strong and well made machine. It is very simple to operate and the different attachments for sawing, dadoing, grooving, rabbeting, tenoning, jointing, matching, molding, etc., can be instantly adjusted.

Catalog on request. Put a No. 10 Standard Universal Woodworker in your shop now, and save a lot of money.

CORDESMAN-RECHTIN CO., 10 Butler St., Cincinnati, Ohio

THE WINDOW CHUTE.

The first piece of real hardware to go into a building is the coal door or coal chute. But often no provision is made for getting coal in aside from the hinged sash, which is frequently left open, oftener broken and an eye-sore instead of a useful feature to the building.



The Holland Furnace Company, in connection with their line of furnaces and building specialties, manufacture a coal door under the name of the window chute. This window chute is used to get the coal into the basement when such work is required and the remainder of the time is a clear glass window, furnishing light to the coal storage space. It is arranged to lock automatically from the outside by merely closing it and can then only be opened from the inside. This gives particular protection against burglars, as the coal man will invariably close the door when he is through.

The Holland Furnace Company, Holland, Mich., have some interesting literature on the window chute, which should be in the hands of every contractor and builder.

DUMBWAITERS.

The dumbwaiter business is practically in its infancy, as their use has been confined almost entirely to the homes of millionaires, where a corps of servants are employed, or in the luxurious apartment houses. A dumbwaiter is not a luxury, however, but a necessity and should be used in every household where the housewife does her own housework, or but one or two servants are employed, in which class of homes the problem of securing competent servants is experienced.

Comparatively few contractors and builders or private individuals have considered the installation of a dumbwaiter advisable or necessary, which reluctance is partly due to the fact that a large number of dumbwaiters (or they might be termed excuses for dumbwaiters) have proven very unsatisfactory, and it is a well-known fact that one dissatisfied customer does more injury (no matter what the article might be) than ten satisfied customers do good.

The idea of installing dumbwaiters was primarily caused by the desire to avoid the necessity of making numerous trips up and down the stairs at meal time.

The first effort made toward avoiding this tiresome task was the installation of several pulleys, the placing of a rope on the pulleys and attaching a box to one end of the rope and a balance-weight to the other end, which arrangement did not prove very satisfactory. With a view to improving on this arrangement several machines were designed and placed on the market, but they were so crude in their construction and worked so hard that they did not solve the problem of saving labor in the household. It is true that these arrangements did overcome the necessity of traveling the stairs to a certain extent, but they required too much power to hoist the load, frequently requiring two and three persons to hoist the load, which, of course, was objectionable.

Some years ago Mr. J. G. Speidel, of Reading, Pa., designed and placed on the market a dumbwaiter machine not only to hoist the load with a minimum amount of power, but to also overcome the possibility of the erector not installing same properly.

Mr. Speidel's machine is built in a very strong and compact manner, not to last only a few months, but a lifetime. The machine is self-contained, all sheaves and bearings being part of the main frame so that they cannot get loose after running a while or be placed in a wrong position, consequently they can be erected properly by any good carpenter in a comparatively short time. It must be appreciated that it is of the greatest importance to have all sheaves and bearings placed in exactly the right position, otherwise the ropes and cables will wear out very quickly. The main shafts of the machines run in self-lubricating graphite bronze bushings and the sheaves on anti-friction steel roller bearings, making the machine not only easy running, strong and durable, but require little or no attention after being in operation. The machines also have an automatic brake that is very powerful and reliable, and holds the load automatically at any point of the lift.

Since these improved machines have been placed on the market the use of dumbwaiters has become more universal and today they are not only used to hoist victuals from the kitchen to the pantry and dining room or from the cellar to the kitchen, in private residences, hotels, hospitals, etc., but are also used to hoist and lower furniture, trunks, and invalids from one floor to another.

The cost of a dumb waiter is small and within the reach of everyone, so that no well regulated household, hotel, apartment house, or philanthropic institution can afford to be without the use of one that will fill the bill.

A line to Mr. Spiedel will bring any desired information regarding the use or installation of these labor-saving devices.

Protect Your Concrete With Bay State Brick and Cement Coating

It is being specified by the leading architects and contractors not only as a coating on cement, stucco, and brick surfaces to protect them against moisture, but on high grade interior work on both wood and plaster.

When you need a coating for cement and want something that will stand up and give protection and durability, also a pleasing finish, use the **Bay State Brick and Cement Coating,** which is the result of research and experimental work for more than a decade. Wherever it is used on stucco, concrete, wood or plaster, it stands up better than any other.

You know how necessary it is to protect concrete surfaces against dampness. My coating is dampproof and gives a pleasing appearance without destroying the texture of concrete and in addition is a fire retarder.

Write for particulars about **Bay State Brick and Cement Coating.** Address for booklet No. 10.

A MECHANICS ADJUSTABLE LEVEL AND PLUMB.

Any optician can readily demonstrate to the most skeptical that it is impossible for the eye to invariably judge distance, length or form with accuracy. Parallel lines can be made to apparently diverge or converge and lines of equal length appear to be of several different lengths.

Knowing this, we can readily see how it is possible to make errors in the building field unless every precaution is taken to secure accuracy and check the work of the naked eye.

In the building line there are two base lines from which we work, the horizontal, and the perpendicular, and we are fortunate in having instruments which will determine these lines with great exactness.

While great accuracy may be obtained with an engineer's transit or level, it is possible to secure accurate results for all ordinary building work with a much cheaper instrument. The Weaver adjustable level and plumb is designed to aid the mechanic or builder in all the operations about the erection of a building, such as leveling, grading, setting partitions, etc. It can be attached to any leveling board or straight edge and when so attached takes the place of the ordinary long level. The facility with which it can be used under these circumstances is apparent to every mechanic, as it gives him the free use of the hand which was formerly required to hold the level in place. As the level is adjustable for various angles, it is possible to lay out a great deal of work which would require a great deal of extra work by other methods and possibly require one or two other men to do it. This principle is used in laying out concrete sidewalks, pitches for trusses, roofs, etc.

The manufacturer of this level, Mr. J. D. Weaver, Jacksonville, Ill., has found this level so satisfactory to his customers that he offers to allow its return any time within thirty days should it not be found perfectly satisfactory. This is about as broad a guarantee as can be made, but we believe that it is justified by the merits of the level.

HOMES OF CHARACTER.

Every age and country has its developments of architecture in cottages, in public buildings, churches, etc. In each there are good features, which are adaptable to the United States with its wide range of climatic conditions.

The architect, watching the taste of his clients sees a steady increase in individual ideas. Perhaps one has visited Switzerland and become imbued with the "Chalet" quaintness. Another finds in the old Mexican Mission the ideas which suit him particularly.

But it will not do to transplant entirely the architecture of any country or age. In its original home, it is the logical result of conditions, climate and customs. The detail, however, will often bear working into the necessary framework to local conditions. The successful architect today is he who harmonizes the ideas of his clients with the conditions and environments of the project.

From the above, it will be seen that the task of the architect is not easy. Specialization has been resorted to by many who are technically fitted for a general practice. The result of concentration has been to greatly increase the value of his work, however, and in no line do we see better results than in bungalows, cottages and low cost residences.

Among the architects who have made this line their study is John Henry Newson, 1238 Williamson building, Cleveland, Ohio. Under the name of "Homes of Character," he presents many beautiful designs of low cost homes, suitable for city suburbs or farms, adapting modern materials to the styles of various countries. Besides the plans and perspective views, he gives a great deal of valuable information for the prospective home owner.

Mr. Newson will be glad to hear from those intending to build and a two-cent stamp will bring his circular, showing a number of plans which have proven particularly adapted to this line of work.

ASPHALT SHINGLES.

Attractive and durable roofs are a necessity in every climate. Whether in the extreme north, subjected to snow and melting ice during the winter, or in the south subjected to torrential rains, the covering must protect the building from the slightest leak.

Owing to the extreme variations in temperature which are greatest on the roof, due to the direct rays of the sun, it is necessary to carefully consider the material to be used for the roof covering.

Many materials have been proposed and many are more or less satisfactory, depending upon the conditions under which they are used and the localities. But the roof must do more than simply keep out the water. It must be attractive so as to be in harmony with the rest of the building. It must be reasonable in price to come within the reach of the man with moderate means and above all, it must be durable so as not to require frequent repairs or replacements.

Possibly no material has been subjected more to the weather than asphalt. Coming from a warm climate where it has been subjected to the heat and the sun and the action of the rain for centuries, it is unquestionably the product of severe conditions and when properly used will protect the building from equally severe attacks of the elements.

The H. M. Reynolds Asphalt Shingle Company, 182 Oakland avenue, Grand Rapids, Mich., prepare a roofing in the form of flexible asphalt shingles, the top of which are covered with finely crushed

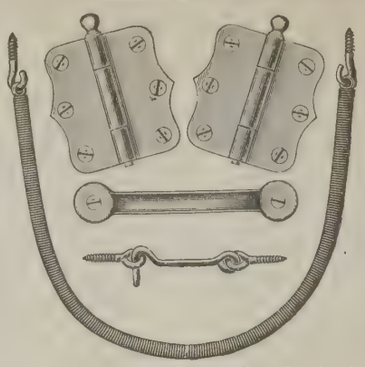
Take a Course in Architectural Perspective



And You will Then be Able to Close Many a Contract that Would Otherwise be Lost

The demand for Architectural Perspective is increasing yearly because those who build are demanding, in addition to the plans, perspective drawings of their buildings. A well made perspective drawing, properly shaded and set off by a little landscape and secondary detail, pleases the eye, and is a valuable adjunct to the regular plans and elevations. Our correspondence course in ARCHITECTURAL PERSPECTIVE and DRAWING of BUILDINGS is complete, practical, and can be learned at home at odd times. Instruction likewise given in twelve separate, complete Art Courses, for pecuniary profit, or pleasure only, as desired. Year Book sent upon request.

slate, which gives it the same appearance as the best qualities of the national material, as well as the wearing value of the natural stone.

By their process of manufacture, the shingles are so made that there is no possibility of warping or breaking and once in place will remain in good condition, even when subjected to considerable rough usage.

The H. M. Reynolds Company have just issued a very interesting booklet showing the various styles and colors, etc., in which their shingles are made, as well as the asphalt roofing in roll form.

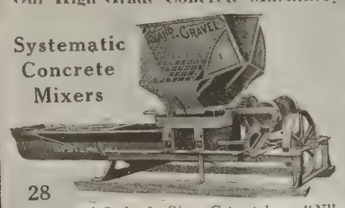
This booklet contains a great deal of useful information regarding materials of this character, directions for laying, etc., and will be sent on request.

ARCHITECTURAL PERSPECTIVE.

There are many conditions entering into the securing of a contract for a building when the contractor or builder is figuring with the owner, but one of the most vital points that comes up is just how this structure will look when finished.

The contractor is well enough versed in the reading of blue prints and plans to form an excellent idea in his own mind of the general perspective of the finished building, but the owner is not. The owner needs a rough perspective drawing to show general effects, as well as some details, to be convinced, which is impossible to explain in words.

It is safe to say that a great many contracts are lost by contractors, who either draw their own plans or have them drawn, by this fact: That he cannot convey to the owner the general effect, in a conclusive way, of the appearance of the structure after being built.



This is one of the services the large professional architect gives his client. He not only makes the working drawings, but clinches his arguments about this or that detail in a general perspective drawing.

Working drawings of straight lines and dimensions mean little to the average man not familiar with mechanical drawing, but a perspective sketch, properly shaded or set off with secondary detail, is a valuable adjunct to plans and elevations, and pleases the eyes.

It would be of interest to our readers to know that the School of Applied Art, 677 Applied Art Building, Battle Creek, Michigan, has some valuable information on this matter in connection with a course, either by correspondence or at their school. It would be beneficial to our readers to at least send for this information.

THE LINE LEVEL.

It takes a good eye to estimate the length of a line within five per cent, and without tools or instruments no workman can be sure his work is accurate within that limit. The use of simple tools, such as the Jackson Aluminum Line Level, eliminate the error entirely for all distances up to forty feet. This means that any ordinary residence, small store building or factory can be built plumb and true with a vest pocket instrument.

It means, too, that all the work ordinarily done with a spirit level and straightedge, leveling floors, plumbing jambs and studding, setting stone, lining up brick courses, etc., can be done with the same simple instrument.

The Jackson Aluminum Line Level is sold by first-class jobbers generally. The Joseph Woodwell Company, sold agents, 201 Wood St., Pittsburg, Pa., will be glad to send further particulars regarding this valuable instrument.

RED GUM FOR INTERIOR FINISH.

No class of owners are more particular about the details of finish than hotel owners. Their buildings are the temporary or semi-permanent home of people with the widest experience of many buildings. From all quarters of the globe the guests are daily assembled, daily changing, and the desire of all is for a home-like interior—quiet, refined and dignified. An expensive finish adds to the cost of maintenance and rates without a corresponding degree of comfort, while a cheap, gaudy finish offends the eye.

When Messrs. Holabird and Roche, the architects of the Hotel Sherman, presented the merits of Red Gum to the owners the last word was said regarding the principal finish. The satisfaction of the owners is apparent from the complimentary remarks from the occasional guest as well as from regular patrons.

HOTEL SHERMAN, CHICAGO.

There are many reasons why Red Gum is the logical wood for the interior finish of homes as well as hotels, offices, and large or public buildings. Red Gum has a fine even grain and is easily worked with little waste at the mill or on the job. This makes it a general favorite with the mill and workmen. Whether in the solid or in veneers, the grain is figured just enough to relieve the flat surface, without being prominent enough to command attention. The nature of the wood permits a wide range of finish, from the neutral gray to green, mission or mahogany. Possibly the most satisfactory finish is in imitation of Circassian Walnut, which it closely resembles in grain and color.

Red Gum is supplied by practically every planing mill in the country, but should the reader wish samples or other information, he is referred to:

Lamb-Fish Lumber Company, Charleston, Miss.

WAS YOUR HOUSE WARM?

Now that an unusually cold winter is about over we look about for the summary of conditions during that period. The question arises, was the house as warm as it should have been for the fuel used? Ideal conditions are hard to realize, of course, but it is a fact that many complained that their walls seemed to simply "leak" cold air when the weather was the coldest.

How can this condition be prevented? The perfect wall excludes all passage of air, except through open windows or doors. To get a wall this tight in a frame building requires an impervious blanket over the sheathing, which shall neither conduct the heat out nor contain even minute openings through which the air may circulate.

An ideal covering of this character is found in Linofelt, manufactured by the Union Fibre Company, 41 Union avenue, Winona, Minn. Linofelt consists of two sheets of weather-proof paper, with a filling of pure flax fibre, and is applied directly to the sheathing before the siding is put on. Where a stucco finish is desired, a waterproof paper is used, thus keeping any possible dampness from entering the building.

Some argue over the expense of weather-proofing materials, such as Linofelt. The cost is small compared to the entire building—usually less than one per cent—while the saving in fuel makes up the difference in two or three years, to say nothing of the comfort of living in a draught-proof house.

The Union Fibre Company have some valuable information regarding Linofelt which should be in the hand of everyone interested in more comfortable buildings. The Linofelt booklet contains directions for using Linofelt under various conditions. Needless to say, this information will be sent free on request.

Amatite ROOFING

Mineral Surfaced

Needs No Painting

EVERYTHING about Amatite appeals to the man with common sense. He can see its superiority at once—the real mineral surface *which never needs painting;* the two layers of Pitch which is the greatest water-proofing material known; the two layers of heavy Tarred Felt—all these contribute to the popularity of Amatite.

We can make Amatite better and cheaper than anyone else on account of our greater facilities, and consequently we sell it at a surprisingly low figure.

Simply the fact that it needs no painting is enough to make a man sit up and take notice—especially the man who has spent time and money in painting and repainting smooth surfaced roofings.

Write today for further information.

The Contractor's Influence in the Building Field

About two full moons ago, a hardware dealer awoke one day from a Rip Van Winkle snooze—and began to wonder why he could not sell a certain Mr. Contractor any bright escutcheons. Instead of sulking around behind the counter and blaming everyone and "T. R." generally, Mr. Dealer induced Mr. Contractor to venture into his store for a few minutes chat

"Mr. Contractor," began the dealer, "I know that you are doing all the real good work out at the end of the town, I know that you buy an awful big lot of builders' hardware every year. Now give it to me straight, why do you never buy anything from me, except a package of brads, or a nail or two, when I have this great big stock for you to select from?"

"Mr. Dealer," replied the contractor, "I'll give it to you straight, although I suppose it will have about the same effect that it has when a traveling man tells a hotel proprietor that his place is a back number.

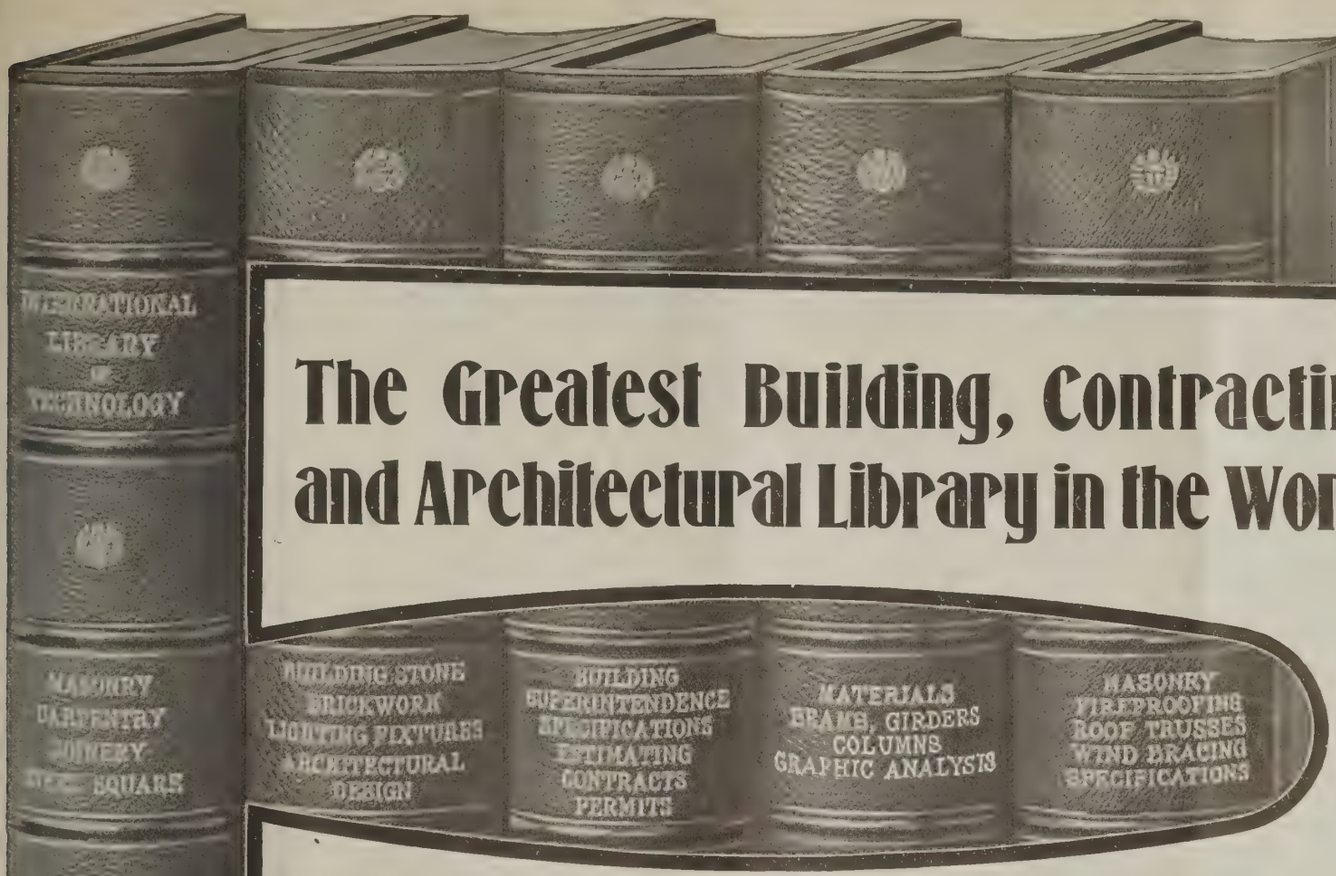
"But to begin, let's go behind your counter. Here is a bunch of lock sets. They look pretty nice and new, but they are about two years old at least in design, and so on all along. Your stock is not up-to-date, and as to price—why you are way high."

"Mr. Contractor," replied the dealer, "I buy my goods from Jones & Jones, about the biggest and best known people in the business, and they surely wouldn't sell me old style stuff, and as to prices, why——"

"The best thing for you to do, Mr. Dealer," interrupted the contractor, is to pretend you are a Contractor for a while and look around. You will find out that some of us Contractors know more about builders' hardware than you fellows, and what I have said about your stock and prices is ***right.***"

Some time after this interview, the salesman from the big, well known house called on Mr. Dealer. He saw a new line on the counters and shelves. The store had more customers in it than he had ever seen before. "Nothing doing," said the Dealer. "I'm buying from up the street now. A Contractor came in here not long ago and showed me where I got off. What! You don't mean it—20% less for the line you have been selling me? Well, well, and you have some new lines too, eh? Well, well! twice in the same place—but, Mr. Salesman, I'm stocked up for a while, and this line seems to be so good, think I'll stick to it as long as I can keep up-to-date, and even if you do come down, 20% now don't interest me. '

Now, the little point to this story is meant to show that the Contractor's influence in the building field is so great that he can swing orders from one big company to another by being posted on what the property owner wants.



This particular Contractor is a real live man, who has built for himself a reputation for good work and honesty, that cannot be assailed by others who will do the work cheaper. This Contractor actually has to turn work down. Property owners insist that the Contractor shall have the job even at a higher price.

But, it's a sad thing that all property owners are not the same. Too many of them expect to get a $10,000 residence put up for about $2,500, with new grass already growing in the front yard. When a Contractor finds himself up against such a game, it's no wonder that some of the houses he builds begin to wiggle in the second story when the graphophone commences to play "Tramp, Tramp, Tramp the Boys are Marching."

The Contractor of to-day is no longer the sloppy looking individual of years ago. He is a business man to begin with. He must have a good appearance or customers will not believe in him. He has a large, well equipped power woodworking shop. He often has 3 or 4 jobs going in different towns, at the same time. He uses an auto truck to hike to the freight depot or to the mill for those frames that have been ordered. He takes the National Builder and reads the advertising as well as the editorial matter. He knows that keeping in close touch with the building material markets is the only thing to do. He treats his men with consideration, knowing that he can get more work out of a man who is feeling pleased with the world generally than one who is sore all the time.

Contractors today, subscribers of the National Builder, are in most cases better posted on building materials and prices than many dealers. They do the buying, so why shouldn't they be posted?

The Greatest Building, Contracting and Architectural Library in the World

This Library of Architecture is part of the 99 volumes of the International Library of Technology that cost over $1,500,000 in its original preparation. It contains the results of years of experience of the best building experts in the country. It contains the best modern practical methods used in every branch of architecture. The matter has been written by the foremost technical building experts and illustrated by a special staff of artists and craftsmen. Not only is this Library suited for architects already well trained in their profession, but it is especially adapted for the use of laborers, carpenters, and contractors that wish to acquire in the easiest and most thorough manner the knowledge that will qualify them for advancement. This Library is the only practical technical library in existence wherein the subjects treated can be readily understood and practically applied by persons having no knowledge of higher mathematics.

The volumes of the International Library of Technology are used and indorsed by 95 of the leading colleges and universities throughout the country. They are also indorsed by leading engineers. An example of these indorsements is to be found in the statement of **Frank L. Mueller, Assistant Secretary of the O'Rourke Engineering Construction Company, of New York,** who states: **"Some time ago I received several volumes of your Library of Technology and it will certainly give you pleasure to know what I think of these books. I have at my disposal a reference library containing more than one thousand engineering books, but I must say that none of these works contain the information generally desired in such concise and simple form as the volumes of your Library of Technology."**

A partial list of the subjects contained in the Architectural Library is as follows: Excavating, Shoring, and Piling; Footings and Foundations; Areas, Vaults, and Retaining Walls; Cements; Concrete Construction; Stone Masonry; Stone Arches; Carpentry; Mechanics of Carpentry; Joinery; The Steel Square; Building Stone; Lathing, Plastering, and Tiling; Common Brickwork; Ornamental Brickwork and Terra Cotta; Lighting Fixtures; Use and Design of Lighting Fixtures; Architectural Design; Building Superintendence; Specification Writing; Specification-Writing Memoranda; Estimating and Calculating Quantities; Contracts; Permits; Fireproofing of Buildings; Stair Building; Ornamental Metal Work; Builders' Hardware; Roofing; Sheet-Metal Work; Mill Design; Loads in Structures; Properties of Sections; Materials of Structural Engineering; Beams and Girders; Columns and Struts; Details of Construction; Graphical Analysis of Stresses; Roof Trusses; Statics of Masonry; Heavy Foundations; Retaining Walls; Fireproofing; Roof-Truss Design; Wind Bracing; Specifications; Geometrical Drawing; Projection Drawing; Freehand and Ornamental Drawing; Wash Work and Brush Drawing; Elementary Perspective Drawing; Architectural Drawing; Painting and Interior Decoration; History of Architecture and Ornaments.

There are 10 volumes in this Architectural Library, beautifully bound in three-fourths red morocco, stamped and numbered in gold, printed on a very high-grade book paper, and fully and practically illustrated. They may be purchased in sets of five or more volumes. Each volume is 6×9 inches in size. For full information, **send this coupon NOW.**

Do You Use Kindling Wood For Roofing?

Residence F. D. Cooper, Wayland, Mass.

That's what the use of wood shingles means. Did you ever stop to think that matches are made from the same thing as wood shingles, so they will light easily and burn well?

Did you ever stop to consider that wood shingles are stacked upon a building just about as you pile wood to make a quick fire?

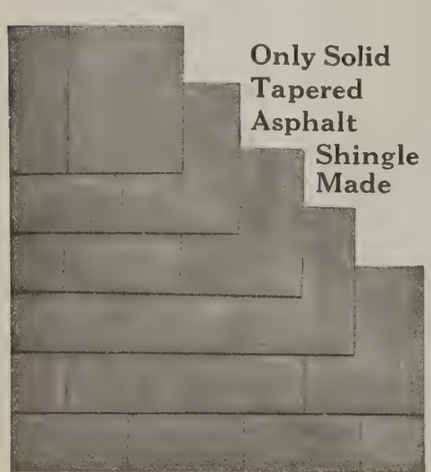
Did you know that wood shingles are made from stumpage, fallen timber and any kind of stuff that's not good for anything else—Do you know

Residence Fred Dollenbach, Champaign, Ill.

The Winthrop Tapered Asphalt Shingles

Guaranteed for 10 Years

Will pave your roof with asphalt nearly an inch thick for the same money that you must spend for a hopeless wood shingle? This asphalt is the same as the pavement you know about—that carries heavy traffic and must stand the coldest as well as the hottest exposure and under terrific traffic wear all the time.



Stucco House at Waukesha, Wis.

Red, Green and Slate Color

We make the Winthrop Shingles in the above colors and the colors are absolutely permanent and non-fading. The colors are genuine slate-pebbled and incorporated in the asphalt—actually a part of the shingle, rolled in and buried in the asphalt.

Cheap as Wood Shingle

Because there are no culls—every shingle perfect.
Because they are uniform in size.
Because they are eight inches wide and lay faster.
Because they last a lifetime.

The Winthrop Asphalt Shingle is PATENTED and cannot be made except under our patents.

Scientific Correction of Acoustics

TO ARCHITECTS, BUILDERS AND ENGINEERS:

One year ago we established a department for the development of Architectural Acoustics along scientific as well as artistic lines. To this end, we sought out and associated with ourselves trained scientists, capable of giving expert advice on the proper methods of acoustical correction. We have spared neither time nor expense in developing the best possible technique for the work, and we expect, in the future, by continual research and practical experience, to remain in the forefront of the development of this important combination of art and science.

We are the only concern which has attacked the problem by means of scientific research. The action of our imitators in attempting to copy our methods without the necessary scientific and practical training for such work, can result only in harm to scientific progress.

It is not our desire to force our services either upon architects or upon the public. We have established this department, not with the idea of interfering between the architect or client, but in the belief that there is a demand for honest, scientific work in the subject of Acoustics. We wish to take this opportunity to make our position known and to offer the services of our department to the architectural and engineering professions. Advice will be gladly given without charge. May we be favored with your confidence and patronage.

These Shingles Are Fully Guaranteed

THOUSANDS of buildings—homes, schools, churches, etc., are today covered with Reynolds Asphalt Shingles. Many of these have stood the heave of frost and the wear and tear of storm for 10 years and are in every way as good as when first laid.

Reynolds Asphalt Shingles have "made good"—they have stood the test. So satisfactory are they in durability and appearance, that leading architects and builders are specifying them for new work on the best class of modern homes.

Reynolds Flexible Asphalt Slate Shingles

Reynolds Asphalt Shingles last. They are 8x12¾ in. and lay 4 in. to the weather. They are fire-resisting and weather-proof. Never split, warp nor rot. Cannot color rain water. These shingles are mineral surfaced and laugh at wind and weather. No better shingles are made than these. If you want to enjoy life, roof your home with Reynolds Asphalt Shingles and—"forget it." We also make strictly high-grade granite surfaced roofing in rolls.

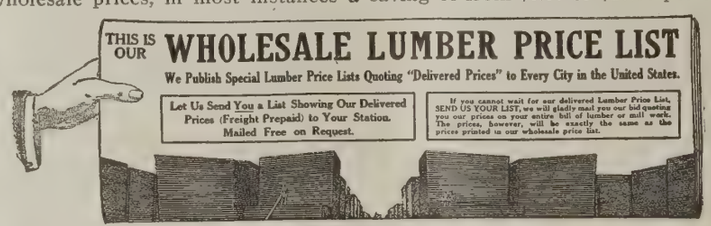
Lumber, Lath and Shingles

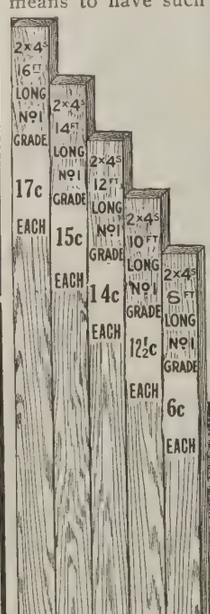


VIEW OF PLANT IN ILLINOIS.

THE WHOLESALE AND RETAIL MERCHANTS BUY LUMBER FROM THE PRODUCING MILLS, WHY DON'T YOU?

We Are Producers and Can Save You $100.00 on the Average House Bill of Lumber

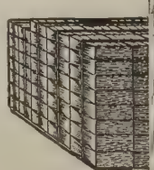
You save lumber dealers' profits when you order from us. Better still, we give you a finer grade of material than the average dealer carries. Furthermore **we can insure delivery in a few days.** We are now operating **two immense lumber plants,** one in Louisiana, another in Illinois. Our Louisiana plant is located in the great lumber forests with saw mills, dry kilns, log trains, planing mills, etc., in connection, permitting us to control our costs and grades and enabling us to sell you the finest lumber manufactured for all building purposes at strictly manufacturer's prices. Our Illinois plant is located on the two largest and fastest freight railroad systems in the North with direct connections to over twenty different railroads. We make a specialty of prompt shipment from this point to the Central and Eastern States, reducing the time in transit from weeks to days. Whether you want a single carload of lumber or twenty carloads, we can make shipment in record breaking time. Remember, our prices to you are strictly manufacturer's wholesale prices, in most instances a saving of from $5.00 to $10.00 per thousand feet.



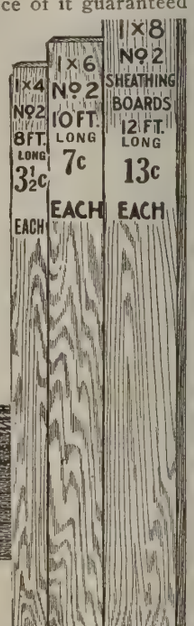
EVERY MAN THINKING OF BUILDING SHOULD HAVE THIS PRICE LIST

THE OPPOSITE PAGE SHOWS WHAT WHOLESALE PRICES WILL DO

ASK FOR LUMBER LIST 205NB.



930 DIFFERENT DESIGNS AND SIZES OF BUILDING LUMBER for all building purposes. Do you realize what it means to have such a large stock of this great big assortment of lumber located at a nearby plant, every piece of it guaranteed to be strictly up to grade and which can be purchased at a saving of about $100.00 on the average order? **We pay the freight to your station** when you order from our Wholesale Lumber Price List, which you can have for the asking, and which quotes delivered prices on yellow pine and cypress finishing lumber, yellow pine and fir flooring, yellow pine ceiling, siding, partition, dimension lumber, shiplap, plain boards, bevel cribbing, joists, lath, cypress and red wood siding, cypress and red cedar shingles, etc., so that you can tell to a penny what a carload of lumber will cost you. Do not buy lumber of any kind until you get this list. It will pay you to make an intelligent comparison of prices. **Architects, construction companies, contractors, carpenters all unite in praising the quality of our lumber.** In our lumber list we print letters from people from Connecticut to Colorado who have bought lumber from us, giving facts and figures that will surprise you, and proving beyond a shadow of a doubt all we have claimed in regard to **saving, quality and quick service.**



If you are thinking of building even a small size house you will need about 9,500 feet of lumber, 14,000 shingles and 10,000 lath. This will make a carload of 30,000 pounds. If you have a barn or any other outbuildings to put up you can safely figure on requiring a minimum carload. If you only require a few thousand feet, perhaps your neighbor has some building to do and can order his lumber with yours. It will pay you both handsomely to make up a club order and secure our wholesale carload delivered prices.

Do not forget that we are producers of lumber, operating two big plants. You can purchase lumber from us for the same money that your local dealer pays for his supply. Write for our Wholesale Lumber Price List today.

THE PRICES shown on this page are for the purpose of giving you some idea of what our prices are F. O. B. our Southern mill (without freight added). Write for our Wholesale Lumber Price List. It names you these same items, also our full assortment, with freight to your station added.

VIEW OF PLANT IN LOUISIANA.

There's a Reason

During March we sold **30 carloads**—more than a train load—to one firm. We sold a solid train load of **17 cars** to another, and many orders of **5 and 10 carload lots** to individuals. We will prove these statements by sending you photographs of these big shipments on request. Ask for photos N. B. 40.

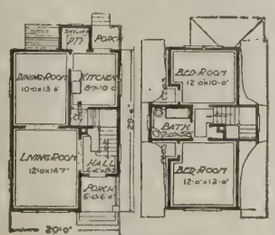
Which One of These Houses Interests You?

Write for further information. It will cost you nothing.

TO EVERY CARPENTER AND BUILDER

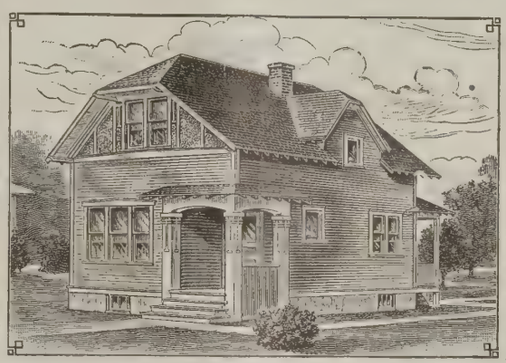
Here's a Gift of $20.00

PLUS A SAVING OF NEARLY ONE-HALF.



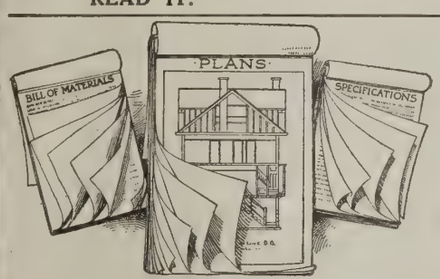
We can now furnish plans for 110 modern homes, all of which we illustrate and describe in our new Book of Modern Homes. We will send this book free and postpaid to every reader of the NATIONAL BUILDER. Write for it. Read about the wonderful bargain on this page which we offer you for April only. We practically make you a present of $20.00, but remember that even at our regular price the materials which we furnish for Modern Home No. NB194 for only $599.00 is worth fully one-third more.

Note the sketches of the different houses on this page. They will give you some idea of the splendid assortment of designs shown in our Book of Modern Homes. If you are interested in any of these houses just cut out the little picture, paste it on your letter and ask us for any information regarding it you may think necessary. We will be glad to answer your inquiries without any obligation whatever on your part.



Ask for Catalog NB196.

$599.00 IS OUR REGULAR LOW PRICE — OUR APRIL PRICE IS $579.00



Floor Plans.

Modern Home No. NB194

Here is a five-room house that can be built complete for $1,250.00. We furnish all of the material, consisting of lumber, lath, shingles, siding, finishing lumber, building paper, pipe, gutter, sash weights, hardware and painting material for $579.00. After April 30th our price will be $599.00. If we receive your order at any time before May 1st we will ship the material whenever you get ready to start building up to June 1st at this low price. Look into the merits of this house, send for the plans and examine them thoroughly. We expect to sell 100 Modern Homes No. NB194 during this sale, and we are willing to sacrifice our own profit for the advertising these 100 houses will bring us.

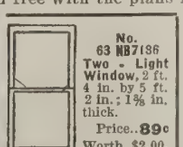
Do You Know Why We Can Save You So Much Money on a House? The Opposite Page Tells the Story. READ IT.

TAKE THESE PLANS FOR 50 CENTS.

We have never before offered a set of plans for less than $1.00, but in order to show you what a big bargain we are offering you in Modern Home No. NB194, we will sell you during April, the complete blue prints, specifications and an itemized bill of materials for only 50 cents. Order now and save half a dollar.

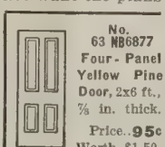
THE ORIGINAL TRACINGS FOR OUR HOUSES COST US $100.00 A SET. The architectural service, which usually costs a builder from $100.00 to $200.00, we offer you practically free. Get the plans for Modern Home No. NB194, study them if you like, but if you want to take advantage of a free gift of $20.00 be sure to get your order for the material to us before May 1st. You do not have to start building before June 1st and we will make shipment at any time before that date to suit your convenience.

Would you like to see reproductions of actual photographs of houses built according to our plans and with our material in all sections of the country? You can see them in our Book of Modern Homes, together with letters from the builders, telling of substantial saving, high quality and good service.



When you are writing for our Book of Modern Homes enclose 50 cents in stamps or money order and ask us to send you the plans for Modern Home No. NB194. BETTER DO IT TODAY. **THE BOOK OF MODERN HOMES IS FREE.**

OUR NEW BUILDING MATERIAL AND MILL WORK CATALOG IS NOW READY.



Our 1912 edition of our big Building Material and Mill Work Catalog is now ready, containing many new items, new illustrations, new cover design and filled from the first to the last page with the greatest building bargains it is possible to secure. We will send it to you free with the plans for Modern Home No. NB194, or if you do not want the plans at 50 cents a set, write for the catalog anyhow. You will have some repairing or remodeling to do during the coming months. This is the book that cuts your expenses down to nearly one-half. Compare the prices shown below with the prices you are now paying. We can make you a proportionate saving on all kinds of doors, windows, door and window frames, flooring, moldings, etc., of guaranteed quality.

GREYHOUND HAND SAWS

SPEED & EASE — TRADE MARK.

The more you know about hand saws the more you can appreciate "GREYHOUND" hand-made hand saws, with their easy-running and rapid cutting qualities and wonderful durability. This saw will be imitated by others—but not equalled.

They are made from Bishop's Refined "GREYHOUND" Steel—a material which leads everything yet produced for use in hand saws. The purity of the steel, the toughness, the even and accurate temper, gives a saw that is the most suitable for particular work, and the most practical for ALL work where a hand saw is used. Made in both straight and skewback, also narrow patterns. Specify which you desire. Remember our warranty accompanies each saw. And the warranty means that if 30 days' trial does not convince you that the "GREYHOUND" saw is the best for your use, you get your money back.

Order one today and let us take all the risk. If you want literature first, write us.

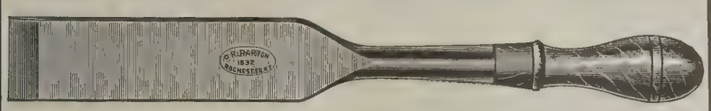
Why a single lip bit and why the FORD

The FORD Twist Saves the Wrist.

You wouldn't think of pushing two wheelbarrows if one would accomplish the same work. Then why bore a bit with two lips when the FORD with one lip does exactly the same work, and does it nearly twice as easy? ¶ Yes sir, Mr. Carpenter, a FORD single lip bit bores 40% easier and does everything any double lip bit will do. The FORD draws in on any wood, even on hard knots and end grain second growth hickory; holds true against knots; is warranted not to follow the grain in any wood; and WILL BORE OUT WITHOUT SPLINTERING. Think what a saving this means!



Ask your dealer for a FORD, and see for yourself what it will do. If he hasn't the genuine FORD write us and we will see that you are supplied.

If you'll write for descriptive circulars we'll send you free a handy memo. book. Simply address DEPT. 2-B.

Ford Auger Bit Co., Holyoke, Mass.

(The FORD is imitated but never equalled. The name FORD on the shank of each genuine bit is your protection against inferior imitations.)

Last a Lifetime and Give Satisfaction to the End!

The Famous Barton Planes and Edge Tools for Carpenters and other workers in wood

Unequaled by any other make for keen, smooth, lasting edges. If your hardware dealer does not handle these **Famous Barton Tools** and is unwilling to order for you, send direct for catalogue. Be sure to specify **Carpenter's Catalogue.** A postal will bring it, together with our story book, "True Stories," which will be found very interesting and instructive to those who are satisfied with the best tools only.

MACK & CO., Sole Makers

Brown's Race **Rochester, N. Y.**

Introductory Trial Offer

If the SELF-SETTING PLANES are not sold in your town and you write us saying "I saw your trial offer in N. B.", we will send you particulars, a carpenter's pencil and our $1.00 CERTIFICATE, which we will receive as $1.00 in part payment for a SELF-SETTING PLANE, as stated in our $1.00 CERTIFICATE, and if this S. S. PLANE is unsatisfactory and returned at our expense, we will send you $1.00 more than you sent us, as the $1.00 CERTIFICATE says.

As this paper guarantees we will do as our advertisement says, you know the plane must be O. K.

ALL WE ASK is to have you TRY the SELF-SETTING PLANE on your own bench, in your own way, with or against the grain, on the WORST cross-grained eaty, knurly, knotty, hard or soft wood you can find, THAT IS FREE FROM SAND OR DIRT.

If it is not worth to YOU or YOUR MEN, TWICE ITS COST, return it at our expense, as above stated.

If you send us the addresses of ten carpenters, no matter where they live, we will send you another carpenter's pencil, hard and tough.

Give the SELF-SETTING PLANE a chance to PROVE ITS WORTH if it fails, RETURN IT AND WE WILL RETURN YOUR MONEY.

Carpenter's Hard, Tough Pencils, 30c per dozen, postage prepaid.

BOVEE ECONOMY FURNACES

Lowest in Price

Highest in Quality

Last The Longest

Burn The Least Fuel

The Bovee is the only Furnace that has a perfect Ventilating System for every part of the House

Don't compare our furnaces with small, cheap furnaces that do not have one-half the capacity. Measure the firepot, measure the combustion chamber, measure the compound circulating radiator. Note the long travel of heat before reaching smoke pipe. See why the Bovee Furnaces **last longer, use less fuel and cost less** in comparison with other furnaces of equal size and capacity.

Bovee Furnaces require less fuel than other furnaces because every inch of the furnace, from the ash pit to the combustion chamber, is clean, direct heating surface, and the combustion chamber is more than double the size of the combustion chamber of other furnaces, compared to the size of the fire pot.

The heat, upon leaving this combustion chamber, instead of going out of the smoke pipe, circulates entirely around a compound circulating radiator before entering the chimney. The large heating surface of the combustion chamber and the long travel of the heat before reaching the smoke pipe utilizes the utmost heat produced from the fuel consumed.

The Bovee Furnace is more durable than other furnaces because the large heating surface and long travel of the heat gives them such great capacity that they do not require to be run at such intense heat. This not only makes the furnace much more durable, but also gives a balmy and far more pleasant atmosphere in the house. All parts of these furnaces subjected to the greatest heat are made of heavy cast iron; the best that can be purchased.

The Bovee Furnace is sold at a less price than other furnaces of anywhere near equal size and capacity because we buy our material in large quantities, manufacture by the most improved methods and sell at a small profit and there is no furnace of equal merit or economy of fuel and durability sold on the market today.

Complete PLANS and SPECIFICATIONS by the best furnace engineers sent FREE on receipt of rough floor plans.

BUY FROM THE MAKER

We have made and sold thousands of steel furnaces in Chicago, and we have sold them everywhere, by mail, direct to contractors, builders, and house owners, all over the country, from Maine to China. We don't offer them through dealers, for the DIRECT DEAL with the consumer is the most satisfactory to all concerned. It means BETTER SERVICE—because of the direct interest of the maker in each contract—and it means BETTER PRICES, for the middlemen's profits are cut out.

In buying the Hess Furnace, **you needn't have faith.** You can buy it now, on trial, and test it before January 1st, 1913. We will deliver it at your station, with all pipes and registers—freight prepaid.

Set it up and use it. If you're not pleased; not sure you have big value for the price—send it back to us—we paying return charges—and we won't claim one cent from you.

We don't offer you credit, however, for we require the price to be deposited with your local banker when you receive the goods. He holds it till the test is made, subject to the conditions outlined above, and gives it to you or to us, according to the result of the test. You take no risk, and you will save money.

Our furnace is made of steel, EVERY SEAM WELDED, and therefore permanently gas—dust—and smoke—tight. Made in six sizes, and burns any fuel. There is no furnace better, at any price.

Our 48 page booklet on furnace heating is free. Ask for one. It will give you a lot of useful information on heating.

REO Trucks

Wheel base, 90 inches—Horsepower, 10 to 12—Length behind seat, 6 feet—
Capacity, 1,500 pounds. Front seat top, $25 extra.

Only $750

Operation—50 Cents a Day

The Reo Truck, designed by R. E. Olds—a truck of 1,500 pounds capacity—is sold for $750.

Compel those who ask $1,200 and up to prove their extra value.

We have a mammoth plant built for trucks alone. We are building trucks there at a minimum cost, and adding a minimum profit.

We are selling these trucks through Reo dealers, already established in a thousand towns.

The result of this policy is a price you can't match on a truck of like capacity.

Two Years of Tests

Mr. R. E. Olds, this truck's designer, is a very careful man.

He has built automobiles for 25 years—tens of thousands of them.

When he offers a truck you may be sure that truck is right.

To test this truck, under every condition, he put hundreds of them into service.

He tested them out in forty sections, in thirty lines of business. And these tests have now covered two years.

One loaded truck was run from New York to Oregon. Two carried the baggage in the Glidden Tour, from New York to Jacksonville.

Whatever requirement a truck must meet, these trucks have been made to meet.

Wherever you are — whatever your service—the Reo truck will do what you expect.

Simple—Strong—Efficient

A boy in ten minutes can learn to operate this truck. He can care for it, too. No expert is needed.

There is nothing to get out of order. Simply supply it with gasoline and oil.

The cost of gasoline, oil and repairs, as per many tests, has averaged under 50 cents per day.

One truck can do five times the work of a one-horse dray. It can do it three times as quickly. It can do it at 60 per cent of the cost of horse delivery.

It can do it in any weather, on any road, in rain or snow or mud. It is always ready, and it costs you nothing when it isn't busy.

You will cease your horse delivery when you prove this truck.

Our local dealer will demonstrate the truck. He will teach your man to run it. He will render Reo service.

Write us for information.

TO THE MAN WHO HAS ALMOST DECIDED TO TRY AN

ATKINS

Silver Steel

SAW

You've read some of our ads.

You've probably been interested in the peculiar and excellent qualities of Silver Steel—the saw steel that takes a better temper and a keener edge, requires less filing yet files more easily, is less liable to rust and stands more hard usage than any other.

You've considered the Atkins taper-ground blade, which doesn't stick or bind in the wood and makes the Atkins the easiest running, fastest cutting saw you ever touched.

You've probably seen the advantage of the Atkins Perfection Handle, which saves your strength and makes the work easier.

Undoubtedly you like the Atkins Guaranty—money refunded by your dealer if the Atkins Silver Steel Saw isn't the very best saw you ever put through a board.

Like hundreds of carpenters who are writing us, you have probably decided to give the Atkins a trial.

We're writing this to suggest that you try the Atkins now. Why put it off?

We know this is your "busy day." But that's all the more reason why you should try the Atkins ***now***. The busier you are, the more you'll like the labor-saving Atkins saw.

Speak to Your Dealer About This.

Select the Atkins Silver Steel saw that you wish to try. Take that saw with you to your work—compare it with the saws you have been using. That's the way to find out, and ***now*** is the time! Money back if we don't make good.

BE SURE the blade says "Silver Steel"—that's our best saw. Remember, too, that it isn't a genuine guaranteed Atkins Saw unless it bears our name.

FREE to Carpenters

Have you got our FREE nail apron yet? We have it here for you. Write for it (enclosing 10 cents to cover postage). With the free nail apron—and it's a good one—we'll send our Carpenter's Time Book and our popular "Saw Sense" booklet, which contains a lot of handy information. Address our Carpenter's Department.

E. C. ATKINS & CO., Inc.

INDIANAPOLIS, IND.

Largest Exclusive Saw Manufacturers in the World

If your dealer doesn't handle Atkins Saws, or hasn't the particular saw you wish, ask him to order it for you from his wholesale house. He should be glad to do this—it's no trouble—and he will do it promptly if you make the request.
